Optical Line Protection Switch for Single-Fiber Bidirectional Transmission

Plug-in Card Type
OTN Solutions for Metro, Regional & Long Haul

Description

Optical Line Protection Switch(OLP) is a product that is used in the protection of network transmission line. By real-time monitoring the power status in working fiber, it can automatically switch from working fiber to backup fiber when the power value of working fiber is lower than a user defined threshold, achieving line protection of optical transmission system.

BIDI OLP needs to be used together with splitter to provide line protection for single fiber bidirectional transmission. The working mode of BIDI is dual transmitting and selective receiving. Optical line protection is realized by ways of bidirectional transmission over single optical fiber. It is mainly applicable to scenarios when there are limited amount of optical fiber resources.
Features

- Independent of data rate, format and wavelength
- Highly configurable to fit network applications
- Real-time monitoring of standby optical power
- Transparent transmission characteristic
- Reduce the loss caused by line fault
- Increase the reliability of the transmission network, improve network quality
- High level of integration by plug-in design, to save the space of cabinet
- Remote configuration through SNMP management

Application

Splitter & BIDI OLP only requires two optical fibers to implement the optical path protection for the single fiber bidirectional transmission. When the main fiber fails, the receiving end automatically switches to the standby fiber to ensure that the communication does not be blocked, improving the stability and reliability and saving fiber resources. While for Rx, the optical signal with better quality will be selected.
