

NSG Series Firewalls WebUI Configuration Guide

Models: NSG-3100; NSG-5100; NSG-8100

Contents

Chapter 1 Getting Started Guide.....	1
Initial Visit to Web Interface.....	1
Preparing the FSOS System.....	2
Installing Licenses.....	2
Creating a System Administrator.....	3
Adding Trust Hosts.....	4
Upgrading FSOS Firmware.....	5
Updating Signature Database.....	5
Connecting to Internet Under Routing Mode.....	5
Restoring Factory Settings.....	10
Restoring using a pin.....	10
Restoring via WebUI.....	11
Chapter 2 Deploying Your Device.....	12
How a Firewall Works.....	12
FSOS System Architecture.....	12
General Rules of Security Policy.....	14
Packet Processing Rule.....	15
Forwarding Rule in Layer 2.....	15
Forwarding Rule in Layer 3.....	17
Deploying Transparent Mode.....	19
Deploying Routing Mode.....	22
Deploying Mix Mode.....	26
Deploying Tap Mode.....	27
Chapter 3 Dashboard.....	30
Customize.....	30
Threats.....	31
Threatscape.....	31

User.....	31
Application.....	32
Total Traffic.....	32
Physical Interface.....	32
System Information.....	33
License.....	34
Specified Period.....	34
Chapter 4 iCenter.....	35
Chapter 5 Network.....	36
Security Zone.....	37
Configuring a Security Zone.....	37
Interface.....	39
Configuring an Interface.....	41
Creating a PPPoE Interface.....	41
Creating a Tunnel Interface.....	48
Creating a Virtual Forward Interface.....	54
Creating a Loopback Interface.....	58
Creating an Aggregate Interface.....	61
Creating a Redundant Interface.....	68
Creating an Ethernet Sub-interface/an Aggregate Sub-interface/a Redundant Sub-interface	68
Creating a VSwitch Interface/a VLAN Interface.....	73
Editing an Interface.....	73
DNS.....	81
Configuring a DNS Server.....	82
Configuring a DNS Proxy.....	82
Configuring a DNS Proxy Rule.....	82
Enabling/Disabling a DNS Proxy Rule.....	85
Adjusting DNS Proxy Rule Position.....	85
DNS Proxy Global Configuration.....	86

Configuring an Analysis.....	86
Configuring a DNS Cache.....	87
NBT Cache.....	88
DHCP.....	89
Configuring a DHCP Server.....	89
Configuring a DHCP Relay Proxy.....	96
Configuring a DHCPv6 Server.....	96
Configuring a DHCPv6 Relay Proxy.....	98
DDNS.....	98
Configuring a DDNS.....	99
PPPoE.....	100
Configuring PPPoE.....	101
Virtual Wire.....	102
Configuring a Virtual-Wire.....	103
Configuring the Virtual Wire Mode.....	104
Virtual Router.....	104
Creating a Virtual Router.....	105
Global Configuration.....	105
Virtual Switch.....	106
Creating a VSwitch.....	106
Outbound Link Load Balancing.....	108
Configuring LLB Profile.....	108
Configuring LLB Rule.....	109
Inbound Link Load Balancing.....	110
Creating a Smart DNS Rule Table.....	110
Application Layer Gateway (ALG).....	112
Enabling ALG.....	113
Global Network Parameters.....	113
Configuring Global Network Parameters.....	113

Chapter 6 Advanced Routing.....	116
Destination Route.....	117
Creating a Destination Route.....	117
Destination-Interface Route.....	119
Creating a Destination-Interface Route.....	119
Source Route.....	120
Creating a Source Route.....	120
Source-Interface Route.....	122
Creating a Source-Interface Route.....	122
ISP Profile.....	124
Creating an ISP Profile.....	124
Uploading an ISP Profile.....	124
Saving an ISP Profile.....	125
ISP Route.....	125
Creating an ISP Route.....	126
Policy-based Route.....	127
Creating a Policy-based Route.....	127
Creating a Policy-based Route Rule.....	128
Adjusting Priority of a PBR Rule.....	133
Applying a Policy-based Route.....	134
DNS Redirect.....	135
Configuring the Global Match Order.....	135
RIP.....	136
Creating RIP.....	136
OSPF.....	139
Creating OSPF.....	140
Viewing the Neighbor Information.....	142
Chapter 7 Authentication.....	144
Authentication Process.....	144

Web Authentication.....	145
Enabling the WebAuth.....	145
Configuring Basic Parameters for WebAuth.....	145
Customizing WebAuth Page.....	149
Single Sign-On.....	151
Enabling SSO Radius for SSO.....	151
Using AD Scripting for SSO.....	151
Step 1: Configuring the Script for AD Server.....	151
Step 2: Configuring AD Scripting for FSOS.....	155
802.1x.....	156
Configuring 802.1x.....	156
Creating 802.1x Profile.....	156
802.1x Global Configuration.....	158
Viewing Online Users.....	159
PKI.....	159
Creating a PKI Key.....	160
Creating a Trust Domain.....	161
Importing/Exporting Trust Domain.....	164
Importing Trust Certification.....	164
Online Users.....	165
Chapter 8 VPN.....	166
IPSec VPN.....	166
Basic Concepts.....	166
Security Association (SA).....	166
Encapsulation Modes.....	167
Establishing SA.....	167
Using IPSec VPN.....	167
Configuring an IKE VPN.....	168
Configuring a Phase 1 Proposal.....	168

Configuring a Phase 2 Proposal.....	171
Configuring a VPN Peer.....	173
Configuring an IKE VPN.....	177
Configuring a Manual Key VPN.....	181
Viewing IPsec VPN Monitoring Information.....	183
Configuring PnPVPN.....	185
PnPVPN Workflow.....	186
PnPVPN Link Redundancy.....	186
Configuring a PnPVPN Client.....	186
Configuring IPsec-XAUTH Address Pool.....	188
SSL VPN.....	190
Configuring an SSL VPN.....	191
Configuring Resource List.....	200
Configuring an SSL VPN Address Pool.....	202
Configuring SSL VPN Login Page.....	204
Host Binding.....	205
Configuring Host Binding.....	206
Configuring Host Binding and Unbinding.....	206
Configuring a Super User.....	207
Configuring a Shared Host.....	208
Importing/Exporting Host Binding List.....	208
Host Compliance Check.....	209
Role Based Access Control and Host Compliance Check Procedure.....	210
Configuring a Host Compliance Check Profile.....	211
SSL VPN Client for Windows.....	214
Downloading and Installing Secure Connect.....	215
Using Username/Password Authentication.....	215
Using Username/Password + Digital Certificate Authentication.....	216
Using Digital Certificate Only.....	217

Starting Secure Connect.....	218
Starting via Web.....	218
Using Username/Password Authentication.....	218
Using Username/Password + USB Key Certificate Authentication.....	219
Using Username/Password + File Certificate Authentication.....	221
Using USB Key Certificate Only Authentication.....	221
Using File Certificate Only Authentication.....	222
Starting Directly.....	222
Starting the Software Based on TLS/SSL Protocol.....	223
Using Username/Password Authentication.....	223
Using Username/Password + USB Key Certificate Authentication.....	225
Using Username/Password + File Certificate Authentication.....	226
Using USB Key Certificate Only.....	228
Using File Certificate Only.....	229
Starting the Software Based on GMSSL Protocol.....	230
Using Username/Password Authentication.....	230
Using Username/Password + Digital Certificate Authentication.....	231
Using Digital Certificate Only Authentication.....	232
Viewing Secure Connect GUI.....	233
General.....	233
Interface.....	234
Route.....	235
Viewing Secure Connect Menu.....	235
Configuring Secure Connect.....	236
Configuring General Options.....	236
Configuring a Login Entry.....	237
SSL VPN Client for Android.....	238
Downloading and Installing the Client.....	238
Starting and Logging into the Client.....	238

GUI.....	239
Connection Status.....	239
Configuration Management.....	240
Adding a Login Entry.....	240
Editing a Login Entry.....	240
Deleting a Login Entry.....	241
Modifying the Login Password.....	241
Disconnecting the Connection or Logging into the Client.....	241
Connection Log.....	242
System Configuration.....	242
About Us.....	242
L2TP VPN.....	242
Configuring an L2TP VPN.....	243
Configuring an L2TP VPN Address Pool.....	246
Viewing L2TP VPN Online Users.....	248
Chapter 9 Object.....	249
Address.....	250
Creating an Address Book.....	250
Viewing Details.....	252
Host Book.....	252
Creating a Host Book.....	252
Service Book.....	253
Predefined Service/Service Group.....	253
User-defined Service.....	253
User-defined Service Group.....	254
Configuring a Service Book.....	254
Configuring a User-defined Service.....	254
Configuring a User-defined Service Group.....	256
Viewing Details.....	257

Application Book.....	257
Editing a Predefined Application.....	257
Creating a User-defined Application.....	257
Creating a User-defined Application Group.....	258
Creating an Application Filter Group.....	259
Creating a Signature Rule.....	259
Viewing Details.....	261
SLB Server Pool.....	261
Configuring SLB Server Pool and Track Rule.....	262
Viewing Details of SLB Pool Entries.....	264
Schedule.....	264
Periodic Schedule.....	264
Absolute Schedule.....	265
Creating a Schedule.....	265
AAA Server.....	266
Configuring a Local AAA Server.....	267
Configuring Radius Server.....	268
Configuring Active Directory Server.....	270
Configuring LDAP Server.....	274
Configuring TACACS+ Server.....	278
Connectivity Test.....	279
User.....	279
Configuring a Local User.....	280
Creating a Local User.....	280
Creating a User Group.....	282
Import User Password List.....	283
Export User Password List.....	283
Configuring a LDAP User.....	283
Synchronizing Users.....	283

Configuring an Active Directory User.....	284
Synchronizing Users.....	284
Configuring a IP-User Binding.....	284
Adding User Binding.....	284
Import Binding.....	285
Export Binding.....	285
Role.....	286
Configuring a Role.....	286
Creating a Role.....	286
Mapping to a Role Mapping Rule.....	287
Creating a Role Mapping Rule.....	288
Creating a Role Combination.....	288
Track Object.....	289
Creating a Track Object.....	289
URL Filtering.....	293
Configuring URL Filtering.....	293
Viewing URL Hit Statistics.....	298
Viewing Web Surfing Records.....	298
Configuring Objects.....	298
Predefined URL DB.....	299
Configuring Predefined URL Database Update Parameters.....	299
Upgrading Predefined URL Database Online.....	300
Upgrading Predefined URL Database from Local.....	300
User-defined URL DB.....	301
Configuring User-defined URL DB.....	301
Importing User-defined URL.....	302
Clearing User-defined URL.....	302
URL Lookup.....	302
Inquiring URL Information.....	302

Configuring URL Lookup Servers.....	303
Keyword Category.....	304
Configuring a Keyword Category.....	304
Warning Page.....	305
Configuring Block Warning.....	305
Configuring Audit Warning.....	307
Configuring the URL Blacklist/Whitelist.....	307
Configuring the URL Blacklist.....	308
Configuring the URL Whitelist.....	309
Data Security.....	310
Configuring Objects.....	311
Predefined URL DB.....	312
Configuring Predefined URL Database Update Parameters.....	312
Upgrading Predefined URL Database Online.....	313
Upgrading Predefined URL Database from Local.....	313
User-defined URL DB.....	313
Configuring User-defined URL DB.....	313
Importing User-defined URL.....	314
Clearing User-defined URL.....	314
URL Lookup.....	315
Inquiring URL Information.....	315
Configuring URL Lookup Servers.....	315
Keyword Category.....	316
Configuring a Keyword Category.....	317
Warning Page.....	317
Configuring Block Warning.....	318
Configuring Audit Warning.....	319
Bypass Domain.....	319
Exempt User.....	320

File Filter.....	321
Creating File Filter Rule.....	321
Content Filter.....	323
Web Content.....	323
Configuring Web Content.....	323
Viewing Monitored Results of Keyword Blocking in Web Content.....	327
Viewing Logs of Keyword Blocking in Web Content.....	327
Web Posting.....	327
Configuring Web Posting.....	327
Viewing Monitored Results of Keyword Blocking in Web Posts.....	330
Viewing Logs of Keyword Blocking in Web Posts.....	331
Email Filter.....	331
Configuring Email Filter.....	331
Viewing Monitored Results of Email Keyword Blocking.....	334
Viewing Logs of Emails Keyword Blocking.....	335
HTTP/FTP Control.....	335
Configuring HTTP/FTP Control.....	335
Viewing Logs of HTTP/FTP Behavior Control.....	338
Network Behavior Record.....	339
Configuring Network Behavior Recording.....	339
Viewing Logs of Network Behavior Recording.....	341
NetFlow.....	342
Configuring NetFlow.....	342
Configuring a NetFlow Rule.....	342
NetFlow Global Configurations.....	344
Chapter 10 Policy.....	345
Security Policy.....	345
Configuring a Security Policy Rule.....	346
Managing Security Policy Rules.....	353

Enabling/Disabling a Policy Rule.....	353
Cloning a Policy Rule.....	353
Adjusting Security Policy Rule Position.....	353
Configuring Default Action.....	354
Viewing and Clearing Policy Hit Count.....	354
Hit Count Check.....	355
Rule Redundancy Check.....	355
Schedule Validity Check.....	356
Showing Disabled Policies.....	356
Configuring a Policy Group.....	357
Creating a Policy Group.....	357
Deleting a Policy Group.....	357
Enabling/Disabling a Policy Group.....	358
Adding/Deleting a Policy Rule Member.....	358
Editing a Policy Group.....	359
Showing Disabled Policy Group.....	359
Viewing and Searching Security Policy Rules/ Policy Groups.....	359
Viewing the Policy/ Policy Group.....	359
Searching Security Policy Rules/ Policy Groups.....	360
User Online Notification.....	361
Configuring User Online Notification.....	362
Configuring the Parameters of User Online Notification.....	362
Viewing Online Users.....	363
NAT.....	363
Basic Translation Process of NAT.....	363
Implementing NAT.....	364
Configuring SNAT.....	364
Enabling/Disabling a SNAT Rule.....	368
Adjusting Priority.....	369

Copying/Pasting a SNAT Rule.....	369
Exporting NAT444 Static Mapping Entries.....	370
Hit Count.....	370
Clearing NAT Hit Count.....	370
Hit Count Check.....	370
Configuring DNAT.....	371
Configuring an IP Mapping Rule.....	371
Configuring a Port Mapping Rule.....	372
Configuring an Advanced NAT Rule.....	373
Enabling/Disabling a DNAT Rule.....	375
Copying/Pasting a DNAT Rule.....	375
Adjusting Priority.....	376
Hit Count.....	376
Clearing NAT Hit Count.....	377
Hit Count Check.....	377
NAT Hit Analysis.....	377
SLB Server.....	379
Viewing SLB Server Status.....	379
Viewing SLB Server Pool Status.....	379
iQoS.....	380
Implement Mechanism.....	380
Pipes and Traffic Control Levels.....	381
Pipes.....	381
Traffic Control Levels.....	383
Enabling iQoS.....	384
Pipes.....	384
Basic Operations.....	385
Configuring a Pipe.....	386
Viewing Statistics of Pipe Monitor.....	394

Session Limit.....	394
Configuring a Session Limit Rule.....	395
Clearing Statistic Information.....	397
Share Access.....	397
Configuring Share Access Rules.....	397
ARP Defense.....	398
Configuring ARP Defense.....	399
Configuring Binding Settings.....	399
Adding a Static IP-MAC-Port Binding.....	399
Obtaining a Dynamic IP-MAC-Port Bindings.....	400
Bind the IP-MAC-Port Binding Item.....	400
Importing/Exporting Binding Information.....	401
Configuring ARP Inspection.....	401
Configuring DHCP Snooping.....	403
Viewing DHCP Snooping List.....	404
Configuring Host Defense.....	404
SSL Proxy.....	405
Work Mode.....	406
Working as Gateway of Web Clients.....	407
Configuring SSL Proxy Parameters.....	407
Specifying the PKI Trust Domain of Device Certificate.....	407
Obtaining the CN Value.....	408
Importing Device Certificate to Client Browser.....	408
Configuring a SSL Proxy Profile.....	409
Working as Gateway of Web Servers.....	411
Configuring a SSL Proxy Profile.....	411
Binding an SSL Proxy Profile to a Policy Rule.....	412
Global Blacklist.....	413
Configuring IP Block Settings.....	413

Configuring Service Block Settings.....	413
Chapter 11 Threat Prevention.....	415
Anti Virus.....	415
Configuring Anti-Virus.....	416
Preparing.....	416
Configuring Anti-Virus Function.....	416
Configuring an Anti-Virus Rule.....	419
Configuring Anti-Virus Global Parameters.....	420
Intrusion Prevention System.....	421
Signatures.....	422
Configuring IPS.....	422
Preparation.....	423
Configuring IPS Function.....	423
Configuring an IPS Rule.....	424
IPS Global Configuration.....	444
Signature List.....	445
Searching Signatures.....	446
Managing Signatures.....	446
Configuring IPS White list.....	449
Attack-Defense.....	450
ICMP Flood and UDP Flood.....	450
ARP Spoofing.....	450
SYN Flood.....	450
WinNuke Attack.....	451
IP Address Spoofing.....	451
IP Address Sweep and Port Scan.....	451
Ping of Death Attack.....	451
Teardrop Attack.....	451
Smurf Attack.....	452

Fraggle Attack.....	452
Land Attack.....	452
IP Fragment Attack.....	452
IP Option Attack.....	452
Huge ICMP Packet Attack.....	452
TCP Flag Attack.....	452
DNS Query Flood Attack.....	453
TCP Split Handshake Attack.....	453
Configuring Attack Defense.....	453
Perimeter Traffic Filtering.....	462
Enabling Perimeter Traffic Filtering.....	463
Configuring User-defined Black/White List.....	463
Searching Black/White List.....	464
Chapter 12 Monitor.....	465
Monitor.....	465
User Monitor.....	466
Summary.....	466
User Details.....	467
Address Book Details.....	468
Monitor Address Book.....	468
Statistical Period.....	469
Application Monitor.....	469
Summary.....	470
Application Details.....	471
Group Details.....	472
Select Application Group.....	473
Statistical Period.....	473
Cloud Application Monitor.....	473
Summary.....	474

Cloud Application Details.....	474
Statistical Period.....	475
Share Access Monitor.....	475
iQoS Monitor.....	476
iQoS Details.....	476
Device Monitor.....	477
Summary.....	477
Statistical Period.....	479
Detailed Information.....	479
Online IP.....	481
URL Hit.....	481
Summary.....	481
User/IP.....	482
URL.....	482
URL Category.....	483
Statistical Period.....	483
Link Status Monitor.....	484
Link User Experience.....	484
Statistical Period.....	484
Link Detection.....	485
Link Configuration.....	485
Detection Destination.....	486
Application Block.....	486
Summary.....	487
Application.....	487
User/IP.....	487
Statistical Period.....	488
Keyword Block.....	488
Summary.....	488

Web Content.....	489
Email Content.....	489
Web Posting.....	490
User/IP.....	490
Statistical Period.....	490
Authentication User.....	491
Monitor Configuration.....	491
User-defined Monitor.....	492
Creating a User-defined Stat-set.....	500
Viewing User-defined Monitor Statistics.....	501
Reporting.....	501
Report File.....	502
User-defined Task.....	503
Creating a User-defined Task.....	503
Enabling/Disabling the User-defined Task.....	504
Viewing Report Files.....	504
Predefined Task.....	505
Generating Report Tasks.....	505
Viewing Report Files.....	506
Logging.....	506
Log Severity.....	507
Destination of Exported Logs.....	508
Log Format.....	508
Event Logs.....	508
Network Logs.....	509
Configuration Logs.....	509
Share Access Logs.....	509
Threat Logs.....	510
Session Logs.....	510

PBR Logs.....	511
NAT Logs.....	511
URL Logs.....	512
File Filter Logs.....	512
Content Filter Logs.....	513
Network Behavior Record Logs.....	513
Managing Logs.....	514
Configuring Logs.....	514
Option Descriptions of Various Log Types.....	514
Log Configuration.....	523
Creating a Log Server.....	523
Configuring Log Encoding.....	524
Adding Email Address to Receive Logs.....	524
Specifying a Unix Server.....	525
Chapter 13 Diagnostic Tool.....	526
Test Tools.....	526
DNS Query.....	526
Ping.....	526
Traceroute.....	527
Chapter 14 High Availability.....	528
Basic Concepts.....	529
HA Cluster.....	529
HA Group.....	529
HA Node.....	529
Virtual Forward Interface and MAC.....	529
HA Selection.....	529
HA Synchronization.....	529
Configuring HA.....	530
Chapter 15 System Management.....	534

System Information.....	534
Viewing System Information.....	534
Device Management.....	535
Administrators.....	535
VSYs Administrator.....	537
Creating an Administrator Account.....	539
Admin Roles.....	540
Trusted Host.....	540
Creating a Trusted Host.....	540
Management Interface.....	541
System Time.....	543
Configuring the System Time Manually.....	543
Configuring NTP.....	544
NTP Key.....	545
Creating a NTP Key.....	545
Option.....	546
Rebooting the System.....	547
System Debug.....	547
Failure Feedback.....	547
System Debug Information.....	548
Configuration File Management.....	548
Managing Configuration File.....	548
Viewing the Current Configuration.....	550
SNMP.....	550
SNMP Agent.....	551
SNMP Host.....	552
Trap Host.....	553
V3 User Group.....	553
V3 User.....	554

SNMP Server.....	555
Creating an SNMP Server.....	555
Upgrading System.....	556
Upgrading Firmware.....	556
Updating Signature Database.....	557
License.....	558
Viewing License List.....	560
Applying for a License.....	560
Installing a License.....	560
Mail Server.....	561
Creating a Mail Server.....	561
VSYS (Virtual System).....	561
VSYS Objects.....	562
Root VSYS and Non-root VSYS.....	562
VRouter, VSwitch, Zone and Interface.....	563
Shared VRouter.....	564
Shared VSwitch.....	564
Shared Zone.....	564
Shared Interface.....	564
Interface Configuration.....	564
Creating Non-root VSYS.....	564
Configuring Dedicated and Shared Objects for Non-root VSYS.....	565
Configuring VSYS Quota.....	566
Entering the VSYS.....	570
Threats.....	31
Threatscape.....	31
User.....	31
Application.....	32
Total Traffic.....	32

Physical Interface.....	32
System Information.....	33
License.....	34
Specified Period.....	34
Chapter 4 iCenter.....	35
Chapter 5 Network.....	36
Security Zone.....	37
Configuring a Security Zone.....	37
Interface.....	39
Configuring an Interface.....	41
Creating a PPPoE Interface.....	41
Creating a Tunnel Interface.....	48
Creating a Virtual Forward Interface.....	54
Creating a Loopback Interface.....	58
Creating an Aggregate Interface.....	61
Creating a Redundant Interface.....	68
Creating an Ethernet Sub-interface/an Aggregate Sub-interface/a Redundant Sub-interface	68
Creating a VSwitch Interface/a VLAN Interface.....	73
Editing an Interface.....	73
DNS.....	81
Configuring a DNS Server.....	82
Configuring a DNS Proxy.....	82
Configuring a DNS Proxy Rule.....	82
Enabling/Disabling a DNS Proxy Rule.....	85
Adjusting DNS Proxy Rule Position.....	85
DNS Proxy Global Configuration.....	86
Configuring an Analysis.....	86
Configuring a DNS Cache.....	87
NBT Cache.....	88

DHCP.....	89
Configuring a DHCP Server.....	89
Configuring a DHCP Relay Proxy.....	96
Configuring a DHCPv6 Server.....	96
Configuring a DHCPv6 Relay Proxy.....	98
DDNS.....	98
Configuring a DDNS.....	99
PPPoE.....	100
Configuring PPPoE.....	101
Virtual Wire.....	102
Configuring a Virtual-Wire.....	103
Configuring the Virtual Wire Mode.....	104
Virtual Router.....	104
Creating a Virtual Router.....	105
Global Configuration.....	105
Virtual Switch.....	106
Creating a VSwitch.....	106
Outbound Link Load Balancing.....	108
Configuring LLB Profile.....	108
Configuring LLB Rule.....	109
Inbound Link Load Balancing.....	110
Creating a Smart DNS Rule Table.....	110
Application Layer Gateway (ALG).....	112
Enabling ALG.....	113
Global Network Parameters.....	113
Configuring Global Network Parameters.....	113
Chapter 6 Advanced Routing.....	116
Destination Route.....	117
Creating a Destination Route.....	117

Destination-Interface Route.....	119
Creating a Destination-Interface Route.....	119
Source Route.....	120
Creating a Source Route.....	120
Source-Interface Route.....	122
Creating a Source-Interface Route.....	122
ISP Profile.....	124
Creating an ISP Profile.....	124
Uploading an ISP Profile.....	124
Saving an ISP Profile.....	125
ISP Route.....	125
Creating an ISP Route.....	126
Policy-based Route.....	127
Creating a Policy-based Route.....	127
Creating a Policy-based Route Rule.....	128
Adjusting Priority of a PBR Rule.....	133
Applying a Policy-based Route.....	134
DNS Redirect.....	135
Configuring the Global Match Order.....	135
RIP.....	136
Creating RIP.....	136
OSPF.....	139
Creating OSPF.....	140
Viewing the Neighbor Information.....	142
Chapter 7 Authentication.....	144
Authentication Process.....	144
Web Authentication.....	145
Enabling the WebAuth.....	145
Configuring Basic Parameters for WebAuth.....	145

Customizing WebAuth Page.....	149
Single Sign-On.....	151
Enabling SSO Radius for SSO.....	151
Using AD Scripting for SSO.....	151
Step 1: Configuring the Script for AD Server.....	151
Step 2: Configuring AD Scripting for FSOS.....	155
802.1x.....	156
Configuring 802.1x.....	156
Creating 802.1x Profile.....	156
802.1x Global Configuration.....	158
Viewing Online Users.....	159
PKI.....	159
Creating a PKI Key.....	160
Creating a Trust Domain.....	161
Importing/Exporting Trust Domain.....	164
Importing Trust Certification.....	164
Online Users.....	165

Chapter 1 Getting Started Guide

This guide helps you go through the initial configuration and the basic set-up of your device. The intended reader is your company's network administrator.

This guide is used when you have finished mounting your device. After following the steps in this guide, your private network will be able to access the Internet. To set up security functions, you will need to read the User Guide (WebUI User Guide or CLI User Guide).

You may configure your firewall in the following sequence:

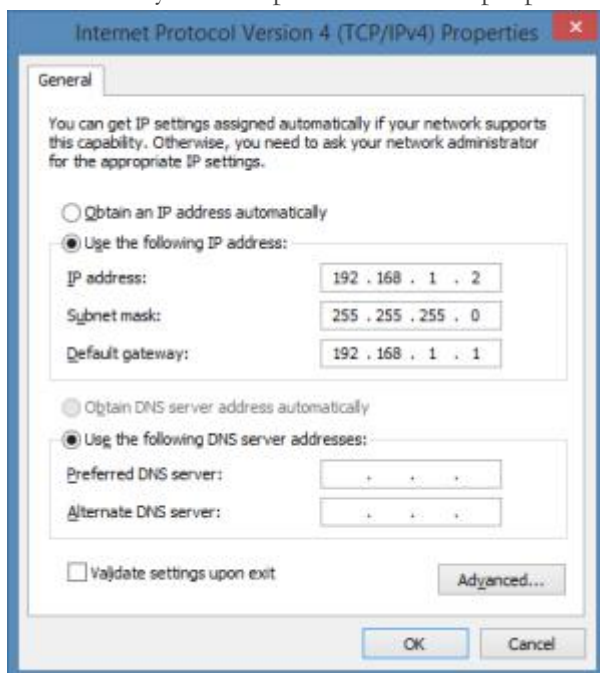

1. ["Initial Visit to Web Interface"](#)
2. ["Preparing the FSOS System"](#) including:
 - ["Installing Licenses"](#)
 - ["Creating a System Administrator"](#)
 - ["Adding Trust Hosts"](#)
 - ["Upgrading FSOS Firmware"](#)
 - ["Updating Signature Database"](#)
3. ["Connecting to Internet Under Routing Mode"](#)
4. ["Restoring Factory Settings"](#)

Initial Visit to Web Interface

Interface eth0/0 is configured with IP address 192.168.1.1/24 by default and it is open to SSH、PING、SNMP、HTTP connection types(except for some custom versions). For the initial visit, use this interface.

To visit the web interface for the first time, take the following steps:

1. Go to your computer's Ethernet properties and set the IPv4 protocol as below.

2. Connect an RJ-45 Ethernet cable from your computer to the eth0/0 of the device.
3. In your browser's address bar, type "http://192.168.1.1" and press **Enter**.

4. In the login interface, type the default username and password: admin/admin.
5. Click **Login**, and the device's system will initiate.

Preparing the FSOS System

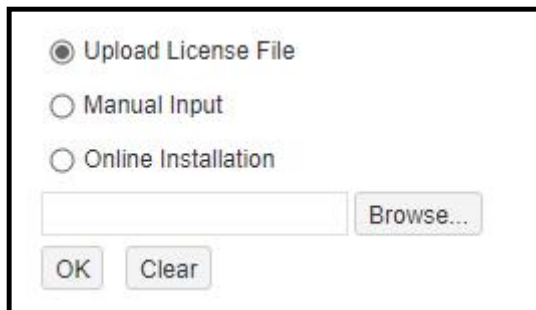

Installing Licenses

Licenses control features and performance.

Before installing any license, you must purchase a license code.

To install a license, take the following steps:

1. Go to **System > License**.
2. Choose one of the three ways to import a license:

- **Upload License File:** Select the radio button, click **Browse**, and select the license file (a .txt file).
 - **Manual Input:** Select the radio button, and paste the license code into the text box.
 - **Online Installation:** Select the **Online Installation** radio button and click the **Online Installation** button, your purchased licenses will be automatically installed. It should be noted that the licenses must be in an activated status in the Online Registration Platform . (To activate the license, you need to log into the platform using your username and password. The username is the same as your email which was provided when placing the order. FS will send the password by email. Then, activate the licenses that need to be installed. If you purchased the device from a FS agent, please contact the agent to activate the licenses.)
3. Click **OK**.
 4. To make the license take effect, reboot the system. Go to **System > Device Management > Options**, and click **Reboot**.

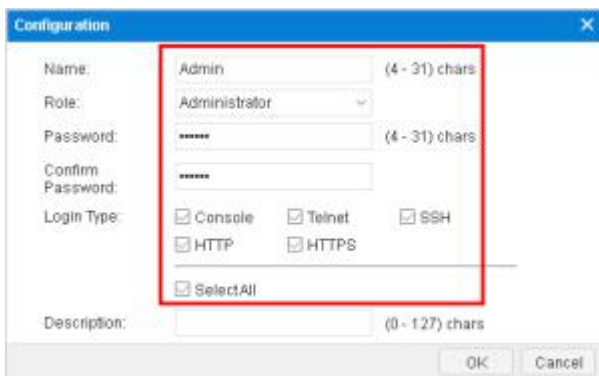

Creating a System Administrator

System administrator has the authority to read, write and execute all the features in system.

To create a system administrator, take the following steps:

1. Go to **System > Device Management > Administrator**.

2. Click **New**.

In the Admin Configuration dialog box, enter values

Option	Value
Name	Admin
Role	Administrator
Password	123456
Confirm Password	123456
Login Type	Select Telnet , SSH , HTTP and HTTPS .

3. Click **OK**.

Notes: The system has a default administrator "admin" , which cannot be deleted or renamed.

Adding Trust Hosts

The trust host is administrator's host. Only computers included in the trust hosts can manage system.

To add a trust host, take the following steps:

1. Go to **System > Device Management**.
2. Select **Trust Host** tab, and click **New**.

In the Trust Host Configuration dialog box, enter value

Option	Value
Type	Select IP/Netmask

Option	Value
IP	192.168.1.2/24
Login Type	Select all: Telnet, SSH, HTTP and HTTPS

3. Click **OK**.

Upgrading FSOS Firmware

Notes: Back up your configuration files before upgrading your system.

To upgrade your system firmware, take the following steps:

1. Go to **System > Upgrade Management**.
2. Select **Browse** and choose the new image from your local computer.
3. Click **Reboot to make new firmware take effect**, then click **Apply**.
4. System will automatically reboot when it finishes installing the new firmware.

Updating Signature Database

Features that require constant updates of signature are license controlled. You must purchase the license in order to be able to update the signature libraries. By default, the system will automatically update the databases daily.

To update a database, take the following steps:

1. Go to **System > Upgrade Management**, and click the <Signature Database Update> tab.
2. Find your intended database, and choose one of the following two ways to upgrade.
 - **Remote Update:** Click **Update**, and system will automatically update the database.
 - **Local Update:** Select **Browse** to open the file explorer, and select your local signature file to import it into system.

Connecting to Internet Under Routing Mode

In routing mode, the device is working as a gateway and router between two networks. This section shows how to connect and configure a new device in routing mode to securely connect the private network to the Internet.

To get your private network access to Internet through a FS device, take the following steps:

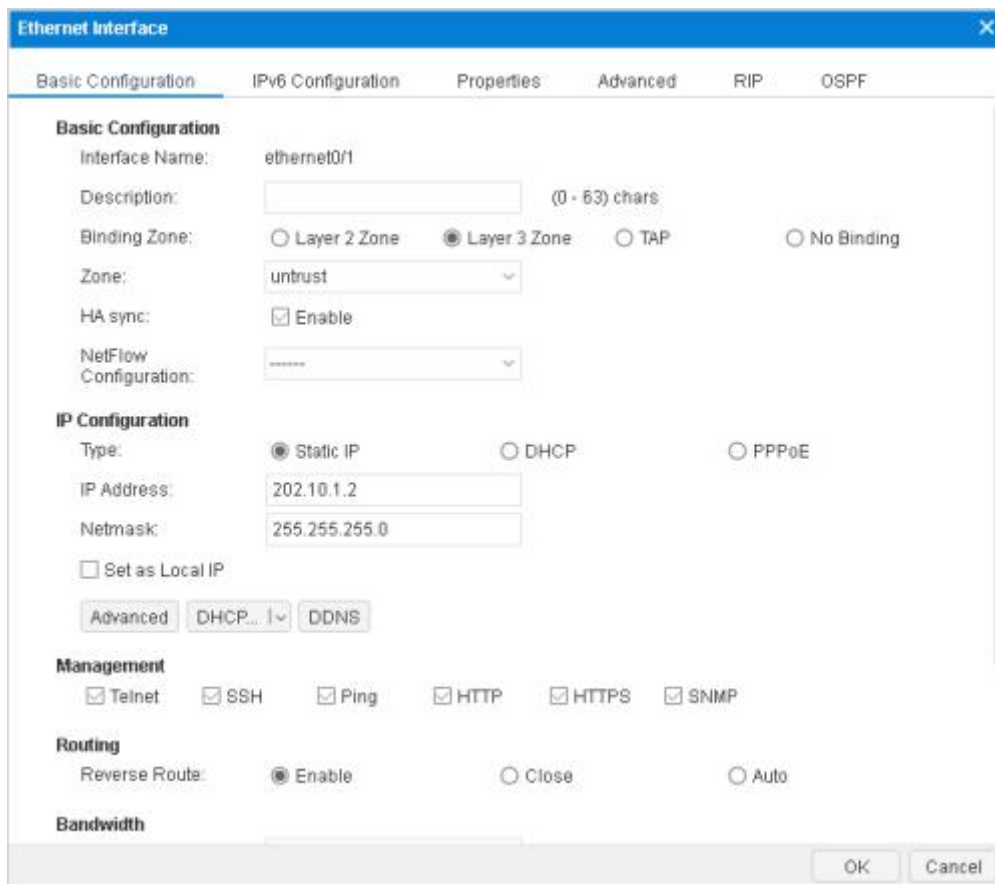

Step 1: Connecting to the device

1. Connect one port (e.g. eth0/1) of FS device to your ISP network. In this way, "eth0/1" is in the untrust zone.
2. Connect your internal network to another Ethernet interfaces (e.g. eth0/0) of the device. This means "eth0/0" is connected to the trust zone.
3. Power on the device and your PCs.
4. If one of the internal interfaces already has been configured with an IP address, use a browser to visit that address from one of your internal PCs.
If it is a new device, use the methods in ["Initial Visit to Web Interface"](#) to visit.
5. Enter "admin" for both the username and the password.

Step 2: Configuring interfaces

1. Go to **Network > Interface**.

2. Double click **eth0/1**.

In the Ethernet Interface dialog box, enter values

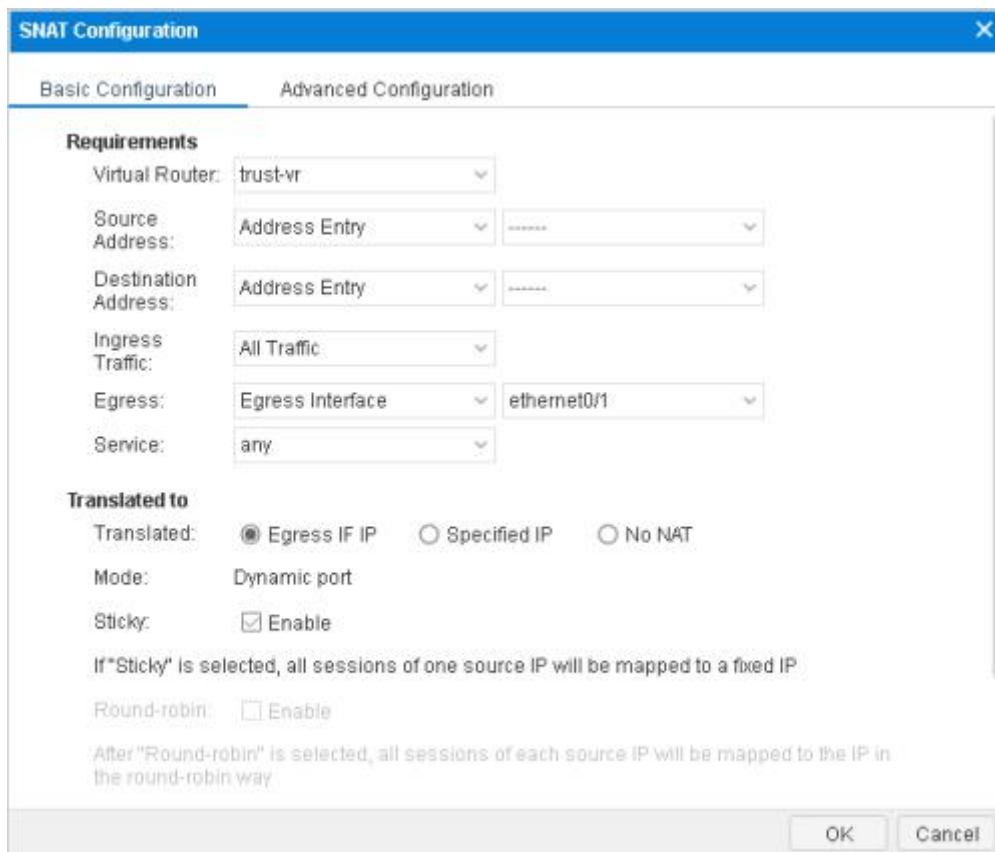

Option	Value
Binding Zone	L3-zone
Zone	untrust
Type	Static IP
IP Address	202.10.1.2 (public IP address provided by your ISP)
Netmask	255.255.255.0
Management	Select protocols that you want to use to access the device.

3. Click **OK**.

Step 3: Creating a NAT rule to translate internal IP to public IP

1. Go to **Policy > NAT > SNAT**.

2. Select **New**

In the SNAT Configuration dialog box, enter values

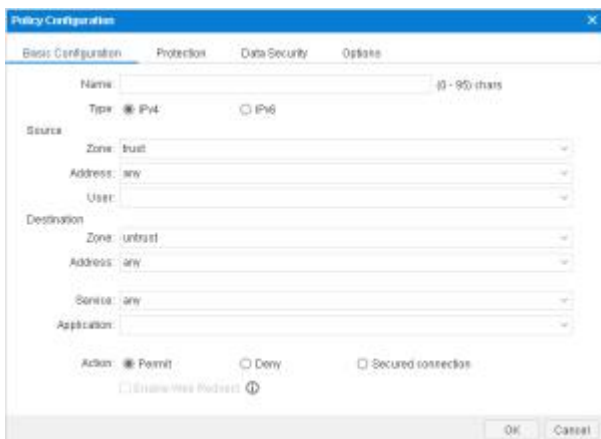

Option	Value
Source Address	Address Entry, Any
Destination Address	Address Entry, Any
Egress	Egress interface, ethernet 0/1
Translated	Egress IP
Sticky	Enable

3. Click **OK**.

Step 4: Creating a security policy to allow internal users access Internet.

1. Go to **Policy > Security Policy**.

2. Click **New**.

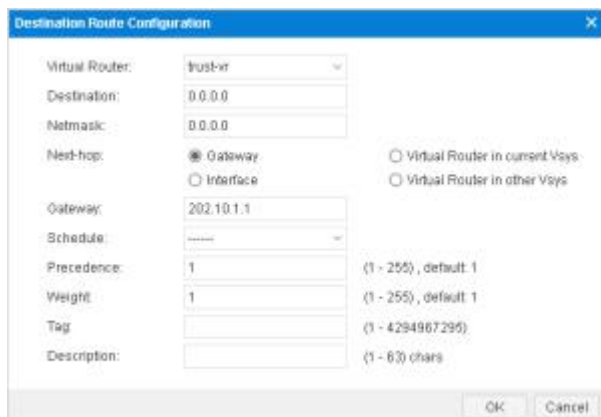

In the Policy Configuration dialog box, enter values.

Source Information	
Zone	trust
Address	Any
Destination Information	
Zone	untrust
Address	Any
Other Information	
Service/Service Group	Any
APP/APP Group	----
Action	Permit

3. Click **OK**.

Step 5: Configuring a default route

1. Go to **Network > Routing > Destination Route**.

2. Click **New**.

The image shows a 'Destination Route Configuration' dialog box with the following fields and values:

- Virtual Router: trust-vr
- Destination: 0.0.0.0
- Netmask: 0.0.0.0
- Next-hop: Gateway Interface
- Gateway: 202.10.1.1
- Schedule: -----
- Precedence: 1 (1 - 255), default: 1
- Weight: 1 (1 - 255), default: 1
- Tag: (1 - 4294967295)
- Description: (1 - 63) chars

Buttons: OK, Cancel

In the Destination Route Configuration dialog box, enter values.

Option	Value
Destination	0.0.0.0 (means all network)
Subnet Mask	0.0.0.0 (means all subnets)
Gateway	202.10.1.1 (gateway provided by your ISP)

3. Click **OK**.

Restoring Factory Settings

Notes: Resetting your device will erase all configurations, including the settings that have been saved. Please be cautious!

To restore factory's default settings, you may use one of the following two ways:

- ["Restoring using a pin"](#)
- ["Restoring via WebUI"](#)

Restoring using a pin

To restore factory default settings using a Web interface, take the following steps:

1. Power off the device.
2. Use a pin to press the CLR pinhole on the front panel; keep pressing and power on the device.
3. Keep pressing until the STA and ALM indicators on the front panel turn a constant red; release the pin. System will start to reset itself.

4. When restoring is complete, system will reboot automatically.

Restoring via WebUI

To restore factory default settings using a Web interface, take the following steps:

1. Go to **System > Configuration File Management**.
2. Click **Backup Restore**.
3. In the prompt, click **Restore**.

4. Click **OK** to confirm.
5. The device will automatically reboot and be back to factory settings.

Chapter 2 Deploying Your Device

This chapter introduces how a firewall works and its most commonly used scenarios. Understanding the system structure, basic elements and flow chart will help you in better organizing your network and making the most of the firewall product.

- ["How a Firewall Works"](#)

A firewall has more than one deployment scenario. Each scenario applies to one environment requirement. The usual deployment modes are:

- ["Deploying Transparent Mode"](#)

Transparent mode is a situation when the IT administrator does not wish to change his/her existing network settings. In transparent mode, the firewall is invisible to the network. Because no IP address configuration is needed, the firewall only provides security features.

- ["Deploying Routing Mode"](#)

Routing mode applies when the firewall offers both routing and NAT functions. In routing mode, the firewall connects two networks typically, an internal network and the Internet, and the firewall interfaces are configured with IP addresses.

- ["Deploying Mix Mode"](#)

If a firewall has Layer-2 interfaces and Layer-3 interfaces, it is in mix mode.

- ["Deploying Tap Mode"](#)

When an IT administrator only wants the monitor, IPS or statistic function of a firewall, while not a gateway device, using tap mode is the right choice. In tap mode, the firewall is not directly connected within the network.

How a Firewall Works

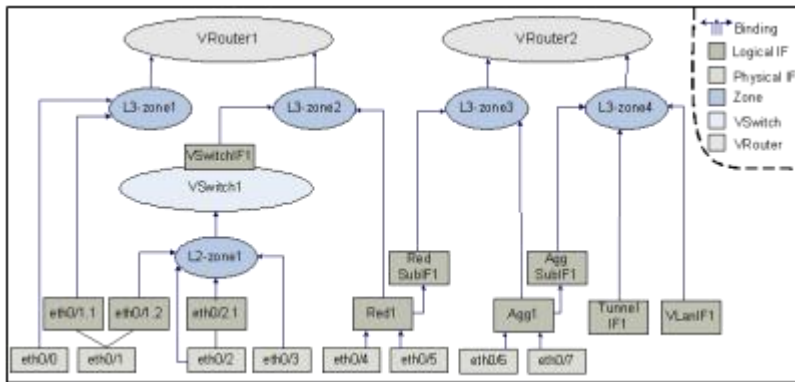

A firewall is a network security device. It protects a network by controlling the traffic that comes in and out of that network. The basic mechanism of how a firewall works is that allowing or denying the data packet by identifying whether it matches the policy rules or not. Besides security functions, a firewall can also work as a bridging device to connect a trust zone (internal network) and untrust zone (external network).

FSOS System Architecture

The elements that constitute system architecture are:

- **Zone:** Zones divide network into multiple segments, for example, trust (usually refers to the trusted segments such as the Intranet), untrust (usually refers to the untrusted segments where security treats exist).
- **Interface:** Interface is the inlet and outlet for traffic going through security zones. An interface must be bound to a security zone so that traffic can flow into and from the security zone. Furthermore, for the Layer 3 security zone, an IP address should be configured for the interface and the corresponding policy rules should also be configured to allow traffic transmission between different security zones. Multiple interfaces can be bound to one security zone, but one interface cannot be bound to multiple security zones.
- **VSwitch:** VSwitch is short for Virtual Switch. A VSwitch functions as a switch in Layer 2. After binding a Layer 2 zone to a VSwitch, all the interfaces in the zone are also bound to the VSwitch. There is a default VSwitch named VSwitch1. By default, all Layer 2 zones will be bound to VSwitch1. You can create new VSwitches and bind Layer 2 zones to VSwitches. Each VSwitch is a Layer 2 forwarding zone with its own MAC address table which supports the Layer 2 traffic transmission for the device. Furthermore, the VSwitchIF helps the traffic to flow between Layer 2 and Layer 3.
- **VRouter:** VRouter is Virtual Router and also abbreviated as VR. A VRouter functions as a router with its own routing table. There is a default VR named trust-vr. By default, all the Layer 3 zones will be bound to trust-vr automatically. The system supports the multi-VR function and the max VR number varies from different platforms. Multiple VRs make the device work as multiple virtual routers, and each virtual router uses and maintains its own routing table. The multi-VR function allows a device to achieve the effects of the address isolating in different route zones and the address overlapping in different VRs, as well as avoiding leakage of route to some extent and enhancing route security of network.
- **Policy:** Policy is used to control the traffic flow in security zones/segments. By default FS devices will deny all traffic in security zones/segments, while the policy can identify which flow in security zones or segments will be permitted, and which will be denied, which is specifically based on policy rules.

For the relationships among interface, security zone, VSwitch and VRouter, see the following diagram:

As shown above, the binding relationships among them are:

- Interfaces are bound to security zones. Interfaces bound to Layer 2 security zones and Layer 3 security zones are known as Layer 2 interfaces and Layer 3 interfaces respectively. One interface can be only bound to one security zone; interface and its sub interface can belong to different security zones.
- Security zones are bound to a VSwitch or VRouter. Layer 2 security zones are bound to a VSwitch (by default the predefined Layer 2 security zone is bound to the default VSwitch1), and Layer 3 security zones are bound to a VRouter (by default the predefined Layer 3 security zone is bound to the default trust-vr), thus realizing the binding between the interfaces and VSwitch or VR. One security zone can be only bound to one VSwitch or VR.

General Rules of Security Policy

By default, all interfaces, even in the same zone, cannot communicate. Traffic in different zones are not allowed to be transferred either. In order to change the rule, you need to set up new policy rules to allow traffic forwarding.

Notes: To allow bidirectional traffic, you need to set up two policies: one is from source to destination, the other is from destination to source. If there is only one-direction initiative access, the responsive direction only need to respond to that visit, you will need to create only one-way policy (from source to destination).

This part explains what policy is needed to allow interfaces in different zones, VSwitches, or VRouters to communicate. The rules are:

- **Interfaces in the same zone**
To allow interfaces in the same zone to communicate, you need to create a policy whose source and destination are both the zone which the interfaces belong to.
For example, to allow eth0/0 and eth0/1 to communicate, you need to create an "allowing" policy with source L3-zone and destination L3-zone.

- **Zones of two interfaces are under the same VSwitch**

To allow communication of interfaces in different zones under the same VSwitch, you need to create two policies: one policy is to allow traffic from a zone to another; the other policy is to allow traffic in the opposite direction.

For example, to allow eth0/2 and eth0/3 to communicate, you should create a policy whose source is L2-zone1 and destination is L2-zone2, then create another policy to allow traffic from L2-zone2 to L2-zone1.

- **Zones of two interfaces are under different VSwitches**

Each VSwitch has its VSwitch interface (VSwitchIF) which is bound to a Layer-3 zone. To allow interfaces in different zones under different VSwitches to communicate, you need to create an "allowing" policy where the source is the zone of one VSwitchIF and the destination is the zone of the other VSwitchIF. After that, create another policy of the opposite direction.

- **Zones of two L3 interfaces are under the same VRouter**

To allow two L3 interfaces to communicate, you need to create a policy allowing one zone to the other zone.

For example, to allow communication between eth0/0 and eth0/5, you should create a policy from L3-zone1 to L3-zone2, and then create an opposite direction policy.

- **Zones of two L3 interfaces are under different VRouters**

To allow two L3 interfaces in two different zones of different VRouters, you need to create a policy with the source being one VRouter and the destination being the other VRouter. Then you create a policy of the opposite direction.

- **An L2 interface and an L3 interface under the same VRouter**

To allow communication between an L2 interface and an L3 interface under the same VRouter, you will need to create a policy whose source is the zone which binds the VSwitchIF of L2 interface and the destination is the zone of L3 interface. After that, create a policy of the opposite direction.

For example, to allow eth0/0 and eth0/2 to communicate, create a policy from L3-zone1 to L2-zone1, and its opposite direction policy.

Packet Processing Rule

Forwarding Rule in Layer 2

Forwarding within Layer 2 means it is in one VSwitch. FSOS system creates a MAC address table for a VSwitch by source address learning. Each VSwitch has its own MAC address table. The packets are forwarded according to the types of the packets, including IP packets, ARP packets, and non-IP-non-ARP packets.

The forwarding rules for IP packets are:

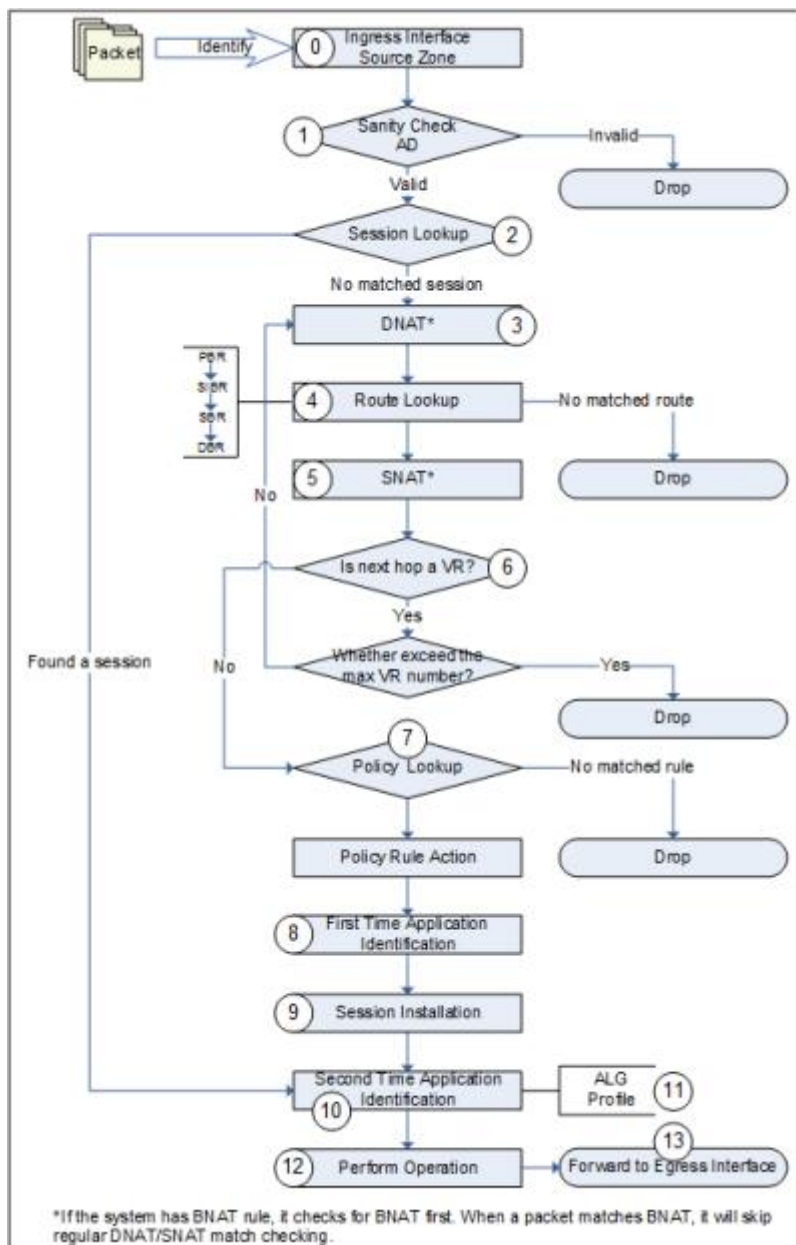

1. Receive a packet.
2. Learn the source address and update the MAC address table.
3. If the destination MAC address is a unicast address, the system will look up the egress interface according to the destination MAC address. And in this case, two situations may occur:
 - If the destination MAC address is the MAC address of the VSwitchIF with an IP configured, system will forward the packet according to the related routes; if the destination MAC address is the MAC address of the VSwitchIF with no IP configured, system will drop the packet.
 - Figure out the egress interface according to the destination MAC address. If the egress interface is the source interface of the packet, system will drop the packet. Otherwise, system will forward the packet from the egress interface.

If no egress interfaces (unknown unicast) is found in the MAC address table, jump to Step 6 directly.

4. Figure out the source zone and destination zone according to the ingress and egress interfaces.
5. Look up the policy rules and forward or drop the packet according to the matched policy rules.
6. If no egress interface (unknown unicast) is found in the MAC address table, system will send the packet to all the other L2 interfaces. The sending procedure is: take each L2 interface as the egress interface and each L2 zone as the destination zone to look up the policy rules, and then forward or drop the packet according to the matched policy rule. In a word, forwarding of unknown unicast is the policy-controlled broadcasting. Process of broadcasting packets and multicasting packets is similar to the unknown unicast packets, and the only difference is the broadcast packets and multicast packets will be copied and handled in Layer 3 at the same time.

For the ARP packets, the broadcast packet and unknown unicast packet are forwarded to all the other interfaces in the VSwitch, and at the same time, system sends a copy of the broadcast packet and unknown unicast packet to the ARP module to handle.

Forwarding Rule in Layer 3

0. Identify the logical ingress interface of the packet to determine the source zone of the packet. The logical ingress interface may be a common interface or a sub-interface.
1. System performs sanity check to the packet. If the attack defense function is enabled on the source zone, system will perform AD check simultaneously.
2. Session lookup. If the packet belongs to an existing session, system will perform Step 11 directly.
3. DNAT operation. If a DNAT rule is matched, system will mark the packet. The DNAT translated address is needed in the step of route lookup.

*Note: If the system has static 1-to-1 BNAT rule, BNAT rule is checked before other NAT

rules. If a packet matches BNAT, it will be processed in accordance with this rule's configuration. It will skip the regular DNAT rule checking.

4. Route lookup. The route lookup order from high to low is: PBR > SIBR > SBR > DBR > ISP route.

Until now, the system has known the logical egress and destination zone of the packet.

5. SNAT operation. If a SNAT rule is matched, system will mark the packet.
*Note: If the system has static 1-to-1 BNAT rule, BNAT rule is checked before other NAT rules. If a packet matches BNAT, it will be processed in accordance with this rule's configuration. It will skip the regular SNAT rule checking.

6. VR next hop check. If the next hop is a VR, system will check whether it is beyond the maximum VR number (current version allows the packet traverse up to three VRs). If it is beyond the maximum number, system will drop the packet; if it is within the maximum number range, return to Step 4. If the next hop is not a VR, go on with policy lookup.

7. Policy lookup. System looks up the policy rules according to the packet's source/destination zones, source/destination IP and port, and protocol. If no policy rule is matched, system will drop the packet; if any policy rule is matched, the system will deal with the packet as the rule specified. And the actions can be one of the followings:

- Permit: Forward the packet.
 - Deny: Drop the packet.
 - Tunnel: Forward the packet to the specified tunnel.
 - Fromtunnel: Check whether the packet originates from the specified tunnel. System will forward the packet from the specified tunnel and drop other packets.
 - WebAuth: Perform WebAuth on the specified user.

First time application identification. System tries to identify the type of the application according to the port number and service specified in the policy rule.

9. Establish the session.
10. If necessary, system will perform the second time application identification. It is a precise identification based on the packet contents and traffic action.
11. Application behavior control. After knowing the type of the application, system will deal with the packet according to the configured profiles and ALG.
12. Perform operations according to the records in the session, for example, the NAT mark.
13. Forward the packet to the egress interface.

Deploying Transparent Mode

Transparent mode is also known as bridge mode or transparent bridging mode. Transparent mode is used when the IT administrator does not wish to change the existing network layout. Normally, the existing network has already set up routers and switches. The firewall will be used as a security device.

Transparent mode has the following advantages:

- No need to change IP addresses
- No need to set up NAT rule

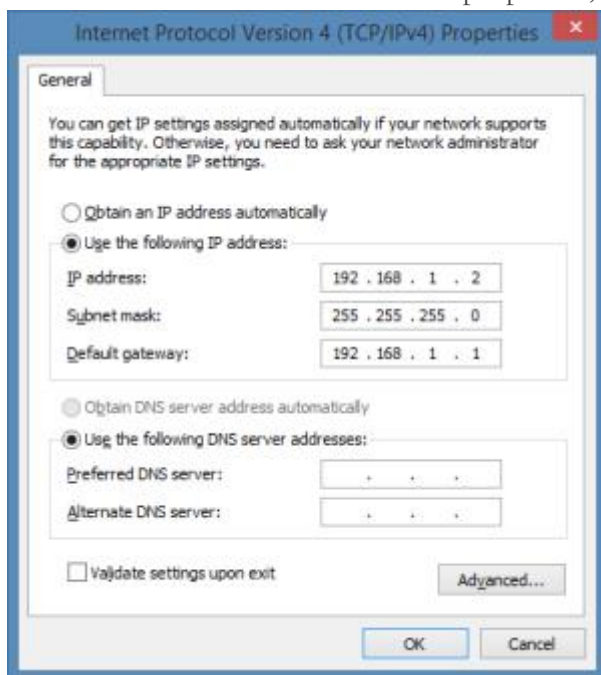

Under normal circumstances, the firewall in transparent mode is deployed between the router and the switch of the protected network, or it is installed between the Internet and a company's router. The internal network uses its old router to access the Internet, and the firewall only provides security control features.

This section introduces a configuration example of a firewall deployed between a router and a switch. In this example, the administrator uses eth0/0 to manage firewall. The firewall's eth0/1 is connected to router (which is connecting to the Internet) and eth0/2 is connected to a switch (which is connecting to internal network).

Step 1: Initial log in the firewall

1. In the administrator's Ethernet properties, set the IPv4 protocol as below.

2. Connect an RJ-45 Ethernet cable from the computer to the eth0/0 of the device.
3. In the browser's address bar, type "http://192.168.1.1" and press **Enter**.
4. In the login interface, type the default username and password: admin/admin.
5. Click **Login**, and the device's system will initiate.

Step 2: Configure interface and zone

- Configure eth0/1 as an Internet connected interface.
 1. Select **Network > Interface**.
 2. Double click ethernet0/1, and configure in the prompt.

3. Click **OK**.
- Configure eth0/2 as a private network connected interface.
 1. Select **Network > Interface**.

2. Double click ethernet0/2, and configure in the prompt.

Basic Configuration

Interface Name: ethernet0/2

Description: (0 - 63) chars

Binding Zone: Layer 2 Zone Layer 3 Zone TAP No Binding

Zone: l2-trust

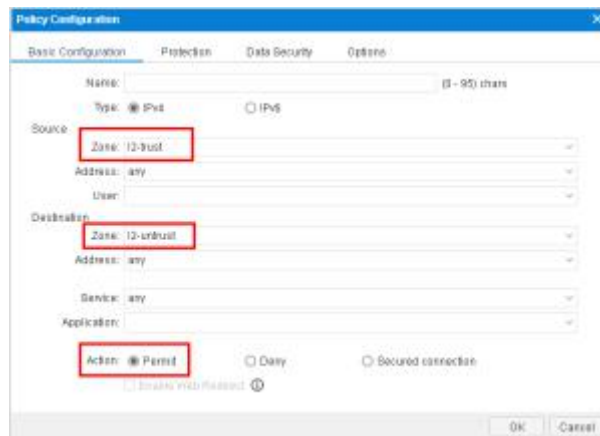

HA sync: Enable

3. Click OK.

Step 3: Configuring policies

- Create a policy to allow visiting the Internet.

1. Select **Policy > Security Policy**.
2. Click **New**.

Policy Configuration

Basic Configuration Protection Data Security Options

Name: (0 - 95) chars

Type: IPv4 IPv6

Source: Zone: l2-trust

Address: any

User:

Destination: Zone: l2-untrust

Address: any

Service: any

Application:

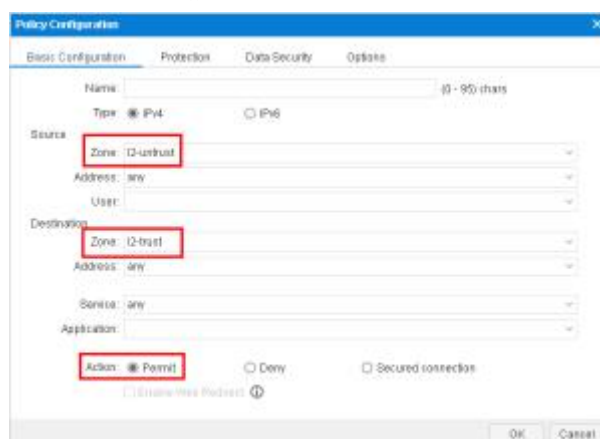

Action: Permit Deny Secured connection

OK Cancel

3. Click OK.

- Create a policy to allow the Internet to visit a private network.

1. Select **Policy > Security Policy**.
2. Click **New**.

Policy Configuration

Basic Configuration Protection Data Security Options

Name: (0 - 95) chars

Type: IPv4 IPv6

Source: Zone: l2-untrust

Address: any

User:

Destination: Zone: l2-trust

Address: any

Service: any

Application:

Action: Permit Deny Secured connection

OK Cancel

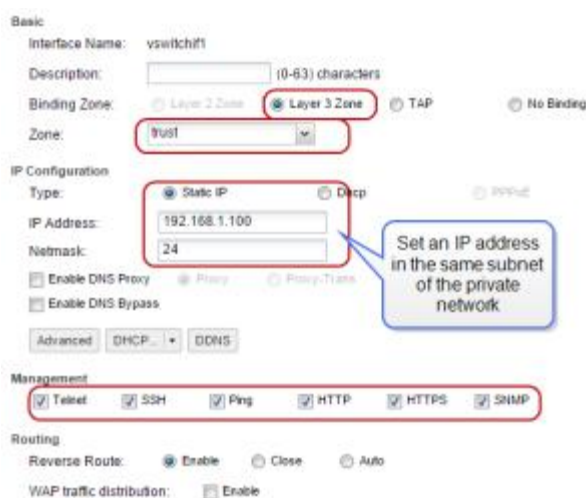

3. Click OK.

- The two policies above ensure communication between a private network and the Internet. If you want to set up more details, e.g. to limit P2P download, you can add more policies and overlap the new policies with the old ones. The match sequence of policies is determined by their position in the policy list, not their ID numbers.

(Optional) Step 4: Configuring VSwitch Interface for managing the firewall.

If you want any PC in the private network to visit and configure the firewall, you can configure a VSwitch interface as a management interface.

1. Select **Network > Interface**.
2. Double click vswitchif1.

3. Click **OK**.
4. With any PC in the private network, enter the IP address of vswitchif1, and you will visit the firewall web user interface.

Deploying Routing Mode

Routing mode deployment often uses the NAT function, so it is also called NAT mode. In routing mode, each interface has its IP address which means interfaces are in the layer 3 zone. A firewall in routing mode can work as a router and a security device.

Routing mode is mostly used when the firewall is installed between an internal network and the Internet.

The example which is based on the below topology shows you how to connect and configure a new device in routing mode. The device connects a private network to the Internet.

Step 1: Connecting to the device

1. Connect one port (e.g. eth0/1) of the FS device to your ISP network. In this way, "eth0/1" is in the untrust zone.
2. Connect your internal network to another Ethernet interface (e.g. eth0/0) of the device. This means "eth0/0" is connected to the trust zone.
3. Power on the device and your PCs.
4. If one of the internal interfaces already has been configured with an IP address, use a browser to visit that address from one of your internal PCs. If it is a new device, use the methods in ["Initial Visit to Web Interface"](#) to visit.
5. Enter "admin" for both the username and the password.

Step 2: Configuring interfaces

1. Go to **Network > Interface**.
2. Double click **eth0/1**.

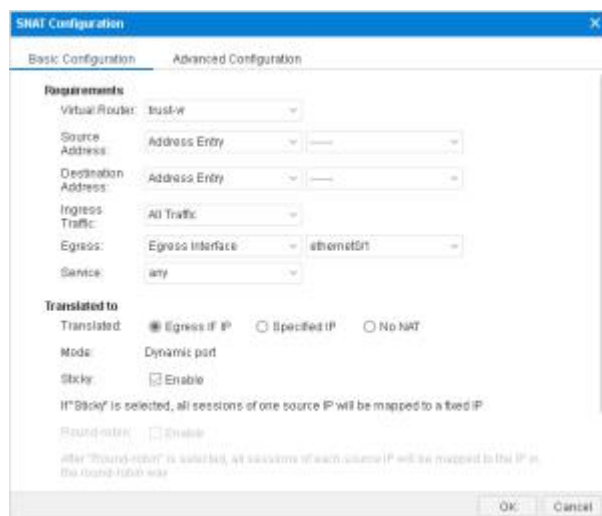

In the Ethernet Interface dialog box, enter values

Option	Value
Binding Zone	L3-zone
Zone	untrust
Type	Static IP
IP Address	202.10.1.1 (public IP address provided by your ISP)
Netmask	255.255.255.0
Management	Select the protocols that you want to use to access the device.

3. Click OK.

Step 3: Creating a NAT rule to translate internal IP to public IP

1. Go to Policy > NAT > SNAT.
2. Select New

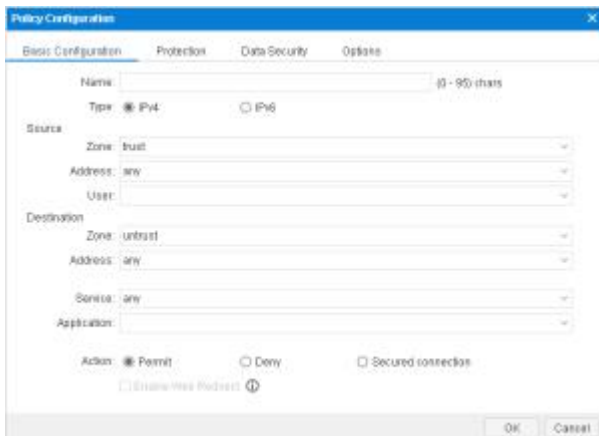

In the SNAT Configuration dialog box, enter values

Option	Value
Source Address	Address Entry, Any
Destination Address	Address Entry, Any
Egress	Egress interface, ethernet 0/1
Translated	Egress IP
Sticky	Enable

3. Click OK.

Step 4: Creating a security policy to allow internal users to access the Internet.

1. Go to **Policy > Security Policy**.
2. Click **New**.

In the Policy Configuration dialog box, enter values.

Source Information	
Zone	trust
Address	Any
Destination Information	
Zone	untrust
Address	Any
Other Information	
Service/Service Group	Any
APP/APP Group	-----
Action	Permit

3. Click OK.

Step 5: Configuring a default route

1. Go to **Network > Routing > Destination Route**.

2. Click **New**.

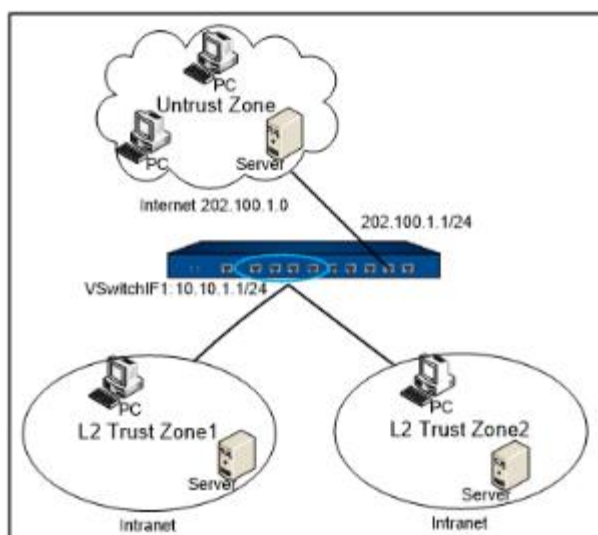

In the Destination Route Configuration dialog box, enter values.

Option	Value
Destination	0.0.0.0 (means all network)
Subnet Mask	0.0.0.0 (means all subnets)
Gateway	202.10.1.1 (gateway provided by your ISP)

Deploying Mix Mode

If the firewall has both L2 interfaces (transparent mode) and L3 interfaces (routing mode), the firewall is in mix mode.

To configure a mix mode, you need to combine the routing mode of the deployment methods with the transparent mode. Please refer to these two modes.

Deploying Tap Mode

In most cases, the security device is deployed within the network as a serial node. However, in some other scenarios, an IT administrator would just want the auditing and statistical functions like IPS, antivirus, and Internet behavior control. For these features, you just need to connect the device to a mirrored interface of a core network. The traffic is mirrored to the security device for auditing and monitoring.

The bypass mode is created by binding a physical interface to a tap zone. Then, the interface becomes a bypass interface.

Use an Ethernet cable to connect e0 of the Switch with e1 of the device. The interface e1 is the bypass interface and e2 is the bypass control interface. The interface e0 is the mirror interface of the switch. The switch mirrors the traffic to e1 and the FS device will monitor, scan, and log the traffic received from e1. After configuring IPS, AV, or network behavior control on the FS device, if the device detects network intrusions, viruses, or illegal network behaviors, it will send a TCP RST packet from e2 to the switch to tell it to reset the connections.

Notes: Before configuring tap mode in the device, you need to set up an interface mirroring your primary switch. Mirror the traffic of the switch from e0 to e1, and the device can scan, monitor and count the mirrored traffic.

Here provides an example of monitoring IPS in tap mode.

Step 1: Creating tap mode by binding an interface

1. Select **Network > Zone**, and click **New**.

Option	Value
Zone	enter a name, e.g. "tap-zone" .
Type	TAP
Binding Interface	Select the bypass interface (only a physical interface, aggregate interface or redundant interface can apply, sub-interface is not allowed).

2. Click **OK**.

Step 2: Creating an IPS rule

1. Select **Object > Intrusion Prevention System**.
2. Click **New**.
3. Enter the rule name.
4. Configure the signatures settings.
5. Configure the protocol settings.
6. Click **OK** to complete IPS rule configuration.

Step 3: Add IPS rule into Tap zone

1. Select **Network > Zone**, and double-click the tap zone created in step 1.
2. In the Treat Prevention tab, enable IPS and select the IPS rule created.

3. Click **OK**.

(Optional) Block traffic in switch

A bypass control interface is used to send control packets (TCP RST packet is supported in current version). After configuring IPS, AV, or network behavior control on the FS device, if the device detects

network intrusions, viruses, or illegal network behaviors, it will send a TCP RST packet from e2 to the switch to tell it to reset the connections.

By default, the bypass interface itself is the control interface. However, you may also change the control interface.

To change a bypass control interface, you can only use the command line interface:

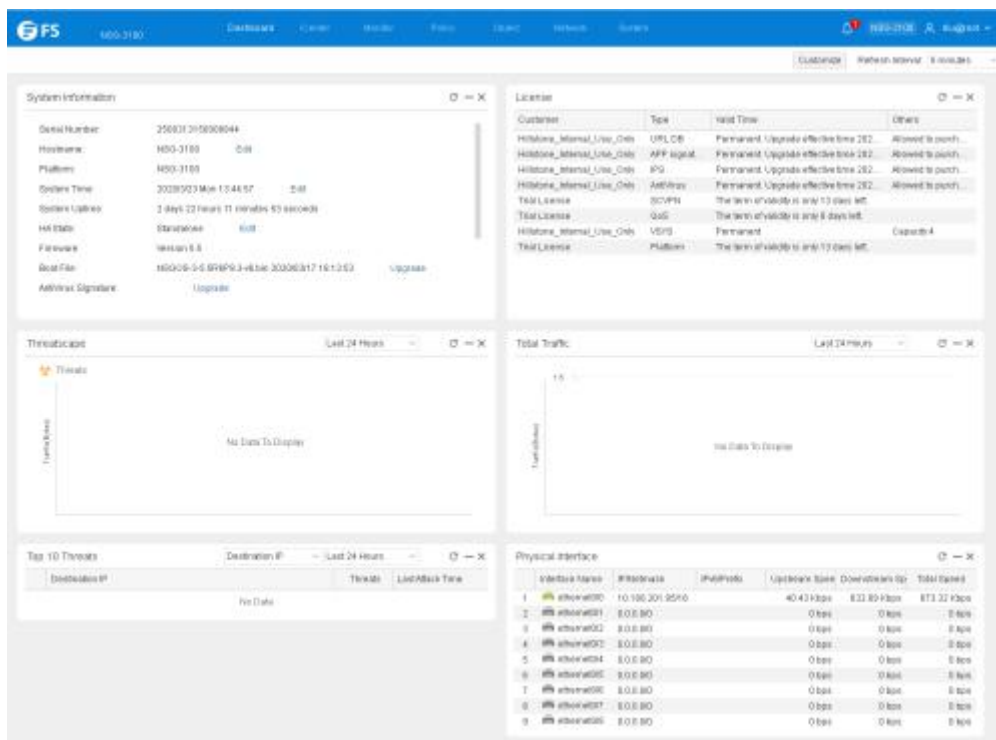

tap control-interface *interface-name*

- *interface-name* - Specifies which interface is used as the bypass control interface.

Chapter 3 Dashboard

This feature may vary slightly on different platforms. If there is a conflict between this guide and the actual page, the latter shall prevail.

The dashboard shows the system and threat information. The layout of the dashboard is shown below:

Customize

You can customize the dashboard display function or modify the function area location as needed.

- To customize the dashboard display function:
 1. Click **Customize** at the top-right corner.
 2. Select the function check box from the expanded list.
- To modify the function area location:
 1. Hover your mouse over the title part in the ribbon.
 2. When appears, press and hold the mouse functional area , the regional location to be displayed .

Threats

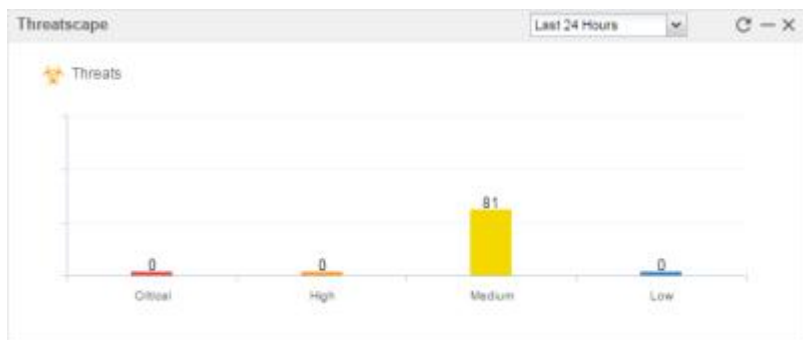

Display the top 10 threats information within the [specified period](#).

	Destination IP	Count	Last Attack Time
1	106.39.16.88	3	2016/07/21 09:02:17
2	10.188.15.38	1	2016/07/20 16:55:44
3	114.247.226.20	1	2016/07/21 13:14:49

- Click to specify the type of display: Destination IP, Source IP or Threat Name.

Threatscape

The threat information statistic chart is displayed within the [specified period](#).

- Click the column to jump to the iCenter page, and the list will display the corresponding threat level.

User

Display the top 10 user traffic information within the [specified period](#).

- Specify the type of display: by Traffic or by Concurrent Sessions from the drop-down menu.
- Click and , switch between the table and the bar chart.

- Hover your mouse over a bar, to view users' upstream traffic, downstream traffic, total traffic or concurrent sessions.

Application

Display the top 10 application traffic information within the [specified period](#).

- Specify the type of display: by Traffic or by New Sessions from the drop-down menu.
- Click and , switch between the table and the bar chart.
- Hover your mouse over a bar, to view users' total traffic or new sessions.

Total Traffic

Show the Total Traffic within the [specified period](#) .

Physical Interface

Display the statistical information of interfaces, including the interface name, IP address, upstream speed, downstream speed, and total speed.

Physical Interface					
Name	IP Address	Speed Out	Speed In	Total Speed	
1	ethernet0/0	114.247.228.18025	1.62 Mbps	2.51 Mbps	4.13 Mbps
2	ethernet0/1	106.38.18.6625	1.03 Mbps	1.42 Mbps	2.52 Mbps
3	ethernet0/2	0.0.0.0/0	0 bps	0 bps	0 bps
4	ethernet0/3	0.0.0.0/0	0 bps	0 bps	0 bps
5	ethernet0/4	0.0.0.0/0	0 bps	0 bps	0 bps
6	ethernet0/5	0.0.0.0/0	0 bps	0 bps	0 bps
7	ethernet1/0	10.89.9.104	50.02 Kbps	601.4 Kbps	650.42 Kbps
8	ethernet1/1	10.188.3.104	484.36 Kbps	33.51 Kbps	517.87 Kbps
9	ethernet1/2	10.89.9.104	31.73 Kbps	42.46 Kbps	74.19 Kbps
10	ethernet1/3	10.89.10.103	336.18 Kbps	366.03 Kbps	704.21 Kbps
11	ethernet1/4	102.165.60.104	48.74 Kbps	4.58 Kbps	53.33 Kbps
12	ethernet1/5	10.89.15.104	385.24 Kbps	275.6 Kbps	660.84 Kbps
13	ethernet1/6	10.89.18.102	2.91 Mbps	2.07 Mbps	4.98 Mbps

System Information

System information include.

- Serial number: The serial number of the device.
- Host name: The host name of the device.
- Platform: The platform type of the device.
- System Time: The time of system.
- System Uptime: The running time of system.
- HA State: The HA State of device:
 - Standalone: Non-HA mode which represents HA is disabled.
 - Init: Initial state.
 - Hello: Negotiation state which represents the device is negotiating the relationship between master and backup.
 - Master: Master state which represents current device is master.
 - Backup: Backup state which represents current device is backup.
 - Failed: Fault state which represents the device is failed.
- Firmware: The version number and version time of the firmware running on the device.
- Boot File: The boot file name.
- AntiVirus Signature: The version number and time of the anti virus signature database.
- IPS Signature: The version number and time of the IPS signature database.
- URL Category Database: The version number and time of the URL category database.

- Application Identification Signature: The version number and time of the application signature database.
- IP Reputation Database: The version number and time of the IP reputation database.

License

Display the detailed information of installed licenses.

Customer	Type	Valid Time	Others
ddf	URL DB	Permanent, Upgrade effective time 2018/0	Allowed to purcha...
cooper	APP signature	Permanent, Upgrade effective time 2018/0	Allowed to purcha...

- Customer: Displays the name of the customer who applied for the license.
- Type: Displays the type of license.
- Valid Time: Displays the valid time of license.
- Others: Displays additional notes for the license.

Specified Period

System supports the predefined time cycle and the custom time cycle. Click () on the top right corner of each tab to set the time cycle.

- Realtime: Display the statistical information within 5 minutes of the current time.
- Last Hour: Display the statistical information within the latest 1 hour.
- Last Day: Display the statistical information within the latest 1 day.
- Last Week: Display the statistical information within the latest 1 week.
- Last Month: Display the statistical information within the latest 1 month.
- Custom: Customize the time cycle. Select **Custom** and the **Custom Date and Time** dialog. Select the start time and the end time as needed.

In the top-right corner, you can set the refresh interface of the displayed data.

Notes: The specified period may vary slightly on different platforms and different statistical objects. Please see the actual page for the feature that your device delivers.

Chapter 4 iCenter

This feature may not be available on all platforms. Please check actual page in system to see whether your device delivers this feature.

The multi-dimensional features show threats to the whole network in depth, threats of the whole network.

If IPv6 function is enabled, you can view the threat information of IPv6 address through iCenter page.

Click **iCenter**.

Click a threat name link in the list to view the detailed information , source/destination, knowledge base and history about the threat.

- **Threat Analysis:** Depending on the threats of the different detection engine , the content of Threat Analysis tab is also different.
 - **Anti Virus/IPS:** Display the detailed threat information .

For the Anti Virus/IPS function introduction, see "[Anti Virus](#)" / "[Intrusion Prevention System](#)".

- **Attack Defense/Perimeter Traffic Filtering:** Display the threat detailed information.

For the Attack Defense/Perimeter Traffic Filtering function introduction, see "[Attack-Defense](#)" / "[Perimeter Traffic Filtering](#)".

- **Knowledge Base:** Display the specified threat description, solution, etc. of the threats detected by IPS .
- **Threat History:** Display the selected threat historical information of the whole network.

Chapter 5 Network

This chapter describes factors and configurations related to network connection, including:

- **Security Zone:** The security zone divides the network into different section, such as the trust zone and the untrust zone. The device can control the traffic flow from and to security zones once the configured policy rules have been applied.
- **Interface:** The interface allows inbound and outbound traffic flow to security zones. An interface must be bound to a security zone so that traffic can flow into and from the security zone.
- **DNS:** Domain Name System.
- **DHCP:** Dynamic Host Configuration Protocol.
- **DDNS:** Dynamic Domain Name Server.
- **PPPoE:** Point-to-Point Protocol over Ethernet.
- **Virtual-Wire:** The virtual wire allows direct Layer 2 communications between sub networks.
- **Virtual Router:** Virtual Route (Virtual Router for short) acts as a router. Different Virtual Routers have their own independent routing tables.
- **Virtual Switch:** Running on Layer 2, VSwitch acts as a switch. Once a Layer 2 security zone is bound to a VSwitch, all the interfaces bound to that zone will also be bound to the VSwitch.
- **Port Mirroring:** Allow users to mirror the traffic of one interface to another interface (analytic interface) for analysis and monitoring.
- **Link Load Balancing:** It takes advantage of dynamic link detection technique to assign traffic to different links appropriately, thus making full use of all available link resources.
- **Application Layer Gate:** ALG can assure the data transmission for the applications that use multiple channels and assure the proper operation of VoIP applications in the strictest NAT mode.
- **Global Network Parameters:** These parameters mainly include the IP packet's processing options, like IP fragmentation, TCP MSS value, etc.

Security Zone

Security zone is a logical entity. One or more interfaces can be bound to one zone. A zone applied with a policy is known as a security zone, while a zone created for a specific function is known as a functional zone. Zones have the following features:

- An interface should be bound to a zone. A Layer 2 zone will be bound to a VSwitch, while a Layer 3 zone will be bound to a VRouter. Therefore, the VSwitch to which a Layer 2 zone is bound decides which VSwitch the interfaces belong to in that Layer 2 zone, and the VRouter to which a Layer 3 zone is bound decides which VRouter the interfaces belong to in that Layer 3 zone.
- Interfaces in Layer 2 and Layer 3 are working in Layer 2 mode and Layer 3 mode respectively.
- System supports internal zone policies, like trust-to-trust policy rule.

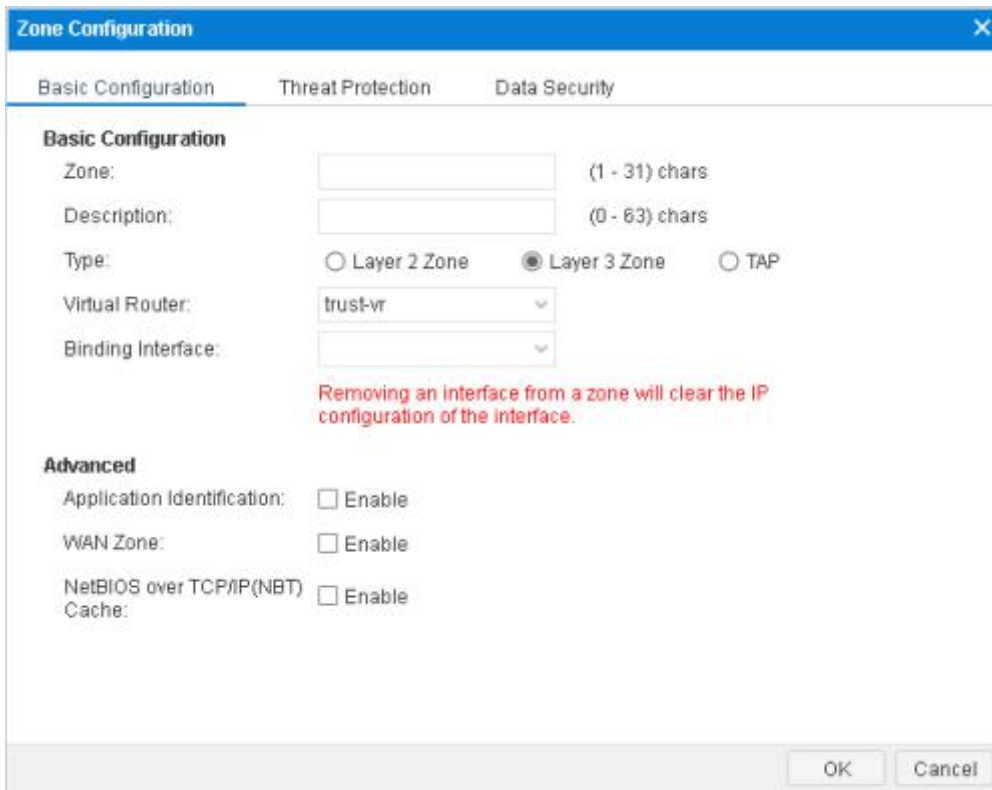

There are 8 pre-defined security zones in FSOS, which are trust, untrust, dmz, L2-trust, L2-untrust, L2-dmz, vpnhub (VPN functional zone) and ha (HA functional zone). You can also customize security zones. Pre-defined security zones and user-defined security zones have no difference in functions, so you can make your choice freely.

Configuring a Security Zone

To create a security zone, take the following steps:

1. Select **Network > Zone**.

2. Click **New**.

Zone Configuration

Basic Configuration Threat Protection Data Security

Basic Configuration

Zone: (1 - 31) chars

Description: (0 - 63) chars

Type: Layer 2 Zone Layer 3 Zone TAP

Virtual Router: ▼

Binding Interface: ▼

Removing an interface from a zone will clear the IP configuration of the interface.

Advanced

Application Identification: Enable

WAN Zone: Enable

NetBIOS over TCP/IP (NBT) Cache: Enable

OK Cancel

3. In the Zone Configuration text box, type the name of the zone into the Zone box.
4. Type the descriptions of the zone in the Description text box.
5. Specify a type for the security zone. For a Layer 2 zone, select a VSwitch for the zone from the VSwitch drop-down list below; for a Layer-3 zone, select a VRouter from the Virtual Router drop-down list. If TAP is selected, the zone created is a tap zone, which is used in Bypass mode.
6. Bind interfaces to the zone. Select an interface from the Binding Interface drop-down list.
7. If needed, select the **Enable** check box to enable APP identification for the zone.
8. If needed, select the **Enable** check box to set the zone to a WAN zone, assuring the accuracy of the statistic analysis sets that are based on IP data.
9. If needed, select the **Enable** check box to enable NetBIOS host query for the zone. For detailed instructions, see ["DNS"](#)
10. If needed, select Threat Protection tab and configure the parameters for Threat Protection function. For detailed instructions, see ["Chapter 11 Threat Prevention"](#).
11. If needed, select Data Security tab and configure the parameters for Data Security function. For detailed instructions, see ["Data Security"](#)

12. Click **OK**.

Notes:

- Pre-defined zones cannot be deleted.
- When changing the VSwitch to which a zone belong, make sure there is no binding interface in the zone.

Interface

Interfaces allow inbound and outbound traffic to flow to security zones. An interface must be bound to a security zone so that traffic can flow into and from the security zone. Furthermore, for the Layer 3 security zone, an IP address should be configured for the interface, and the corresponding policy rules should also be configured to allow traffic transmission between different security zones. Multiple interfaces can be bound to one security zone, but one interface cannot be bound to multiple security zones.

The security devices support various types of interfaces which are basically divided into physical and logical interfaces based on the nature.

- **Physical Interface:** Each Ethernet interface on devices represents a physical interface. The name of a physical interface, consisting of media type, slot number and location parameter, is pre-defined, like ethernet2/1 or ethernet0/2.
- **Logical Interface:** Include sub-interface, VSwitch interface, VLAN interface, loopback interface, tunnel interface, aggregate interface, redundant interface, PPPoE interface and Virtual Forward interface.

Interfaces can also be divided into Layer 2 interface and Layer 3 interface based on their security zones.

- **Layer 2 Interface:** Any interface in Layer 2 zone or VLAN.
- **Layer 3 Interface:** Any interface in Layer 3 zone. Only Layer 3 interfaces can operate in NAT/routing mode.

Different types of interfaces provide different functions, as described in the table below.

Type	Description
Sub-interface	The name of an sub-interface is an extension to the name of its original interface, like ethernet0/2.1. System supports the following types of sub-interfaces: Ethernet sub-interface, aggregate sub-interface and redundant sub-interface. An interface

Type	Description
	and its sub-interfaces can be bound to one single security zone, or to different zones.
VSwitch interface	A Layer 3 interface that represents the collection of all the interfaces of a VSwitch. The VSwitch interface is virtually the upstream interface of a switch that implements packet forwarding between Layer 2 and Layer 3.
VLAN interface	A Layer 3 interface that represents the collection of all the Ethernet interfaces within a VLAN. If only one Ethernet interface is in UP state, the VLAN interface will be UP as well. The VLAN interface is the outbound communication interface for all the devices within a VLAN. Typically its IP address is the gateway's address of the network device within the VLAN.
Loopback interface	A logical interface. If only the security device with loopback interface configured is in the working state, the interface will be in the working state as well. Therefore, the loopback interface is featured with stability.
Tunnel interface	Only a Layer 3 interface, the tunnel interface acts as an ingress for VPN communications. Traffic flows into VPN tunnel through this interface.
Aggregate interface	Collection of physical interfaces that include 1 to 16 physical interfaces. These interfaces averagely share the traffic load to the IP address of the aggregate interface, in an attempt to increase the available bandwidth for a single IP address. If one of the physical interfaces within an aggregate interface fails, other physical interfaces can still process the traffic normally. The only effect is the available bandwidth will decrease.
Redundant interface	The redundant interface allows backup between two physical interfaces. One physical interface, acting as the primary interface, processes the inbound traffic, and another interface, acting as the alternative interface, will take over the processing if the primary interface fails.
PPPoE interface	A logical interface based on Ethernet interface that allows connection to PPPoE servers over PPPoE protocol.
Virtual Forward interface	In HA environment, the Virtual Forward interface is HA group's interface designed for traffic transmission.

Configuring an Interface

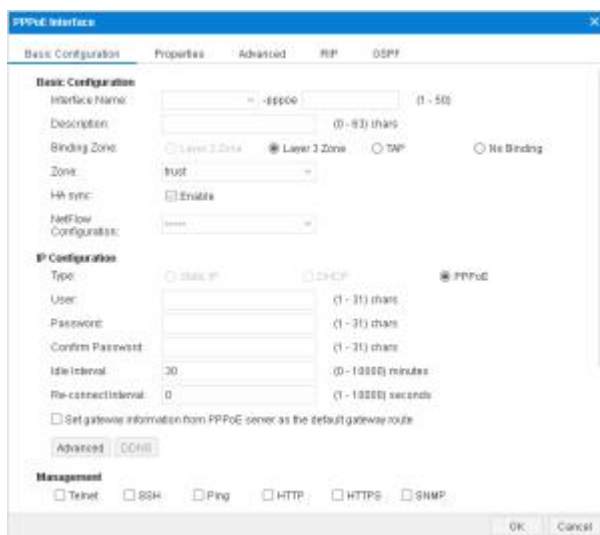

The configuration options for different types of interfaces may vary. For more information, see the following instructions.

Both IPv4 and IPv6 address can be configured for the interface, but IPv6 address is not supported for the PPPoE interface.

Creating a PPPoE Interface

To create a PPPoE interface, take the following steps:

1. Select **Network > Interface**.
2. Click **New > PPPoE Interface**.

In the Basic tab, configure the following.

Option	Description
Interface Name	Specifies a name for the PPPoE interface.
Description	Enter descriptions for the PPPoE interface.
Binding Zone	If Layer 3 zone is selected, you should also select a security zone from the Zone drop-down list, and the interface will bind to a Layer 3 zone. If TAP is selected, the interface will bind to a tap zone. If No Binding is selected, the interface will not bind to any zone.
Zone	Select a security zone from the Zone drop-down list.
HA sync	Select this check box to enable the HA Sync function, which disables Local property and uses the virtual MAC, and the primary device will synchronize its information with the backup

Option	Description
	device; not selecting this check box disables the HA Sync function, which enables Local property and uses the original MAC, and the primary device will not synchronize its information with the backup device.
NetFlow Configuration	Select a configured NetFlow profile from the drop-down list below.
User	Specifies a username for PPPoE.
Password	Specifies PPPoE user's password.
Confirm Password	Enter the password again to confirm.
Idle interval	If the PPPoE interface has been idle (no traffic) for a certain period, i.e. the specified idle interval, system will disconnect the Internet connections; if the interface requires Internet access, the system will connect to the Internet automatically. The value range is 0 to 10000 minutes. The default value is 30.
Re-connect interval	Specifies a re-connect interval (i.e., system will try to re-connect automatically after being disconnected for the interval). The value range is 0 to 10000 seconds. The default value is 0, which means the function is disabled.
Set gateway information from PPPoE server as the default gateway route	With this selected checkbox, system will set the gateway information provided by PPPoE server as the default gateway route.
Advanced	<p>In the Advanced dialog, configure advanced options for PPPoE, including:</p> <ul style="list-style-type: none"> • Access Concentrator - Specifies a name for the concentrator. • Authentication - The devices will have to pass PPPoE authentication when trying to connect to a PPPoE server. The supported authentication methods include CHAP, PAP and Any (the default, anyone between CHAP and PAP).

Option	Description
	<ul style="list-style-type: none"> • Netmask - Specifies a netmask for the IP address obtained via PPPoE. • Static IP - You can specify a static IP address and negotiate about using this address to avoid IP change. To specify a static IP address, type it into the box. • Distance - Specifies a route distance. The value range is 1 to 255. The default value is 1. • Weight - Specifies a route weight. The value range is 1 to 255. The default value is 1. • Service - Specifies allowed service. The specified service must be the same with that provided by the PPPoE server. If no service is specified, system will accept any service returned from the server automatically.
DDNS	<p>In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" .</p> <p>Tip: This function is available only when you edit the interface.</p>
Management	<p>Select one or more management method check boxes to configure the interface management method.</p>
Reverse Route	<p>Enable or Disable reverse route as needed:</p> <ul style="list-style-type: none"> • Enable: Force to use a reverse route. If the reverse route is not available, packets will be dropped. This option is enabled by default. • Close: Reverse route will not be used. When reaching the interface, the reverse data stream will be returned to its original route without any reverse route check. That is to say, reverse packets will be sent from the ingress interface that initializes the packets. • Auto: Reverse route will be prioritized. If available, the reverse route will be used to send packets; otherwise the ingress interface that initializes the packets will be used as the egress interface that sends reverse

Option	Description
	packets.
Auth Service	<p>Click the Enable, Close or Global Default radio button as needed.</p> <ul style="list-style-type: none"> • Enable: Enable the WebAuth function of the specified interface. • Close: Disable the WebAuth function of the specified interface. • Global Default: Specify that the interface uses the global default configuration of WebAuth. For the global default configuration of WebAuth function, see "Web Authentication".
Proactive WebAuth	<p>Select the Enable check box to enable proactive webauth function and Specify the AAA server.</p> <p>After enabling, you can access the Web authentication address initiate authentication request, and then fill in the correct user name and password in the authentication login page. The Web authentication address consists of the IP address of the interface and the port number of the HTTP/HTTPS of the authentication server. For example the IP address of the interface is 192.168.3.1, authentication server HTTP/HTTPS port numbe is respectively configured as 8182/44434. When the authentication server is configured for HTTP authentication mode, Web address is: http:// 192.168.3.1:8182; when the authentication server is configured for HTTPS mode, the Web address for the https:// 192.168.3.1:44434 certification.</p>

In the Properties tab, configure properties for the interface.

Option	Description
MTU	Specifies a MTU for the interface. The value range is 1280 to 1500/1800 bytes. The default value is 1500. The max MTU may vary on different platforms.
ARP Learning	Select the Enable checkbox to enable ARP learning.

Option	Description
ARP Timeout	Specifies an ARP timeout for the interface. The value range is 5 to 65535 seconds. The default value is 1200.
Keep-alive IP	Specifies an IP address that receives the interface's keep-alive packets.
MAC clone	Select the MAC clone check box to enable the MAC clone function. System clones a MAC address in the Ethernet sub-interface. If the user click "Restore Default MAC", the Ethernet sub-interface will restore the default MAC address.
Mirror	Enable port mirroring on an Ethernet interface, and select the traffic type to be mirrored.

In the **Advanced** tab, configure advanced options for the interface.

Option	Description
Shutdown	<p>System supports interface shutdown. You can not only force a specific interface to shut down, but also control the time it shuts down by schedule or according to the link status of tracked objects. Configure the options as below:</p> <ol style="list-style-type: none"> 1. Select the Shut down check box to enable interface shutdown. 2. To control the shutdown by schedule or tracked objects, select the appropriate check box, and then select an appropriate schedule or tracked object from the drop-down list.
Monitor and Backup	<p>Configure the options as below:</p> <ol style="list-style-type: none"> 1. Select the appropriate check box, and then select an appropriate schedule or tracked object from the drop-down list. 2. Select an action: <ul style="list-style-type: none"> • Shut down the interface: During the time specified in the schedule, or when the tracked object fails, the interface will be shut down and

Option	Description
	<p>its related route will fail;</p> <ul style="list-style-type: none"> <p>Migrate traffic to backup interface: During the time specified in the schedule, or when the tracked object fails, traffic flowing to the interface will be migrated to the backup interface. In such a case you need to select a backup interface from the Backup interface drop-down list and type the time into the Migrating time box. (Migrating time, 0 to 60 minutes, is the period during which traffic is migrated to the backup interface before the primary interface is switched to the backup interface. During the migrating time, traffic is migrated from the primary interface to the backup interface smoothly. By default the migrating time is set to 0, i.e., all the traffic will be migrated to the backup interface immediately.)</p>

In the RIP tab, configure RIP for the interface.

Option	Description
Authentication mode	Specifies a packet authentication mode for the system, including plain text (the default) and MD5. The plain text authentication, during which unencrypted string is transmitted together with the RIP packet, cannot assure security, so it cannot be applied to the scenarios that require high security.
Authentication string	Specifies a RIP authentication string for the interface.
Transmit version	Specifies a RIP information version number transmitted by the interface. By default V1&V2 RIP information will be transmitted.
Receive version	Specifies a RIP information version number transmitted by the interface. By default V1&V2 RIP information will be transmitted.
Split horizon	Select the Enable checkbox to enable split horizon. With this function enabled, routes learned from an interface will not be sent from the same interface, in order to avoid routing loop and

Option	Description
	assure correct broadcasting to some extent.

In the OSPF tab, configure OSPF for the interface.

Option	Description
Interface Timer	<p>There are four interface timers: the interval for sending Hello packets, the dead interval of adjacent routers, the interval for retransmitting LSA, and the transmit delay for updating packets.</p> <ul style="list-style-type: none"> • Hello Transmission Interval: Specifies the interval for sending Hello packets for an interface. The value range is 1 to 65535 seconds. The default value is 10. • Dead Time: Specifies the dead interval of adjacent routes for an interface. The value range is 1 to 65535 seconds. The default value is 40 (4 times of sending the Hello packets). If a router has not received the Hello packet from its peer for a certain period, it will determine the peering router is dead. This period is known as the dead interval between the two adjacent routers. • LSA Transmit Interval: Specifies the LSA retransmit interval for an interface. The value range is 3 to 65535 seconds. The default value is 5. • LSU Transmit Delay Time: Specifies the transmit delay for updating packet for an interface. The value range is 1 to 65535 seconds. The default value is 1.
Priority	<p>Specifies the router priority. The value range is 0 to 255. The default value is 1. The router with priority set to 0 will not be selected as the designated router (The designated router will receive the link information of all the other routers in the network, and broadcast the received link information). If two routers within a network can both be selected as the designated router, the router with higher priority will be selected; if the priority level is the same, the one with higher Router ID will be selected.</p>

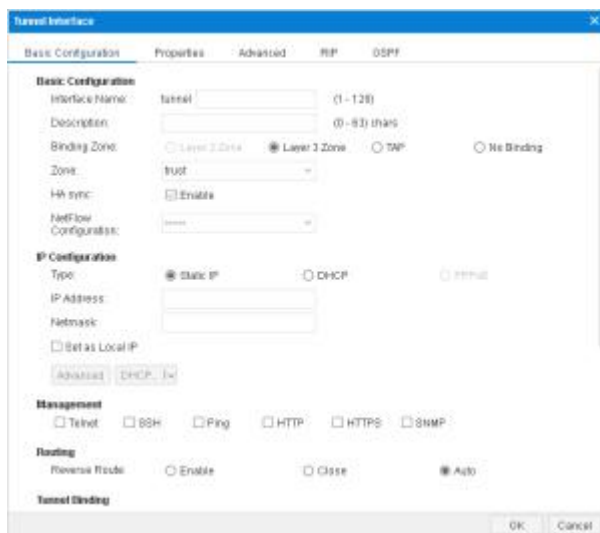

Option	Description
Network Type	Specifies the network type of an interface. The network types of an interface have the following options: broadcast, point-to-point, and point-to-multipoint. By default, the network type of an interface is broadcast.
Link Cost	Select the Enable check box to enable the link cost function. The value range is 1 to 65535. By default, the HA synchronization function is enabled, and the link cost will be synchronized to the backup device. Clear the check box to disable the synchronization function, and the system will stop synchronizing.

3. Click **OK**.

Creating a Tunnel Interface

To create a tunnel interface:

1. Select **Network > Interface**.
2. Select **New > Tunnel Interface**.

In the Basic tab, configure the following.

Option	Description
Interface Name	Specifies a name for the tunnel interface.
Description	Enter descriptions for the tunnel interface.
Binding Zone	If Layer 3 zone is selected, you should also select a security zone

Option	Description
	from the Zone drop-down list, and the interface will bind to a Layer 3 zone. If TAP is selected, the interface will bind to a tap zone. If No Binding is selected, the interface will not bind to any zone.
Zone	Select a security zone from the Zone drop-down list.
HA sync	Select this check box to enable the HA Sync function, which disables Local property and uses the virtual MAC, and the primary device will synchronize its information with the backup device; not selecting this check box disables the HA Sync function, which enables Local property and uses the original MAC, and the primary device will not synchronize its information with the backup device.
NetFlow configuration	Select a configured NetFlow profile from the drop-down list below.
IP Configuration	
Static IP	IP address: Specifies an IP address for the interface.
	Netmask: Specifies a netmask for the interface.
	Set as Local IP: In an HA environment, if this option is specified, the interface IP will not synchronize to the HA peer.
	Advanced: <ul style="list-style-type: none"> • Management IP: Specifies a management IP for the interface. Type the IP address into the box. • Secondary IP: Specifies secondary IPs for the interface. You can specify up to 6 secondary IP addresses.
	DHCP: In the DHCP Configuration dialog, configure DHCP options for the interface. For detailed instructions, see "DHCP" .
	DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" . Tip: This function is available only when you edit the interface.
Auto-obtain	Set gateway information from DHCP server as the default gateway route: With this check box selected, system will set the

Option	Description
	<p>gateway information provided by the DHCP server as the default gateway route.</p> <p>Advanced:</p> <ul style="list-style-type: none"> • Distance: Specifies a route distance. The value range is 1 to 255. The default value is 1. • Weight: Specifies a route weight. The value range is 1 to 255. The default value is 1. • Management Priority: Specifies a priority for the DNS server. Except for static DNS servers, system can also learn DNS servers dynamically via DHCP or PPPoE. Therefore, you need to configure priorities for the DNS servers, so that system can choose a DNS server according to its priority during DNS resolution. The priority is represented in numbers from 1 to 255. The larger the number is, the higher the priority is. The priority of static DNS servers is 20. • Classless Static Routes: Enable the classless static routing function via the DHCP options. When it is enabled, the DHCP client will send a request message with the Option121 (i.e., classless static routing option) to the server, and then the server will return the classless static route information. Finally, the client will add the classless static routing information to the routing table. <p>DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" . Tip: This function is available only when you edit the interface.</p>
Management	Select one or more management method check boxes to configure the interface management method.
Reverse Route	<p>Enable or Disable reverse route as needed:</p> <ul style="list-style-type: none"> • Enable: Enforces to use a reverse route. If the reverse route is not available, packets will be dropped. This option is enabled by default.

Option	Description
	<ul style="list-style-type: none"> • Close: Reverse route will not be used. When reaching the interface, the reverse data stream will be returned to its original route without any reverse route check. That is, reverse packets will be sent from the ingress interface that initializes the packets. • Auto: Reverse route will be prioritized. If available, the reverse route will be used to send packets; otherwise the ingress interface that initializes the packets will be used as the egress interface that sends reverse packets.
Tunnel Binding	<p>Bind the interface to a IPsec VPN tunnel or a SSL VPN tunnel. One tunnel interface can be bound to multiple IPsec VPN tunnels, while only to one SSL VPN tunnel.</p> <ul style="list-style-type: none"> • IPsec VPN: Select IPsec VPN radio button. Specifies a name for the IPsec VPN tunnel that is bound to the interface. Then select a next-hop address for the tunnel, which can either be the IP address or the egress IP address of the peering tunnel interface. This parameter, which is 0.0.0.0 by default, will only be valid when multiple IPsec VPN tunnels is bound to the tunnel interface. • SSL VPN: Select SSL VPN radio button. Specifies a name for the SSL VPN tunnel that is bound to the interface.
Upstream Bandwidth	Specifies the maximum value of the upstream rate of the interface.
Downstream Bandwidth	Specifies the maximum value of the downstream rate of the interface.

3. In the IPv6 Configuration tab, configure the following.

Option	Description
Enable	Enable IPv6 in the interface.
IPv6 Address	Specifies the IPv6 address prefix.

Option	Description
Prefix Length	Specifies the prefix length.
Autoconfig	<p>Select the checkbox to enable Auto-config function. In the address auto-config mode, the interface receives the address prefix in RA packets first, and then combines it with the interface identifier to generate a global address.</p> <ul style="list-style-type: none"> • Set Default Route - If the interface is configured with a default router, this option will generate a default route to the default router.
Enable DNS Proxy	Select this check box to enable DNS proxy for the interface.
DHCP	<p>System supports DHCPv6 client, DHCPv6 server and DHCPv6 relay proxy.</p> <ul style="list-style-type: none"> • Select DHCP check box to enable DHCP client for the interface. After enabling, system will act as a DHCPv6 client and obtain IPv6 addresses from the DHCP server. Selecting Rapid-commit option can help fast get IPv6 addresses from the server. You need to enable both of the DHCP client and the server's Rapid-commit function. • Select DHCPv6 Server from DHCP drop-down list and configure options as Configuring DHCPv6 Server, system will act as a DHCPv6 server to appropriate IPv6 addresses for DHCP client. • Select DHCPv6 Relay Proxy from DHCP drop-down list and configure options as Configuring DHCPv6 Relay Proxy, system will act as a DHCPv6 relay proxy to receive requests from a DHCPv6 client and send requests to the DHCPv6 server

Option	Description
Advanced	Enable DNS Proxy: Select this check box to enable DNS proxy for the interface.
Static	Click Add button to add several IPv6 address, at most 5 IPv6 addresses.. Click Delete button to delete IPv6 address.
Dynamic	Shows IPv6 address which is dynamic.
Link-local	Specifies link-local address. Link-local address is used for communication between adjacent nodes of a single link. For example, communication between hosts when there are no routers on the link. By default system will generate a link-local address for the interface automatically if the interface is enabled with IPv6 (in the interface configuration mode, use the command <code>ipv6 enable</code>). You can also specify a link-local address for the interface as needed, and the specified link-local address will replace the automatically generated one.
MTU	Specifies an IPv6 MTU for an interface.
DAD Attempts	<p>Specifies NS packet attempt times. The value range is 0 to 20. Value 0 indicates DAD is not enabled on the interface. If system does not receive any NA response packets after sending NS packets for the attempt times, it will verify that the IPv6 address is an unique available address.</p> <p>DAD (Duplicate Address Detection) is designed to verify the uniqueness of IPv6 addresses. This function is implemented by sending NS (Neighbor Solicitation) requests. After receiving a NS packet, if any other host on the link finds that the address of the NS requester is duplicated, it will send a NA (Neighbor Advertisement) packet advertising that the address is already in use, and then the NS requester will mark the address as duplicate, indicating that the</p>

Option	Description
	address is an invalid IPv6 address.
ND Interval	Specifies an interval for sending NS packets.
ND Reachable Time	Specifies reachable time. After sending an NS packet, if the interface receives acknowledgment from a neighbor within the specified time, it will consider the neighbor as reachable. This time is known as reachable time.
Hop Limit	Specifies the hop limit. Hop limit refers to the maximum number of hops for IPv6 or RA packets sent by the interface.
ND RA Suppress	Select the checkbox to disable RA suppress on LAN interfaces. By default, FDDI interface configured with IPv6 unicast route will send RA packets automatically, and interfaces of other types will not send RA packets.
Manage IP/MASK	Specifies the manage IP/MASK.

Creating a Virtual Forward Interface

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

To create a virtual forward interface, take the following steps:

1. Select **Network > Interface**.
2. Select **New > Virtual Forward Interface**.

In the Basic tab, configure the following.

Option	Description
Interface Name	Specifies a name for the virtual forward interface.
Description	Enter descriptions for the virtual forward interface.
Binding Zone	If Layer 3 zone is selected, you should also select a security zone from the Zone drop-down list, and the interface will bind to a Layer 3 zone. If TAP is selected, the interface will bind to a tap zone. If No Binding is selected, the interface will not bind to any zone.
Zone	Select a security zone from the Zone drop-down list.
NetFlow configuration	Select a configured NetFlow profile from the drop-down list below.
IP Configuration	
Static IP	IP address: Specifies an IP address for the interface.
	Netmask: Specifies a netmask for the interface.
	Set as Local IP: In an HA environment, if this option is specified, the interface IP will not synchronize to the HA peer.
	Advanced: <ul style="list-style-type: none"> Management IP: Specifies a management IP for the interface. Type the IP address into the box. Secondary IP: Specifies secondary IPs for the interface. You can specify up to 6 secondary IP

Option	Description
	<p>addresses.</p> <p>DHCP: In the DHCP Configuration dialog, configure DHCP options for the interface. For detailed instructions, see "DHCP" .</p> <p>DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" .</p> <p>Tip: This function is available only when you edit the interface.</p>
Auto-obtain	<p>Set gateway information from DHCP server as the default gateway route: With this check box selected, system will set the gateway information provided by the DHCP server as the default gateway route.</p> <p>Advanced:</p> <ul style="list-style-type: none"> • Distance: Specifies a route distance. The value range is 1 to 255. The default value is 1. • Weight: Specifies a route weight. The value range is 1 to 255. The default value is 1. • Management Priority: Specifies a priority for the DNS server. Except for static DNS servers, system can also learn DNS servers dynamically via DHCP or PPPoE. Therefore, you need to configure priorities for the DNS servers, so that system can choose a DNS server according to its priority during DNS resolution. The priority is represented in numbers from 1 to 255. The larger the number is, the higher the priority is. The priority of static DNS servers is 20. • Classless Static Routes: Enable the classless static routing function via the DHCP options. When it is enabled, the DHCP client will send a request message with the Option121 (i.e., classless static routing option) to the server, and then the server will return the classless static route information. Finally, the client will add the classless static routing information to the routing table. <p>DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" .</p>

Option	Description
	Tip: This function is available only when you edit the interface.
Management	Select one or more management method check boxes to configure the interface management method.
Reverse Route	<p>Enable or Disable reverse route as needed:</p> <ul style="list-style-type: none"> • Enable: Enforces to use a reverse route. If the reverse route is not available, packets will be dropped. This option is enabled by default. • Close: Reverse route will not be used. When reaching the interface, the reverse data stream will be returned to its original route without any reverse route check. That is, reverse packets will be sent from the ingress interface that initializes the packets. • Auto: Reverse route will be prioritized. If available, the reverse route will be used to send packets; otherwise the ingress interface that initializes the packets will be used as the egress interface that sends reverse packets.
Upstream Bandwidth	Specifies the maximum value of the upstream rate of the interface.
Downstream Bandwidth	Specifies the maximum value of the downstream rate of the interface.
Proactive WebAuth	<p>Select the Enable check box to enable proactive webauth function and Specify the AAA server.</p> <p>After enabling, you can access the Web authentication address initiate authentication request, and then fill in the correct user name and password in the authentication login page. The Web authentication address consists of the IP address of the interface and the port number of the HTTP/HTTPS of the authentication server. For example the IP address of the interface is 192.168.3.1, authentication server HTTP/HTTPS port numbe is respectively configured as 8182/44434. When the authentication server is configured for HTTP authentication mode, Web address is: http:// 192.168.3.1:8182; when the authentication server is</p>

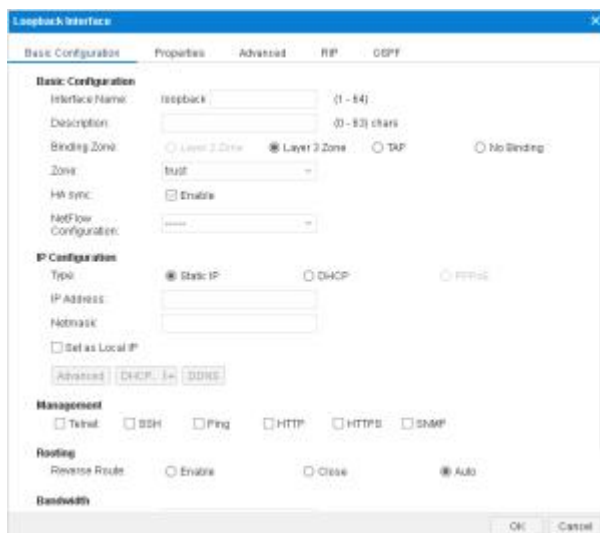

Option	Description
	configured for HTTPS mode, the Web address for the https://192.168.3.1:44434 certification.

- "In the IPv6 Configuration tab, configure the following."
- "In the Properties tab, configure properties for the interface."
- "In the Advanced tab, configure advanced options for the interface."
- "In the RIP tab, configure RIP for the interface."
- [In the OSPF tab, configure OSPF for the interface.](#)
- Click **OK**.

Creating a Loopback Interface

To create a loopback interface, take the following steps:

- Select **Network > Interface**.
- Click **New > Loopback Interface**.

In the Basic tab, configure the following.

Option	Description
Interface Name	Specifies a name for the loopback interface.
Description	Enter descriptions for the loopback interface.
Binding Zone	If Layer 3 zone is selected, you should also select a security zone

Option	Description
	from the Zone drop-down list, and the interface will bind to a Layer 3 zone. If TAP is selected, the interface will bind to a tap zone. If No Binding is selected, the interface will not bind to any zone.
Zone	Select a security zone from the Zone drop-down list.
HA sync	Select this check box to enable the HA Sync function, which disables Local property and uses the virtual MAC, and the primary device will synchronize its information with the backup device; not selecting this check box disables the HA Sync function, which enables Local property and uses the original MAC, and the primary device will not synchronize its information with the backup device.
NetFlow configuration	Select a configured NetFlow profile from the drop-down list below.
IP Configuration	
Static IP	IP address: Specifies an IP address for the interface.
	Netmask: Specifies a netmask for the interface.
	Set as Local IP: In an HA environment, if this option is specified, the interface IP will not synchronize to the HA peer.
	Advanced: <ul style="list-style-type: none"> • Management IP: Specifies a management IP for the interface. Type the IP address into the box. • Secondary IP: Specifies secondary IPs for the interface. You can specify up to 6 secondary IP addresses.
	DHCP: In the DHCP Configuration dialog, configure DHCP options for the interface. For detailed instructions, see "DHCP" .
	DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" . Tip: This function is available only when you edit the interface.
Auto-obtain	Set gateway information from DHCP server as the default gateway route: With this check box selected, system will set the

Option	Description
	<p>gateway information provided by the DHCP server as the default gateway route.</p> <p>Advanced:</p> <ul style="list-style-type: none"> • Distance: Specifies a route distance. The value range is 1 to 255. The default value is 1. • Weight: Specifies a route weight. The value range is 1 to 255. The default value is 1. • Management Priority: Specifies a priority for the DNS server. Except for static DNS servers, system can also learn DNS servers dynamically via DHCP or PPPoE. Therefore, you need to configure priorities for the DNS servers, so that system can choose a DNS server according to its priority during DNS resolution. The priority is represented in numbers from 1 to 255. The larger the number is, the higher the priority is. The priority of static DNS servers is 20. • Classless Static Routes: Enable the classless static routing function via the DHCP options. When it is enabled, the DHCP client will send a request message with the Option121 (i.e., classless static routing option) to the server, and then the server will return the classless static route information. Finally, the client will add the classless static routing information to the routing table. <p>DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" Tip: This function is available only when you edit the interface.</p>
Management	<p>Select one or more management method check boxes to configure the interface management method.</p>
Reverse Route	<p>Enable or Disable reverse route as needed:</p> <ul style="list-style-type: none"> • Enable: Enforces to use a reverse route. If the reverse route is not available, packets will be dropped. This option is enabled by default.

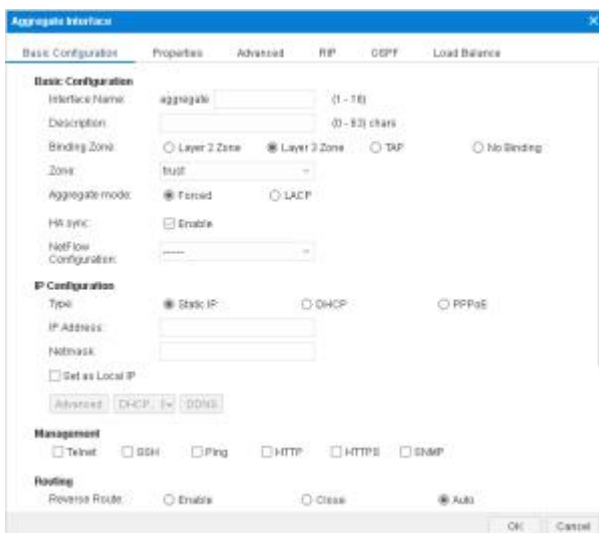

Option	Description
	<ul style="list-style-type: none"> • Close: Reverse route will not be used. When reaching the interface, the reverse data stream will be returned to its original route without any reverse route check. That is, reverse packets will be sent from the ingress interface that initializes the packets. • Auto: Reverse route will be prioritized. If available, the reverse route will be used to send packets; otherwise the ingress interface that initializes the packets will be used as the egress interface that sends reverse packets.
Upstream Bandwidth	Specifies the maximum value of the upstream rate of the interface.
Downstream Bandwidth	Specifies the maximum value of the downstream rate of the interface.

Option	Description
	<p>DNS servers dynamically via DHCP or PPPoE. Therefore, you need to configure priorities for the DNS servers, so that system can choose a DNS server according to its priority during DNS resolution. The priority is represented in numbers from 1 to 255. The larger the number is, the higher the priority is. The priority of static DNS servers is 20.</p> <ul style="list-style-type: none"> • Classless Static Routes: Enable the classless static routing function via the DHCP options. When it is enabled, the DHCP client will send a request message with the Option121 (i.e., classless static routing option) to the server, and then the server will return the classless static route information. Finally, the client will add the classless static routing information to the routing table. <p>DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS" .</p> <p>Tip: This function is available only when you edit the interface.</p>
PPPoE	<p>User: Specifies a username for PPPoE.</p> <p>Password: Specifies PPPoE user's password.</p> <p>Confirm Password: Enter the password again to confirm.</p> <p>Idle Interval: If the PPPoE interface has been idle (no traffic) for a certain period, i.e. the specified idle interval, system will disconnect the Internet connection; if the interface requires Internet access, system will connect to the Internet automatically. The value range is 0 to 10000 minutes. The default value is 30.</p> <p>Re-connect Interval: Specifies a re-connect interval (i.e., system will try to re-connect automatically after being disconnected for the interval). The value range is 0 to 10000 seconds. The default value is 0, which means the function is disabled.</p> <p>Set gateway information from PPPoE server as the default gateway route: With this check box being selected, system will set the gateway information provided by PPPoE server as the default gateway route.</p> <p>Advanced Access concentrator: Specifies a name for the concentrator.</p> <p>Authentication: The devices will have to pass PPPoE authentication when trying to connect to a PPPoE server. The supported authentication methods include CHAP, PAP and Any (the default, anyone between CHAP and PAP). Click an</p>

Option	Description
	<p>authentication method.</p> <p>Netmask: Specifies a netmask for the IP address obtained via PPPoE.</p> <p>Static IP: You can specify a static IP address and negotiate to use this address to avoid IP change. To specify a static IP address, type it into the box.</p> <p>Service: Specifies allowed service. The specified service must be the same with that provided by the PPPoE server. If no service is specified, FS will accept any service returned from the server automatically.</p> <p>Distance: Specifies a route distance. The value range is 1 to 255. The default value is 1.</p> <p>Weight: Specifies a route weight. The value range is 1 to 255. The default value is 1.</p> <p>DDNS: In the DDNS Configuration dialog, configure DDNS options for the interface. For detailed instructions, see "DDNS".</p> <p>Tip: This function is available only when you edit the interface.</p>
Management	<p>Select one or more management method check boxes to configure the interface management method.</p>
Reverse Route	<p>Enable or Disable reverse route as needed:</p> <ul style="list-style-type: none"> • Enable: Enforces to use a reverse route. If the reverse route is not available, packets will be dropped. This option is enabled by default. • Close: Reverse route will not be used. When reaching the interface, the reverse data stream will be returned to its original route without any reverse route check. That is, reverse packets will be sent from the ingress interface that initializes the packets. • Auto: Reverse route will be prioritized. If available, the reverse route will be used to send packets; otherwise the ingress interface that initializes the packets will be used as the egress interface that sends reverse packets.

Option	Description
Upstream Bandwidth	Specifies the maximum value of the upstream rate of the interface.
Downstream Bandwidth	Specifies the maximum value of the downstream rate of the interface.
Auth Service	<p>Click the Enable, Close or Global Default radio button as needed.</p> <ul style="list-style-type: none"> • Enable: Enable the WebAuth function of the specified interface. • Close: Disable the WebAuth function of the specified interface. • Global Default: Specify that the interface uses the global default configuration of WebAuth. For the global default configuration of WebAuth function, see "Web Authentication".
Proactive WebAuth	<p>Select the Enable check box to enable proactive webauth function and Specify the AAA server.</p> <p>After enabling, you can access the Web authentication address initiate authentication request, and then fill in the correct user name and password in the authentication login page. The Web authentication address consists of the IP address of the interface and the port number of the HTTP/HTTPS of the authentication server. For example the IP address of the interface is 192.168.3.1, authentication server HTTP/HTTPS port number is respectively configured as 8182/44434. When the authentication server is configured for HTTP authentication mode, Web address is: http:// 192.168.3.1:8182; when the authentication server is configured for HTTPS mode, the Web address for the https:// 192.168.3.1:44434 certification.</p>

4. ["In the IPv6 Configuration tab, configure the following."](#)
5. **In the Properties tab, configure properties for the interface.**

Property	Description
Duplex	Specifies a duplex working mode for the interface. Options include auto, full duplex and half duplex. Auto is the default working mode, in which system will select the most appropriate duplex working mode automatically. 1000M half duplex is not supported.
Rate	Specifies a working rate for the interface. Options include Auto, 10M, 100M and 1000M. Auto is the default working mode, in which system will detect and select the most appropriate working mode automatically. 1000M half duplex is not supported.
Combo type	<p>This option is applicable to the Combo port of copper port + fiber port. If both the copper port and the fiber port are plugged with cable, the fiber port will be prioritized by default; if the copper port is used at first, and the cable is plugged into the fiber port, and the fiber port will be used for data transmission after reboot. You can specify how to use a copper port or fiber port. For detailed options, see the following instructions:</p> <ul style="list-style-type: none"> • Auto: The above default scenario. • Copper forced: The copper port is enforced. • Copper preferred: The copper port is prioritized. • Fiber forced: The fiber port is enforced. • Fiber preferred: The fiber port is prioritized. With this option configured, the device will migrate the traffic on the copper port to the fiber port automatically without reboot.
MTU	Specifies a MTU for the interface. The value range is 1280 to 1500/1800 bytes. The default value is 1500. The max MTU may vary in different FS models.
ARP Learning	Select the Enable checkbox to enable ARP learning.
ARP Timeout	Specifies an ARP timeout for the interface. The value range is 5 to 65535 seconds. The default value is 1200.
Keep-alive IP	Specifies an IP address that receives the interface's keep-alive packets.
MAC clone	Select the MAC clone check box to enable the MAC clone

Property	Description
	function. System clones a MAC address to the Ethernet sub-interface. If the user click "Restore Default MAC", the Ethernet sub-interface will restore the default MAC address.

6. ["In the Advanced tab, configure advanced options for the interface."](#)
7. ["In the RIP tab, configure RIP for the interface."](#)
8. [In the OSPF tab, configure OSPF for the interface.](#)
9. Click **OK**.

Notes:

- Before deleting an aggregate/redundant interface, you must cancel other interfaces' bindings to it, aggregate/redundant sub-interface's configuration, its IP address configuration and its binding to the security zone.
- An Ethernet interface can only be edited but cannot be deleted.
- When a VSwitch interface is deleted, the corresponding VSwitch will be deleted as well.

DNS

DNS, the abbreviation for Domain Name System, is a computer and network service naming system in form of domain hierarchy. DNS is designed for TCP/IP network to query for Internet domain names (e.g., www.xxxx.com) and translate them into IP addresses (e.g., 10.1.1.1) to locate related computers and services.

The security device's DNS provides the following functions:

- **Server:** Configures DNS servers and default domain names for the security device.
- **Proxy:** As a DNS proxy, the device can filter the DNS request according to the DNS proxy rules set by the user, and system will forward the qualified DNS request to the designated DNS server.
- **Analysis:** Sets retry times and timeout for device's DNS service.
- **Cache:** DNS mappings to cache can speed up query. You can create, edit and delete DNS mappings.
- **NBT Cache:** Displays NBT cache information.

Configuring a DNS Server

You can configure a DNS server for system to implement DNS resolution. To create a DNS server, take the following steps:

1. Select **Network > DNS > DNS Server**.
2. Click **New** in the DNS Server section.
3. In the DNS Server Configuration dialog, type the IP address for the DNS server into the Server IP box.
4. Select a VRouter from the VR drop-down list. The default VRouter is trust-vr.
5. Click **OK**.

Configuring a DNS Proxy

DNS Proxy function take effect by the DNS proxy rules. Generally a proxy rule consists of two parts: filtering condition and action. You can set the filtering condition by specifying traffic's ingress interface , source address, destination address, and domain name. The action of the DNS proxy rules includes proxy, bypass and block. When the action of the proxy rule is specified as proxy, you need to configure the DNS proxy servers, so that the DNS request meeting the filtering condition will be resolved by these DNS proxy servers.

Configuring a DNS Proxy Rule

To create a DNS proxy rule, take the following steps:

1. Select **Network > DNS > DNS Proxy**.
2. Click **New** in the DNS Proxy section.
3. In the <DNS Proxy Rule Configuration> dialog, configure the following settings.

Option	Description
Description	Add the description.
Ingress Interface	Specify the ingress interface of DNS request in the rule to filter the DNS request message. It is permissible to specify numbers of interfaces.
Source Address	Specify the source address of DNS request to filter the DNS request message. It is permissible to specify multiple source address filtering conditions. Select the address entry type and then type the address. Click Add to add the selected entry to the

Option	Description
	<p>pane.</p> <ol style="list-style-type: none"> 1. Select an address type from the Address drop-down list. 2. Select or type the source addresses based on the selected type. 3. Click <input type="checkbox"/> to add the addresses to the right pane. 4. After adding the desired addresses, click the blank area in this dialog box to complete the source address configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Address Book type, you can click Add to create a new address entry. • When selecting the IPv4 type, the default address configuration is any. To restore the configuration to this default one, select the any check box. • When selecting the IPv6 type, the default address configuration is IPv6-any. To restore the configuration to this default one, select the IPv6-any check box.
Destination Address	<p>Specify the destination address of DNS request to filter the DNS request message. It is permissible to specify multiple destination address filtering conditions. Select the address entry type and then type the address. Click Add to add the selected entry to the pane.</p> <ol style="list-style-type: none"> 1. Select an address type from the Address drop-down list. 2. Select or type the destination addresses based on the selected type. 3. Click <input type="checkbox"/> to add the addresses to the right pane. 4. After adding the desired addresses, click the blank area in this dialog box to complete the destination address configuration.

Option	Description
	<p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Address Book type, you can click Add to create a new address entry. • When selecting the IPv4 type, the default address configuration is any. To restore the configuration to this default one, select the any check box. • When selecting the IPv6 type, the default address configuration is IPv6-any. To restore the configuration to this default one, select the IPv6-any check box
Domain	<p>Specify the domain name of DNS request to filter the DNS request message. It is permissible to specify multiple domain name filtering conditions. Select the domain entry type and then type the domain. Click Add to add the selected entry to the pane.</p> <ol style="list-style-type: none"> 1. Select an address type from the Domain drop-down list. 2. Select or type the domain name. 3. Click <input type="checkbox"/> to add the domain to the right pane. 4. After adding the desired domain, click the blank area in this dialog box to complete the domain configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Host Book type, you can click Add to create a new host book entry. • The default domain configuration is any. To restore the configuration to this default one, select the any check box.
Action	<p>Specify the action for a DNS proxy rule. For the DNS request that meets the filtering conditions, system can proxy, bypass or block the traffic.</p>
DNS Proxy Failed	<p>Specify the action for DNS proxy failed. System can block or bypass the DNS request and then forward it to the DNS server</p>

Option	Description
	originally requested by the message.
DNS Server	<p>Specify the DNS proxy server. When the action of the proxy rule is specified as proxy, you need to configure the DNS proxy servers. You can specify up to six DNS server and you can configure the interface and preferred properties for the DNS server as needed. When you configure multiple DNS servers, the DNS server with preferred property will be selected for domain name resolution. If no preferred server is specified, the system will query whether there are DNS servers that have specified the egress interface; If so, select these DNS server in a round robin. Except for these two kinds of DNS servers, which means that there are only regular DNS server, then system will select this kind of DNS servers in a round robin.</p> <p>At the bottom of the DNS server list, click the "+" button, and a table entry will be added. Enter the IP address (IPv4 address or IPv6 address) of server and other parameters ,such as the virtual router.</p>

4. Click **OK**.

Enabling/Disabling a DNS Proxy Rule

DNS proxy rule is enabled by default. To disable or enable the function, take the following steps:

1. Select **Network > DNS > DNS Proxy**.
2. Select the rule that you want to enable/disable.
3. Click **Enable** or **Disable** to enable or disable the rule.

Adjusting DNS Proxy Rule Position

To adjust the rule position, take the following steps:

1. Select **Network > DNS > DNS Proxy**.
2. Select the check box of the security policy whose position will be adjusted.
3. Click **Priority**.

- In the pop-up menu, type the rule ID or name , and click **Before ID** , **After ID** , **Before Name** or **After Name**. Then the rule will be moved before or after the specified ID or name.

DNS Proxy Global Configuration

To set the DNS proxy global configuration, take the following steps:

- Select **Network > DNS > DNS Proxy**.
- Click **DNS Proxy Global Configuration** in the DNS Proxy section.
- In the <DNS Proxy Global Configuration> dialog, configure the following settings.

Option	Description
TTL	Enable and specifies the 'TTL for DNS-proxy' s response packets. If the DNS-proxy requests are not responded after the TTL, the DNS client will clear all DNS records. The value range is 30 to 600 seconds. The default value is 60.
Server Track	Enable the DNS proxy server track and configure the time interval of tracking for DNS proxy server. System will periodically detect the DNS proxy server at a specific time interval. When the server cannot be tracked, the IP address of server will be removed from the DNS resolution list untill the link is restored. By default, the tracking for DNS proxy server is enabled.
UDP Checksum	Click the checkbox to enable/disable calculating the checksum of UDP packet for DNS proxy. The system will calculate the checksum of UDP packet for DNS proxy when the DNS proxy on interfaces is enabled. If you need to improve the performance of the device, you can disable this function.

- Click **OK**.

Configuring an Analysis

Analysis configuration includes DNS requests' retry times and timeout.

- Retry:** If there is no response from the DNS server after the timeout, system will send the request again; if there is still no response from the DNS server after the specified retry times (i.e. the number of times to repeat the DNS request), system will send the request to the next DNS server.

- **Timeout:** System will wait for the DNS server's response after sending the DNS request and will send the request again if no response returns after a specified time. The period of waiting for a response is known as timeout.

To configure the retry times and timeout for DNS requests, take the following steps:

1. Select **Network > DNS > Analysis**
2. Select the retry times radio button.
3. Select the timeout values radio button.
4. Click **Apply**.

Configuring a DNS Cache

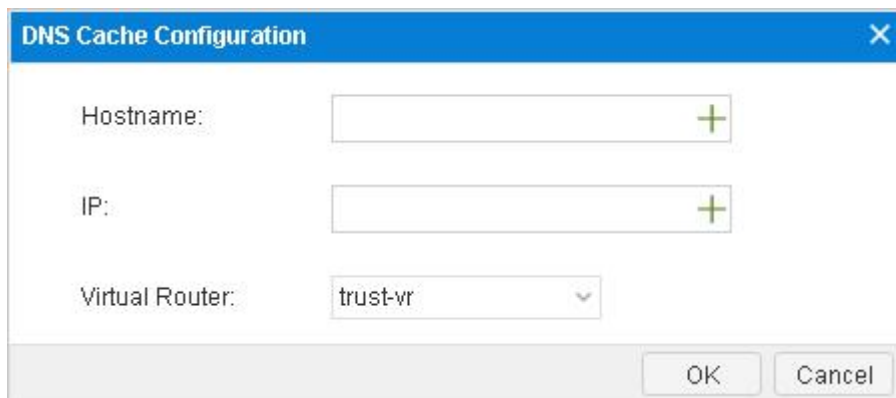

When using DNS, system might store the DNS mappings to its cache to speed up the query. There are three ways to obtain DNS mappings:

- **Dynamic:** Obtains from DNS response.
- **Static:** Adds DNS mappings to cache manually.
- **Register:** DNS hosts specified by some modules of security devices, such as NTP, AAA, etc.

For convenient management , DNS static cache supports group function, which means users make the multiple domain hosts with the same IP address and virtual router is a DNS static cache group.

To add a static DNS mapping to cache, take the following steps:

1. Select **Network > DNS > Cache**
2. Click **New**.

Option	Description
--------	-------------

Option	Description
Hostname	Specify the hostname of a DNS cache group. You can click  to add or click  button to delete the specified hostname. The maximum number of domain hosts is 128, and the maximum length of each hostname is 255 characters.
IP	Specify the host IPv4 address of a DNS cache group. You can click  to add or click  button to delete the specified IP. The maximum number of host IP address is 8, and the earlier configured IP will be matched first.
Virtual Router	Select a VRouter.

3. Click **OK**.

Notes:

- Only DNS static cache group can support new, edit and delete operation , while dynamic and register cache cannot .
- The DNS dynamic cache can be deleted by command or the lifetime reset. For detailed information , refer to **FSOS CLI User Guide** and [download PDF](#) on website.
- User can clear the register cache only by deleting the defined hosts in function module.
- DNS static cache is superior to dynamic and register cache, which means the static cache will cover the same existed dynamic or register cache.

NBT Cache

System supports NetBIOS name resolution. With this function enabled, system can automatically obtain all the NetBIOS host names registered by the hosts within the managed network, and store them in the cache to provide IP address to NetBIOS host name query service for other modules.

Enabling a NetBIOS name resolver is the pre-requisition for displaying host names in NAT logs. For more information on how to display host names in the NAT logs, see "[Log Configuration](#)" .

To enable NetBIOS for a zone, select the NBT cache check box when creating or editing the zone. For more details, see "[Security Zone](#)" . The security zone with NetBIOS enabled should not be the zone that is connected to WAN. After NetBIOS is enabled, the query process might last for a while, and the query

result will be added to the NetBIOS cache table. System will perform the query again periodically and update the result.

Notes: Only when PCs have NetBIOS enabled can their host names be queried. For more information on how to enable NetBIOS, see the detailed instructions of your PC's Operating System.

To clear NBT cache, take the following steps:

1. Select **Network > DNS > NBT Cache**.
2. Select a VRouter from the VR drop-down list to display the NBT cache in that VRouter.
3. Select a NBT cache entry from the list and click **Delete**.

DHCP

DHCP, the abbreviation for Dynamic Host Configuration Protocol, is designed to allocate appropriate IP addresses and related network parameters for subnetworks automatically, thus reducing requirement on network administration. Besides, DHCP can avoid address conflict to assure the re-allocation of idle resources.

DHCP supports to allocate IPv4 and IPv6 addresses.

System supports DHCP client, DHCP server and DHCP relay proxy.

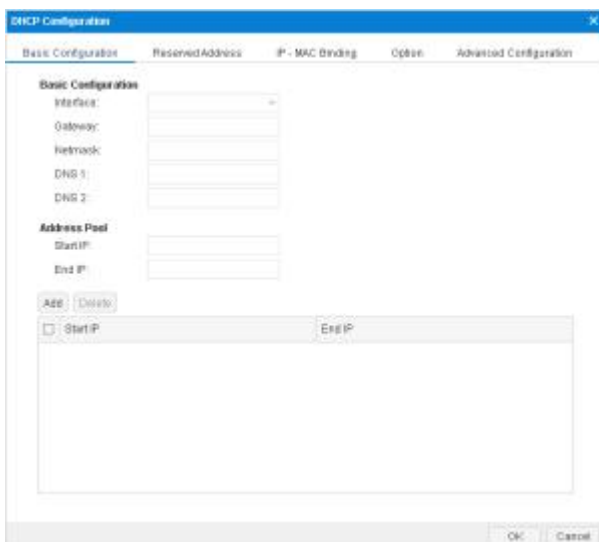

- DHCP client: The interface can be configured as a DHCP client and obtain IP addresses from the DHCP server. For more information on configuring a DHCP client, see "[Configuring an Interface](#)".
- DHCP server: The interface can be configured as a DHCP server and allocate IP addresses chosen from the configured address pool for the connected hosts.
- DHCP relay proxy: The interface can be configured as a DHCP relay proxy to obtain DHCP information from the DHCP server and forward the information to connected hosts.

The security devices are designed with all the above three DHCP functions, but an individual interface can be only configured with one of the above functions.

Configuring a DHCP Server

To create a DHCP server, take the following steps:

1. Select **Network > DHCP**.
2. Select **New > DHCP Server**.

3. In the DHCP Configuration dialog, configure as following:

Option	Description
Interface	Configures a interface which enables the DHCP server.
Gateway	Configures a gateway IP for the client.
Netmask	Configures a netmask for the client.
DNS1	Configures a primary DNS server for the client. Type the server's IP address into the box.
DNS2	Configures an alternative DNS server for the client. Type the server's IP address into the box.
Address pool	<p>Configures an IP range in the address pool. The IPs within this range will be allocated. Take the following steps:</p> <ol style="list-style-type: none"> 1. Type the start IP and end IP into the Start IP and End IP box respectively. 2. Click Add to add an IP range which will be displayed in the list below. 3. Repeat the above steps to add more IP ranges. To delete an IP range, select the IP range you want to delete from the list and click Delete.

4. Configure Reserved Address (IP addresses in the Reserved Address, within the IP range of the address pool, are reserved for the DHCP server and will not be allocated).

To configure a reserved address, click the **Reserved Address** tab, type the start and end IP for

an IP range into the Start IP and End IP box respectively, and then click **Add**. To delete an IP range, select the IP range you want to delete from the list and then click **Delete**.

5. Configure IP-MAC Binding. If the IP is bound to a MAC address manually, the IP will only be allocated to the specified MAC address.

To configure an IP-MAC Binding, click the **IP-MAC Binding** tab and type the IP and MAC address into the IP address and MAC box respectively, type the description in the Description text box if necessary, and then click **Add**. Repeat the above steps to add multiple entries. To delete an IP-MAC Binding, select an entry from the list and click **Delete**.

6. In the **Option** tab, configure the options supported by DHCP server

Option	Description
43	<p>Option 43 is used to exchange specific vendor specific information (VSI) between DHCP client and DHCP server. The DHCP server uses option 43 to assign Access Controller (AC) addresses to wireless Access Point (AP), and the wireless AP use DHCP to discover the AC to which it is to connect.</p> <ol style="list-style-type: none"> 1. Select 43 from the Option drop-down list. 2. Select the type of the VSI, ASCII or HEX. When selecting ASCII, the VSI matching string must be enclosed in quotes if it contains spaces. 3. Enter the VSI in the Sign text box. 4. Click Add. 5. Click OK to save the settings. <p>Notes: If the VCI matching string has been configured, first of all, you need to verify the VCI carried by the option 60 field in client's DHCP packets. When the VCI matches the configured one, the IP address, option 43 and corresponding information will be offered. If not, DHCP server will drop client's DHCP packets and will not reply to the client.</p>
49	<p>After you configure the option 49 settings, the DHCP client can obtain the list of the IP addresses of systems that are running the X window System Display Manager.</p> <p>To configure the option 49 settings:</p>

Option	Description
	<ol style="list-style-type: none"> 1. Select 49 from the Option drop-down list. 2. Enter the IP address of the system that is running the X window System Display Manager into the IP address box. 3. Click Add. 4. Repeat the above steps to add multiple entries. To delete an entry, select it from the list and click Delete.
60	<p>After configuring the VCI carried by option 60 for DHCP server, the DHCP packets sent by the DHCP server will carry this option and the corresponding VCI.</p> <ol style="list-style-type: none"> 1. Select 60 from the Option drop-down list. 2. Select the type of the VCI, ASCII or HEX. When selecting ASCII, the VCI matching string must be enclosed in quotes if it contains spaces. 3. Enter the VCI in the Sign text box. 4. Click Add. 5. Click OK to save the settings.
66	<p>The option 66 is used to configure the TFTP server name option. By configuring Option 66, the DHCP client get the domain name or the IP address of the TFTP server. You can download the startup file specified in the Option 67 from the TFTP server.</p> <ol style="list-style-type: none"> 1. Select 66 from the Option drop-down list. 2. Select the type of the TFTP server name, ASCII or HEX. When selecting ASCII, the length of TFTP server is 1 to 255 characters, but the maximum length between the two periods (.) is only 63 characters. 3. Enter the domain name or the IP address of the TFTP server in the Sign text box.

Option	Description
	<ol style="list-style-type: none"> 4. Click Add. 5. Click OK to save the settings.
67	<p>The option 67 is used to configure the startup file name option for the TFTP server. By configuring option 67, the DHCP client can get the name of the startup file.</p> <ol style="list-style-type: none"> 1. Select 67 from the Option drop-down list. 2. Select the type of the startup file name, ASCII or HEX. When selecting ASCII, the length of startup file name is 1 to 255 characters. 3. Enter the startup file name in the Sign text box. 4. Click Add. 5. Click OK to save the settings.
138	<p>The DHCP server uses option 138 to carry a list of 32-bit (binary) IPv4 addresses indicating one or more CAPWAP ACs available to the WTP. Then the WTP discovers and connects to the AC according to the provided AC list.</p> <ol style="list-style-type: none"> 1. Select 138 from the Option drop-down list. 2. Enter the AC IP address in the IP address text box. 3. Click Add. <p>You can add up to four AC IP addresses.</p> <p>If you do not set the option 138 for the DHCP server or the DHCP client does not request option 138, DHCP server will not offer the option 138 settings.</p>
150	<p>The option 150 is used to configure the address options for the TFTP server. By configuring option 150, the DHCP client can get the address of the TFTP server.</p> <ol style="list-style-type: none"> 1. Select 150 from the Option drop-down list.

Option	Description
	<ol style="list-style-type: none"> 2. Enter the TFTP server IP address in the IP address text box. 3. Click Add. You can configure up to 8 TFTP servers.
242	<p>The option 242 is a private DHCP private option for IP phones. By configuring option 242, the specific parameters information of IP phone can be exchanged between DHCP server and DHCP client, such as call server address (MCIPADD), call the server port (MCPORT), the address of the TLS server (TLSSRVR), HTTP (HTT*PSRVR) HTTP server address and server port (HTT*PPORT) etc.</p> <ol style="list-style-type: none"> 1. Select 242 from the Option drop-down list. 2. Select the type of the specific parameters of the IP phone, ASCII or HEX. When selecting ASCII, the length of startup file name is 1 to 255 characters. 3. Enter the specific parameters of the IP phone in the Sign text box. 4. Click Add. 5. Click OK to save the settings.

7. Click the **Advanced** tab to configure the DHCP server's advanced options.

Option	Description
Domain	The domain name configured by the DHCP client.
Lease	Specifies a lease time. The value range is 300 to 1048575 seconds. The default value is 3600. Lease is the period during which a client is allowed to use an IP address, starting from the time the IP address is assigned. After the lease expires, the client will have to request an IP address again from the DHCP server.
Auto Configure	Enables automatic configuration. Select an interface with DHCP client enabled on the same gateway from the drop-down list. "----" indicates auto configure is not enabled.

Option	Description
	<p>Auto configure will activate function in the following condition: Another interface with DHCP configured on the device enables DHCP client. When auto configure is enabled, if the DHCP server does not have DNS, WINS or domain name configured, the DHCP client (DHCP) will dispatch the DNS, WINS and domain name information obtained from a connected DHCP server to the host that obtains such information from the DHCP server. However, the DNS, WINS and domain name that are configured manually still have the priority.</p>
WINS1	Configures a primary WINS server for the client. Type the server's IP address into the box.
WINS2	Configures an alternative WINS server for the client. Type the server's IP address into the box.
SMTP server	Configures a SMTP server for the client. Type the server's IP address into the box.
POP3 server	Configures a POP3 server for the client. Type the server's IP address into the box.
News server	Configures a news server for the client. Type the server's IP address into the box.
Relay agent	<p>When the device1 with DHCP server enabled is connected to another device2 with DHCP relay enabled, and the PC obtains device1's DHCP information from device2, then only when the relay agent's IP address and netmask are configured on device1 can the DHCP information be transmitted to the PC successfully.</p> <p>Relay agent: Type relay agent's IP address and netmask, i.e., the IP address and netmask for the interface with relay agent enabled on device2.</p>
VCI-match-string	The DHCP server can verify the VCI carried by option 60 in the client's DHCP packets. When the VCI in the client's DHCP packet matches the VCI matching string you configured in the

Option	Description
	<p>DHCP server, the DHCP server will offer the IP address and other corresponding information. If not, the DHCP server will drop the client's DHCP packets and will not reply to the client. If you do not configure a VCI matching string for the DHCP server, it will ignore the VCI carried by option 60.</p> <ol style="list-style-type: none"> <li data-bbox="619 555 1331 683">1. Select the type of the VCI matching string, ASCII or HEX. When selecting ASCII, the VCI matching string must be enclosed in quotes if it contains spaces. <li data-bbox="619 719 1331 757">2. Enter the VCI matching string in the text box.

8. Click **OK**.

Configuring a DHCP Relay Proxy

The device can act as a DHCP relay proxy to receive requests from a DHCP client and send requests to the DHCP server, and then obtain DHCP information from the server and return it to the client.

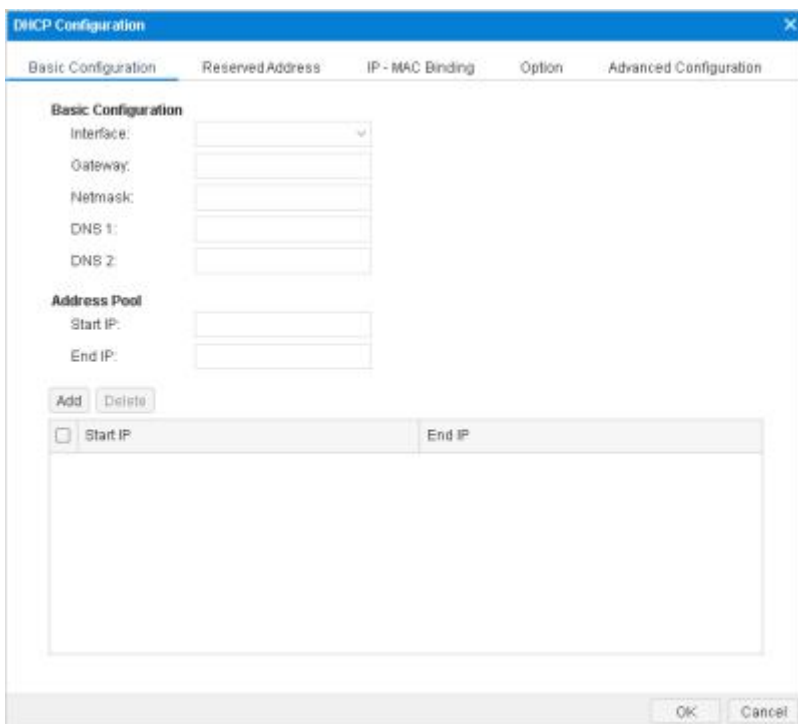

To create a DHCP relay proxy, take the following steps:

1. Select **Network > DHCP**.
2. Click **New > DHCP Relay Proxy**.
3. In the DHCP Relay Proxy dialog, select an interface to which the DHCP Relay Proxy will be applied from the Interface drop-down list.
4. Type the IP addresses of DHCP servers into the Server 1/Server 2/Server 3 boxes.
5. Click **OK**.

Configuring a DHCPv6 Server

To create a DHCPv6 server to appropriate IPv6 addresses, take the following steps:

1. Select **Network > DHCP**.
2. Select **New > DHCPv6 Server**.

3. In the DHCPv6 Configuration dialog, configure as following:

Option	Description
Interface	Configures a interface which enables the DHCPv6 server to appropriate IPv6 addresses.
rapid-commit	Selecting this check box can help fast get IPv6 address from the server. You need to enable both of the DHCP client and server's Rapid-commit function.
Preference	Specifies the priority of the DHCPv6 server. The range should be from 0 to 255. The bigger the value is, the higher the priority is.
DNS1	Configures a primary DNS server for the client. Type the server's IP address into the box.
DNS2	Configures an alternative DNS server for the client. Type the server's IP address into the box.
Domain	Configures the domain name for the DHCP client.
Address Pool:	System can act as a DHCPv6 server to allocate IPv6 addresses for the DHCP clients in the subnets.
IP	Specifies the IPv6 address prefix and prefix length.
Valid Lifetime	Specifies the lifetime of the address.

Option	Description
Preferred Lifetime	Specifies the preferred lifetime for the IPv6 address. The preferred lifetime should not be larger than the valid lifetime.

4. Click **OK**.

Configuring a DHCPv6 Relay Proxy

The device can act as a DHCPv6 relay proxy to receive requests from a DHCPv6 client and send requests to the DHCPv6 server, and then obtain DHCP information from the server and return it to the client.

To create a DHCPv6 relay proxy, take the following steps:

1. Select **Network > DHCP**.
2. Click **New > DHCPv6 Relay Proxy**.
3. In the DHCP Relay Proxy dialog, select an interface to which the DHCPv6 Relay Proxy will be applied from the Interface drop-down list.
4. Type the IPv6 addresses of DHCPv6 servers into the Server 1/Server 2/Server 3 boxes.
5. If the DHCPv6 server is specified as link-local address, you need to select the egress interface name from Egress Interface 1/Egress Interface 2/Egress Interface 3 dropdown list.
6. Click **OK**.

DDNS

DDNS (Dynamic Domain Name Server) is designed to resolve fixed domain names to dynamic IP addresses. Generally you will be allocated with a dynamic IP address from ISP each time you connect to the Internet, i.e., the allocated IP addresses for different Internet connections will vary. DDNS can bind the domain name to your dynamic IP address, and the binding between them will be updated automatically each time you connect to the Internet.

In order to enable DDNS, you will have to register in a DDNS provider to obtain a dynamic domain name. FS devices support the following 5 DDNS providers, and you can visit one of the following websites to complete the registration:

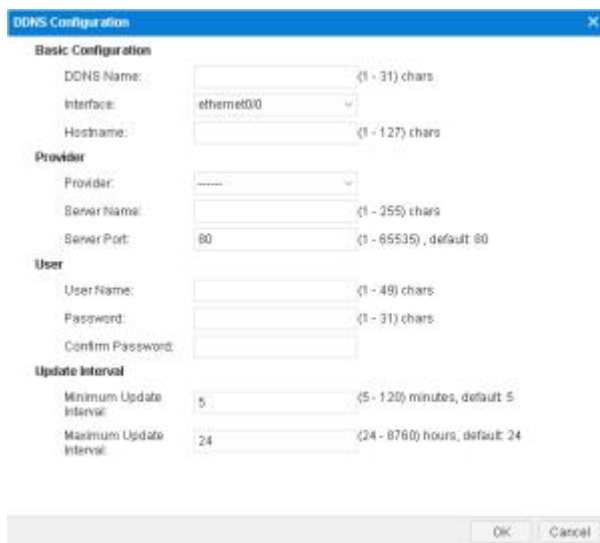

- dyndns.org: <http://dyndns.com/dns>
- 3322.org: <http://www.pubyun.com>

- no-ip.com: http://www.noip.com
- Huagai.net: http://www.ddns.com.cn
- ZoneEdit.com: http://www.zoneedit.com

Configuring a DDNS

To create a DDNS, take the following steps:

1. Select **Network > DDNS**.
2. Click **New**.

3. In the DDNS Configuration dialog, configure as follows:

Option	Description
DDNS Name	Specifies the name of DDNS.
Interface	Specifies the interface to which DDNS is applied.
Hostname	Specifies the domain name obtained from the DDNS provider.
Provider	Specifies a DDNS provider. Choose one from the drop-down list.
Server Name	Specifies a server name for the configured DDNS.
Server Port	Specifies a server port number for the configured DDNS. The value range is 1 to 65535.
User Name	Specifies the user name registered in the DDNS provider.
Password	Specifies the corresponding password.

Option	Description
Confirm Password	Enter the password again to confirm.
Minimum Update Interval	When the IP address of the interface with DDNS enabled changes, system will send an update request to the DDNS server. If the server does not respond to the request, system will send the request again according to the configured min update interval. For example, if the minimum update interval is set to 5 minutes, then system will send the second request 5 minutes after the first request failure; if it fails again, system will send the third request 10 (5x2) minutes later; if it fails again, and system will send the fourth request 20 (10*2) minutes later, and so forth. The value will not increase anymore when reaching 120 minutes. That is, system will send the request at a fixed interval of 120 minutes. The default value is 5.
Maximum Update Interval	In case the IP address has not changed, system will send an update request to the DDNS server at the maximum update interval. Type the maximum update interval into the box. The value range is 24 to 8760 hours. The default value is 24.

4. Click **OK**.

Notes: The Server name and Server port in the configuration options must be the corresponding name and port of the DDNS server. Do not configure these options if the exact information is unknown. The server will return the name and port information automatically after connection to the DDNS server has been established successfully.

PPPoE

PPPoE, Point-to-Point Protocol over Ethernet, combines PPP protocol and Ethernet to implement access control, authentication, and accounting on clients during an IP address allocation.

The implementation of PPPoE protocol consists of two stages: discovery stage and PPP session stage.

- Discovery stage: The client discovers the access concentrator by identifying the Ethernet MAC address of the access concentrator and establishing a PPPoE session ID.

- PPP session stage: The client and the access concentrator negotiate over PPP. The negotiation procedure is the same with that of a standard PPP negotiation.

Interfaces can be configured as PPPoE clients to accept PPPoE connections.

Configuring PPPoE

To create a PPPoE instance, take the following steps:

1. Select **Network > PPPoE**.
2. Click **New**.

3. In the PPPoE Configuration dialog, configure as follows.

Option	Description
PPPoE Name	Specifies a name for the PPPoE instance.
Interface	Select an interface from the drop-down list.
User Name	Specifies a username.
Password	Specifies the corresponding password.
Confirm Password	Enter the password again to confirm.
Idle Interval	Automatic connection. If the PPPoE interface has been idle (no traffic) for a certain period, i.e., the specified idle interval, system will disconnect the Internet connection; if the interface requires Internet access, system will connect to the Internet automatically. The value range is 0 to 10000 minutes. The default value is 30.

Option	Description
Reconnect Interval	If the PPPoE connection disconnects for any reason for a certain period, i.e. the specified re-connect interval, system will try to re-connect automatically. The value range is 0 to 10000 seconds. The default value is 0, which means the function is disabled.
Access Concentrator	Specifies a name for the concentrator.
Authentication	The devices will have to pass PPPoE authentication when trying to connect to a PPPoE server. The supported authentication methods include CHAP, PAP and Any (the default, anyone between CHAP and PAP). To configure a PPPoE authentication method, click the authentication you want to select. The configured authentication must be the same with that configured in the PPPoE server.
Netmask	Specifies a netmask for the IP address obtained via PPPoE.
Distance	Specifies a route distance. The value range is 1 to 255. The default value is 1.
Weight	Specifies a route weight. The value range is 1 to 255. The default value is 1.
Service	Specifies allowed service. The specified service must be the same with that provided by the PPPoE server. If no service is specified, system will accept any service returned from the server automatically.
Static IP	You can specify a static IP address and negotiate to use this address to avoid IP change. To specify a static IP address, type it into the Static IP box.

4. Click **OK**.

Virtual Wire

The system supports the VSwitch-based Virtual Wire. With this function enabled and the Virtual Wire interface pair configured, the two Virtual Wire interfaces form a virtual wire that connects the two subnetworks attached to the Virtual Wire interface pair together. The two connected subnetworks can communicate directly on Layer 2, without any requirement on MAC address learning or other sub

network's forwarding. Furthermore, controls of policy rules or other functions are still available when Virtual Wire is used.

Virtual Wire operates in two modes, which are Strict and Non-Strict mode respectively, as detailed below:

- Strict Virtual Wire mode:** Packets can only be transmitted between Virtual Wire interfaces, and the VSwitch cannot operate in Hybrid mode. Any PC connected to Virtual Wire can neither manage devices nor access Internet over this interface.
- Non-Strict Virtual Wire mode:** Packets can be transmitted between Virtual Wire interfaces, and the VSwitch also supports data forwarding in Hybrid mode. That is, this mode only restricts Layer 2 packets' transmission between Virtual Wire interfaces, and does not affect Layer 3 packets' forwarding.

The table below lists packet transmission conditions in Strict Virtual Wire and Non-Strict Virtual Wire mode. You can choose an appropriate Virtual Wire mode according to the actual requirement.

Packet	Strict	Non-strict
Egress and ingress are interfaces of one Virtual Wire interface pair	Allow	Allow
Ingress is not Virtual Wire's interface	Deny	Deny
Egress and ingress are interfaces of different Virtual Wire interface pairs	Deny	Deny
Ingress of to-self packet is a Virtual Wire's interface	Deny	Allow
Ingress is Virtual Wire's interface, and egress is a Layer 3 interface	Deny	Allow

Configuring a Virtual-Wire

To create a Virtual-Wire, take the following steps:

- Select **Network > Virtual-Wire**.
- Click **New**.
- In the Virtual-Wire Configuration dialog, select a virtual switch from the VSwitch drop-down list.
- In the Interface 1 drop-down list, specify an interface for the virtual wire interface pair. The two interfaces in a single virtual wire interface pair must be different, and one interface cannot belong to two different virtual wire interface pairs simultaneously.

5. In the Interface 2 drop-down list, specify an interface for the virtual wire interface pair. The two interfaces in a single virtual wire interface pair must be different, and one interface cannot belong to two different virtual wire interface pairs simultaneously.
6. Click **OK**.

Configuring the Virtual Wire Mode

To configure a virtual wire mode, take the following steps:

1. Select **Network > Virtual-Wire**.
2. Click **Virtual-Wire Mode**.
3. In the Virtual-Wire Mode Configuration dialog, select a virtual switch from the VSwitch drop-down list.
4. Specify a virtual wire mode from one of the following options:
 - **Strict** - Packets can only be transmitted between virtual wire interfaces, and the VSwitch cannot operate in Hybrid mode. Any PC connected to the virtual wire can neither manage devices nor access Internet over this interface.
 - **Non-strict** - Packets can be transmitted between virtual wire interfaces, and the VSwitch also supports data forwarding in Hybrid mode. That is, this mode only restricts Layer 2 packets' transmission between virtual wire interfaces, and does not affect Layer 3 packets' forwarding.
 - **Disabled** - Disables the virtual wire.
5. Click **OK**.

Virtual Router

Virtual Router (VRouter) is known as VR in system. VR acts as a router, and different VRs have their own independent routing tables. A VR named "trust-vr" is implemented with the system, and by default, all of the Layer 3 security zones are bounded to the trust-vr automatically. FS devices support multiple VRs, and the max amount of supported VRs may vary with different hardware platforms. Multiple VRs divide a device into multiple virtual routers, and each router utilizes and maintains their independent routing table. In such a case one device is acting as multiple routers. Multiple VRs allow a device to achieve the effects of the address isolation between different route zones and address overlapping between different VRs, as well as to avoid route leaking to some extent, enhancing route security of

network. For more information about the relationship between interface, security zone, VSwitch and VRouter, see the following diagram:

As shown above, the binding relationship between them are:

- Interfaces are bound to security zones. Those that are bound to Layer 2 security zones and Layer 3 security zones are known as Layer 2 interfaces and Layer 3 interfaces respectively. One interface can be only bound to one security zone; the primary interface and sub interface can belong to different security zones.
- Security zones are bound to a VSwitch or VRouter. Layer 2 security zones are bound to a VSwitch (by default the pre-defined Layer 2 security zone is bound to the default VSwitch1), and Layer 3 security zones are bound to a VRouter (by default the pre-defined Layer 3 security zone is bound to the default trust-vr), thus realizing the binding between the interfaces and VSwitch or VR. One security zone can be only bound to one VSwitch or VR.

Creating a Virtual Router

To create a Virtual Router, take the following steps:

1. Select **Network > Virtual Router > Virtual Router**.
2. Click **New**.
3. Type the name into the Virtual Router name box.
4. Select the **Enable** check box for Vsys Share to share the Virtual Router between different virtual systems.
5. Click **OK**.

Global Configuration

Virtual Router's global configuration is the configuration for multiple Virtual Routers. To configure Multi-Virtual Router, take the following steps:

1. Select **Network > Virtual Router > Global Configuration**.
2. Select the **Enable** check box for Multi-Virtual Router.

3. Click **Apply**.

Notes:

- After Multi-Virtual Router is enabled or disabled, system must reboot to make it take effect. After rebooting, system's max concurrent sessions will decrease by 15% if the function is enabled, or restore to normal if the function is disabled. When AV and Multi-Virtual Router are enabled simultaneously, the max concurrent session will further decrease by 50% (with AV enabled, the max concurrent session will decrease by half). The formula is: Actual max concurrent sessions = original max concurrent sessions*(1-0.15)*(1-0.5).
- If Multi-Virtual Router is enabled, traffic can traverse up to 3 Virtual Routers, and any traffic that has to traverse more than 3 Virtual Routers will be dropped.

Virtual Switch

System might allow packets between some interfaces to be forwarded in Layer 2 (known as transparent mode), and packets between some interfaces to be forwarded in Layer 3 (known as routing mode), specifically depending on the actual requirement. To facilitate a flexible configuration of hybrid mode of Layer 2 and Layer3, system introduces the concept of Virtual Switch (VSwitch). By default system uses a VSwitch known as VSwitch1. Each time you create a VSwitch, system will create a corresponding VSwitch interface (VSwitchIF) for the VSwitch automatically. You can bind an interface to a VSwitch by binding that interface to a security zone, and then binding the security zone to the VSwitch.

A VSwitch acts as a Layer 2 forwarding zone, and each VSwitch has its own independent MAC address table, so the packets of different interfaces in one VSwitch will be forwarded according to Layer 2 forwarding rules. You can configure policy rules conveniently in a VSwitch. A VSwitchIF virtually acts as a switch uplink interface, allowing packets forwarding between Layer 2 and Layer 3.

Creating a VSwitch

To create a VSwitch, take the following steps:

1. Select **Network > VSwitch**.
2. Click **New**.

Options are described as follows.

Option	Description
VSwitch Name	Specifies a name for the VSwitch.
Vsys Shared	Select the Enable check box and then system will share the

Option	Description
	VSwitch with different VSYS.
Virtual-Wire Mode	<p>Specifies a Virtual-Wire mode for the VSwitch, including (for specific information on Virtual Wire, see "Virtual Wire")</p> <ul style="list-style-type: none"> • Strict - Packets can only be transmitted between Virtual Wire interfaces, and the VSwitch cannot operate in Hybrid mode. Any PC connected to Virtual Wire can neither manage devices nor access Internet over this interface. • Non-strict - Packets can be transmitted between Virtual Wire interfaces, and the VSwitch also supports data forwarding in Hybrid mode. That is, this mode only restricts Layer 2 packets' transmission between Virtual Wire interfaces, and does not affect Layer 3 packets' forwarding. • Disabled - Disables Virtual Wire.
IGMP Snooping	Enables IGMP snooping on the VSwitch.
Forward Tagged Packets	Enables VLAN transparent so that the device can transmit VLAN tagged packets transparently, i.e., packets tagged with VLAN ID will still keep the original ID after passing through the device.
Forward Double Tagged Packets	Enables VLAN transparent so that the device can transmit VLAN double tagged packets transparently, i.e., packets tagged with VLAN ID will still keep the original ID after passing through the device.
Drop Unknown Multicast Packets	Drops the packets sent to unknown multicast to save bandwidth.

3. Click **OK**.

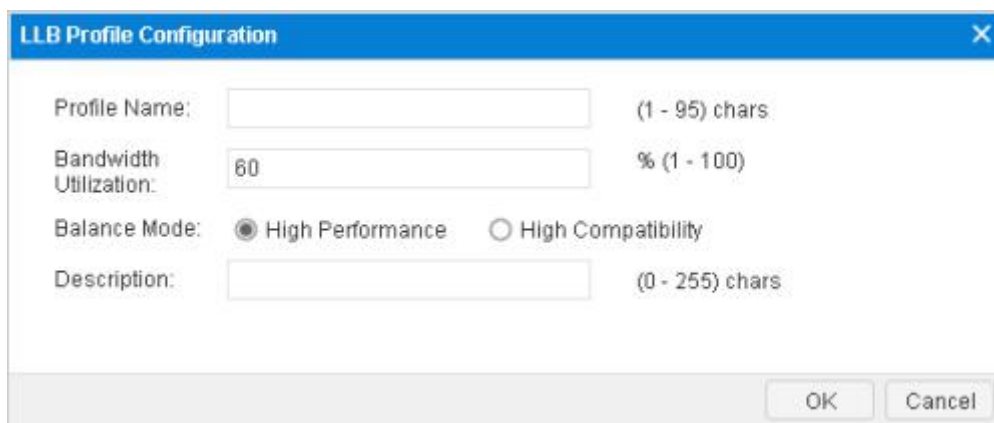

Outbound Link Load Balancing

For Outbound LLB, the system can intelligently route and dynamically adjust the traffic load of each link by monitoring the delay, jitter, packet loss rate and bandwidth utilization of each link in real-time. You can configure a flexible LLB profile to bind to the route (the current system only supports DBR and PBR), forming LLB rules to implement outbound dynamic link load balancing, and thus make efficient use of network bandwidth.

Configuring LLB Profile

The LLB profile contains the parameters of the load balancing algorithm, such as bandwidth utilization threshold, probe switch, probe mode, and equalization direction.

1. Select **Network > Outbound > Profile**.
2. Click **New**.

3. In the LLB Profile Configuration, configure as follows:

Option	Description
Profile Name	Specifies the Profile name whose length range is 1-96 characters.
Bandwidth Utilization	Specifies the bandwidth utilization threshold of the interface. When the rate does not exceed the threshold by the interface bandwidth, the system will only analysis delay, jitter and packet loss rate to dynamically adjust the routing link; when the rate exceeds the threshold by the interface bandwidth, system will analysis of each link bandwidth utilization rate of the parameters at the same time to adjust the routing method. Value ranges from 0 to 100 (0% to 100%) and defaults to 60.
Balance Mode	There are two equalization modes: High Performance and High

Option	Description
	Compatibility. <ul style="list-style-type: none"> High Performance - In this mode, system adjusts link to keep the link balance as fast as possible High Compatibility - When the link load changes, system does not switch the link frequently, but ensures that the service is as far as possible on the previous link. This mode is suitable for services that are sensitive to link switching, such as banking services, only when the previous link is overloaded.
Description	Configure Additional details for the LLB profile.

4. Click **OK**.

Configuring LLB Rule

The LLB Profile and the route is bound by the formation of LLB rules that currently support binding destination routing (DBR) and policy-based routing (PBR).

1. Select **Network > Outbound > Rule**.
2. Click **New**.

3. In the LLB Rule Configuration, configure the following:

Option	Description
Rule Name	Specifies the Rule name, length of 1-96 characters
LLB Profile	Specifies the bandwidth utilization threshold. It is in the range of

Option	Description
	0-100 (0% -100%) and defaults to 60.
Bind Route	Specify the route to be bound in the rule: Destination Route or Policy Based Route. <ul style="list-style-type: none"> • Destination Route - When this option is selected, specify the virtual router and destination address of the destination route. • Policy Based Routing - Select this option to specify the name and id of the policy route.

4. Click **OK**.

Inbound Link Load Balancing

After enabling the LLB for inbound traffic, the system will resolve domains of different IPs based on the sources of the DNS requests and return IPs for different ISPs to the corresponding users who initiate the requests, which reduces access across ISPs. Such a resolution method is known as SmartDNS.

You can enable inbound LLB by the following steps:

1. Enable SmartDNS. This is the prerequisite for the implementation of inbound LLB.
2. Configure a SmartDNS rule table. The smart domain-to-IP resolution is implemented based on the rule table.

Creating a Smart DNS Rule Table

To create a SmartDNS rule table, take the following steps:

1. Select **Network > Inbound**.
2. Click **New > Domain Table**.
3. In the Domain Configuration dialog, type a domain table name into Domain Table text box.
4. Type a domain name into Domain text box. Separate multiple domain names with comma. Each rule table supports up to 64 domain names (case insensitive).
5. Click **OK**.

6. In the Inbound LLB page, click the domain table name you already created and then click **New > SmartDNS Rule**.

In the New SmartDNS Rule, configure the following:

Option	Description
ISP Static Address	Select a predefined or user-defined ISP from the drop-down list. If the source address matches any address entry of the ISP, system will return the specified IP.
Return IP	<p>Specifies the return IP for different request sources. Options include:</p> <ul style="list-style-type: none"> • IP - Specifies the return IP. You can configure up to 64 IPs for a domain name. • Weight - Specifies the weight of the return IP. The value range is 1 to 100. The default value is 1. In the SmartDNS rule table, one domain name might correspond to multiple IPs. System will sort the IPs based on the weight and then return to the users.
ISP Link	Specifies the inbound interface for the return IP address. System will judge whether the return IP address is valid according to the track result or the protocol status of the inbound interface. Only the valid IP address will be returned to the request source. When there's track object configured on the inbound interface, if the track status is successful, the return IP address is valid. Otherwise the IP address is invalid. When there's no track object configured on inbound interface, if the protocol state of the interface is UP, the return IP address is valid. Otherwise the IP

Option	Description
	<p>address is invalid. If you don't specify the inbound interface for the return IP address, the return IP address is always valid.</p> <ul style="list-style-type: none"> • Inbound Interface - Select the proximity address to which the request source address will be matched from the drop-down list. • Track Object - Select a track object of interface type from the drop-down list. When the track object fails, the return IP address is invalid.

7. Click **OK**.

Notes: The ISP route being referenced by the SmartDNS rule table cannot be deleted.

Application Layer Gateway (ALG)

Some applications use multi-channels for data transmission, such as the commonly used FTP. In such a condition the control channel and data channel are separated. Devices under strict security policy control may set strict limits on each data channel, like only allowing FTP data from the internal network to the external network to transfer on the well-known port TCP 21. Once in the FTP active mode, if a FTP server in the public network tries to initiate a connection to a random port of the host in the internal network, devices will reject the connection and the FTP server will not work properly in such a condition. This requires devices to be intelligent enough to properly handle the randomness of legitimate applications under strict security policies. In FTP instances, by analyzing the transmission information of the FTP control channel, devices will be aware that the server and the client reached an agreement, and open up a temporary communication channel when the server takes the initiative to connect to a port of the client, thus assuring the proper operation of FTP.

The system adopts the strictest NAT mode. Some VoIP applications may work improperly after NAT due to the change of IP address and port number. The ALG mechanism can ensure the normal communication of VoIP applications after the NAT. Therefore, the ALG supports the following functions:

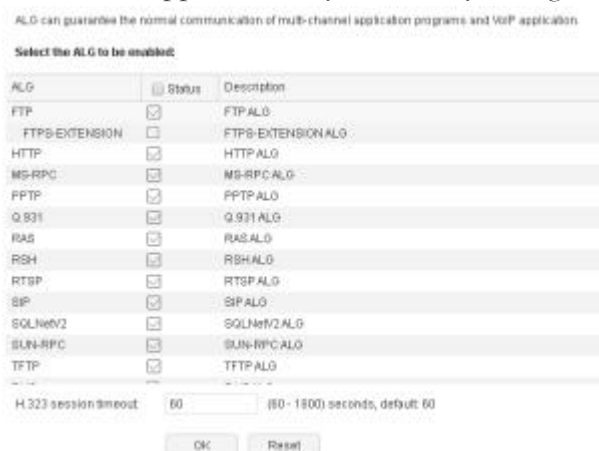

- Ensures normal communication of multi-channel applications under strict security policy rules.
- Ensures the proper operation of VoIP applications such as SIP and H.323 in NAT mode, and performs monitoring and filtering according to policies.

Enabling ALG

The system allows you to enable or disable ALG for different applications. Devices support ALG for the following applications: FTP, HTTP, MSRPC, PPTP, Q.931, RAS, RSH, RTSP, SIP, SQLNetV2, SUNRPC, TFTP, DNS, Auto. You can not only enable ALG for applications, but also specify H323's session timeout.

To enable the ALG for applications, take the following steps:

1. Select **Network > Application Layer Gateway**.
2. In the Application Layer Gateway dialog, select the applications that require ALG.

3. To modify H323's session timeout, type the value into the **H323 session timeout** box. The value range is 60 to 1800 seconds. The default value is 60.
4. Click **OK** to save your changes.

Global Network Parameters

Global network parameter configuration includes IP fragment, TCP packet processing methods and other options.

Configuring Global Network Parameters

To configure global network parameters, take the following steps:

1. Select **Network > Global Network Parameters > Global Network Parameters**.

IP Fragment

Maximum Fragment Number: (1-1024)

Timeout: (1-60) sec

Long Duration Session: Enable

TCP

TCP MSS: Enable

TCP MSS VPN: Enable

Maximum MSS: (64-65535)

TCP Sequence Number Check: Enable

TCP Three-way Handshaking: Enable

Timeout: (1-1800) sec

TCP SYN Packet Check: Enable

Others

Non-IP and Non-ARP Packet: Drop Forward

2. Configure the following parameters.

Option	Description
IP Fragment	
Maximum Fragment Number	Specifies a maximum fragment number for every IP packet. The value range is 1 to 1024. The default value is 48. Any IP packet that contains more fragments than this number will be dropped.
Timeout	Specifies a timeout period of fragment reassembling. The value range is 1 to 30. The default value is 2. If the FS device has not received all the fragments after the timeout, the packet will be dropped.
Long Duration Session	Enables or disables long duration session. If this function is enabled, specify long duration session's percentage in the Percentage text box below. The default value is 10, i.e., 10% of long duration session in the total sessions.
TCP	
TCP MSS	Specifies a MSS value for all the TCP SYN/ACK packets. Select the Enable check box, and type the value into the Maximum MSS text box below.
Maximum MSS	Type the max MSS value into the Maximum MSS text box below. The value range is 64 to 65535. The default value is

Option	Description
	1448.
TCP MSS VPN	Specifies a MSS value for IPSec VPN's TCP SYN packets. Select the Enable check box, and type the value into the Maximum MSS text box below.
Maximum MSS	Type the max MSS value for IPSEC VPN into the Maximum MSS text box below. The value range is 64 to 65535. The default value is 1380.
TCP Sequence Number Check	Configures if the TCP sequence number will be checked. When this function is enabled, if the TCP sequence number exceeds TCP window, that TCP packet will be dropped.
TCP Three-way Handshaking	Configures if the timeout of TCP three-way handshaking will be checked. Select the Enable check box to enable this function, and specify a timeout value in the Timeout text box below. The value range is 1 to 1800 seconds. The default value is 20. If the three-way handshaking has not been completed after timeout, the connection will be dropped.
TCP SYN Packet Check	<p>Select the Enable check box to enable this function and specify the action for TCP non-SYN packet. When the received packet is a TCP SYN packet, the TCP connection will be established. When the received packet is a TCP non-SYN packet, the packet will be processed according to the specified action.</p> <ul style="list-style-type: none"> • drop: When the received packet is a TCP non-SYN packet, the system will drop the packet. • reset: When the received packet is a TCP non-SYN packet, the system will drop the packet and send RST packet to the peer device.
Others	
Non-IP and Non-ARP Packet	Specifies how to process packets that are neither IP nor ARP.

3. Click **OK**.

Chapter 6 Advanced Routing

Routing is the process of forwarding packets from one network to the destination address in another network. Router, a packet forwarding device between two networks, is designed to transmit packets based on the various routes stored in routing tables. Each route is known as a routing entry.

FS devices are designed with Layer 3 routing. This function allows you to configure routing options and forward various packets via VRouter. System implements with a default VRouter trust-vr, and also supports multiple VRouters (multi-VR).

FS devices support destination routing, ISP routing, Source-Based Routing (SBR), Source-Interface-Based Routing (SIBR), Destination-Interface-Based Routing (DIBR), Policy-Based Routing (PBR), dynamic routing (including RIP, OSPF and BGP) and Equal Cost MultiPath Routing (ECMP).

- **Destination Routing:** A manually-configured route which determines the next routing hop according to the destination IP address.
- **DIBR:** A manually-configured route which determines the next routing hop according to the destination IP address and ingress interface.
- **SBR:** Source IP based route which selects routers and forwards data according to the source IP address.
- **SIBR:** Source IP and ingress interface based route.
- **ISP Profile:** Add a subnet to an ISP.
- **ISP Routing:** A kind of route which determines the next hop based on different ISPs.
- **PBR:** A route which forwards data based on the source IP, destination IP address and service type.
- **Dynamic Routing:** Selects routers and forwards data according to the dynamic routing table generated by dynamic routing protocols ("**RIP**", "**OSPF**" or BGP).

When forwarding the inbound packets, the device will select a route in the following sequence: PBR > SIBR > SBR > DIBR > Destination routing/ISP routing/Proximity routing/Dynamic routing.

Routing supports IPv4 and IPv6 address. If IPv6 is enabled, you can configure IPv6 address entry for the routing rule.

Destination Route

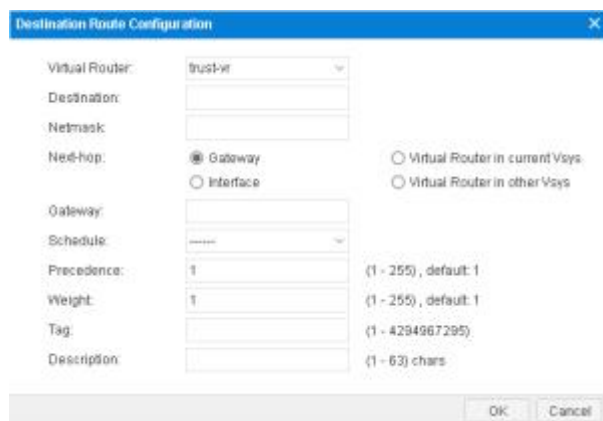

The destination route is a manually-configured route entry that determines the next routing hop based on the destination IP address. Usually a network with comparatively a small number of outbound connections or stable Intranet connections will use a destination route. You can add a default route entry at your own choice as needed.

Creating a Destination Route

To create a destination route, take the following steps:

1. Select **Network > Routing > Destination Route**.
2. Click **New**.

In the Destination Route Configuration dialog box, enter values.

Option	Description
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".
Destination	Type the IP address for the route into the text box.
Netmask	Type the corresponding subnet mask into the text box.

Option	Description
Next-hop	<p>To specify the type of next hop, click Gateway, Current VRouter, Interface, or Other VRouter.</p> <ul style="list-style-type: none"> • Gateway: Type the IP address into the Gateway text box. • Current VRouter: Select a name from the drop-down list. • Interface: Select a name from the Interface drop-down list. Type the IP address into the Gateway text box. For a tunnel interface, you need to type the gateway address for the tunnel's peer in the optional box below. • Other VRouter: Select a name from the Vsys drop-down list. Select a name from the Virtual Router drop-down list.
Schedule	<p>Specifies a schedule when the rule will take effect. Select a desired schedule from the Schedule drop-down list. After selecting the desired schedules, click the blank area in this dialog to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>
Precedence	<p>Type the route precedence into the text box. The smaller the parameter is, the higher the precedence is. If multiple routes are available, the route with higher precedence will be prioritized. The value range is 1 to 255. The default value is 1. When the value is set to 255, the route will be invalid.</p>
Weight	<p>Type the weight for the route into the text box. This parameter is used to determine the weight of traffic forwarding in load balance. The value range is 1 to 255. The default value is 1.</p>
Description	<p>Type the description information into the Description text box if necessary.</p>

3. Click **OK**.

Destination-Interface Route

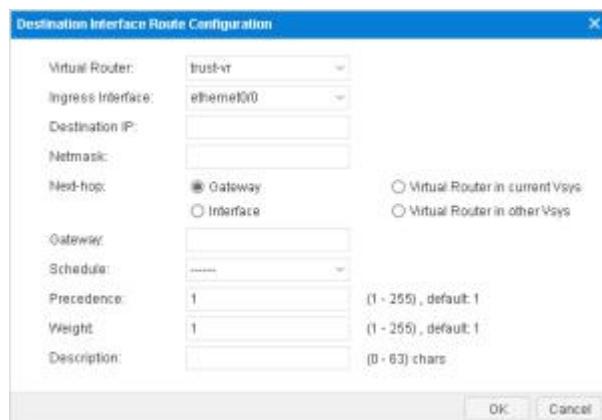

Destination interface route is designed to select a route and forward data based on the Destination IP address and ingress interface of a packet.

Creating a Destination-Interface Route

To create a Destination-Interface route, take the following steps:

1. Select **Network > Routing > Destination Interface Route**.
2. Click **New**.

In the Destination Interface Route Configuration dialog box, enter values.

Option	Description
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".
Ingress Interface	Select an interface for the route from the drop-down list.
Destination IP	Type the Destination IP for the route into the textbox.
Netmask	Type the corresponding subnet mask into the textbox.
Next-hop	To specify the type of next hop, click Gateway , Virtual Router in current Vsys , Interface , or Virtual Router in other Vsys . <ul style="list-style-type: none"> • Gateway: Type the IP address into the Gateway text box. • Virtual Router in current Vsys: Select a name from the Virtual Router drop-down list. • Interface: Select a name from the Interface drop-

Option	Description
	<p>down list. Type the IP address into the Gateway text box. For a tunnel interface, you need to type the gateway address for the tunnel's peer in the optional box below.</p> <ul style="list-style-type: none"> Virtual Router in other Vsys: Select a name from the Vsys drop-down list. Select a name from the Virtual Router drop-down list.
Schedule	<p>Specifies a schedule when the rule will take effect. Select a desired schedule from the Schedule drop-down list. After selecting the desired schedules, click the blank area in this dialog to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>
Precedence	<p>Type the route precedence into the textbox. The smaller the parameter is, the higher the precedence is. If multiple routes are available, the route with higher precedence will be prioritized. The value range is 1 to 255. The default value is 1. When the value is set to 255, the route will be invalid.</p>
Weight	<p>Type the weight for the DIBR into the textbox. This parameter is used to determine the weight of traffic forwarding in load balance. The value range is 1 to 255. The default value is 1.</p>
Description	<p>Type the description information into the Description text box if necessary.</p>

3. Click **OK**.

Source Route

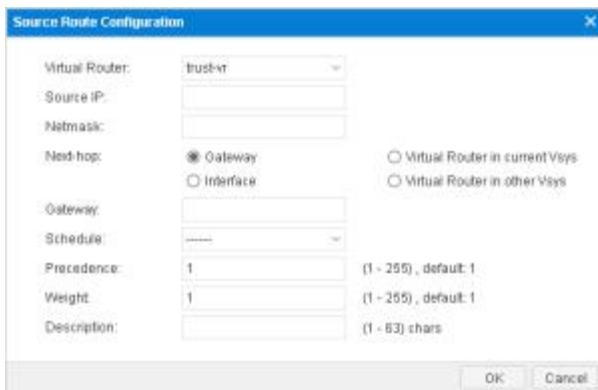

Source route is designed to select a router and forward data based on the source IP address of a packet.

Creating a Source Route

To create a source route, take the following steps:

1. Select **Network > Routing > Source Route**.
2. Click **New**.

In the Source Route Configuration dialog box, enter values.

Option	Description
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".
Source IP	Type the source IP for the route into the box.
Netmask	Type the corresponding subnet mask into the box.
Next-hop	<p>To specify the type of next hop, click Gateway, Virtual Router in current Vsys, Interface, or Virtual Router in other Vsys.</p> <ul style="list-style-type: none"> • Gateway: Type the IP address into the Gateway text box. • Virtual Router in current Vsys: Select a name from the drop-down list. • Interface: Select a name from the Interface drop-down list. Type the IP address into the Gateway text box. For a tunnel interface, you need to type the gateway address for the tunnel's peer in the optional box below. • Virtual Router in other Vsys: Select a name from the Vsys drop-down list. Select a name from the Virtual Router drop-down list.
Schedule	<p>Specifies a schedule when the rule will take effect. Select a desired schedule from the Schedule drop-down list. After selecting the desired schedules, click the blank area in this dialog to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>
Precedence	Type the route precedence into the box. The smaller the parameter is, the higher the precedence is. If multiple routes are

Option	Description
	available, the route with higher precedence will be prioritized. The value range is 1 to 255. The default value is 1. When the value is set to 255, the route will be invalid.
Weight	Type the weight for the route into the box. This parameter is used to determine the weight of traffic forwarding in load balance. The value range is 1 to 255. The default value is 1.
Description	Type the description information into the Description text box if necessary.

3. Click **OK**.

Source-Interface Route

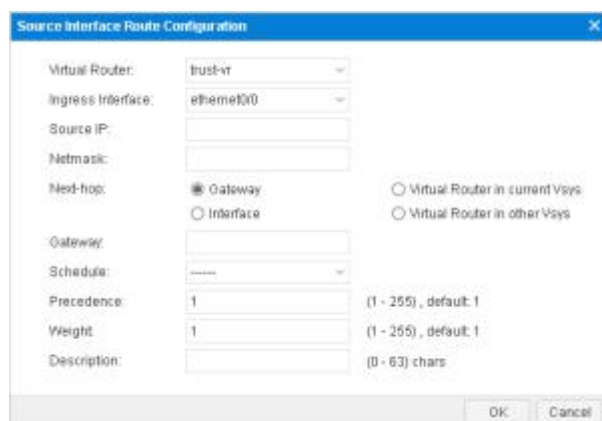

Source interface route is designed to select a router and forward data based on the source IP address and ingress interface of a packet.

Creating a Source-Interface Route

To create a Source-Interface route, take the following steps:

1. Select **Network > Routing > Source Interface Route**.
2. Click **New**.

In the Source Interface Route Configuration dialog box, enter values.

Option	Description
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".

Option	Description
Ingress Interface	Select an interface for the route from the drop-down list.
Source IP	Type the source IP for the route into the textbox.
Netmask	Type the corresponding subnet mask into the textbox.
Next-hop	<p>To specify the type of next hop, click Gateway, Virtual Router in current Vsys, Interface, or Virtual Router in other Vsys.</p> <ul style="list-style-type: none"> • Gateway: Type the IP address into the Gateway text box. • Virtual Router in current Vsys: Select a name from the Virtual Router drop-down list. • Interface: Select a name from the Interface drop-down list. Type the IP address into the Gateway text box. For a tunnel interface, you need to type the gateway address for the tunnel's peer in the optional box below. • Virtual Router in other Vsys: Select a name from the Vsys drop-down list. Select a name from the Virtual Router drop-down list.
Schedule	<p>Specifies a schedule when the rule will take effect. Select a desired schedule from the Schedule drop-down list. After selecting the desired schedules, click the blank area in this dialog to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>
Precedence	Type the route precedence into the textbox. The smaller the parameter is, the higher the precedence is. If multiple routes are available, the route with higher precedence will be prioritized. The value range is 1 to 255. The default value is 1. When the value is set to 255, the route will be invalid.
Weight	Type the weight for the ISP route into the textbox. This parameter is used to determine the weight of traffic forwarding in load balance. The value range is 1 to 255. The default value is 1.
Description	Type the description information into the Description text box if necessary.

3. Click **OK**.

ISP Profile

To configure an ISP route, you need to first add a subnet to an ISP, and then configure the ISP route. The destination of the route is determined by the name of the ISP. You can customize ISP information, or upload profiles that contain different ISP information.

Creating an ISP Profile

To create an ISP Profile, take the following steps:

1. Select **Network > Routing > ISP Profile**.
2. Click **New**.

In the ISP Configuration dialog box, enter values.

Option	Description
ISP Profile	Type the name for the new ISP profile into the textbox.
Subnet Prefix	Type the IP address for the subnet into the textbox.
Netmask	Type the subnet mask into the textbox.
Add	Add the subnet to the ISP profile. The subnet will be displayed in the ISP subnet list below. If needed, repeat the steps to add multiple subnets for the ISP profile.
Delete	Delete the selected ISP profiles.

3. Click **OK**.

Uploading an ISP Profile

To upload an ISP Profile, take the following steps:

1. Select **Network > Routing > ISP Profile**.
2. Click **Upload**.

In the Upload ISP File dialog box, enter values.

Option	Description
Upload Predefined ISP File	To update the predefined IPS file: <ol style="list-style-type: none"> 1. Select Upload Predefined IPS File. 2. Click Browse to select an ISP profile in your PC.
User-defined ISP File	To update the user-defined IPS file: <ol style="list-style-type: none"> 1. Select Upload Predefined IPS File. 2. Click Browse to select an ISP profile in your PC.

3. Click **Upload** to upload the selected ISP profile to device.

Saving an ISP Profile

To save an ISP Profile, take the following steps:

1. Select **Network > Routing > ISP Profile**.
2. Click **Save**.
3. In the Save User-defined ISP Configuration dialog box, select an ISP profile from the **ISP profile** drop-down list.
4. Click **Save** to save the profile to a specified location in PC.

ISP Route

Generally many users might apply for multiple lines for load balancing purpose. However, a typical balance will not have the function based on the traffic's direction. For such a scenario, the device

provides the ISP route, which allows traffic from different ISPs to take their proprietary routes, thus accelerating network access.

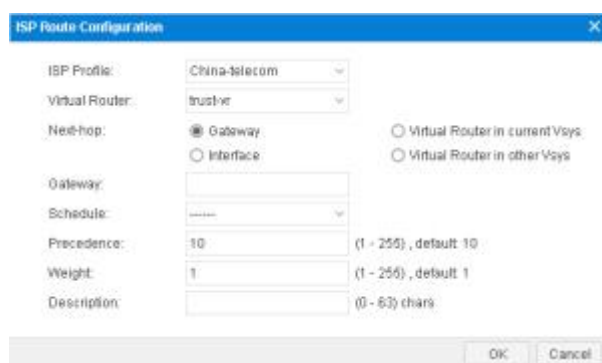

To configure an ISP route, first you need to add a subnet to an ISP, and then configure the ISP route. The destination of the route is determined by the name of the ISP. You can customize ISP information, or upload profiles that contain different ISP information.

Creating an ISP Route

To create an ISP route, take the following steps:

1. Select **Network > Routing > ISP Route**.
2. Click **New**.

In the ISP Configuration dialog box, enter values.

Option	Description
ISP Profile	Select an ISP profile name from the drop-down list.
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".
Next-hop	<p>To specify the type of next hop, click Gateway, Current VRouter, Interface, or Other VRouter.</p> <ul style="list-style-type: none"> • Gateway: Type the IP address into the Gateway text box. • Current VRouter: Select a name from the Virtual Router drop-down list. • Interface: Select a name from the Interface drop-down list. Type the IP address into the Gateway text box. For a tunnel interface, you need to type the gateway address for the tunnel's peer in the optional box below.

Option	Description
	<ul style="list-style-type: none"> Other VRouter: Select a name from the Vsys drop-down list. Select a name from the Virtual Router drop-down list.
Schedule	<p>Specifies a schedule when the rule will take effect. Select a desired schedule from the Schedule drop-down list. After selecting the desired schedules, click the blank area in this dialog to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>
Precedence	<p>Type the route precedence into the textbox. The smaller the parameter is, the higher the precedence is. If multiple routes are available, the route with higher precedence will be prioritized. The value range is 1 to 255. The default value is 10. When the value is set to 255, the route will be invalid.</p>
Weight	<p>Type the weight for the ISP route into the textbox. This parameter is used to determine the weight of traffic forwarding in load balance. The value range is 1 to 255. The default value is 1.</p>
Description	<p>Type the description information into the Description text box if necessary.</p>

3. Click **OK**.

Policy-based Route

Policy-based Route (PBR) is designed to select a router and forward data based on the source IP address, destination IP address and service type of a packet.

Creating a Policy-based Route

To create a Policy-based route, take the following steps:

1. Select **Network > Routing > Policy-based Routing**.
2. Click **New**. Select **PBR** from the drop-down list.

In the Policy-based Route Configuration dialog box, configure the following.

Option	Description
PBR Name	Specifies a name for the policy-based route.
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".
Type	<p>Specifies the object type that the policy-based route binds to. You can select Zone, Virtual Router, Interface or No Binding.</p> <ul style="list-style-type: none"> • Zone: Click this option button and select a zone from the Zone drop-down list. • Virtual Router: Click this option button and show the virtual router that the policy-based route bind to. • Interface: Click this option button and select a interface from the Interface drop-down list. • No Binding: This policy-based route is no binding.

3. Click **OK**.

Creating a Policy-based Route Rule

To create a Policy-based Route rule, take the following steps:

1. Select **Network > Routing > Policy-based Routing**.
2. Click **New**. Select **Rule** from the drop-down list.

In the Rule Condition tab, configure the following.

Option	Description
PBR Name	Specifies a name for the policy-based route.
Description (Optional)	Type information about the PBR rule.
Source	
Address	<p>Specifies the source addresses of PBR rule.</p> <ol style="list-style-type: none"> Select an address type from the Address drop-down list. Select or type the source addresses based on the selected type. Click to add the addresses to the right pane. After adding the desired addresses, click the blank area in this dialog to complete the source address configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> When selecting the Address Book type, you can click Add to create a new address entry. The default address configuration is any. To restore the configuration to this default one, select the any check box.
User	<p>Specifies a role, user or user group for the PBR rule.</p> <ol style="list-style-type: none"> From the User drop-down menu, select the AAA server which the users and user groups belongs to. To

Option	Description
	<p>specify a role, select Role from the AAA Server drop-down list.</p> <ol style="list-style-type: none"> Based on different types of AAA server, you can execute one or more actions: search a user/user group/role, expand the user/user group list, enter the name of the user/user group. After selecting users/user groups/roles, click <input type="button" value="➔"/> to add them to the right panes. After adding the desired objects, click the blank area in this dialog to complete the user configuration.
Destination	
Address	<p>Specifies the destination addresses of PBR rule.</p> <ol style="list-style-type: none"> Select an address type from the Address drop-down list. Select or type the source addresses based on the selected type. Click <input type="button" value="➔"/> to add the addresses to the right panes. After adding the desired addresses, click the blank area in this dialog to complete the destination address configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> When selecting the Address Book type, you can click Add to create a new address entry. The default address configuration is any. To restore the configuration to this default one, select the any check box.
Other	
Host Book	<p>Specifies the Host-book of PBR rule. Select an Host-book from the Host Book drop-down list.</p>
Service	<p>Specifies a service or service group.</p>

Option	Description
	<ol style="list-style-type: none"> 1. From the Service drop-down menu, select a type: Service, Service Group. 2. You can search the desired service/service group, expand the service/service group list. 3. After selecting the desired services/service groups, click <input type="checkbox"/> to add them to the right panes. 4. After adding the desired objects, click the blank area in this dialog to complete the service configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • To add a new service or service group, click Add. • The default service configuration is any. To restore the configuration to this default one, select the any check box.
Application	<p>Specifies an application/application group/application filters.</p> <ol style="list-style-type: none"> 1. From the Application drop-down menu, you can search the desired application/application group/application filter, expand the list of applications/application groups/application filters. 2. After selecting the desired applications/application groups/application filters, click <input type="checkbox"/> to add them to the right panes. 3. After adding the desired objects, click the blank area in this dialog to complete the application configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • To add a new application group, click New AppGroup. • To add a new application filter, click New AppFilter.

Option	Description
Schedule	<p>Specifies a schedule when the PBR rule will take effect. Select a desired schedule from the Schedule drop-down list. After selecting the desired schedules, click the blank area in this dialog to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>
Record log	Select the Enable check box to enable the logging function for PBR rules.

In the Next-hop tab, configure the following.

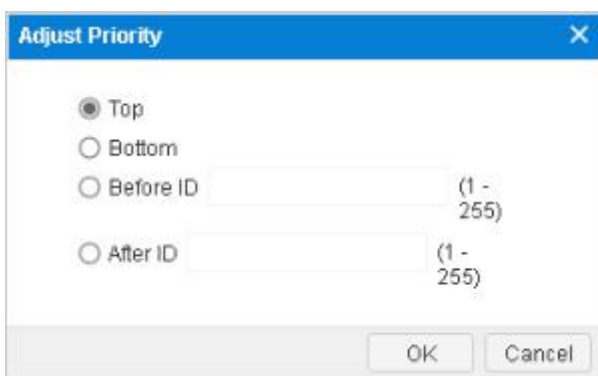

Option	Description
Set Next-hop	<p>To specify the type of next hop, click IP Address, Virtual Router in current Vsys, Interface, Virtual Router in other Vsys.</p> <ul style="list-style-type: none"> • IP Address: Type IP address into the IP address text box and specify the weight into the Weight text box. When more than one next hops are available, the traffic will be allocated to the different next hops according to the weight value. • Virtual Router in current Vsys: Select a name from the Next-Hop Virtual Router drop-down list and specify the weight into the Weight text box. When more than one next hops are available, the traffic will be allocated to the different next hops according to the weight value. • Interface: Select an interface from the Interface drop-down list and specify the weight into the Weight text box. When more than one next hops are available, the traffic will be allocated to the different next hops according to the weight value. • Virtual Router in other Vsys: Check the radio button to specify a virtual router in the current VSYS as the next hop. Select a virtual router from the Virtual Router drop-down list and specify the weight into the Weight text box. When more than one next hops are available, the traffic will be allocated to the different next

Option	Description
	hops according to the weight value.
Track Object	Select the track object from the drop-down list. See " Track Object "
Weight	Specifies the weight for the next hop. The value range is 1 to 255. The default value is 1. If a PBR rule is configured with multiple next hops, system will distribute the traffic in proportion to the corresponding weight.
Add	Click to add the specified next hop.
Delete	Select next-hop entries from the next hop table and click this button to delete.

Adjusting Priority of a PBR Rule

To adjust priority of a Policy-based Route rule, take the following steps:

1. Select **Network > Routing > Policy-based Routing**.
2. From the **Virtual Router** drop-down list, select the Virtual Router for the new route.
3. Select the rule you want to adjust priority from the list below, click **Priority**.
4. In the Adjust Priority dialog box, enter values.

Option	Description
Top	Click this option button to move the PBR rule to the top.
Bottom	Click this option button to move the PBR rule to the bottom.
Before ID	Click this option button and type the ID into the box to move

Option	Description
	the PBR rule to the position before the ID.
After ID	Click this option button and type the ID into the box to move the PBR rule to the position after the ID.

Notes: Each PBR rule is labeled with a unique ID. When traffic flows into a FS device, the device will query for PBR rules by turn, and process the traffic according to the first matched rule. However, the PBR rule ID is not related to the matching sequence during the query. You can move a PBR rule's location up or down at your own choice to adjust the matching sequence accordingly.

Applying a Policy-based Route

You can apply a policy-based route by binding it to an interface, virtual router or zone.

To apply a policy-based route, take the following steps:

1. Select **Network > Routing > Policy-based Routing**.
2. From the **Virtual Router** drop-down list, select the Virtual Router for the new route.
3. Click **Bind to**.

In the Policy-based Route Configuration dialog box, enter values.

Option	Description
PBR Name	Select a route from the PBR name drop-down list.
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the new route. The default value is "trust-vr".
Type	Specifies the object type that the policy-based route binds to. You can select Zone , Virtual Router , Interface or No Binding . <ul style="list-style-type: none"> • Zone: Click this option button and select a zone from the Zone drop-down list. • Virtual Router: Click this option button and show the virtual router that the policy-based route binds to.

Option	Description
	<ul style="list-style-type: none"> Interface: Click this option button and select a interface from the Interface drop-down list. No Binding: This policy-based route is no binding.

- Click **OK**.

DNS Redirect

System supports the DNS redirect function, which redirects the DNS requests to a specified DNS server. For more information about specifying IP addresses of the DNS server, see [Configuring a DNS Server](#). Currently, the DNS redirect function is mainly used to redirect the video traffic for load balancing. With the policy based route working together, system can redirect the Web video traffic to different links, improving the user experience.

To enable the DNS redirect function, take the following steps:

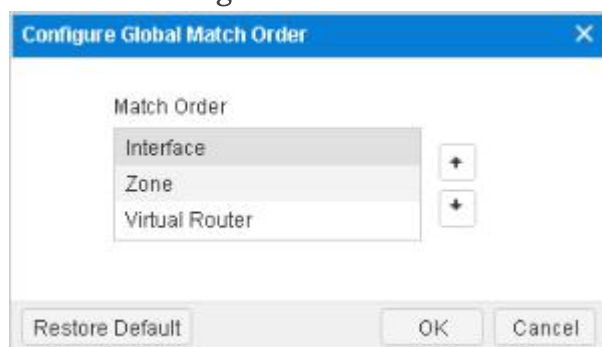

- Select **Network > Routing > Policy-based Routing**.
- Click **Enable DNS Redirect**.

Configuring the Global Match Order

By default, if the PRB rule is bound to both an interface , VRouter and the security zone the interface belongs to, the traffic matching sequence will be: Interface > Zone > VRouter. You can configure the global match order of PBR.

To configure the global match order, take the following steps:

- Select **Network > Routing > Policy-based Routing**.
- Click **Configure Global Match Order**.

- Select the items that need to be adjusted, and click  and .

4. To restore the default matching sequence, click **Restore Default**.
5. Click **OK**.

RIP

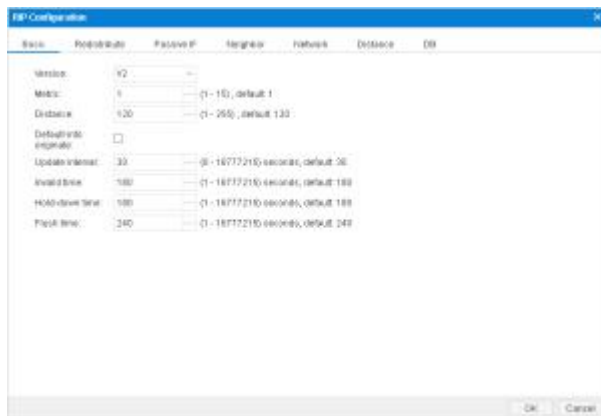

RIP, Routing Information Protocol, is an internal gateway routing protocol that is designed to exchange routing information between routers. Currently, devices support both RIP versions, i.e., RIP-1 and RIP-2.

RIP configuration includes basic options, redistribute, Passive IF, neighbor, network and distance. You will also need to configure RIP parameters for different interfaces, including RIP version, split horizon, and authentication mode.

Creating RIP

To create RIP, take the following steps:

1. Select **Network > Routing > RIP**.
2. From the **Virtual Router** drop-down list, select the Virtual Router for the new route.
3. Click **New**.

In the Basic tab, configure the following.

Option	Description
Version	Specifies a RIP version. FS devices support RIP-1 and RIP-2. RIP-1 transmits packets by broadcasting, while RIP-2 transmits packet by multicasting. Select a version from the drop-down list. The default version is RIP-2.
Metric	Specifies a default metric. The value range is 1 to 15. If no value is specified, the value of 1 will be used. RIP measures the distance to the destination network by hops. This distance is

Option	Description
	known as metric. The metric from a router to a directly connected network is 1, increment is 1 for every additional router between them. The max metric is 15, and the network with metric larger than 15 is not reachable. The default metric will take effect when the route is redistributed.
Distance	Specifies a default distance. The value range is 1 to 255. If no value is specified, the value of 120 will be used.
Information originate	Specifies if the default route will be redistributed to other routers with RIP enabled. By default RIP will not redistribute the default route. Select the check box to redistribute the default route.
Update interval	Specifies an interval in which all RIP routes will be sent to all the neighbors. The value range is 0 to 16777215 seconds. The default value is 30.
Invalid time	If a route has not been updated for the invalid time, its metric will be set to 16, indicating an unreachable route. The value range is 1 to 16777215 seconds. The default value is 180.
Holddown time	If the metric becomes larger (e.g., from 2 to 4) after a route has been updated, the route will be assigned with a holddown time. During the holddown time, the route will not accept any update. The value range is 1 to 16777215 seconds. The default value is 180.
Flush time	System will keep on sending the unreachable routes (metric set to 16) to other routers during the flush time. If the route still has not been updated after the end of flush time, it will be deleted from the RIP information database. The value range is 1 to 16777215 seconds. The default value is 240.

In the Redistribute tab, configure the following.

Option	Description
Protocol	Select a protocol type for the route from the Protocol drop-down list. The type can be Connected, Static, OSPF or BGP.
Metric	Type the metric for the route into the Metric box. If no value is specified, system will use the default metric value.
Add	Click Add to add the Redistribute route entry. All the entries that have been added will be displayed in the Redistribute Route list below.

Option	Description
Delete	Repeat the above steps to add more Redistribute route entries. To delete a Redistribute route entry, select the entry you want to delete from the list, and click Delete .

In the Passive IF tab, configure the following.

Option	Description
Interface	Select a passive interface from the Interface drop-down list.
Add	Click Add to add the passive interface. All the interfaces that have been added will be displayed in the list below.
Delete	Repeat the above steps to add more Passive IFs. To delete a Passive IF, select the entry you want to delete from the list, and click Delete .

In the Neighbor tab, configure the following.

Option	Description
Neighbor IP	Type the neighbor IP into the Neighbor IP box.
Add	Click Add to add the neighbor IP. All the neighbor IPs that have been added will be displayed in the list below.
Delete	Repeat the above steps to add more neighbor IPs. To delete a neighbor IP, select the entry you want to delete from the list, and click Delete .

In the Network tab, configure the following.

Option	Description
Network(IP/netmask)	Type the IP address and netmask into the Network(IP/netmask) box.
Add	Click Add to add the network. All the networks that have been added will be displayed in the list below.
Delete	Repeat the above steps to add more networks. To delete a network, select the entry you want to delete from the list, and click Delete .

In the Distance tab, configure the following.

Option	Description
Distance	Type the distance into the Distance box. The priority of the specified distance is higher than than the default distance.

Option	Description
Network(IP/netmask)	Type the IP prefix and netmask into the Network(IP/netmask) box.
Add	Click Add to add the distance. All the distances that have been added will be displayed in the list below.
Delete	Repeat the above steps to add more distances. To delete a distance, select the entry you want to delete from the list, and click Delete .

In the DB tab, view the database of the RIP route .

All the route entries that can reach target network are stored in the database.

4. Click **OK**.

Notes: Configuration for RIP on device's interfaces includes: RIP version, split horizon and authentication mode. For more information on how to configure RIP on an interface, see ["Configuring an Interface"](#)

OSPF

OSPF, the abbreviation for Open Shortest Path First, is an internal gateway protocol based on link state developed by IETF. The current version of OSPF is version 2 (RFC2328). OSPF is applicable to networks of any size. Its quick convergence feature can send update message immediately after the network topology has changed, and its algorithm assures it will not generate routing loops. OSPF also have the following characteristics:

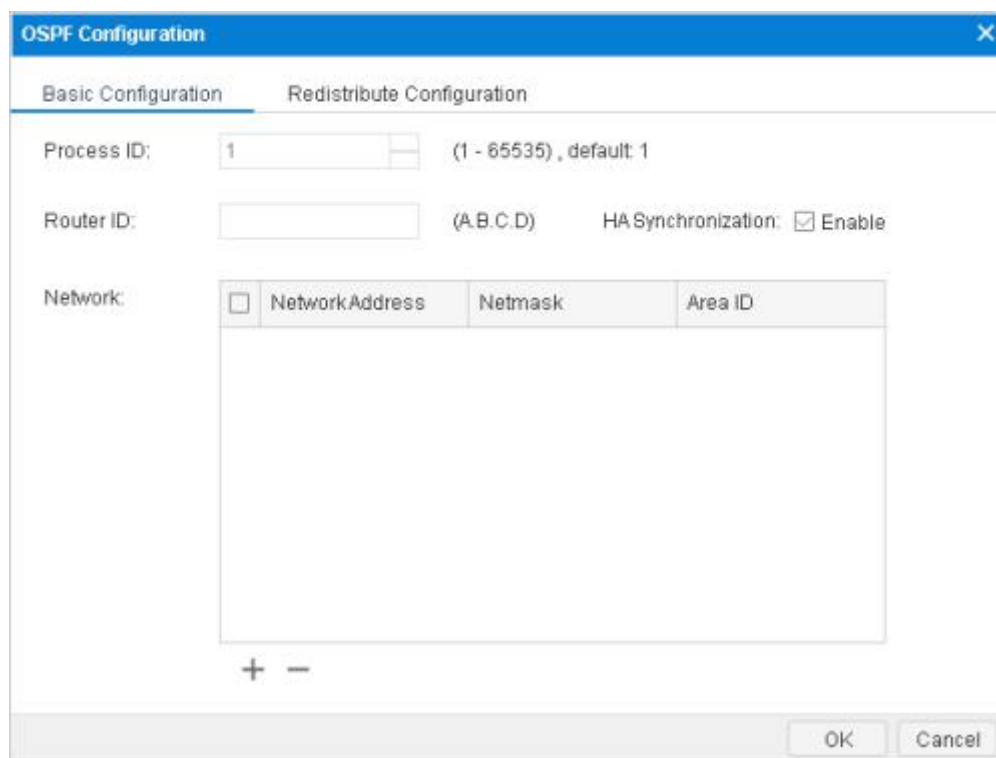

- **Area division:** divides the network of autonomous system into areas to facilitate management, thereby reducing the protocol's CPU and memory utilization, and improving performance.
- **Classless routing:** allows the use of variable length subnet mask.
- **ECMP:** improves the utilization of multiple routes.
- **Multicasting:** reduces the impact on non-OSPF devices.
- **Verification:** interface-based packet verification ensures the security of the routing calculation.

Note: Autonomous system is a router and network group under the control of a management institution. All routers within an autonomous system must run the same routing protocol.

Creating OSPF

To create OSPF, take the following steps:

1. Select **Network > Routing > OSPF**.
2. From the **Virtual Router** drop-down list, select the Virtual Router for the new route.
3. Click **New**.

In the Basic tab, configure the following.

Option	Description
Process ID	<p>Enter the OSPF process ID. The default value is 1. The value ranges from 1 to 65535. Each OSPF process is individual, and has its own link state database and the related OSPF routing table. Each VRouter supports up to 4 OSPF processes and multiple OSPF processes maintain a routing table together. When specifying the OSPF process ID, note the following matters:</p> <ul style="list-style-type: none"> • When running multiple OSPF processes in a VRouter, the network advertised in interfaces in each OSPF process cannot be same. • When route entries with the same prefix exist in

Option	Description
	<p>multiple OSPF processes, the system will compare the administrative distance of each route entry and the route entry with the lower administrative distance will be added to the VRouter's routing table. If their AD is the same, the route entry that was first discovered will be added to the routing table.</p> <ul style="list-style-type: none"> • If the OSPF route entries are redistributed to other routing protocols, the routing information of process 1 will be redistributed by default. If this process does not exist, the routing information of OSPF will not be redistributed.
Router ID	<p>Enter the Router ID used by OSPF protocol. Each router running OSPF protocol should be labeled with a Router ID. The Router ID is the unique identifier of an individual router in the whole OSPF domain, represented in the form of an IP address.</p>
HA Synchronization	<p>Select Enable check box to enable HA synchronization. The OSPF configuration of the master and backup will be synchronized.</p>
Network	<p>Configure the network interface that enables OSPF and add the network to the specified area.</p> <p>Click + button, and enter the network address, network mask and area ID.</p> <ul style="list-style-type: none"> • Network Address: Enter the IP address of network interface that enables OSPF protocol. • Network Mask: Enter the mask of IP address. • Area ID: Enter the area ID the network will be added to, in form of a 32-bit digital number, or an IP address.

In the Redistribute tab, configure the following.

Option	Description
Static	<p>Select the Enable check box to introduce the static route protocol into the OSPF route and redistribute.</p>

Option	Description
Connected	Select the Enable check box to introduce the connected route protocol into the OSPF route and redistribute.
RIP	Select the Enable check box to introduce the RIP route protocol into the OSPF route and redistribute.
OSPF	Select the Enable check box to introduce the OSPF route protocol into the OSPF route and redistribute.
ISIS	Select the Enable check box to introduce the ISIS route protocol into the OSPF route and redistribute.
BGP	Select the Enable check box to introduce the BGP route protocol into the OSPF route and redistribute.
VPN	Select the Enable check box to introduce the VPN route into the OSPF route and redistribute.

4. Click **OK**.

Notes: Configuration for OSPF on device's interfaces includes: hello transmission interval, dead time, LSA transmit interval and LSU transmit delay time. For more information on how to configure OSPF on an interface, see "[Configuring an Interface](#)".

Viewing the Neighbor Information

To view the neighbor information, take the following steps:

1. Select **Network > Routing > OSPF**.
2. Select the process ID check box, and the neighbor information will be displayed in the list below.

Neighbor Information					
Neighbor Router ID	Priority	Neighbor State	Timeout	Neighbor IP	Local Interface
1.1.1.1	1	FullDR	00:00:31	10.100.123.4	eth0/0/0/0
2.2.2.2	1	Exchange	00:00:31	10.100.123.5	eth0/0/0/0

- **Neighbor Router ID:** Shows the router ID of OSPF neighbors.
- **Priority:** Shows the router priority. The router priority is used to determine which router will act as the designated router. The designated router will receive the link information of all the other routers in the network, and broadcast the received link information.
- **Neighbor State:** Shows the OSPF neighbor state. The OSPF neighbor state includes 8 types: Down, Attempt, Init, 2-Way, Exstart, Exchange, Loading and Full. The Full state includes Full/DR and Full/BDR.

- **Timeout:** Shows the neighbor timeout, which is the difference between dead time and hello transmission interval. The unit is second. If the OSPF doesn't receive the Hello packets from neighbor, the neighbor ship cannot be established continually.
- **Neighbor IP:** Shows the IP address of neighbor router.
- **Local Interface:** Shows the interface sends the Hello packets to the neighbor router.

Chapter 7 Authentication

Authentication is one of the key features for a security product. When a security product enables authentication, the users and hosts can be denied or allowed to access certain networks.

From a user's point of view, authentication is divided into the following categories:

- If you are a user from an internal network who wants to access the Internet, you can use:
 - ["Web Authentication"](#)
 - ["Single Sign-On"](#)
 - ["PKI"](#)
- If you are a user from the Internet who wants to visit an internal network (usually with VPN), you can use:
 - ["SSL VPN"](#)
 - ["IPSec VPN"](#) (IPSec VPN (with radius server)+Xauth)
 - ["L2TP VPN"](#)(L2TP over IPsec VPN)

Authentication Process

A user uses his/her terminal to connect to the firewall. The firewall calls the user data from the AAA server to check the user's identity.

- User (authentication applicant): The applicant initiates an authentication request, and enters his/her username and password to prove his/her identity.
- Authentication system (i.e. the firewall in this case):The firewall receives the username and password and sends the request to the AAA server. It is an agent between the applicant and the AAA server.
- ["AAA Server"](#): This server stores user information like the username and password, etc. When the AAA server receives a legitimate request, it will check if the applicant has the right to the user network services and send back the decision. For more information, refer to ["AAA Server"](#) . AAA server has the following four types:
 - [Local server](#)

- [Radius server](#)
- [LDAP server](#)
- [AD server](#)
- [TACACS+server](#)

Web Authentication

After the Web authentication (WebAuth) is configured, when you open a browser to access the Internet, the page will redirect to the WebAuth login page. According to different authentication modes, you need to provide corresponded authentication information. With the successful Web authentication, system will allocate the role for IP address according to the policy configuration, which provides a role-based access control method.

Web authentication means you will be prompted to check the identity on the authentication page. It includes the following four modes:

- Password Authentication: Using username and password during the Web authentication.

Enabling the WebAuth

To enable the Web authentication, take the following steps:

1. Click **Network > WebAuth > WebAuth**.
2. Select the **Enable** check box of **WebAuth** to enable the WebAuth function.

Configuring Basic Parameters for WebAuth

The basic parameters are applicable to all WebAuth policies.

To configure WebAuth basic parameters, take the following steps:

1. Click **Network > WebAuth > WebAuth**.

2. In the **Basic Configuration** tab, configure the following options

Basic Configuration	
HTTP	<p>Select the HTTP authentication methods.</p> <p>Port: Specifies the HTTP protocol transmission port number of the authentication server. The range is 1 to 65535, and the default value is 8181.</p>
HTTPS	<p>Select the HTTPS authentication methods. HTTPS is encrypted, and can avoid information leakage.</p> <p>Port: Specify the HTTPS protocol transmission port number of the authentication server. The range is 1 to 65535, and the default value is 44433.</p> <p>Trust Domain: Specifies the HTTPS trust domain. This domain is previously created in PKI and has imported international CA certified certificate.</p>
All Interface	<p>After the WebAuth function is enabled, the WebAuth function of all interfaces is disabled by default. You can specify the Webauth global default configuration of all interfaces, including Disable authentication service by default and Enable authentication service by default. For more information about configuring the WebAuth of interface, see "Configuring an Interface"</p>
Proxy Port	<p>Specifies the port number for HTTPS, HTTPS and SSO proxy server. The port number applies to all. If it changes in any page, the other mode will also use the new port. The range is 1 to 65535.</p>
User Login	
Address Type	<p>Specifies IP address or MAC address as the address type of authentication user. By default, the address type of authentication user is IP address</p> <p>Note: When the MAC is specified as the address type of authentication user, the device needs to be deployed in the same Layer 2 network environment with the client. Otherwise, system will fail to get the MAC address of the client or get an incorrect MAC address.</p>

Basic Configuration	
Multiple Login	<p>If you disable the multiple login, one account cannot login if it has already logged in elsewhere. You can click Replace to kick out the registered user or you can click Refuse New Login to prevent the same user from logging in again.</p> <p>If you enable multiple login, more than one clients can login with the same account. But you can still set up the maximum number of clients using one account.</p>
Authentication Mode	
Password: Specifies the password authentication mode as the authentication mode.	
Idle Timeout	<p>If there is no traffic during a specified time period after the successful authentication, system will disconnect the connection. By default, system will not disconnect the connection if there is no traffic after the successful authentication.</p> <p>Select the Idle Timeout check box to enable the idle timeout function, and type the idle timeout value into the text box. Clear the check box to disable the idle timeout function.</p>
Force Timeout	<p>If the forced re-login function is enabled, users must re-login after the configured interval ends.</p> <p>Select the Force Timeout check box to enable the forced timeout function, and type the forced timeout value into the text box. Clear the check box to disable the forced timeout function.</p>
Heartbeat Timeout	<p>When authentication is successful, the system will automatically refresh the login page before the configured timeout value ends in order to maintain the login status. If configuring the idle time at the same time, you will log off from the system at the smaller value.</p> <p>Select the Heartbeat Timeout check box to enable the heartbeat timeout function, and type the heartbeat timeout value into the text box. Clear the check box to disable the heartbeat timeout function.</p>
Re-Auth	System can re-authenticate a user after a successful

Basic Configuration	
Interval	<p>authentication. By default, the re-authentication function is inactive.</p> <p>Select the Re-Auth Interval check box to enable the re-auth function, and type the re-auth interval into the text box. Clear the check box to disable the re-auth function.</p>
Redirect URL	<p>The redirect URL function redirects the client to the specified URL after successful authentication. You need to turn off the pop-up blocker of your web browser to ensure this function can work properly.</p> <p>Notes:</p> <ul style="list-style-type: none"> You can specify the username and password in the URL address. When the specified redirect URL is the application system page with the authentication needed in the intranet, you do not need the repeat authentication and can access the application system. The corresponding keywords are \$USER, \$PWD, or \$HASHPWD. Generally, you can select one keyword between \$PWD and \$HASHPWD. The format of the URL is "URL" + "username=\$USER&password=\$PWD". When entering the redirect URL in CLI, add double quotations to the URL address if the URL address contains question mark. For example, "http://192.10.5.201/oa/login.do?username=\$USER&password=\$HASHPWD"

3. Click **Apply**.

Notes:

- If the WebAuth success page is closed, you can log out not only by timeout, but also by visiting the WebAuth status page (displaying online users, online times and logout button). You can visit it through "http(https):// IP-Address: Port-Number". In the URL, IP-Address refers to the IP address of the WebAuth interface, and Port-Number refers to HTTP/HTTPS port.

By default, the HTTP port is 8181, the HTTPS port is 44433. The WebAuth status page will be invalid if there are no online users on the client or the WebAuth is disabled.

- After basic configurations, you should create two policy rules in "[Security Policy](#)" to make WebAuth effective, and then adjust the priority of the two policies to the highest. The WebAuth policies need to be configured according to the following policy template:

Policy Template(Ensure DNS traffic is permitted and enable WebAuth)						
Source Z...	Destinatio...	Source A...	Destinati...	User	Service	Action
Any	Any	Any	Any		DNS	Permit
Any	Any	Any	Any	unknown	Any	WebAuth

- After WebAuth is configured, the users who matched the WebAuth policy are recommended to input the correct username and password, and then the users can access the network. System takes actions to avoid illegal users from getting usernames and passwords by brute-force. If one fails to log in through the same host three times in two minutes, that host will be blocked for 2 minutes.

Customizing WebAuth Page

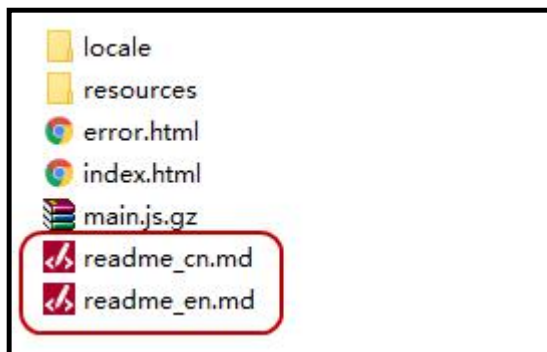

The WebAuth page is the redirected page when an authenticated user opens the browser. By default, you need to enter the username and password in the WebAuth page. You can also select the SMS authentication mode or the WeChat authentication mode.

1. Click **Network > WebAuth > WebAuth**.
2. Click **Login Page Customization** tab, and click **Download Template** to download the zip file "webauth" of the default WebAuth login page, and then unzip the file.

3. Open the source file and modify the content(including style, picture, etc.)according to the requirements. For more detailed information, see the file of [readme_cn.md](#) or

readme_en.md.

4. Compress the modified file and click **Upload** to upload the zip file to system.

Notes:

- After upgrading the previous version to the 5.5 version, the WebAuth login page you already specified will be invalid and restored to the default page. You should re-download the template after the version upgrade and customize the login page.
- After upgrading the system version, you should re-download the template, modify the source file, and then upload the custom page compression package. If the uploaded package version is not consistent with the current system version, the function of the custom login page will not be used normally.
- The zip file should comply with the following requirements: the file format should be zip; the maximum number of the file in the zip file is 50; the upper limit of the zip file is 1M; the zip file should contain “index.html” .
- System can only save one file of the default template page and the customized page. When you upload the new customized page file, the old file will be covered. You are suggested to back up the old file.
- If you want trigger WebAuth through HTTPS request, you need [import the root certificate \(certificate of the device\) to the browser](#) firstly. Triggering WebAuth through HTTPS requests depends on the feature of SSL proxy . If the device does not support the SSL proxy. Triggering WebAuth through HTTPS requests will not work and you can then trigger WebAuth through HTTP requests.

Single Sign-On

When the user authenticates successfully for one time, system will obtain the user's authentication information. Then the user can access the Internet without authentication later.

SSO can be realized through three methods, which are independent from each other, and they all can achieve the "no-sign-on"(don't need to enter a user name and password) authentication.

Method	Installing Software or Script	Description
<u>SSO Radius</u>	---	After enabling SSO Radius function, system can receive the accounting packets that based on Radius standard protocol. System will obtain user authentication information, update online user information and manage user's login and logout according to the packets.
<u>AD Scripting</u>	Logonscript.exe	This method needs to install the script "Logonscript.exe" on the AD server. The triggered script can also send user information to FSOS. This method is recommended if you have a higher accuracy requirement for statistical monitoring and don't mind to change the AD server.

Using AD Scripting for SSO

Before using a script for SSO, make sure you have established your Active Directory server first. To use a script for SSO, take the following steps:

Enabling SSO Radius for SSO

After enabling SSO Radius function, system can receive the accounting packets that based on Radius standard protocol. System will obtain user authentication information, update online user information and manage user's login and logout according to the packets.

To configure the SSO Radius function, take the following steps:

1. Click **Object >SSO Server >SSO Radius** and enter **SSO Radius** page. By default, SSO Radius is disabled.

SSO Radius: Enable

Port: (1024 - 65535), default: 1813

AAA Server:

Client: 

<input type="checkbox"/>	IP Address	Shared Key	User Timeout(minute)
+ -			

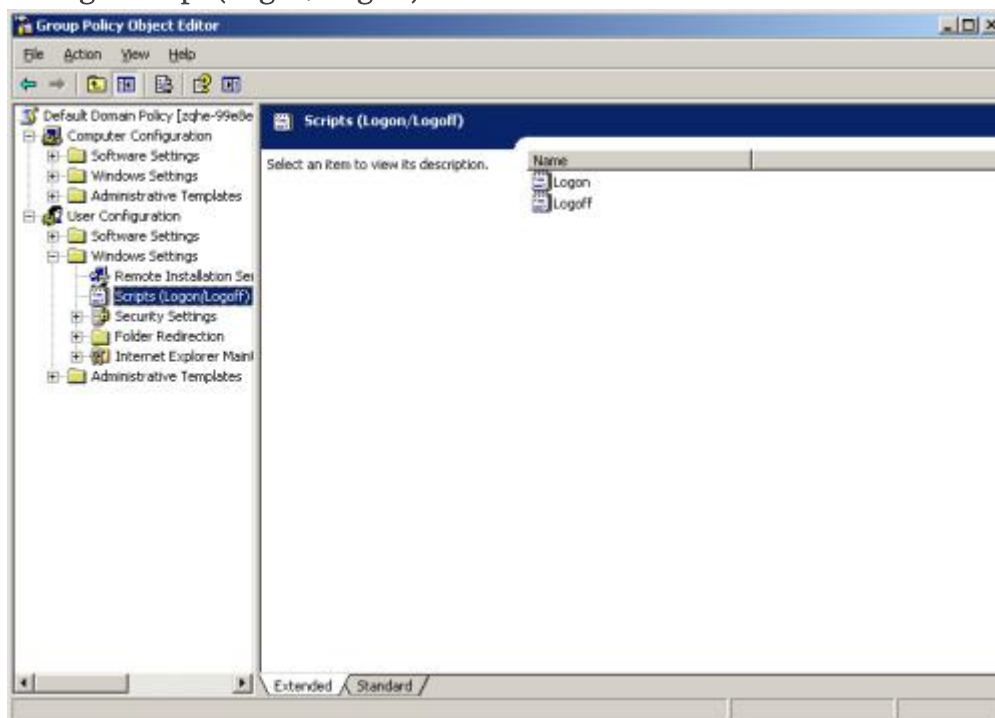

2. Click the **Enable** check box to enable the SSO Radius function.
3. Specify the Port to receive Radius packets for FSOS (Don't configure port in non-root VSYS). The range is 1024 to 65535. The default port number is 1813.
4. Specify the AAA Server that user belongs to. You can select the configured Local, AD or LDAP server. After selecting the AAA server, system can query the corresponding user group and role information of the online user on the referenced AAA server, so as to realize the policy control based on the user group and role.
5. Specify the IP Address, Shared Secret and Idle Interval of SSO Radius client which is allowed to access system. You can configure up to 8 clients.
 - IP Address: Specify the IPv4 address of SSO Radius client. If the IPv4 address is 0.0.0.0, it means that system receives the packets sent from any Radius client.
 - Shared Key: Specify the shared secret key of SSO Radius client. The range is 1 to 31 characters. System will verify the packet by the shared secret key, and parse the packet after verifying successfully. If system fails to verify the packet, the packet will be dropped. The packet can be verified successfully only when SSO Radius client is configured the same shared secret key with system or both of them aren't configured a shared secret key.
 - User Timeout(minute): Configure the idle interval for the authentication information of Radius packet in the device. If there's no update or delete packet of the user during the idle interval, the device will delete the user authentication

information. The range is 0 to 1440 minutes. The default value is 30. 0 means the user authentication information will never timeout.

6. Click **Apply** button to save all the configurations.

Step 1: Configuring the Script for AD Server

1. Visit FS.COM or contact related sales staff to get the script "Logonscript.exe" , and save it in a directory where all domain users can access.
2. In the AD server, enter **Start** menu, and select **Management Tools > Active Directory User and Computer**.
3. In the pop-up <Active Directory User and Computer> dialog box, right-click the domain which will apply SSO to select **Properties**, and then click <Group Policy> tab.
4. In the Group Policy list, double-click the group policy which will apply SSO. In the pop-up <Group Policy Object Editor> dialog box, select **User Configuration > Windows Settings> Script (Logon/Logout)**.

5. Double-click **Logon** on the right window, and click **Add** in the pop-up <logon properties> dialog box.

6. In the <Add a Script> dialog box, click **Browse** to select the logon script (logonscript.exe) for the Script Name; enter the authentication IP address of FSOS and the text "logon" for the Script Parameters(the two parameters are separated by space). Then, click **OK**.

7. Take the steps of 5-6 to configure the script for logging out, and enter the text "logoff" in the step 6.

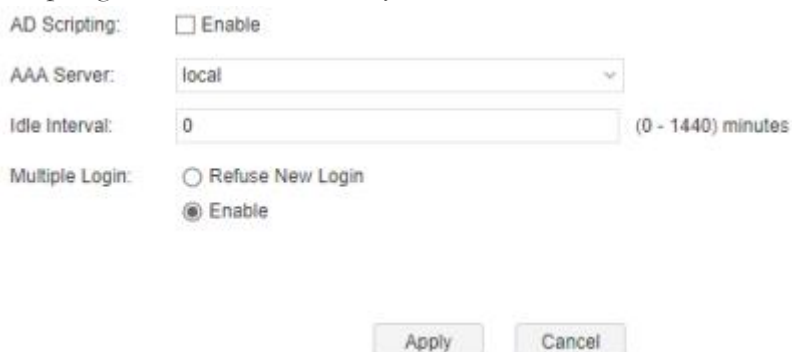

Notes: The directory of saving the script should be accessible to all domain users, otherwise, when a user who does not have privilege will not trigger the script when logs in or out.

Step 2: Configuring AD Scripting for FSOS

After the AD Scripting is enabled, the user can log in device simultaneously when logging in the AD server successfully. System only supports AD Scripting of Active Directory server.

To configure the AD Scripting function, take the following steps:

1. Click **Object> SSO Server > AD Scripting** to enter the AD Scripting page. The AD Scripting function is disabled by default.

AD Scripting: Enable

AAA Server: local

Idle Interval: 0 (0 - 1440) minutes

Multiple Login: Refuse New Login
 Enable

Apply Cancel

2. Select the **Enable** check box of AD Scripting to enable the function.
3. Specify the AAA Server that user belongs to. You can select the configured Local, AD or LDAP server. After selecting the AAA server, system can query the corresponding user group and role information of the online user on the referenced AAA server, so as to realize the policy control based on the user group and role.
4. Specify the Idle Interval, which specifies the longest time that the authentication user can keep online without any traffic. After the interval timeout, FSOS will delete the user authentication information. The value range is 0 to 1440 minutes. 0 means always online.
5. Allow or disable users with the same name to log in depends on needs.
 - **Enable:** Click to permit the user with the same name to log in from multiple terminals simultaneously.
 - **Refuse New Login:** Click to permit only one user with the same name to log in, and the user logged in will be kicked out by the user logging in.
6. Click **Apply** to save the changes.

After completing the above two steps, the script can send the user information to FSOS in real time. When users log in or out, the script will be triggered and send the user behavior to FSOS.

802.1x

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

802.1X is a standard defined by IEEE for Port-based Network Access Control. It uses Layer-2 based authentication (protocol: EAPOL, Extensible Authentication Protocol over LAN) to verify the legality of the users accessing the network through LAN. Before authentication, the security device only allows the 802.1X message to pass through the port. After authentication, all of the normal traffic can pass through.

The AAA servers for 802.1x are Local server and Radius server. Other types of AAA servers like AD or LDAP server do not support 802.1x.

The authenticating process is the same with other authentication, please refer to "[Chapter 7 Authentication](#)"

Configuring 802.1x

A complete configuration for 802.1x authentication includes the following points:

- Prerequisite: Before configuration, you should already have the AAA server you want (only local or Radius server is supported for 802.1x). The AAA server has been added in the firewall system (refer to AAA server), and the interface or VLAN for authentication has been bound to a security zone (refer to interface or VLAN).
- Configuration key steps:
 1. Creating a 802.1x profile.
 2. Creating a security policy to allow accessing.
- In the user's PC, modify the network adapter's properties: If the computer is connected to the 802.1x interface, this computer should enable its authentication function on its LAN port (right click **LAN** and select **Properties**, in the prompt, under the <Authentication> tab, select **MD5-Challenge** or **Microsoft: Protected EAP (PEAP)**, and click **OK** to confirm.)

Notes: Early versions of Windows have enabled 802.1x by default, but Windows 7 and Window 8 do not have this feature enabled. To enable 802.1x, please search online for a solution that suits your system.

Creating 802.1x Profile

To create a 802.1x profile, take the following steps:

1. Select **Network > 802.1X > 802.1X**.

2. Click **New** and a prompt appears.

Under the **Basic** tab and **Advanced** tab, enter values

Basic Configuration	
802.1x Name	Enter a name for the 802.1x profile
Interface	Select the interface for 802.1x authentication. It should be a Layer-2 interface interface.
AAA Server	Select the AAA server for 802.1x authentication. It should be a local server or a Radius server.
Access Mode	Select an access mode. If you select Port and one of the clients connected to 802.1x interface has passed authentication, all clients can access the Internet. If you select MAC , every client must pass authentication before using Internet.
Advanced Configuration	
Port authorized	<p>If you select Auto, system will allow users who have successfully passed authentication to connect to network;</p> <p>If you select Force-unauthorized, system will disable the authorization of the port; as a result, no client can connect to the port, so there is no way to connect to the network.</p>
Re-auth period	Enter a time period as the re-authentication time. After a user has successfully connected to the network, system will automatically re-auth the user's credentials. The range is from 0 to 65535 seconds. If the value is set to 0, this function is disabled.
Quiet period	If the authentication fails, it will take a moment before system can process the authenticating request from the same client again. The range is 0 to 65535 seconds, and the default value is 60 seconds. If this value is set to 0, system will not wait, and will immediately process the request from the same client.
Retries	Specifies a number for retry times. If the authentication system

Basic Configuration	
	does not receive any response from the client, system will try to require user's credentials again. When system has tried for the specified times, it will stop trying. The range is 1 to 10 times, and the default is 2 times.
Sever timeout	Specifies a server timeout value. The authenticator transmits the client's credentials to the authentication server. If the server does not answer the authenticator within a specified time, the authenticator will resend request to the authentication server. The range is 1 to 65535 seconds, the default value is 30 seconds.
Client timeout	When the authenticator sends a request to ask the client to submit his/her username, the client needs to respond within a specified period. If the client does not respond before timeout, system will resend the authentication request message. The range is 1 to 65535 seconds, and the default value is 30 seconds.

3. Click **OK**.

802.1x Global Configuration

Global parameters apply to all 802.1x profiles.

To configure global parameters, take the following steps:

1. Select **Network > 802.1X > Global Configuration**.

Maximum Users: (1 - 600) , default: 600

Multiple logins:

Repeated logins: Replace Refuse

Re-Auth time: (180 - 86400) seconds

In the Global Configuration dialog box, specify the parameters that will be applicable for all 802.1x profiles.

Option	Description
Maximum Users	The maximum user client number for a authentication port.
Multiple logins	You may choose to allow or disable one account to login from different clients.

Option	Description
	<ul style="list-style-type: none"> Disable: If you select Disable, one account can only login from one client simultaneously. Then, when you want to kick off the old login user, you should select Replace; if you want to disallow new login user, select Refuse. Enable: If you select Enable, different clients can use one account to login. If you do not limit the login client number, select Unlimited; if you want to set up a maximum login number, select Max attempts and enter a value for maximum user client number.
Re-Auth time	Specify a time for authentication timeout value. If the client does not respond within the timeout period, the client will be required to re-enter its credentials. The range is 180 to 86400 seconds, the default value is 300 seconds.

2. Click **OK**.

Viewing Online Users

To view which authenticated users are online:

1. Select **Network > 802.1X > Online user**.
2. The page will show all online users. You can set up filters to view results that match your conditions.

PKI

PKI (Public Key Infrastructure) is a system that provides public key encryption and digital signature service. PKI is designed to automate secret key and certificate management, and assure the confidentiality, integrity and non-repudiation of data transmitted over the Internet. The certificate of PKI is managed by a public key by binding the public key with a respective user identity by a trusted third-party, thus authenticating the user over the Internet. A PKI system consists of Public Key Cryptography, CA (Certificate Authority), RA (Certificate Authority), Digital Certificate and related PKI storage library.

PKI terminology:

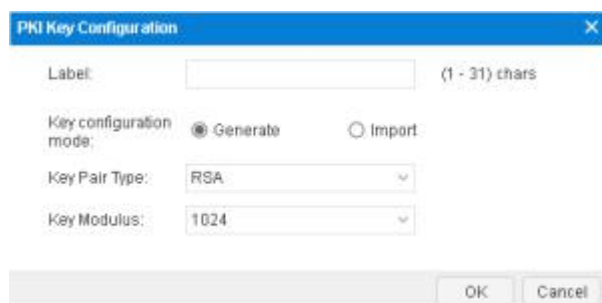

- **Public Key Cryptography:** A technology used to generate a key pair that consists of a public key and a private key. The public key is widely distributed, while the private key is only known to the recipient. The two keys in the key pair complement each other, and the data encrypted by one key can only be decrypted by the other key of the key pair.
- **CA:** A trusted entity that issues digital certificates to individuals, computers or any other entities. CA accepts requests for certificates and verifies the information provided by the applicants based on certificate management policy. If the information is legal, CA will sign the certificates with its private key and issue them to the applicants.
- **RA:** The extension to CA. RA forwards requests for a certificate to CA, and also forwards the digital certificate and CRL issued by CA to directory servers in order to provide directory browsing and query services.
- **CRL:** Each certificate is designed with expiration. However, CA might revoke a certificate before the date of expiration due to key leakage, business termination or other reasons. Once a certificate is revoked, CA will issue a CRL to announce the certificate is invalid, and list the series number of the invalid certificate.

PKI is used in the following two situations:

- **IKE VPN:** PKI can be used by IKE VPN tunnel.
- **HTTPS/SSH:** PKI applies to the situation where a user accesses a FS device over HTTPS or SSH.

Creating a PKI Key

1. Select **System > PKI > Key**.
2. Click **New**.

In the PKI Key Configuration dialog, configure the following.

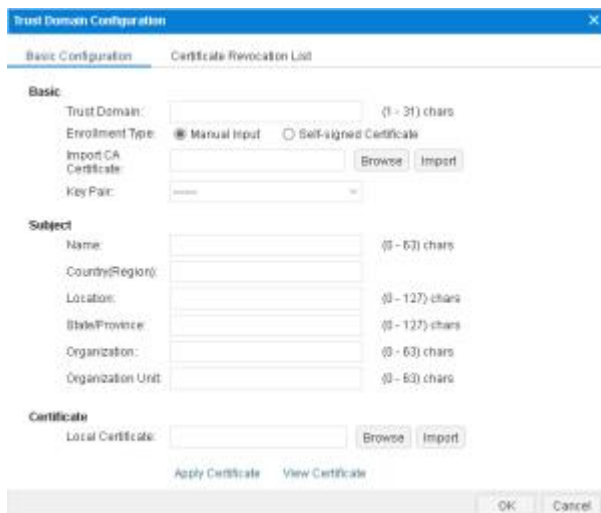

Option	Description
--------	-------------

Option	Description
Label	Specifies the name of the PKI key. The name must be unique.
Key configuration mode	Specifies the generation mode of keys, which includes Generate and Import.
Generate	
Key Pair Type	Specifies the type of key pair, either RSA, DSA or SM2.
Key Modulus	Specifies the modulus of the key pair. The modulus of RSA and DSA is 1024 (the default value), 2048, 512 or 768 bits, and the modulus of SM2 is 256.
Import	
Type	<p>Specifies the type of key, including Encryption Key and Key Pair.</p> <ul style="list-style-type: none"> • Encryption Key - Protects the signing key pair by digital envelope. If you select this option, you should specify the signing key pair when importing key. • Key Pair - If you select this option, you should specify the imported key pair type as RSA, DSA or SM2.
Import Key	Browse your local file system and import the key file.

3. Click **OK**.

Creating a Trust Domain

1. Select **System > PKI > Trust Domain**.
2. Click **New**.

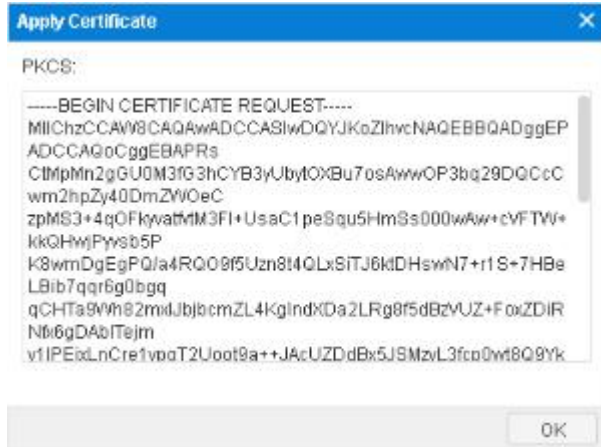

In the Basic Configuration tab, configure values for basic properties.

Option	Description
Basic	
Trust Domain	Enter the name of the new trust domain.
Enrollment Type	Use one of the two following methods: <ul style="list-style-type: none"> Select Manual Input, and click Browse to find the certificate and click Import to import it into system. Select Self-signed Certificate, and the certificate will be generated by the device itself.
Key Pair	Select a key pair.
Subject	
Name	Enter a name of the subject.
Country (Region)	Enter the name of applicant's country or region. Only an abbreviation of two letters are allowed, like CN.
Location	Optional. The location of the applicant.
State/Province	Optional. State or province name.
Organization	Optional. Organization name.
Organization Unit	Optional. Department name within applicant's organization.

- Click **Apply Certificate**, and a string of code will appear.

- Copy this code and send it to CA via email.

- When you receive the certificate sent from CA. Click **Browse** to import the certificate.

- (Optional) In the CRL tab, configure the following.

Certification Revocation List	
Check	<ul style="list-style-type: none"> No Check - System does not check CRL. This is the default option. Optional - System accepts certificating from peer, no matter if CRL is available or not. Force - System only accepts certificating from peer when CRL is available.
URL 1-3	<p>The URL address for receiving CRL. At most 3 URLs are allowed, and their priority is from 1 to 3.</p> <ul style="list-style-type: none"> Select http:// if you want to get CRL via HTTP. Select ldap:// if you want to get CRL via LDAP. If you use LDAP to receive CRL, you need to enter the login-DN of LDAP server and password. If no login-DN or password is added, the transmission will be anonymous.

Certification Revocation List	
Auto Update	Update frequency of CRL list.
Manually Update	Get the CRL immediately by clicking Obtain CRL .

7. Click **OK**.

Importing/Exporting Trust Domain

To simplify configurations, you can export certificates (CA or local) and private key (in the format of PKSC12) to a computer and import them to another device.

To export a PKI trust domain, take the following steps:

1. Select **System > PKI > Trust Domain Certificate**.
2. Select a domain from drop-down menu.
3. Select the radio button of the item you want to export, and click **Export**.
If you choose PKCS, you need to set up password.
4. Click **OK**, and select a storage path to save the item.

To import the saved trust domain to another device, take the following steps:

1. Log in the other device, select **System > PKI > Trust Domain Certificate**.
2. Select a domain from drop-down menu.
3. Select the radio button of the item you want to import, and click **Import**.
If you choose PKCS, you need to enter the password when it was exported.
4. Click **Browse** and find the file to import.
5. Click **OK**. The domain file is imported.

Importing Trust Certification

System will not detect the PE file whose certification is trusted. To import trust certification of PE files, take the following steps:

1. Select **System > PKI > Trusted Root Certificate**.
2. Click **Import** and choose a certificate file in your PC.
3. Click **OK** and then the file will be imported.

Online Users

To view the online authenticated users, take the following steps:

1. Select **Network > WebAuth > Online Users**.
2. The page will show all online users. You can set up filters to views results that match your conditions.

- **User Name:** Displays the name of online users.
- **IP/MAC:** Displays the IP or MAC address of online users.
- **Interface:** Displays the authentication interface of online users.
- **Online Time:** Displays the online time of online users.
- **Authentication Type:** Displays the authentication type of online users.
- **Operation:** Displays the executable operation of online users.

Chapter 8 VPN

System supports the following VPN functions:

- **"IPSec VPN"**: IPSec is a security framework defined by the Internet Engineering Task Force (IETF) for securing IP communications. It is a Layer 3 virtual private network (VPN) technology that transmits data in a secure tunnel established between two endpoints.
- **"SSL VPN"** : SSL provides secure connection services for TCP-based application layer protocols by using data encryption, identity authentication, and integrity authentication mechanisms.
- **"L2TP VPN"** : L2TP is one protocol for VPDN tunneling. VPDN technology uses a tunneling protocol to build secure VPNs for enterprises across public networks. Branch offices and traveling staff can remotely access the headquarters' Intranet resources through a virtual tunnel over public networks.

IPSec VPN

IPSec is a widely used protocol suite for establishing a VPN tunnel. IPSec is not a single protocol, but a suite of protocols for securing IP communications. It includes Authentication Headers (AH), Encapsulating Security Payload (ESP), Internet Key Exchange (IKE) and some authentication methods and encryption algorithms. IPSec protocol defines how to choose the security protocols and algorithms, as well as the method for exchanging security keys among communicating peers, while offering the upper layer protocols with network security services, including access control, data source authentication, data encryption, etc.

Basic Concepts

- Security association
- Encapsulation modes
- Establishing SA
- Using IPSec VPN

Security Association (SA)

IPSec provides encrypted communication between two peers which are known as IPSec ISAKMP gateways. Security Association (SA) is the basis and essence of IPSec. SA defines some factors of communication peers like the protocols, operational modes, encryption algorithms (DES, 3DES, AES-

128, AES-192 and AES-256), shared keys of data protection in particular flows and the life cycle of SA, etc.

SA is used to process data flow in one direction. Therefore, in a bi-directional communication between two peers, you need at least two security associations to protect the data flow in both of the directions.

Encapsulation Modes

IPSec supports the following IP packet encapsulation modes:

- Tunnel mode - IPSec protects the entire IP packet, including both the IP header and the payload. It uses the entire IP packet to calculate an AH or ESP header, and then encapsulates the original IP packet and the AH or ESP header with a new IP header. If you use ESP, an ESP trailer will also be encapsulated. Tunnel mode is typically used for protecting gateway-to-gateway communications.
- Transport mode - IPSec only protects the IP payload. It only uses the IP payload to calculate the AH or ESP header, and inserts the calculated header between the original IP header and payload. If you use ESP, an ESP trailer is also encapsulated. The transport mode is typically used for protecting host-to-host or host-to-gateway communications.

Establishing SA

There are two ways to establish SA: manual and IKE auto negotiation (ISAKMP).

- Manually configuring SA is complicated as all the information will be configured by yourself and some advanced features of IPSec are not supported (e.g. timed refreshing), but the advantage is that manually configured SA can independently fulfill IPSec features without relying on IKE. This method applies to a situation with a small number of devices or an environment of static IP addresses.
- IKE auto negotiation method is comparatively simple. You only need to configure information of IKE negotiation and leave the rest jobs of creating and maintaining SA to the IKE auto negotiation function. This method is for medium and large dynamic networks. Establishing SA by IKE auto negotiation consists of two phases. The Phase 1 negotiates and creates a communication channel (ISAKMP SA) and authenticates the channel to provide confidentiality, data integrity and data source authentication services for further IKE communication; the Phase 2 creates IPSec SA using the established ISAKMP. Establishing SA in two phases can speed up key exchanging.

Using IPSec VPN

To apply VPN tunnel feature in the device, you can use policy-based VPN or route-based VPN.

- Policy-based VPN - Applies the configured VPN tunnel to a policy so that the data flow which conforms to the policy settings can pass through the VPN tunnel.
- Route-based VPN - Binds the configured VPN tunnel to the tunnel interface and define the next hop of static route as the tunnel interface.

Configuring an IKE VPN

IKE auto negotiation method is comparatively simple. You only need to configure information of IKE negotiation and leave the rest jobs of creating and maintaining SA to the IKE auto negotiation function. This method is for medium and large dynamic network. Establishing SA by IKE auto negotiation consists of two phases. The Phase 1 negotiates and creates a communication channel (ISAKMP SA) and authenticates the channel to provide confidentiality, data integrity and data source authentication services for further IKE communication; the Phase 2 creates IPSec SA using the established ISAKMP. Establishing SA in two phases can speed up key exchanging.

To configure an IKE VPN, you need to confirm the Phase 1 proposal, the Phase 2 proposal, and the VPN peer. After confirming these three contents, you can proceed with the configuration of IKE VPN settings.

Configuring a Phase 1 Proposal

The P1 proposal is used to negotiate the IKE SA. To configure a P1 proposal, take the following steps:

1. Select **Network > VPN > IPSec VPN**.
2. In the P1 Proposal tab, click **New**.

In the Phase1 Proposal Configuration dialog box, configure the corresponding options.

Option	Description
Proposal Name	Specifies the name of the Phase1 proposal.
Authentication	Specifies the IKE identity authentication method. IKE identity authentication is used to verify the identities of both

Option	Description
	<p>communication parties. There are three methods for authenticating identity: pre-shared key, RSA signature, DSA signature and GM-DE. The default value is pre-shared key. For pre-shared key method, the key is used to generate a secret key and the keys of both parties must be the same so that it can generate the same secret keys.</p>
Hash	<p>Specifies the authentication algorithm for Phase1. Select the algorithm you want to use.</p> <ul style="list-style-type: none"> • MD5 – Uses MD5 as the authentication algorithm. Its hash value is 128-bit. • SHA – Uses SHA as the authentication algorithm. Its hash value is 160-bit. This is the default hash algorithm. • SHA-256 – Uses SHA-256 as the authentication algorithm. Its hash value is 256-bit. • SHA-384 – Uses SHA-384 as the authentication algorithm. Its hash value is 384-bit. • SHA-512 – Uses SHA-512 as the authentication algorithm. Its hash value is 512-bit. • SM3 – Use the state password SM3 as the authentication algorithm. Its hash value is 256-bit. It is used for the digital signature and authentication, the generation and authentication of message authentication code, and the generation of random digit, which can meet the security requirement of multiple password applications.
Encryption	<p>Specifies the encryption algorithm for Phase1.</p> <ul style="list-style-type: none"> • 3DES - Uses 3DES as the encryption algorithm. The key length is 192-bit. This is the default encryption algorithm. • DES – Uses DES as the encryption algorithm. The key length is 64-bit.

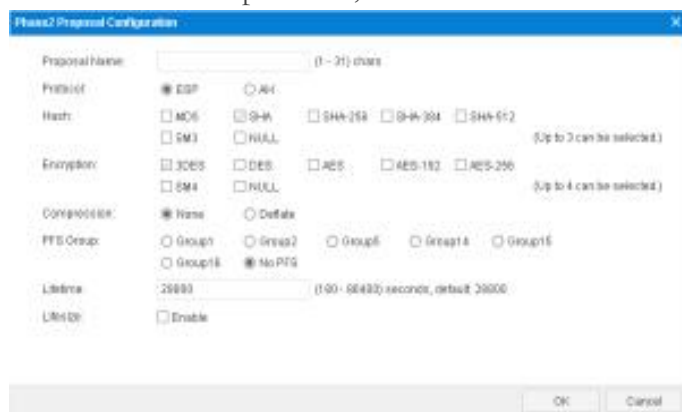

Option	Description
	<ul style="list-style-type: none"> • AES – Uses AES as the encryption algorithm. The key length is 128-bit. • AES-192 – Uses 192-bit AES as the encryption algorithm. The key length is 192-bit. • AES-256 – Uses 256-bit AES as the encryption algorithm. The key length is 256-bit. • SM1 – Uses the state password SM1 as the encryption algorithm. The key length is 128-bit. Only the state password device supports SM1. • SM4 – Uses the state password SM4 as the encryption algorithm. The key length is 128-bit.
DH Group	<p>Specifies the DH group for Phase1 proposal.</p> <ul style="list-style-type: none"> • Group1 – Uses Group1 as the DH group. The key length is 768-bit. • Group2 – Uses Group2 as the DH group. The key length is 1024-bit. Group2 is the default value. • Group5 – Uses Group5 as the DH group. The key length is 1536-bit. • Group14 – Uses Group14 as the DH group. The key length is 2048-bit. • Group15 – Uses Group5 as the DH group. The key length is 3072-bit. • Group16 – Uses Group5 as the DH group. The key length is 4096-bit.
Lifetime	<p>Specifies the lifetime of SA Phase1. The value range is 300 to 86400 seconds. The default value is 86400. Type the lifetime value into the Lifetime box. When the SA lifetime runs out, the device will send a SA P1 deleting message to its peer, notifying that the P1 SA has expired and it requires a new SA negotiation.</p>

3. Click **OK** to save the settings.

Configuring a Phase 2 Proposal

The P2 proposal is used to negotiate the IPSec SA. To configure a P2 proposal, take the following steps:

1. Select **Network > VPN > IPSec VPN**.
2. In the P2 Proposal tab, click **New**.

In the Phase2 Proposal Configuration dialog box, configure the corresponding options.

Option	Description
Proposal Name	Specifies the name of the Phase2 proposal.
Protocol	Specifies the protocol type for Phase2. The options are ESP and AH. The default value is ESP.
Hash	<p>Specifies the authentication algorithm for Phase2. Select the algorithm you want to use.</p> <ul style="list-style-type: none"> • MD5 – Uses MD5 as the authentication algorithm. Its hash value is 128-bit. • SHA – Uses SHA as the authentication algorithm. Its hash value is 160-bit. This is the default hash algorithm. • SHA-256 – Uses SHA-256 as the authentication algorithm. Its hash value is 256-bit. • SHA-384 – Uses SHA-384 as the authentication algorithm. Its hash value is 384-bit. • SHA-512 – Uses SHA-512 as the

Option	Description
	<p>authentication algorithm. Its hash value is 512-bit.</p> <ul style="list-style-type: none"> • SM3 – Uses the state password SM3 as the authentication algorithm. Its hash value is 256-bit. It is used for the digital signature and authentication, the generation and authentication of message authentication code, and the generation of random digit, which can meet the security requirement of multiple password applications. • Null – No authentication.
Encryption	<p>Specifies the encryption algorithm for Phase2.</p> <ul style="list-style-type: none"> • 3DES - Uses 3DES as the encryption algorithm. The key length is 192-bit. This is the default encryption algorithm. • DES – Uses DES as the encryption algorithm. The key length is 64-bit. • AES – Uses AES as the encryption algorithm. The key length is 128-bit. • AES-192 – Uses 192-bit AES as the encryption algorithm. The key length is 192-bit. • AES-256 – Uses 256-bit AES as the encryption algorithm. The key length is 256-bit. • SM1 – Uses the state password SM1 as the encryption algorithm. The key length is 128-bit. Only the state password device supports SM1. • SM4 – Uses the state password SM4 as the encryption algorithm. The key length is 128-bit. • Null – No authentication.
Compression	<p>Specifies the compression algorithm for Phase2. By default, no compression algorithm is used.</p>
PFS Group	<p>Specifies the PFS function for Phase2. PFS is used to protect</p>

Option	Description
	DH algorithm. <ul style="list-style-type: none"> • No PFS - Disables PFS. This is the default value. • Group1 – Uses Group1 as the DH group. The key length is 768-bit. • Group2 – Uses Group2 as the DH group. The key length is 1024-bit. • Group5 – Uses Group5 as the DH group. The key length is 1536-bit. • Group14 – Uses Group14 as the DH group. The key length is 2048-bit. • Group15 – Uses Group5 as the DH group. The key length is 3072-bit. • Group16 – Uses Group5 as the DH group. The key length is 4096-bit.
Lifetime	You can evaluate the lifetime by two standards which are the time length and the traffic volume. Type the lifetime length of P2 proposal into the box. The value range is 180 to 86400 seconds. The default value is 28800.
Lifesize	Select Enable to enable the P2 proposal traffic-based lifetime. By default, this function is disabled. After selecting Enable, specifies the traffic volume of lifetime. The value range is 1800 to 4194303 KBs. The default value is 1800. Type the traffic volume value into the box.

3. Click **OK** to save the settings.

Configuring a VPN Peer

To configure a VPN peer, take the following steps:

1. Select **Network > VPN > IPSec VPN**.

2. In the VPN Peer List tab, click **New**.

In the VPN Peer Configuration dialog box, configure the corresponding options.

Basic Configuration	
Name	Specifies the name of the ISAKMP gateway.
Interface	Specifies interface bound to the ISAKMP gateway.
Interface Type	Select the interface type, including IPv4 or IPv6. Only the IPv6 firmware supports to configure IPv6 type interface.
Protocol Standard	<p>Specifies the protocol standard, including IKEv1 and GUOMI. The default protocol standard is IKEv1. If you select GUOMI, specify the version:</p> <ul style="list-style-type: none"> • v1.0: the version is 1.0. • v1.1: the version is 1.1. • Default: the initiator can negotiate with the peer when the initiator version is v1.0 or v1.1. <p>Note: If you specify the version as 1.0 or 1.1, the version of the two peers which negotiate with each other should be the same, or system will fail to negotiate.</p>
Mode	Specifies the mode of IKE negotiation. There are two IKE negotiation modes: Main and Aggressive . The main mode is the default mode. The aggressive mode cannot protect identity. You have no choice but use the aggressive mode in the situation where the IP address of the center device is static and the IP address of client

Basic Configuration	
	device is dynamic.
Type	Specifies the type of the peer IP. If the peer IP is static, type the IP address into the Peer IP box; if the peer IP type is user group, select the AAA server you need from the AAA Server drop-down list.
Local ID	Specifies the local ID. System supports five types of ID: FQDN, U-FQDN, Asn1dn (only for license), KEY-ID and IP. Select the ID type you want, and then type the content for this ID into the Local ID box or the Local IP box.
Peer ID	Specifies the peer ID. System supports five types of ID: FQDN, U-FQDN, Asn1dn (only for license), KEY-ID and IP. Select the ID type you want, and then type the content for this ID into the Peer ID box or the Peer IP box.
Proposal1/2/3/4	Specifies a P1 proposal for ISAKMP gateway. Select the suitable P1 proposal from the Proposal1 drop-down list. You can define up to four P1 proposals for an ISAKMP gateway.
Pre-shared Key	If you choose to use pre-shared key to authenticate, type the key into the box.
Self-signed Trust Domain	If you choose to use RSA signature or DSA signature, select a trust domain.
Peer Trust Domain	Configure the trust domain of peer certification. The peer certification is used for data encryption and authentication in the negotiation. The initiator should import the peer certification first. Only GUOMI v1.0 supports this option.
Encryption Trust Domain	Configure the trust domain of encryption certification. The encryption certification is used for data encryption in the negotiation. Only GUOMI v1.1 supports this option.

3. If necessary, click the **Advanced Configuration** tab to configure some advanced options.

In the **Advanced Configuration** tab, configure the corresponding options.

Advanced Configuration	
Connection Type	<p>Specifies the connection type for ISAKMP gateway.</p> <ul style="list-style-type: none"> • Bidirectional - Specifies that the ISAKMP gateway serves as both the initiator and responder. This is the default value. • Initiator - Specifies that the ISAKMP gateway serves as the only initiator. • Responder - Specifies that the ISAKMP gateway serves as the only responder.
NAT Traversal	<p>This option must be enabled when there is a NAT device in the IPSec or IKE tunnel and the device implements NAT. By default, this function is disabled.</p>
Any Peer ID	<p>Makes the ISAKMP gateway accept any peer ID and not check the peer IDs.</p>
Generate Route	<p>Select the Enable check box to enable the auto routing function. By default, this function is disabled. This function allows the device to automatically add routing entries which are from the center device to the branch, avoiding the problems caused by manual configured routing.</p>
DPD	<p>Select the Enable check box to enable the DPD (Delegated Path Discovery) function. By default, this function is disabled. When the responder does not receive the peer's packets for a long period, it can enable DPD and initiate a DPD request to the peer so that it can test if the ISAKMP gateway exists.</p> <ul style="list-style-type: none"> • DPD Interval - The interval of sending DPD request to the peer. The value range is 1 to 10 seconds. The default value is 10 seconds. • DPS Retries - The times of sending DPD request to the peer. The device will keep sending discovery requests to the peer until it reaches the specified times of DPD retries. If the device does not receive response from the peer after the retry times, it will determine that the peer ISAKMP gateway is down.

Advanced Configuration	
	The value range is 1 to 10 times. The default value is 3.
Description	Type the description for the ISAKMP gateway.
XAUTH Server	Select Enable to enable the XAUTH server in the device. Then select an address pool from the drop-down list. After enabling the XAUTH server, the device can verify the users that try to access the IPsec VPN network by integrating the configured AAA server.

4. Click **OK** to save the settings.

Configuring an IKE VPN

Use IKE to negotiate IPsec SA automatically. To configure IKE VPN, take the following steps:

1. Select **Network > VPN > IPsec VPN**.
2. In the IKE VPN List tab, click **New**.

In the Basic Configuration tab, configure the corresponding options.

Peer	
Peer Name	Specifies the name of the ISAKMP gateway. To edit an ISAKMP gateway, click Edit .
Information	Shows the information of the selected peer.
Tunnel	
Name	Type a name for the tunnel.
Mode	Specifies the mode, including tunnel mode and transport mode.
P2 Proposal	Specifies the P2 proposal for tunnel.

Peer	
Proxy ID	<p>Specifies ID of Phase 2 for the tunnel which can be Auto or Manual.</p> <ul style="list-style-type: none"> • Auto - The Phase 2 ID is automatically designated. • Manual - The Phase 2 ID is manually designated. Manual configuration of P2 ID includes the following options: <ul style="list-style-type: none"> • Local IP/Netmask - Specifies the local ID of Phase 2. • Remote IP/Netmask - Specifies the Phase 2 ID of the peer device. • Service - Specifies the service.

3. If necessary, click the **Advanced Configuration** tab to configure some advanced options.

In the **Advanced Configuration** tab, configure the corresponding options.

Advanced	
DNS1/2/3/4	Specifies the IP address of the DNS server allocated to the client by the PnPVPN server. You can define one primary DNS server and three backup DNS servers.
WINS1/2	Specifies the IP address of WINS server allocated to the client by the PnPVPN server. You can define one primary WINS server and a backup WINS server.
Enable Idle Time	Select the Enable check box to enable the idle time function. By default, this function is disabled. This time length is the longest time the tunnel can exist without traffic passing through. When the time is over, SA will be cleared.
DF-Bit	<p>Select the check box to allow the forwarding device to execute IP packet fragmentation. The options are:</p> <ul style="list-style-type: none"> • Copy - Copies the IP packet DF options from the sender directly. This is the default value. • Clear - Allows the device to execute packet fragmentation.

Advanced	
	<ul style="list-style-type: none"> • Set - Disallows the device to execute packet fragmentation.
Anti-Replay	<p>Anti-replay is used to prevent hackers from attacking the device by resending the sniffed packets, i.e., the receiver rejects the obsolete or repeated packets. By default, this function is disabled.</p> <ul style="list-style-type: none"> • Disable - Disables this function. • 32 - Specifies the anti-replay window as 32. • 64 - Specifies the anti-replay window as 64. • 128 - Specifies the anti-replay window as 128. • 256 - Specifies the anti-replay window as 256. • 512 - Specifies the anti-replay window as 512.
Commit Bit	<p>Select the Enable check box to make the corresponding party configure the commit bit function, which can avoid packet loss and time difference. However, commit bit may slow the responding speed.</p>
Accept-all-proxy-ID	<p>This function is disabled by default. With this function enabled, the device which is working as the initiator will use the peer's ID as its Phase 2 ID in the IKE negotiation, and return the ID to its peer.</p>
Auto Connect	<p>Select the Enable check box to enable the auto connection function. By default, this function is disabled. The device has two methods of establishing SA: auto and intrigued traffic mode. When it is auto mode, the device will check SA status every 60 seconds and initiate negotiation request when SA is not established; when it is in intrigued traffic mode, the tunnel will send negotiation request only when there is traffic passing through the tunnel. By default, the intrigued traffic mode is enabled.</p> <p>Note: Auto connection works only when the peer IP is static and the local device is the initiator.</p>

Advanced	
Tunnel Route	This item can be modified only after this IKE VPN is created. Click Choose to add one or more tunnel routes in the appearing Tunnel Route Configuration dialog box. You can add up to 128 tunnel routes.
Description	Type the description for the tunnel.
VPN Track	<p>Select the Enable check box to enable the VPN track function. The device can monitor the connectivity status of the specified VPN tunnel, and also allows backup or load sharing between two or more VPN tunnels. This function is applicable to both route-based and policy-based VPNs. The options are:</p> <ul style="list-style-type: none"> • Track Interval - Specifies the interval of sending Ping packets. The unit is second. • Threshold - Specifies the threshold for determining the track failure. If system did not receive the specified number of continuous response packets, it will identify a track as failure, i.e., the target tunnel is disconnected. • Src Address - Specifies the source IP address that sends Ping packets. • Dst Address - Specifies the IP address of the tracked object. • Notify Track Event - Select the Enable check box to enable the VPN tunnel status notification function. With this function enabled, for route-based VPN, system will inform the routing module about the information of the disconnected VPN tunnel and update the tunnel route once any VPN tunnel disconnection is detected; for policy-based VPN, system will inform the policy module about the information of the disconnected VPN tunnel and update the tunnel policy once any VPN tunnel disconnection is detected.

4. Click **OK** to save the settings.

Configuring a Manual Key VPN

Manually configuring SA is complicated as all the information will be configured by yourself and some advanced features of IPSec are not supported (e.g. timed refreshing), but the advantage is that manually configured SA can independently fulfill IPSec features without relying on IKE. This method applies to a situation with a small number of devices or an environment of static IP addresses.

To create a manual key VPN, take the following steps:

1. Select **Network > VPN > IPSec VPN**.
2. In the Manual Key VPN Configuration section, click **New**.

In the Manual Key VPN Configuration dialog box, configure the corresponding options.

Basic Configuration	
Tunnel Name	Specifies the name of manually created key VPN.
Mode	Specifies the mode, including Tunnel and Transport. The tunnel mode is the default mode.
Peer IP	Specifies the IP address of the peer.
Local SPI	Type the local SPI value. SPI is a 32-bit value transmitted in AH and ESP header, which uniquely identifies a security association. SPI is used to seek corresponding VPN tunnel for decryption.
Remote SPI	Type the remote SPI value. Note: When configuring an SA, you should configure the parameters of both the inbound and outbound direction.

Basic Configuration	
	Furthermore, SA parameters of the two ends of the tunnel should be totally matched. The local inbound SPI should be the same with the outbound SPI of the other end; the local outbound SPI should be the same with the inbound SPI of the other end.
Interface	Specifies the egress interface for the manual key VPN. Select the interface you want from the Interface drop-down list.
Interface Type	Select the interface type, including IPv4 or IPv6. Only the IPv6 firmware supports to configure IPv6 type interface.
Encryption	
Protocol	Specifies the protocol type. The options are ESP and AH. The default value is ESP.
Encryption	<p>Specifies the encryption algorithm.</p> <ul style="list-style-type: none"> • None – No authentication. • 3DES – Uses 3DES as the encryption algorithm. The key length is 192-bit. This is the default encryption algorithm. • DES – Uses DES as the encryption algorithm. The key length is 64-bit. • AES – Uses AES as the encryption algorithm. The key length is 128-bit. • AES-192 – Uses 192-bit AES as the encryption algorithm. The key length is 192-bit. • AES-256 – Uses 256-bit AES as the encryption algorithm. The key length is 256-bit.
Inbound Encryption Key	Type the encryption key of the inbound direction. You should configure the keys of both ends of the tunnel. The local inbound encryption key should be the same with the peer's outbound encryption key, and the local outbound encryption key should be the same with the peer's inbound encryption key.
Outbound	Type the encryption key of the outbound direction.

Basic Configuration	
Encryption Key	
Hash	<p>Specifies the authentication algorithm. Select the algorithm you want to use.</p> <ul style="list-style-type: none"> • None – No authentication. • MD5 – Uses MD5 as the authentication algorithm. Its hash value is 128-bit. • SHA-1 – Uses SHA as the authentication algorithm. Its hash value is 160-bit. This is the default hash algorithm. • SHA-256 – Uses SHA-256 as the authentication algorithm. Its hash value is 256-bit. • SHA-384 – Uses SHA-384 as the authentication algorithm. Its hash value is 384-bit. • SHA-512 – Uses SHA-512 as the authentication algorithm. Its hash value is 512-bit.
Inbound Hash Key	Type the hash key of the inbound direction. You should configure the keys of both ends of the tunnel. The local inbound hash key should be the same with the peer's outbound hash key, and the local outbound hash key should be the same with the peer's inbound hash key.
Outbound Hash Key	Type the hash key of the outbound direction.
Compression	Select a compression algorithm. By default, no compression algorithm is used.
Description	
Description	Type the description for the manual key VPN.

3. Click **OK** to save the settings.

Viewing IPSec VPN Monitoring Information

By using the ISAKMP SA table, IPSec SA table, and Dial-up User table, IPSec VPN monitoring function can show the SA negotiation results of IPSec VPN Phase1 and Phase2 as well as information of dial-up users.

To view the VPN monitoring information, take the following steps:

1. Select **Network > VPN > IPSec VPN**.
2. In the IKE VPN Configuration section, click **IPSec VPN Monitor**.

Options in these tabs are described as follows:

ISAKMP SA

Option	Description
Cookie	Displays the negotiation cookies which are used to match SA Phase 1.
Status	Displays the status of SA Phase1.
Peer	Displays the IP address of the peer.
Port	The port number used by the SA Phase1. 500 indicates that no NAT has been found during the SA Phase 1; 4500 indicates that NAT has been detected.
Algorithm	Displays the algorithm of the SA Phase1, including authentication method, encryption algorithm and verification algorithm.
Lifetime	Displays the lifetime of SA Phase1. The unit is second.

IPSec SA

Option	Description
ID	Displays the tunnel ID number which is auto assigned by the system.
VPN Name	Displays the name of VPN.
Direction	Displays the direction of VPN.
Peer	Displays the IP address of the peer.
Port	The port number used by the SA Phase2.
Algorithm	The algorithm used by the tunnel, including protocol type, encryption algorithm, verification algorithm and depression algorithm.
SPI	Displays the local SPI and the peer SPI. The direction of inbound is local SPI, while outbound is peer SPI.
CPI	Displays the compression parameter index (CPI) used by SA Phase2.

Option	Description
Lifetime (s)	Displays the lifetime of SA Phase2 in seconds, i.e. SA Phase2 will restart negotiations after X seconds.
Lifetime (KB)	Displays the lifetime of SA Phase2 in KB, i.e. SA Phase2 will restart negotiations after X kilobytes of data flow.
Status	Displays the status of SA Phase2.

Dial-up User

Option	Description
Peer	Displays the statistical information of the peer user. Select the peer you want from the Peer drop-down list.
User ID	Displays the IKE ID of the user selected.
IP	Displays the corresponding IP address.
Encrypted Packets	Displays the number of encrypted packets transferred through the tunnel.
Encrypted Bytes	Displays the number of encrypted bytes transferred through the tunnel.
Decrypted Packets	Displays the number of decrypted packets transferred through the tunnel.
Decrypted Bytes	Displays the number of decrypted bytes transferred through the tunnel.

Configuring PnPVPN

IPSec VPN requires sophisticated operational skills and high maintenance cost. To relieve network administrators from the intricate work, system provides an easy-to-use VPN technology - PnPVPN (Plug-and-Play VPN). PnPVPN consists of two parts: PnPVPN Server and PnPVPN Client.

- **PnPVPN Server:** Normally deployed in the headquarters and maintained by an IT engineer, the PnPVPN Server sends most of the configuration commands to the clients. The device usually works as a PnPVPN Server and one device can serve as multiple servers.
- **PnPVPN Client:** Normally deployed in the branch offices and controlled remotely by a headquarters engineer, the PnPVPN Client can obtain configuration commands (e.g. DNS, WINS, DHCP address pool, etc.) from the PnPVPN Server with simple configurations, such as client ID, password, and server IP settings.

The device can serve as both a PnPVPN Server and a PnPVPN Client. When working as a PnPVPN Server, the maximum number of VPN instance and the supported client number of each device may vary according to the platform series.

PnPVPN Workflow

The workflow for PnPVPN is as follows:

1. The client initiates a connection request and sends his/her own ID and password to the server.
2. The server verifies the ID and password when it receives the request. If the verification succeeds, the server will send the configuration information, including DHCP address pool, DHCP mask, DHCP gateway, WINS, DNS and tunnel routes, etc., to the client.
3. The client distributes the received information to corresponding functional modules.
4. The client PC automatically gains an IP address, IP mask, gateway address and other network parameters and connects itself to the VPN.

PnPVPN Link Redundancy

The PnPVPN server supports dual VPN link dials for a PnPVPN client, and automatically generates the routing to the client. Also, it can configure the VPN monitor for the client. Two ISAKMP gateways and two tunnel interfaces need to be configured in the server. The two VPN tunnels need to refer different ISAKMP gateways and be bound to different tunnel interfaces.

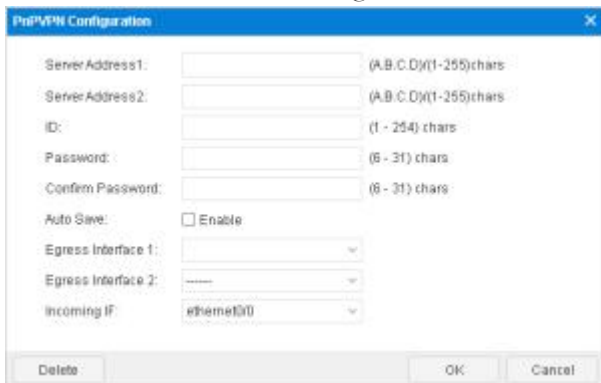

The client supports to configure dual VPN dials and redundant routing. When the two VPN tunnels are negotiating with the server, the client generates routes with different priority according to the tunnel routing configuration at the server side. The high priority tunnel acts as the master link and the tunnel with low priority as the backup link, so as to realize redundant routing. The master VPN tunnel will be in the active state first. When master tunnel is interrupted, the client will use the backup tunnel to transfer the data. When the master tunnel restores to be normal, it will transfer the data again.

Configuring a PnPVPN Client

To configure a PnPVPN client, take the following steps:

1. Select **Network > VPN > IPSec VPN**.

- In the IKE VPN Configuration section, click **PnPVPN Client**.

In the PnPVPN Configuration dialog box, configure the following options.

Option	Description
Server Address1	Type the IP address of PnPVPN Server into the box. PnPVPN client supports dual link dials to the server side. This option is required.
Server Address2	Type the IP address of PnPVPN Server into the box. The server address 1 and the server address 2 can be the same or different. It is optional.
ID	Specifies the IKE ID assigned to the client by the server.
Password	Specifies the password assigned to the client by the server.
Confirm Password	Enter the password again to confirm.
Auto Save	Select Enable to auto save the DHCP and WINS information released by the PnPVPN Server.
Egress Interface 1	Specifies the interface connecting to the Internet. This option is required.
Egress Interface 2	Specifies the interface connecting to the Internet. The IF1 and the IF2 can be the same or different. It is optional.
Incoming IF	Specifies the interface on the PnPVPN Client accessed by the Intranet PC or the application servers.

- Click **OK** to save the settings.

Notes:

- Server Addresses1 and Egress IF1 both need to be configured. If you want to configure a backup link, you need to configure both the Server Address2 and Egress IF2.

- If the server addresses or the Egress IFs are different, two separate VPN links will be generated.
- The configuration of the two servers can be configured on one device, and can also be configured on two different devices. If you configure it on two devices, you need to configure AAA user on the two devices. The DHCP configuration for the AAA user should be the same, otherwise it might cause that the client and server negotiate successfully, but the traffic is blocked.

Configuring IPSec-XAUTH Address Pool

XAUTH server assigns the IP addresses in the address pool to users. After the client has established a connection to the XAUTH server successfully, the XAUTH server will choose an IP address along with other related parameters (such as DNS server address, WINS server address, etc) from the address pool, and will assign them to the client.

XAUTH server provides fixed IP addresses by creating and implementing IP binding rules that consist of a static IP binding rule and an IP-role binding rule. The static IP binding rule binds the client user to a fixed IP address in the address pool. Once the client has established a connection successfully, system will assign the binding IP to the client. The IP-role binding rule binds the role to a specific IP range in the address pool. Once the client has established a connection successfully, system will assign an IP address within the IP range to the client.

When the XAUTH server is allocating IP addresses in the address pool, system will check the IP binding rule and determine how to assign IP addresses to the client based on the specific checking order below:

1. Check if the client is configured with any static IP binding rule. If so, assign the binding IP address to the client; otherwise, check the other configuration. Note if the binding IP address is in use, the user will be unable to log in.
2. Check if the client is configured with any IP-role binding rule. If so, assign an IP address within the binding IP range to the client; otherwise, the user will be unable to log in.

Notes: The IP addresses defined in the static IP binding rule and IP-role binding rule should not be overlapped.

To configure the IPSec-XAUTH address pool, take the following steps:

1. Select **Network > VPN > IPSec VPN**.
2. At the top-right corner, Select **IPSec-XAUTH Address Pool**.
3. In the XAUTH Address Pool Configuration dialog box, click **New**.

Address Pool Configuration
✕

Basic Configuration

IP User Binding

IP Role Binding

Address Pool Name: (1 - 31) chars

Start IP:

End IP:

Reserved start IP:

Reserved end IP:

Netmask:

DNS1:

DNS2:

WINS1:

WINS2:

In the Basic Configuration tab, configure the corresponding options.

Option	Description
Address Pool Name	Specifies the name of the address pool.
Start IP	Specifies the start IP of the address pool.
End IP	Specifies the end IP of the address pool.
Reserved Start IP	Specifies the reserved start IP of the address pool.
Reserved End IP	Specifies the reserved end IP of the address pool.
Netmask	Specifies the netmask of the IP address.
DNS1/2	Specifies the DNS server IP address for the address pool. It is optional. At most two DNS servers can be configured for one address pool.
WINS1/2	Specifies the WIN server IP addresses for the address pool. It is optional. Up to two WIN servers can be configured for one address pool.

In the IP User Binding tab, configure the corresponding options.

Option	Description
User	Type the user name into the User box.
IP	Type the IP address into the IP box.
Add	Click Add to add the item that binds the specified user to the IP address.

In the **IP Role Binding** tab, configure the corresponding options.

Option	Description
Role	Select a role from the Role drop-down list.
Start IP	Type the start IP address into the Start IP box.
End IP	Type the end IP address into the End IP box.
Add	Click Add to add the item that binds the specified role to the IP address range.
Up/Down/Top/Bottom	Move the selected IP-role binding rule. For the user that is bound to multiple roles that are also configured with their corresponding IP-role binding rules, system will query the IP-role binding rules in order, and assign an IP address based on the first matched rule.

4. Click **OK** to save the settings.

SSL VPN

The device provides an SSL based remote access solution. Remote users can access the intranet resource safely through the provided SSL VPN.

SSL VPN consists of two parts: SSL VPN server and SSL VPN client. The device configured as the SSL VPN server provides the following functions:

- Accept client connections.
- Allocate IP addresses, DNS server addresses, and WIN server addresses to SSL VPN clients.
- Authenticate and authorize clients.
- Perform host checking to client.

- Encrypt and forward IPsec data.

By default, the concurrent online client number may vary on different platform series. You can expand the supported number by purchasing the corresponding license.

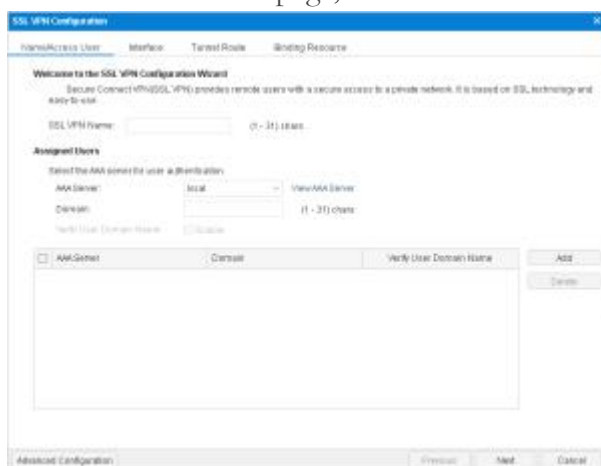

After successfully connecting to the SSL VPN server, the SSL VPN client secures your communication with the server. The following SSL VPN clients are available:

- ["SSL VPN Client for Windows"](#)
- ["SSL VPN Client for Android"](#)

Configuring an SSL VPN

To configure an SSL VPN, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. In the SSL VPN page, click **New**.

In the **Name/Access User** tab, configure the corresponding options.

Option	Description
SSL VPN Name	Type the name of the SSL VPN instance
Assigned Users	
AAA Server	Select an AAA server from the AAA Server drop-down list. You can click View AAA Server to view the detailed information of this AAA server.
Domain	Type the domain name into the Domain box. The domain name is used to distinguish the AAA server.
Verify User	After enabling this function, system will verify the username and

Option	Description
Domain Name	its domain name.
Add	Click Add to add the assigned users. You can repeat to add more items.

In the Interface tab, configure the corresponding options.

Access Interface	
Egress Interface1	Select the interface from the drop-down list as the SSL VPN server interface. This interface is used to listen to the request from the SSL VPN client.
Egress Interface2	Select the interface from the drop-down list. This interface is needed when the optimal path detection function is enabled.
Service Port	Specifies the SSL VPN service port number.
Tunnel Interface	
Tunnel Interface	<p>Specifies the tunnel interface used to bind to the SSL VPN tunnel. Tunnel interface transmits traffic to/from SSL VPN tunnel.</p> <ul style="list-style-type: none"> Select a tunnel interface from the drop-down list, and then click Edit to edit the selected tunnel interface. Click New in the drop-down list to create a new interface.
Information	Shows the zone, IP address, and netmask of the selected tunnel interface.
Address Pool	
Address Pool	<p>Specifies the SSL VPN address pool.</p> <ul style="list-style-type: none"> Select an address pool from the drop-down list, and then click Edit to edit the selected address pool. Click New in the drop-down list to create a new address pool.
Information	Shows the start IP address, end IP address, and mask of the address pool.

In the Tunnel Route tab, configure the following options.

Tunnel Route

Specify the destination network segment that you want to access through SCVPN tunnel. The specified destination network segment will be distributed to the VPN client, then the client uses it to generate the route to the specified destination.	
IP	Type the destination IP address.
Mask	Type the netmask of the destination IP address.
Metric	Type the metric value.
Add	Click Add to add this route. You can repeat to add more items.
Delete	Click Delete to delete the selected route.
Enable Domain Route	
Specify the destination domain name that you want to access through SCVPN tunnel.	
After selecting the Enable Domain Route check box, system will distribute the specified domain names to the VPN client, and the client will generate the route to the specified destination according to the resolving results from the DNS.	
Domain	Specify the URL of the domain name. The URL cannot exceed 63 characters and it cannot end with a dot (.). Both wildcards and a single top level domain, e.g. com and .com are not supported.
Add	Click Add to add the domain name to the list and you can add up to 64 domain names.
Delete	Click Delete to delete the selected domain name.
Maximum	The maximum numbers of routes that can be generated after obtaining the resolved IP addresses of the domain name. The value ranges from 1 to 10000.

In the Binding Resource tab, configure the binding relationship between user groups and resources.

Binding Resource	
Resource List	Types or selects an existing resource name.
User Group	Specifies a user group name. <ol style="list-style-type: none"> From the User Group drop-down menu, select the AAA servers where user groups reside. Currently, only the local authentication server and the RADIUS server are available.

	<ol style="list-style-type: none"> 2. Based on different types of AAA server, you can execute one or more actions: search a user group, expand the user group list, and enter the name of the user group. 3. After selecting user groups, click to add them to the right pane. 4. After adding the desired objects, click the blank area in this dialog to complete the configuration. <p>Note:</p> <ul style="list-style-type: none"> • A user group can be bound with multiple resources, and a resource can also be bound with multiple user groups. • Only 32 binding entries can be configured in an SSL VPN instance.
Add	Click Add to add binding entries for resources and user groups to the list below. You can repeat to add more items.
Delete	Click Delete to delete the selected item.

3. If necessary, click **Advanced Configuration** to configure the advanced functions, including parameters, client, host security, SMS authentication, and optimized path.

In the **Parameters** tab, configure the corresponding options.

Security Kit	
SSL Version	<p>Specifies the SSL protocol version. Any indicates one of SSLv2, SSLv3, TLSv1, TLSv1.1, TLSv1.2 or GMSSLv1.0 protocol will be used.</p> <p>If tls1.2 or any is specified to the SSL protocol in SSL VPN server, you need to convert the certificate that you are going to import to the browser or certificate in the USB Key to make it support the tls1.2 protocol before the digital certificate authentication via SSL VPN client, so that the SSL VPN server can be connected successfully when the Username/Password + Digital Certificate or Digital Certificate Only authentication method is selected. Prepare a PC with Windows or Linux system which has been installed with OpenSSL 1.0.1 or later before</p>

	<p>processing the certificate. We will take the certificate file named oldcert.pfx as an example, the procedure is as follows:</p> <ol style="list-style-type: none"> 1. In the OpenSSL software interface, enter the following command to convert a certificate in .pfx format to a certificate in .pem format. openssl pkcs12 -in oldcert.pfx -out cert.pem 2. Enter the following command to convert the certificate in .pem format to a .pfx format certificate that supports tls1.2 protocol. openssl pkcs12 -export -in cert.pem -out newcert.pfx -CSP "Microsoft Enhanced RSA and AES Cryptographic Provider" 3. Import the newly generated .pfx format certificate into your browser or USB Key. <p>After the above operation, you have to log into SSL VPN server with SSL VPN client whose version is 1.4.6.1239 or later.</p>
Trust Domain	Specifies the trust domain. When the GMSSLv1.0 protocol is used, the specified PKI trust domain needs to include the SM2 signature certificate and its private key for the GMSSL negotiation.
Encryption Trust Domain	When using the GMSSLv1.0 protocol, you must config this option. The specified encryption PKI trust domain needs to include the SM2 encryption certificate and its private key for the GMSSL negotiation.
Encryption	Specifies the encryption algorithm of the SSL VPN tunnel. The default value is 3DES. NULL indicates no encryption. When using the GMSSLv1.0 protocol, you're recommended to select SM4 for the encryption algorithm.
Hash	Specifies the hash algorithm of the SSL VPN tunnel. The default value is SHA-1. NULL indicates no hash. When using the GMSSLv1.0 protocol, you're recommended to select SM3 for the hash algorithm.
Compression	Specifies the compression algorithm of the SSL VPN tunnel. By default, no compression algorithm is used.
Client Connection	

Idle Time	Specifies the time that a client stays online without any traffic with the server. After waiting for the idle time, the server will disconnect from the client. The value range is 15 to 1500 minutes. The default value is 30.
Multiple Login	This function permits one client to sign in more than one place simultaneously. Select the Enable check box to enable the function.
Multiple Login Times	Type the login time into the Multiple Login Times box. The value range is 0 to 99,999,999. The value of 0 indicates no login time limitation.
Advanced Parameters	
Anti-Replay	The anti-replay function is used to prevent replay attacks. The default value is 32.
DF-Bit	Specifies whether to permit packet fragmentation on the device forwarding the packets. The actions include: <ul style="list-style-type: none"> • Set - Permits packet fragmentation. • Copy - Copies the DF value from the destination of the packet. It is the default value. • Clear - Forbids packet fragmentation.
Port (UDP)	Specifies the UDP port number for the SSL VPN connection.

In the Client tab, configure the corresponding options.

Client Configuration	
Redirect URL	<p>This function redirects the client to the specified redirected URL after a successful authentication. Type the redirected URL into the box. The value range is 1 to 255 characters. HTTP (http://) and HTTPS (https://) URLs are supported. Based on the type of the URL, the corresponding fixed format of URL is required. Take the HTTP type as the example:</p> <ul style="list-style-type: none"> • For the UTF-8 encoding page - The format is URL+username=\$USER&password=\$PWD, e.g., http://www.abc.com/oa/login.do?username=\$USER&password=\$PWD • For the GB2312 page - The format is

	<p>URL+username=\$GBUSER&password=\$PWD, e.g., http://www.abc.com/oa/login.do?username=\$GBUSER&password=\$PWD</p> <ul style="list-style-type: none"> • Other pages: - Type the URL directly, e.g., http://www.abc.com
Title	Specifies the description for the redirect URL. The value range is 1 to 31 bytes. This title will appear as a client menu item.
Delete privacy data after disconnection	Select Enable to delete the corresponding privacy data after the client's disconnection.
Digital Certificate Authentication	
Authentication	<p>Select the Enable check box to enable this function. There are two options available:</p> <ul style="list-style-type: none"> • Username/Password + Digital Certificate - To pass the authentication, you need to have the correct file certificate, or the USB Key that stores the correct digital certificate, and also type the correct username and password. The USB Key certificate users also need to type the USB Key password. • Digital Certificate only - To pass the authentication, you need to have the correct file certificate, or the USB Key that stores the correct digital certificate. The USB Key certificater users also need to type the USB Key password. No username or user's password is required. <p>When Digital Certificate only is selected:</p> <ul style="list-style-type: none"> • System can map corresponding roles for the authenticated users based on the CN or OU field of the USB Key certificate. For more information about the role mapping based on CN or OU, see "Role". • System does not allow the local user to change the password. • System does not support SMS authentication. • The client will not re-connect automatically if the

	USB Key is removed.
USB KEY Download URL	When USB Key authentication is enabled, you can download the UKey driver from this URL.
Trust Domain Subject&User name Checking CN Matching OU Matching	<p>To configure the trust domain and the subject & username checking function:</p> <ol style="list-style-type: none"> From the Trust domain drop-down list, select the PKI trust domain that contains the CA (Certification Authority) certificate. If the client's certificate is the only one that matches to any CA certificate of the trust domain, then the authentication will succeed. If necessary, select the Subject&Username Checking check box to enable the subject & username check function. After enabling it, when the user is authenticated by the USB Key certificate, system will check whether the subject CommonName in the client certificate is the same as the name of the login user. You can also enter the strings in the CN Match box and the OU box to determine whether matches them. Click Add. The configured settings will be displayed in the list below. To delete an item, select the item you want to delete from the list, and then click Delete.

In the Host Compliance Check/Binding tab, configure the corresponding options.

Host Compliance Check	
	Creates a host compliance check rule to perform the host compliance check function. Before creating a host compliance check rule, you must first configure the host compliance check profile in " Configuring a Host Compliance Check Profile ".
Role	Specifies the role to which the host compliance check rule will be applied. Select the role from the Role drop-down list. Default indicates the rule will take effect to all the roles.
Host Compliance	Specifies the compliance check profile. Select the profile from the Host Compliance Check drop-down list.

Check	
Guest Role	Select the guest role from the Guest Role drop-down list. The user will get the access permission of the guest role when the host checking fails. If Null is selected, system will disconnect the connection when the host compliance check fails.
Periodic Check	Specify the host compliance check period. System will check the status of the host automatically according to the host compliance check profile in each period.
Add	Click Add . The configured settings will be displayed in the table below.
Delete	To delete an item, select the item you want to delete from the list, and then click Delete .
Host Binding	
Enable Host Binding	<p>Select the Enable Host Binding check box to enable the function. By default, one user can only log in one host. You can change the login status by configuring the following options.</p> <ul style="list-style-type: none"> • Allow one user to login through multiple hosts. • Allow multiple users to login on one host. • Automatically add the user-host ID entry into the binding list at the first login. <p>Note: To use the host binding function, you still have to configure it in the host binding configuration page. For more information about host binding, see "Host Binding".</p>

In the **Optimized Path** tab, configure the corresponding options.

Option	Description
	Optimal path detection can automatically detect which ISP service is better, giving remote users a better user experience.
No Check	Do not detect.
Client	The client selects the optimal path automatically by sending UDP probe packets.
The device	When the client connects to the server directly without any NAT device, this is the detection process:

	<ol style="list-style-type: none"> 1. The server recognizes the ISP type of the client according to the client's source address. 2. The server sends all of the sorted IP addresses of the egress interfaces to the client. 3. The client selects the optimal path. <p>When the client connects to the server through a NAT device, this is the detection process:</p> <ol style="list-style-type: none"> 1. The server recognizes the ISP type of the client according to the client's source address. 2. The server sends all of the sorted NAT IP addresses of the external interfaces to the client. 3. The client selects the optimal path.
<p>NAT Mapping Address and Port</p>	<p>If necessary, in the NAT mapping address and port section, specify the mapped public IPs and ports of the server referenced in the DNAT rules of the DNT device. When the client connects to the server through the DNAT device, the NAT device will translate the destination address of the client to the server's egress interface address. Type the IP address of the NAT device's external interface and the HTTPS port number (You are not recommended to specify the HTTPS port as 443, because 443 is the default HTTPS port of WebUI management). You can configure up to 4 IPs.</p>

4. Click **Done** to save the settings.

To view the SSL VPN online users, take the following steps:

1. Select **Configure > Network > SSL VPN**.
2. Select an SSL VPN instance.
3. View the detailed information of the online users in the table.

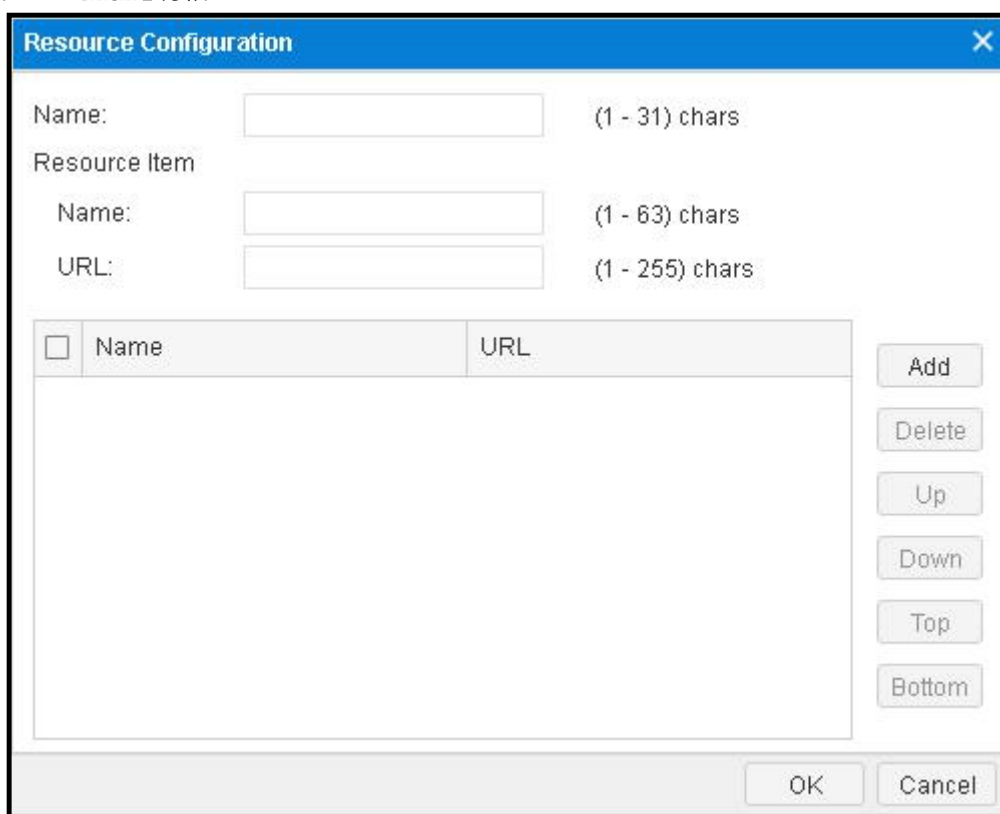

Configuring Resource List

Resource list refers to resources configured in system that can be easily accessible by users. Each resource contains multiple resource items. The resource item is presented in the form of a resource item name followed by a URL in your default browser page. After the SSL VPN user is authenticated

successfully, the authentication server will send the user group information of the user to the SSL VPN server. Then, according to the binding relationship between the user group and resources in the SSL VPN instance, the server will send a resource list in which the user can access to the client. After that, the client will analyze and make the IE browser in system pop up a page to display the received resource list information, so that the user can access the private network resource directly by clicking the URL link. The resource list page pops up only after the authentication is passed. If a user does not belong to any user group, the browser will not pop up the resource list page unless authentication is passed.

To configure resource list for SSL VPN:

1. Select **Network > VPN > SSL VPN**.
2. Click **Resources List** at the top-right corner.
3. Click **New**.

In the Resources Configuration dialog box, configure the corresponding options.

Option	Description
Name	Enters a name for the new resource.
Resource Item	
Name	Enters a name for a new resource item. Names of resource items in different resources can not be the same.

URL	Enters a URL for a new resource item.
Add	Click Add to add this binding item to the list below. Note: The number of resource items that can be added in a resource ranges from 0 to 48. The total number of resource items that can be added in all resources can not exceed 48.
Delete	To delete a rule, select the rule you want to delete from the list and click Delete .
Up/Down/Top/ Bottom	You can move the location for items at your own choice to adjust the presentation sequence accordingly.

- Click **OK**, the new resource will be displayed in the resource list.
At most 3 resource items can be displayed in the resource list for each resource, and the other items will be displayed as "...". You can click **Edit** or **Delete** button to edit or delete the selected resource.

Notes:

- Less than 48 resources can be configured in a SSL VPN instance.
- The resource list function is only available for Windows SSL VPN clients.

Configuring an SSL VPN Address Pool

The SSL VPN servers allocate the IPs in the SSL VPN address pools to the clients. After the client connects to the server successfully, the server will fetch an IP address along with other related parameters (e.g., DNS server address, and WIN server address) from the SSL VPN address pool and then allocate the IP and parameters to the client.

You can create an IP binding rule to meet the fixed IP requirement. The IP binding rule includes the IP-user binding rule and the IP-role binding rule. The IP-user binding rule binds the client to a fixed IP in the configured address pool. When the client connects to the server successfully, the server will allocate the binding IP to the client. The IP-role binding rule binds the role to an IP range in the configured address pool. When the client connects to the server successfully, the server will select an IP from the IP range and allocate the IP to the client.

After the client successfully connects to the server, the server will check the binding rules in a certain order to determine which IP to allocate. The order is shown as below:

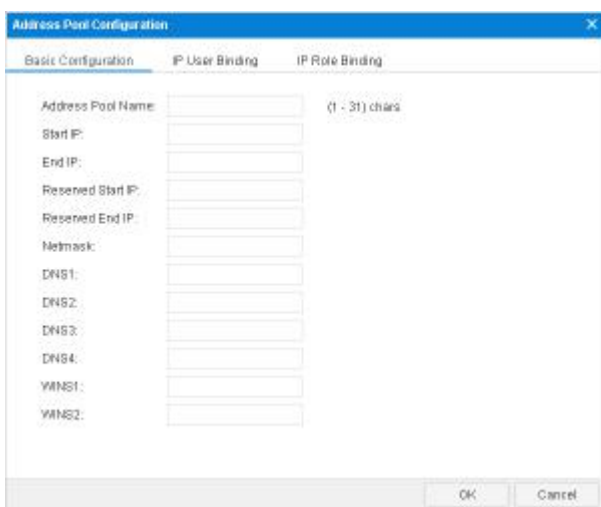

- Check whether the IP-user binding rule is configured for the client. If yes, allocate the bound IP to the client; if no, the server will select an IP which is not bound or used from the address pool, then allocate it to the client.

- Check whether the IP-role binding rule is configured for the client. If yes, get an IP from the IP range and allocate to the client; if no, the server will select an IP which is not bound or used from the address pool, then allocate it to the client.

Notes: IP addresses in the IP-user binding rule and the IP address in the IP-role binding rules should not overlap.

To configure an address pool, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. Click **Address Pool** at the top-right corner.
3. Click **New**.

In the Basic tab, configure the following options.

Option	Description
Address Pool Name	Specifies the name of the address pool.
Start IP	Specifies the start IP of the address pool.
End IP	Specifies the end IP of the address pool.
Reserved Start IP	Specifies the reserved start IP of the address pool.
Reserved End IP	Specifies the reserved end IP of the address pool.
Netmask	Specifies the netmask in the dotted decimal format.
DNS1/2/3/4	Specifies the DNS server IP address for the address pool. It is optional. 4 DNS servers can be configured for one address pool at most.

WINS1/2	Specifies the WIN server IP addresses for the address pool. It is optional. Up to 2 WIN servers can be configured for one address pool.
---------	---

In the **IP User Binding** tab, configure the corresponding options.

Option	Description
User	Type the user name into the User box.
IP	Type the IP address into the IP box.
Add	Click Add to add this IP user binding rule.
Delete	To delete a rule, select the rule you want to delete from the list and click Delete .

In the **IP Role Binding** tab, configure the corresponding options.

Option	Description
Role	Type the role name into the Role box.
Start IP	Type the start IP address into the Start IP box.
End IP	Type the end IP address into the End IP box.
Add	Click Add to add this IP role binding rule.
Delete	To delete a rule, select the rule you want to delete from the list and click Delete .
Up/Down/Top/ Bottom	System will query IP role binding rules by turn, and allocate the IP address according to the first matched rule. You can move the location up or down at your own choice to adjust the matching sequence accordingly.

4. Click **OK** to save the settings.

Configuring SSL VPN Login Page

You can customize the title and background of the SSL VPN login page. The default title is **Login** and the login page is shown as below:

To customize the SSL VPN login page, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top-right corner, click **Login Page Configuration**.
3. Click **Browse** to select the background picture. The selected pictures must be zipped, and the file name must be **Login_box_bg_en.gif** for English pages. The picture size must be 624px*376px.
4. Click **Upload** to upload the background picture to system. After uploading successfully, you will have completed the background picture modification.
5. Enter the title in the **Authentication Page Title** box to customize the title of the login page.
6. Click **OK** to save the settings. Clicking **Cancel** will only affect the authentication page title modification.

If you want to use the default authentication title **Login**, click **Clear Page Title**. Then click **OK**. If you want to restore the default picture, click **Restore Default Background** and select **English** in the pop-up dialog. Then click **OK**.

Host Binding

The host binding function verifies that the hosts are running the SSL VPN clients according to their host IDs and user information. The verification process is:

1. When an SSL VPN user logs in via the SSL VPN client, the client will collect the host information of main board serial number, hard disk serial number, CUP ID, and BIOS serial number.
2. Based on the above information, the client performs the MD5 calculation to generate a 32-digit character, which is named host ID.
3. The client sends the host ID and user/password to the SSL VPN server.

4. The SSL VPN server verifies the host according to the entries in the host unbinding list and host binding list, and deals with the verified host according to the host binding configuration.

The host unbinding list and host binding list are described as follows:

- Host unbinding list: The host unbinding list contains the user-host ID entries for the first-login users.
- Host binding list: The host binding list contains the user-host ID entries for the users who can pass the verification. The entries in the host unbinding list can be moved to the host binding list manually or automatically for the first login. When a user logs in, the SSL VPN server will check whether the host binding list contains the user-host ID entry of the login user. If there is a matched entry in the host binding list, the user will pass the verification and the sever will go on checking the user/password. If there is no matched entry for the login user, the connection will be disconnected.

Configuring Host Binding

Configuring host binding includes host binding/unbinding configurations, super user configurations, shared host configurations, and user-host binding list importing/exporting.

Configuring Host Binding and Unbinding

To add a binding entry to the host binding list, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Compliance Check/Binding page.
2. Click **Host Binding**.
3. With the Binding and Unbinding tab active, select the entries you want to add to the Host Unbinding List.
4. Click **Add** to add the selected entries to the Host Binding List.

To delete a binding entry from the host binding list, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Compliance Check/Binding page.
3. Click **Host Binding**.

4. With the Binding and Unbinding tab active, select the entries you want to delete from the Host binding List.
5. Click **Unbinding** to remove the selected entries from this list.

Configuring a Super User

The super user won't be controlled by the host checking function, and can log into any host. To configure a super user, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Checking/Binding page.
3. Click **Host Binding**.
4. With the User Privilege tab active, click **New**.

In the New dialog box, configure the corresponding options.

Option	Description
User	Specifies the name of the user.
Privilege	Select the Enable check box to make it a super user.
Preapproved Number	If system allows one user to login from multiple hosts, and the option of automatically adding the user-host ID entry into the host binding list at the first login is enabled, then by default system only records the user and first login host ID entry to the host binding list. For example, if the user logs in from other hosts, the user and host ID will be added to the host unbinding list. This pre-approved number specifies the maximum number of user-host ID entries for one user in the host binding list.

5. Click **OK** to save the settings.

Configuring a Shared Host

Clients that log in from the shared host won't be controlled by the host binding list. To configure a shared host, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Checking/Binding page.
3. Click **Host Binding**.
4. With the Host ID Privilege tab active, click **New**.

In the New dialog box, configure the corresponding options.

Option	Description
Host ID	Type the host ID into the Host ID box.
Shared Host	Select the Enable check to make it a shared host. By default, this check box is selected.

5. Click **OK** to save the settings.

Importing/Exporting Host Binding List

To import the host binding list, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Checking/Binding page.
3. Click **Host Binding**.
4. With the Binding and Unbinding tab active, click **Import**.
5. Click **Browse** to find the binding list file and click **Upload**.

To export the host binding list, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Checking/Binding page.
3. Click **Host Binding**.
4. With the Binding and Unbinding tab active, click **Export**.
5. Select a path to save the host binding list.

Host Compliance Check

The host compliance check function checks the security status of the hosts running SSL VPN clients, and according to the check result, the SSL VPN server will determine the security level for each host and assign corresponding resource access right based on their security level. It a way to assure the security of SSL VPN connection. The checked factors include the operating system, IE version, and the installation of some specific software.

The factors to be checked by the SSL VPN server are displayed in the list below:

Factor	Description
Operating system	<ul style="list-style-type: none"> • Operating system, e.g., Windows 2000, Windows 2003, Windows XP, Windows Vista, Windows 7m Windows 8, etc. • Service pack version, e.g., Service Pack 1 • Windows patch, e.g., KB958215, etc.
	<ul style="list-style-type: none"> • Whether the Windows Security Center and Automatic Updates are enabled. • Whether the installation of AV software is compulsory, and whether the real-time monitor and the auto update of the signature database are enabled. • Whether the installation of anti-spyware is compulsory, and whether the real-time monitor and the online update of the signature database are enabled. • Whether the personal firewall is installed, and

Factor	Description
	whether the real-time protection is enabled.
	Whether the IE version and security level reach the specified requirements.
Other configurations	Whether the specified processes are running.
	Whether the specified services are installed.
	Whether the specified services are running.
	Whether the specified registry key values exist.
	Whether the specified files exist in the system.

Role Based Access Control and Host Compliance Check Procedure

Role Based Access Control (RBAC) means that the permission of the user is not determined by his user name, but his role. The resources can be accessed by a user after the login is determined by his corresponding role. So role is the bridge connecting the user and permission.

The SSL VPN host checking function supports RBAC. And the concepts of primary role and guest role are introduced in the host checking procedure. The primary role determines which host compliance check profile (contains the host checking contents and the security level) will be applied to the user and what access permission can the user have if he passes the host checking. The guest role determines the access permissions for the users who fail the host checking.

The host compliance check procedure is shown as below

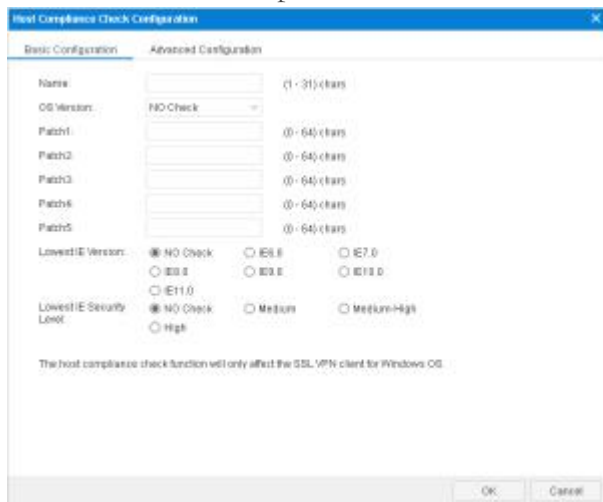

1. The SSL VPN client sends request for connection and passes the authentication.
2. The SSL VPN server sends the host checking profile to the client.
3. The client checks the host security status according to the items in the host checking profile. If it fails the host compliance check, system will be notified of the checking result.
4. The client sends the checking result back to the server.
5. The server disconnects the connection to the failed client or gives the guest role's access permission to the failed client.

The host compliance check function also supports dynamic access permission control. On one side, when the client's security status changes, the server will send a new host checking profile to the client to make him re-check; on the other side, the client can perform security checks periodically. For example, if the AV software is disabled and is detected by the host checking function, the role assigned to the client may change as will the access permissions.

Configuring a Host Compliance Check Profile

To configuring host compliance check profile, take the following steps:

1. Select **Network > VPN > SSL VPN**.
2. At the top right corner, click **Host Compliance Check/Binding** to visit the Host Compliance Check/Binding page.
3. In the Host Compliance Check tab, click **New** to create a new host checking rule.

In the Basic Configuration tab, configure the corresponding options.

Option	Description
Name	Specifies the name of the host checking profile.
OS Version	<p>Specifies whether to check the OS version on the client host. Click one of the following options:</p> <ul style="list-style-type: none"> • No Check: Do not check the OS version. • Must Match: The OS version running on the client host must be the same as the version specified here. Select the OS version and service pack version from the drop-down lists respectively. • At Least: The OS version running on the client host should not be lower than the version specified here. Select the OS version and service pack version from the drop-down lists respectively.
Patch1/2/3/4/5	Specifies the patch that must be installed on the client

	host. Type the patch name into the box. Up to 5 patches can be specified.
Lowest IE Version	Specifies the lowest IE version in the Internet zone on the client host. The IE version running on the client host should not be lower than the version specified here.
Lowest IE Security Level	Specifies the lowest IE security level on the client host. The IE security level on the host should not be lower than the level specified here.

In the **Advanced Configuration** tab, configure the corresponding options.

Option	Description
Security Center	Checks whether the security center is enabled on the client host.
Auto Update	Checks whether the Windows auto update function is enabled.
Anti-Virus Software	Checks the status and configurations of the anti-virus software: <ul style="list-style-type: none"> • Installed: The client host must have the AV software installed. • Monitor: The client host must enable the real-time monitor of the AV software. • Virus Signature DB Update: The client host must enable the signature database online update function.
Anti-Spyware Software	Checks the status and configurations of the anti-spyware software: <ul style="list-style-type: none"> • Installed: The client host must have the anti-spyware installed. • Monitor: The client host must enable the real-time monitor of the anti-spyware. • Signature DB Update: The client host must enable the signature database online update function.

Firewall	<p>Checks the status and configurations of the firewall:</p> <ul style="list-style-type: none"> • Installed: The client host must have the personal firewall installed. • Monitor: The client host must enable the real-time monitor function of the personal firewall.
Registry Key Value	
Key1/2/3/4/5	<p>Checks whether the key value exists. Up to 5 key values can be configured. The check types are:</p> <ul style="list-style-type: none"> • No Check: Do not check the key value. • Exist: The client host must have the key value. Type the value into the box. • Do not Exist: The client cannot have the key value. Type the value into the box.
File Path Name	
File1/2/3/4/5	<p>Checks whether the file exists. Up to 5 files can be configured. The check types are:</p> <ul style="list-style-type: none"> • No Check: Do not check file. • Exist: The client host must have the file. Type the value into the box. • Do not Exist: The client cannot have the file. Type the value into the box.
Name of Running Process	
Process1/2/3/4/5	<p>Checks whether the process is running. Up to 5 processes can be configured. The check types are:</p> <ul style="list-style-type: none"> • No Check: Do not check the process. • Exist: The client host must have the process run. Type the process name into the box.

	<ul style="list-style-type: none"> Do not Exist: The client cannot have the process run. Type the process name into the box.
Name of Installed Service	
Service1/2/3/4/5	<p>Checks whether the service is installed. Up to 5 services can be configured. The check types are:</p> <ul style="list-style-type: none"> No Check: Do not check the service. Exist: The client host must have the service installed. Type the service name into the box. Do not Exist: The client host cannot have the service installed. Type the service name into the box.
Name of Running Service	
Service1/2/3/4/5	<p>Checks whether the service is running. Up to 5 services can be configured. The check types are:</p> <ul style="list-style-type: none"> No Check: Do not check the service. Exist: The client host must have the service run. Type the service name into the box. Do not Exist: The client host cannot have the service run. Type the service name into the box.

4. Click **OK** to save the settings.

SSL VPN Client for Windows

SSL VPN client for Windows is named FS Secure Connect. FS Secure Connect can be run with the following operating systems: Windows 2000/2003/XP/Vista/Windows 7/Windows 8/Windows 2008/Windows 10/Windows 2012. The encrypted data can be transmitted between the SSL VPN client and SSL VPN server after a connection has been established successfully. The functions of the client are:

- Get the interface and the route information of the PC on which the client is running.

- Show the connecting status, statistics, interface information, and route information.
- Show SSL VPN log messages.
- Upgrade the client software.
- Resolve the resource list information received from the server.

This section mainly describes how to download, install, start, uninstall the SSL VPN client, and its GUI and menu. The method for downloading, installing and starting the client may vary from the authentication methods configured on the server. The SSL VPN server supports the following authentication methods:

- Username/Password
- Username/Password + Digital Certificate
- Digital Certificate only

Downloading and Installing Secure Connect

When using the SSL VPN client for the first time, you need to download and install the client software FS Secure Connect. This section describes three methods for downloading and installing the client software based on three available authentication methods. For the Username/Password + Digital Certificate authentication, the digital certificate can either be the USB Key certificate provided by the vendor, or the file certificate provided by the administrator.

Using Username/Password Authentication

When the Username/Password authentication is configured on the server, take the following steps to download and install the SSL VPN client software - FS Secure Connect:

1. Visit the following URL with a web browser: `https://IP-Address:Port-Number`. In the URL, IP-Address and Port-Number refer to the IP address and HTTPS port number of the egress interface specified in the SSL VPN instance.
2. In the SSL VPN login page (shown in Figure 1), type the username and password into the **Username** and **Password** boxes respectively, and then click **Login**.
 - If the local authentication server is configured on the device, the username and password should already be configured on the device.
 - If "Radius authentication + RSA SecurID Token authentication by RSA Server" is configured on the device, and the user logs in for the first time, the username should be the username configured on the Radius server, and the password should be the

dynamic Token password bound to the user. Click **Login**, and in the PIN Setting page (shown in Figure 2), set a PIN (4 to 8 digits). After the PIN has been set successfully, you will be prompted to login again with the new password (shown in Figure 3). Click **Login again** to return to the login page, type the correct username and new password, and click **Login**. The new password is PIN + dynamic Token password. For example, if the PIN is set to 54321, and the dynamic Token password is 808771, then the new password is 54321808771.

- If "Radius authentication + RSA SecurID Token authentication by RSA Server" is configured on the device, but the user is not logging in for the first time, the username should be the username configured on the Radius server, and the password should be PIN + dynamic Token password.

3. After logging in, IE will download the client software automatically, and you can install it by following the prompts; for other web browsers, e.g., Firefox, you should click **Download** to download the client software scvpn.exe first, and then double click it to install.

A virtual network adapter will be installed on your PC together with Secure Connect. It is used to transmit encrypted data between the SSL VPN server and client.

Using Username/Password + Digital Certificate Authentication

When the Username/Password + Digital Certificate authentication is configured on the server, take the following steps to download and install the SSL VPN client software - FS Secure Connect:

1. Insert the USB Key to the USB port of the PC, or import the file certificate provided by the administrator manually.

2. Visit the following URL with a web browser: `https://IP-Address:Port-Number`. In the URL, IP-Address and Port-Number refer to the IP address and HTTPS port number of the egress interface specified in the SSL VPN instance.
3. In the Select Digital Certificate dialog box, select the certificate you want and click **OK**. If USB Key certificate is selected, in the pop-up dialog box, provide the UKey PIN code (1111 by default) and click **OK**.
4. In the SSL VPN login page shown below, type the username and password into the **Username** and **Password** boxes respectively, and then click **Login**. The login user should be configured before in the device.

5. After logging in, IE will download the client software automatically, and you can install it by following the prompts; for other web browsers, e.g., Firefox, you should click **Download** to download the client software `scvpn.exe` first, and then double click it to install.

A virtual network adapter will be installed on your PC together with Secure Connect. It is used to transmit encrypted data between the SSL VPN server and client.

Using Digital Certificate Only

When only the Digital Certificate authentication is configured on the server, take the following steps to download and install the SSL VPN client software - FS Secure Connect:

1. Insert the USB Key to the USB port of the PC, or import the file certificate provided by the administrator manually.
2. Visit the following URL with a web browser: `https://IP-Address:Port-Number`. In the URL, IP-Address and Port-Number refer to the IP address and HTTPS port number of the egress interface specified in the SSL VPN instance.

3. In the Select Digital Certificate dialog box, select the certificate you want and click **OK**. If USB Key certificate is selected, in the Enter Password dialog box, provide the UKey user password (1111 by default) and click **OK**.
4. After logging in, IE will download the client software automatically, and you can install it by following the prompts; for other web browsers, e.g., Firefox, you should click **Download** to download the client software scvpn.exe first, and then double click it to install.

A virtual network adapter will be installed on your PC together with Secure Connect. It is used to transmit encrypted data between the SSL VPN server and client.

Starting Secure Connect

After installing Secure Connect on your PC, you can start it in two ways:

- Starting via Web
- Starting directly

Starting via Web

This section describes how to start Secure Connect via Web based on the three authentication methods configured on the server. For the Username/Password + Digital Certificate authentication, the digital certificate can either be the USB Key certificate provided by the vendor, or the file certificate provided by the administrator.

Using Username/Password Authentication

When the Username/Password authentication is configured on the server, take the following steps to start Secure Connect via web:

1. Type the URL `https://IP-Address:Port-Number` into the address bar of your web browser.
2. In the login page (shown in Figure 4), type the username and password into the **Username** and **Password** boxes respectively, and then click **Login**.
 - If local authentication server is configured on the device, the username and password should be configured before on the device;
 - If "Radius authentication + RSA SecurID Token authentication by RSA Server" is configured on the device, and the user logs in for the first time, the username should be the username configured on the Radius server, and the password should be the dynamic Token password bound to the user. Click **Login**, and in the PIN Setting page

(shown in Figure 5), set a PIN (4 to 8 digits). After the PIN has been set successfully, you will be prompted to login again with the new password (shown in Figure 6). Click **Login again** to return to the login page, type the correct username and new password, and click **Login**. The new password is PIN + dynamic Token password. For example, if the PIN is set to 54321, and the dynamic Token password is 808771, then the new password is 54321808771.

- If "Radius authentication + RSA SecurID Token authentication by RSA Server" is configured on the device, but the user is not logging in for the first time, the username should be the username configured on the Radius server, and the password should be PIN + dynamic Token password.

Tips: If the password control function and the change password function are enabled on the device, the system will remind the user to change the password before and after the password expires, and verify the historical password to ensure that the new password is different from the previous password. For more information about password control function, refer to [Configuring a Local AAA Server](#).

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

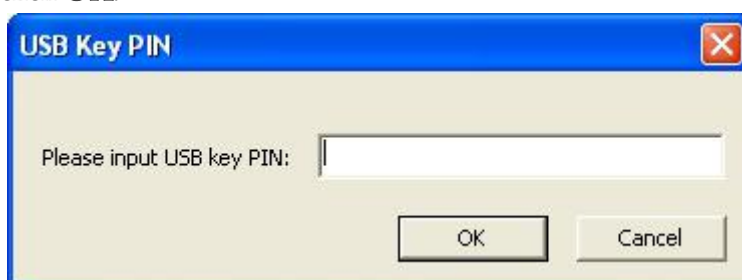

Using Username/Password + USB Key Certificate Authentication

When the Username/Password + Digital Certificate authentication for the USB Key certificate is configured on the server, to start Secure Connect via web, take the following steps:

1. Insert the USB Key to the USB port of the PC.
2. Type the URL `https://IP-Address:Port-Number` into the address bar of your web browser.
3. In the Select Digital Certificate dialog box, select the digital certificate you want and click **OK**. In the Enter Password dialog box, provide the UKey user password (1111 by default) and click **OK**.
4. In the SSL VPN login page shown below, type the username and password into the **Username** and **Password** boxes respectively, and then click **Login**. The login user should already be configured on the device.

5. In the USB Key PIN dialog box shown below, type the UKey PIN (1111 by default), and click **OK**.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Using Username/Password + File Certificate Authentication

When the Username/Password + Digital Certificate authentication for the file certificate is configured on the server, to start the Secure Connect via web, take the following steps:

1. Import the file certificate provided by the administrator manually.
2. Type the URL `https://IP-Address:Port-Number` into the address bar of your web browser.
3. In the Select Digital Certificate dialog box, select the digital certificate you want and click **OK**.
4. In the SSL VPN login page shown below, type the username and password into the **Username** and **Password** boxes respectively, and then click **Login**. The login user should already be configured on the device.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Using USB Key Certificate Only Authentication

When the Digital Certificate only authentication for the USB Key certificate is configured on the server, to start the Secure Connect via web, take the following steps:

1. Insert the USB Key to the USB port of the PC.

2. Type the URL `https://IP-Address:Port-Number` into the address bar of your web browser.
3. In the Select Digital Certificate dialog box, select the digital certificate you want and click **OK**. In the Enter Password dialog box, provide the UKey user password (1111 by default) and click **OK**.
4. In the USB Key PIN dialog box shown below, type the UKey PIN (1111 by default), and click **OK**.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Using File Certificate Only Authentication

When the Digital Certificate only authentication for the file certificate is configured on the server, to start the Secure Connect via web, take the following steps:

1. Import the file certificate provided by the administrator manually.
2. Type the URL `https://IP-Address:Port-Number` into the address bar of your web browser.
3. In the Select Digital Certificate dialog box, select the digital certificate you want and click **OK**.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Starting Directly

This section describes how to start Secure Connect directly based on the three authentication methods configured on the server.

Starting the Software Based on TLS/SSL Protocol

For the Username/Password + Digital Certificate authentication, the digital certificate can either be the USB Key certificate provided by the vendor, or the file certificate provided by the administrator.

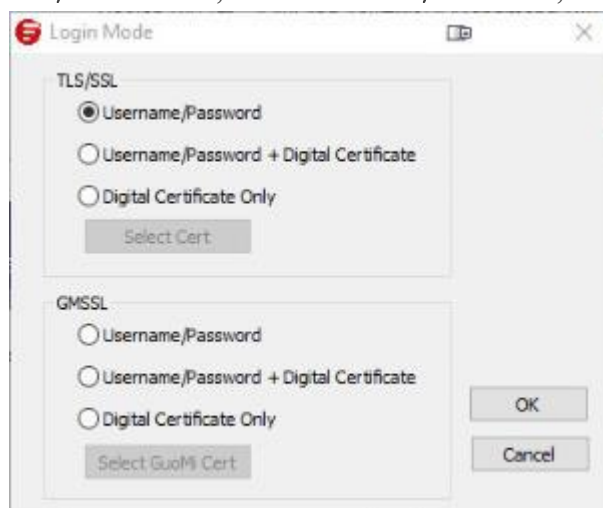

The starting mode based on TLS/SSL protocol are as follows:

- Username/Password
- Username/Password + USB Key Certificate
- Username/Password + File Certificate
- USB Key Certificate Only
- File Certificate Only

Using Username/Password Authentication

When the Username/Password authentication is configured on the server, to start the Secure Connect directly, take the following steps:

1. On your PC, double click the shortcut of FS Secure Connect on your desktop.
2. In the Login dialog box, click **Mode**. In the Login Mode dialog shown below, in **TLS/SSL** section, click **Username/Password**, and then click **OK**.

3. In the Login dialog box of the Username/Password authentication mode (shown in Figure 7), configure the options to login.

Option	Description
Saved	Provides the connection information you have filled before.
Connection	Select a connection from the drop-down list.

Option	Description
Server	Enter the IP address of SSL VPN server.
Port	Enter the HTTPS port number of SSL VPN server.
Username	Enter the name of the login user.
Password	Enter the password of the login user.

- If the local authentication server is configured on the device, the username and password should already be configured on the device.
- If "Radius authentication + RSA SecurID Token authentication by RSA Server" is configured on the device, and the user logs in for the first time, the username should be the username configured on the Radius server, and the password should be the dynamic Token password bound to the user. Click **Login**, and in the PIN Setting page (shown in Figure 8), set a PIN (4 to 8 digits). After the PIN has been set successfully, you will be prompted to login again with the new password (shown in Figure 9). Click **Login again** to return to the login page, type the correct username and new password, and click **Login**. The new password is PIN + dynamic Token password. For example, if the PIN is set to 54321, and the dynamic Token password is 808771, then the new password is 54321808771.
- If "Radius authentication + RSA SecurID Token authentication by RSA Server" is configured on the device, but the user is not logging in for the first time, the username should be the username configured on the Radius server, and the password should be PIN + dynamic Token password.

Tips: If the password control function and the change password function are enabled on the device, the system will remind the user to change the password before and after the password expires, and verify the historical password to ensure that the new password is different from the previous password. For more information about password control function, refer to [Configuring a Local AAA Server](#).

Finishing the above steps, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. And the encrypted communication between the client and server can be implemented now.

Using Username/Password + USB Key Certificate Authentication

When the Username/Password + Digital Certificate authentication is configured on the server, for the USB Key certificate, to start Secure Connect directly, take the following steps:

1. Insert the USB Key to the USB port of the PC.
2. In your PC, double click the shortcut to FS Secure Connect on your desktop.
3. In the Login dialog box, click **Mode**. In the Login Mode dialog box, first click **Username/Password + Digital Certificate** in **TLS/SSL** section, and if necessary, click **Select Cert**. In the Select Certificate dialog box shown below, select a USB Key certificate. If the USB Key certificate is not listed, click **Update**. The client will send the selected certificate to

the server for authentication. Finally click **OK**.

4. In the Login dialog of the Username/Password + Digital Certificate authentication mode (as shown below), configure the options to login.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Using Username/Password + File Certificate Authentication

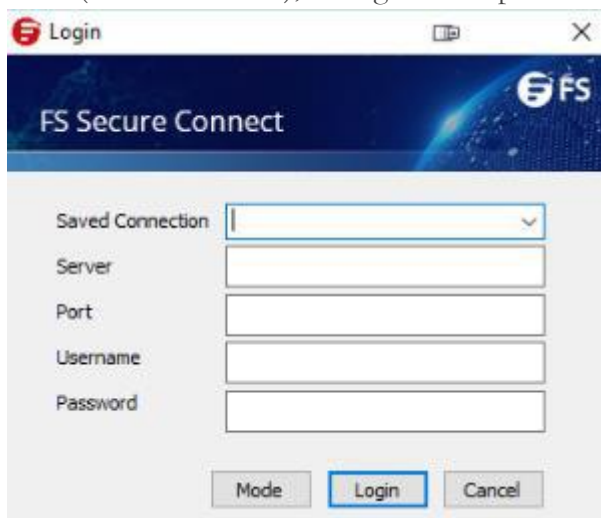

When the Username/Password + Digital Certificate authentication for the USB Key certificate is configured on the server, to start the Secure Connect directly, take the following steps:

1. Import the file certificate provided by the administrator manually.

2. On your PC, double click the shortcut to FS Secure Connect on your desktop.
3. In the Login dialog box, click **Mode**. In the Login Mode dialog, first click **Username/Password + Digital Certificate** in **TLS/SSL** section, and if necessary, click **Select Certificate**. In the Select Certificate dialog box shown below, select a file certificate. If the file certificate is not listed, click **Update**. The client will send the selected certificate to the server for authentication. Finally click **OK**.

4. In the Login dialog box of the Username/Password + Digital Certificate authentication mode (as shown below), configure the options to login.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Using USB Key Certificate Only

When the Username/Password + Digital Certificate authentication for the file certificate is configured on the server, to start the Secure Connect directly, take the following steps:

1. Insert the USB Key to the USB port of the PC.
2. On your PC, double click the shortcut to FS Secure Connect on your desktop.
3. In the Login dialog box, click **Mode**. In the Login Mode dialog box, first click **Username/Password + Digital Certificate** in **TLS/SSL** section, and if necessary, click **Select Certificate**. In the Select Certificate dialog box shown below, select a USB Key certificate. If the USB Key certificate is not listed, click **Update**. The client will send the selected certificate to the server for authentication. Finally click **OK**.

4. In the Login dialog box of the Username/Password + Digital Certificate authentication mode (as shown below), configure the options to login.

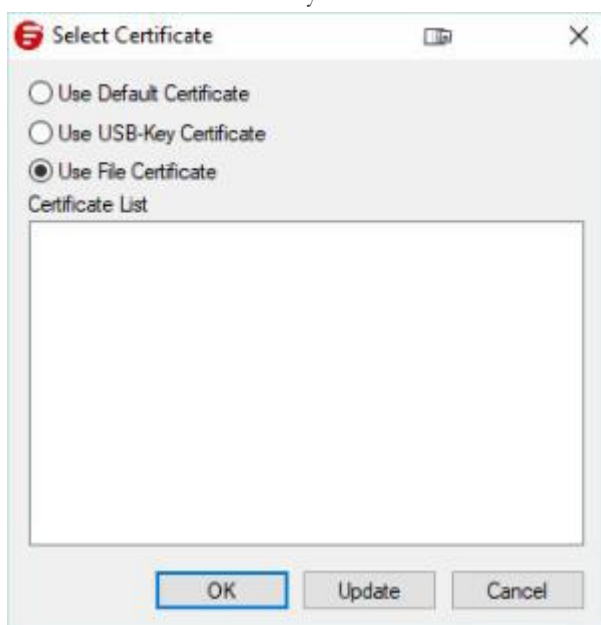

5. Finishing the above configuration, click **Login**.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Using File Certificate Only

When the Digital Certificate Only authentication for the USB Key certificate is configured on the server, to start the Secure Connect directly, take the following steps:

1. Import the file certificate provided by the administrator manually.
2. On your PC, double click the shortcut to FS Secure Connect on your desktop.
3. In the Login dialog box, click **Mode**. In the Login Mode dialog box, first click **Username/Password + Digital Certificate** in **TLS/SSL** section, and if necessary, click **Select Certificate**. In the Select Certificate dialog box shown below, select a file certificate. If the file certificate is not listed, click **Update**. The client will send the selected certificate to the server for authentication. Finally click **OK**.

- In the Login dialog box of the Digital Certificate Only authentication mode (as shown below), configure the options to login.

- Finishing the above configuration, click **Login**.

After the above steps being finished, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. The encrypted communication between the client and server can be implemented now.

Starting the Software Based on GMSSL Protocol

The starting mode based on GMSSL protocol are as follows:

- Username/Password
- Username/Password + Digital Certificate
- Digital Certificate Only

Using Username/Password Authentication

To start the Secure Connect client software, take the following steps:

- On your PC, double click the shortcut of FS Secure Connect on your desktop.
- In the Login dialog box, click **Mode**. In the Login Mode dialog shown below, click **Username/Password** in **GMSSL** section,, and then click **OK**.
- In the Login dialog box of the Username/Password authentication mode, configure the options to login.

Option	Description
Saved	Provides the connection information you have filled before.

Option	Description
Connection	Select a connection from the drop-down list.
Server	Enter the IP address of SSL VPN server.
Port	Enter the HTTPS port number of SSL VPN server.
Username	Enter the name of the login user.
Password	Enter the password of the login user.

Finishing the above steps, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. And the encrypted communication between the client and server can be implemented now.

Using Username/Password + Digital Certificate Authentication

When the Username/Password + Digital Certificate authentication is configured on the server, for the USB Key certificate, to start the Secure Connect software directly, take the following steps:

1. Insert the USB Token to the USB port of the PC.
2. In your PC, double click the shortcut to FS Secure Connect on your desktop.
3. In the Login dialog, click **Mode**. In the Login Mode dialog, first click **Username/Password + Digital Certificate** in **GMSSL** section, and if necessary, click **Select GuoMi Cert**. In the Select Certificate dialog as shown below, select a GM certificate. Finally click **OK**.
4. In the Select Certificate dialog box, configure the options to login.

Option	Description
Device	Select the current USB Token device name in the drop-down list.
Application	The application is a structure that contains a container, a device authentication key, and a file. Select the specified application name in the drop-down list.
Container	The container is the unique storage space in the USB Token device to save the key. It is used to store the encryption key pair, the encryption certificate corresponding to the encryption key pair, the signature key pair, and the signature certificate corresponding to the signature key pair. Select the name of the specified container in the drop-down list.
Signature Certificate	Display the name of the SM2 signature certificate in the specified container.

Option	Description
Encryption Certificate	Display the name of the SM2 encryption certificate in the specified container.

- In the Login dialog of the Username/Password + Digital Certificate authentication mode as shown below, configure the options to login.

Option	Description
Saved Connection	Provides the connection information you have filled before. Select a connection from the drop-down list.
Server	Enter the IP address of SSL VPN server.
Port	Enter the HTTPS port number of SSL VPN server.
Username	Enter the name of the login user.
Password	Enter the password of the login user.
USB Key PIN	Enter the PIN code of the USB Key (1111 by default). One USB Key only corresponds to one password.

Finishing the above steps, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. And the encrypted communication between the client and server can be implemented now.

Using Digital Certificate Only Authentication

When the Digital Certificate Only authentication is configured on the server, for the file certificate, to start the Secure Connect software directly, take the following steps:

- Insert the USB Token to the USB port of the PC.
- In your PC, double click the shortcut to FS Secure Connect on your desktop.
- In the Login dialog, click **Mode**. In the Login Mode dialog, first click **Digital Certificate only** in **GMSSL** section, and if necessary, click **Select GuoMi Cert**. In the Select Certificate dialog as shown below, select a GM certificate. Finally click **OK**.
- In the Select Certificate dialog box, configure the options to login.

Option	Description
Device	Select the current USB Token device name in the drop-down list.
Application	The application is a structure that contains a container, a device authentication key, and a file. Select the specified application name in the drop-down list.

Option	Description
Container	The container is the unique storage space in the USB Token device to save the key. It is used to store the encryption key pair, the encryption certificate corresponding to the encryption key pair, the signature key pair, and the signature certificate corresponding to the signature key pair. Select the name of the specified container in the drop-down list.
Signature Certificate	Display the name of the SM2 signature certificate in the specified container.
Encryption Certificate	Display the name of the SM2 encryption certificate in the specified container.

5. In the Login dialog of the Digital Certificate Only authentication mode as shown below, configure the options to login.

Option	Description
Saved Connection	Provides the connection information you have filled before. Select a connection from the drop-down list.
Server	Enter the IP address of SSL VPN server.
Port	Enter the HTTPS port number of SSL VPN server.
USB Key PIN	Enter the PIN code of the USB Key (1111 by default). One USB Key only corresponds to one password.

6. Finish the above configuration, click **Login**.

Finishing the above steps, the client will connect to the server automatically. After the connection has been established successfully, the icon () will be displayed in the notification area. And the encrypted communication between the client and server can be implemented now.

Viewing Secure Connect GUI

Double click the Secure Connect icon () in the notification area, and the Network Information dialog box appears. This dialog box shows information about statistics, interfaces, and routes.

General

Descriptions of the options on the General tab:

Address Information	
Server	The IP address of the connected SSL VPN server.

Address Information	
Client	The IP address of the client.
Crypto Suite	
Cipher	The encryption algorithm and authentication algorithm used by SSL VPN.
Version	The SSL version used by SSL VPN.
Connection Status	
Status	The current connecting status between the client and server. The possible statuses are: connecting, connected, disconnecting, and disconnected.
IPCompress	
Algorithm	Shows the compression algorithm used by SSL VPN.
Tunnel Packets	
Sent	The number of sent packets through the SSL VPN tunnel.
Received	The number of received packets through the SSL VPN tunnel.
Tunnel Bytes	
Sent	The number of sent bytes through the SSL VPN tunnel.
Received	The number of received bytes through the SSL VPN tunnel.
Connected Time	
Duration	Shows the time period during which the client is online.
Compress Ratio	
Sent	Shows the length ratio of sent data after compression.
Received	Shows the length ratio of received data after compression.

Interface

Descriptions of the options on the Interface tab:

Option	Description
Adapter Name	The name of the adapter used to send SSL VPN encrypted data.
Adapter Type	The type of the adapter used to send SSL VPN encrypted data.
Adapter Status	The status of the adapter used to send SSL VPN encrypted data.
Physical Address	The MAC address of the interface used to send SSL VPN encrypted data.
IP Address	The type of the interface address used to send SSL VPN

Option	Description
Type	encrypted data.
Network Address	The IP address (allocated by SSL VPN server) of the interface used to send SSL VPN encrypted data.
Subnet Mask	The subnet mask of the interface used to send SSL VPN encrypted data.
Default Gateway	The gateway address of the interface used to send SSL VPN encrypted data.
DNS Server Address	The DNS server addresses used by the client.
WINS Address	The WINS server addresses used by the client.

Route

Description of the option on the Route tab:

Option	Description
Local LAN Routes	The routes used by the virtual network adapter.

Viewing Secure Connect Menu

Right-click the Secure Connect icon () in the notification area and the menu appears.

Descriptions of the menu items are as follows:

Option	Description
Network Information	Displays the related information in the Network Information dialog box.
Log	Shows Secure Connect log messages in the Log dialog box. This dialog box shows the main log messages. To view the detailed log messages, click Detail . Click Clear to remove the messages in the dialog box. Click OK to close the Log dialog box.
Debug	Configures Secure Connect's debug function in the Debug dialog box.

Option	Description
About	Shows Secure Connect related information in the About dialog box.
Connect	When Secure Connect is disconnected, click this menu item to connect.
Disconnect	When Secure Connect is connected, click this menu item to disconnect.
Option	Configures Secure Connect options, including login information, auto start, auto login, and so on. For more information, see "Configuring Secure Connect" .
Exit	Click Exit to exit the client. If the client is connected to the server, the connection will be disconnected.

Configuring Secure Connect

You can configure Secure Connect in the Secure Connect Options dialog box(click **Option** from the client menu). The configurations include:

- Configuring General Options
- Configuring a Login Entry

Configuring General Options

In the Secure Connect Options dialog box, select **General** from the navigation pane and the general options will be displayed.

Descriptions of the options:

Option	Description
Auto Start	Select this check box to autorun the SSL VPN client when the PC is started.
Auto Login	Select this check box to allow the specified user to login automatically when the PC is started. Select the auto login user from the Default Connection drop-down list.
Auto Reconnect	Select this check box to allow the client to reconnect to the SSL VPN server automatically after an unexpected disconnection.
Select Cert	Click the button to select a USB Key certificate in the Select

Option	Description
	Certificate dialog box. This option is available when the USB KEY authentication is enabled.

Configuring a Login Entry

Login entry contains the login information for clients. The configured login entries will be displayed in the Saved Connection drop-down list in the Login dialog box. You can login by simply choosing the preferred connection instead of filling up the options in the Login dialog box.

To add a login entry, take the following steps:

1. In the Secure Connect Options dialog box, select **Saved Connection** from the navigation pane and the login options will be displayed.

In the dialog box, configure the corresponding options.

Option	Description
Connection Name	Specifies the name for the connection to identify it. System will assign a name to the connection based on its server, port, and user automatically if this option is kept blank
Server	Specifies the IP address of the SSL VPN server.
Port	Specifies the HTTPS port number of the SSL VPN server.
Username	Specifies the login user.
Login Mode	Specifies the login mode. It can be one of the following options: <ul style="list-style-type: none"> • Password (the username/password authentication method). If Password is selected, select Remember Password to make system remember the password and type the password into the Password box. • Password + UKey (the USB KEY authentication method). If Password + UKey is selected, select Remember PIN to make system remember the PIN number and type PIN number into the UKey PIN box.
Proximity Auto Detection	Select the option to enable the optimal path detection function. For more information about optimal path detection, see "Configuring an SSL VPN" .

2. Click **Apply**.

SSL VPN Client for Android

The SSL VPN client for Android is FS Secure Connect. It can run on Android 4.0 and above. The functions of FS Secure Connect contains the following items:

- Obtain the interface information of the Android OS.
- Display the connection status with the device, traffic statistics, interface information, and routing information.
- Display the log information of the application.

Downloading and Installing the Client

To download and install the client, take the following steps:

1. Visit //客户端下载地址 to download the installation file of the client.
2. After downloading successfully, find this file in your mobile phone.
3. Click it and the installation starts.
4. Read the permission requirements.
5. Click **Install**.

After the client being installed successfully, the icon of FS Secure Connect appears in the desktop as shown below:

Starting and Logging into the Client

To start and log into the client, take the following steps:

1. Click the icon of FS Secure Connect. The login page appears.
2. Provide the following information and then click **Login**.

- **Please Choose:** Select a login entry. A login entry stores the login information and it facilitates your next login. For more information on login entry, see the Configuration Management section below.
- **Server:** Enters the IP address or the server name of the device that acts as the VPN server.
- **Port:** Enters the HTTPs port number of the device.
- **Username:** Enters the username for logging into the VPN.
- **Password:** Enters the corresponding password.

After the client connecting to the SSL VPN server, the key icon () will appear at the notification area of your Android system.

GUI

After the client connects to the SSL VPN server, you can view the following pages: Connection Status page, Configuration Management page, Connection Log page, System Configuration page, and About Us page.

Connection Status

Click **Status** at the bottom of the page to enter into the **Connection Status** page and it displays the statistics and routing information:

- **The Connection Time:** Time period during which the client is online.
- **Received Bytes:** Shows the received bytes through the SSL VPN tunnel.
- **Sent Bytes:** Shows the sent bytes through the SSL VPN tunnel.
- **Server:** Shows the IP address or the server name of the device that client connects to.
- **Port:** Shows the HTTPs port number of the device.
- **Account:** Shows the username that logs into the VPN instance.
- **Private Server Address:** Shows the interface's IP address of the device that the client connects to.
- **Client Private Address:** Shows the IP address of the interface. This interface transmits the encrypted traffic and this IP address is assigned by the SSL VPN server.
- **Address Mask:** Shows the netmask of the IP address of the interface. This interface transmits the encrypted traffic.

- **DNS Address:** Shows the DNS Address used by the client.
- **Routing Information:** Shows the routing information for transmitting encrypted data.
- **Disconnection Connection:** Click this button to disconnect the current connection with the server.

Configuration Management

Click **VPN** at the bottom of the page to enter into the **Configuration Management** page. In this page, you can perform the following operations:

- Add/Edit/Delete a login entry
- Modify the login password
- Disconnect the connection with SSL VPN server
- Connect to the SSL VPN server

Adding a Login Entry

To facilitate the login process, you can add a login entry that stores the login information. The added login entry will display in the drop-down list of **Please Choose** in the login page. You can select a login entry and the login information will be filled in automatically.

To add a login entry, take the following steps:

1. In the Configuration Management page, click the  icon at the top-right corner.
2. **In the pop-up window, enter the following information:**
 - a. **Connection Name:** Enter a name as an identifier for this login entry
 - b. **Server:** Enter the IP address or the server name of the device that acts as the VPN server.
 - c. **Port:** Enter the HTTPs port number of the device.
 - d. **Username:** Enter the username for logging into the VPN.
3. Click **Confirm** to save this login entry.

Editing a Login Entry

To edit a login entry, take the following steps:

1. In the login entry list, click the one that you want to edit and several buttons will appear.
2. Click **Edit** to make the Edit Configuration dialog box appear.
3. In the dialog box, edit the login entry.
4. Click **Confirm** to save the modifications.

Deleting a Login Entry

To delete a login entry, take the following steps:

1. In the login entry list, click the one that you want to delete and several buttons will appear.
2. Click **Delete**.
3. Click **Yes** in the pop-up dialog box to delete this login entry.

Modifying the Login Password

To modify the login password, take the following steps:

1. In the login entry list, click the one that you want to modify the password and several buttons will appear.
2. Click **Modify Password**.
3. Enter the current password and new password in the pop-up dialog box.
4. Click **Confirm** to save the settings.

Disconnecting the Connection or Logging into the Client

To disconnect the connection or log into the client, take the following steps:

1. In the login entry list, click a login entry and several buttons will appear.
2. If the connection status to this server is disconnected, you can click **Login** to log into the client; if the connection status is connected, you can click **Disconnect Connection** to disconnect the connection.
3. In the pop-up dialog box, confirm your operation.

Connection Log

Click **Log** at the bottom of the page to enter into the **Configuration Log** page. In this page, you can view the logs.

System Configuration

Click **Config** at the bottom of the page to enter into the **System Configuration** page. In this page, you can configure the following options:

- **Auto Reconnect:** After turning on this switch, the client will automatically reconnect to the server if the connection is disconnected unexpectedly.
- **Show Notify:** After turning on this switch, the client icon will display in the notification area.
- **Allow To Sleep:** After turning on this switch, the client can stay connected while the Android system is in the sleep status. With this switch turned off, the client might disconnect the connection and cannot stay connected for a very long time while the Android system is in the sleep status.
- **Auto Login:** After turning on this switch, the client will automatically connect to the server when it starts. The server is the one that the client connects to the last time.
- **Remember The Password:** After turning on this switch, the client will remember the password and automatically fill in the login entry.
- **Exit:** Click **Exit** to exit this application.

About Us

Click **About** at the bottom of the page to enter the About US page. This page displays the version information, contact information, copyright information, etc.

L2TP VPN

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

L2TP (Layer Two Tunneling Protocol) is a VPDN technique that allows dial-up users to launch VPN connection from L2TP clients or L2TP access concentrators (LAC), and connect to a L2TP network server (LNS) via PPP. After the connection has been established successfully, LNS will assign IP addresses to legal users and permit them to access the private network.

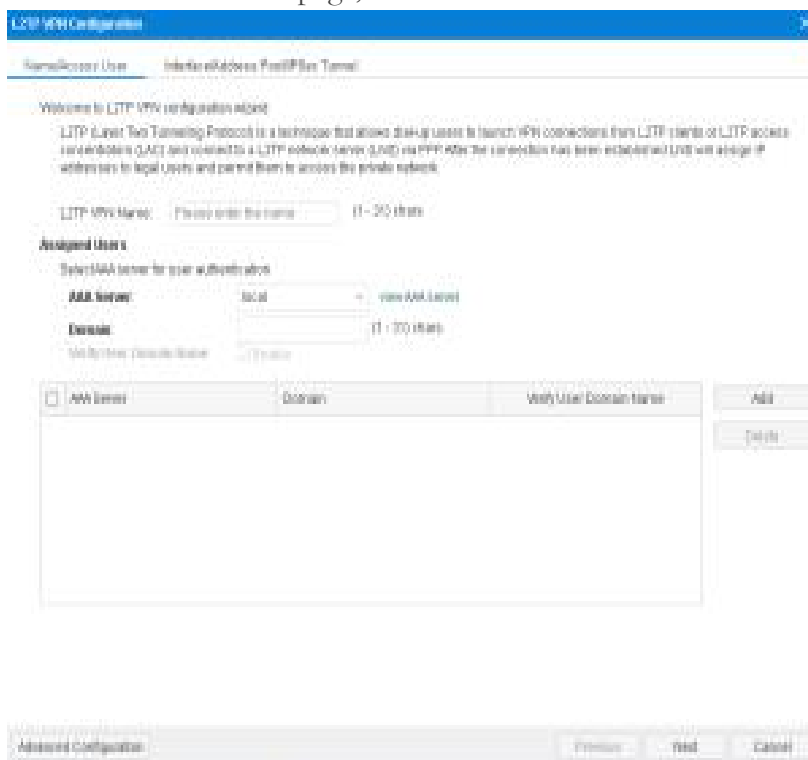

The device acts as a LNS in the L2TP tunnel network. The device accepts connections from L2TP clients or LACs, implements authentication and authorization, and assigns IP addresses, DNS server addresses and WINS server addresses to legal users.

L2TP does not encrypt the data transmitted through the tunnel, so it cannot assure security during the transmission. You can use L2TP in combination with IPsec, and encrypt data by IPsec, thus assuring the security during the data transmitted through the L2TP tunnel.

Configuring an L2TP VPN

To create an L2TP VPN instance, take the following steps:

1. Select **Network > VPN > L2TP VPN**.
2. In the L2TP VPN page, click **New**.

In the Name/Access User tab, configure the corresponding options.

Option	Description
L2TP VPN Name	Type the name of the L2TP VPN instance
Assigned Users	
AAA Server	Select an AAA server from the AAA Server drop-down list. You can click View AAA Server to view the detailed information of this AAA server.

Option	Description
Domain	Type the domain name into the Domain box. The domain name is used to distinguish the AAA server.
Verify User Domain Name	After this function is enable, system will verify the username and its domain name.
Add	Click Add to add the assigned users. You can repeat to add more items.

In the **Interface/Address Pool/IPSec Tunnel** tab, configure the corresponding options.

Access Interface	
Egress Interface	Select the interface from the drop-down list as the L2TP VPN server interface. This interface is used to listen to the request from L2TP clients.
Tunnel Interface	
Tunnel Interface	<p>Specifies the tunnel interface used to bind to the L2TP VPN tunnel. Tunnel interface transmits traffic to/from L2TP VPN tunnel.</p> <ul style="list-style-type: none"> Select a tunnel interface from the drop-down list, and then click Edit to edit the selected tunnel interface. Click New in the drop-down list to create a new interface.
Information	Shows the zone, IP address, and netmask of the selected tunnel interface.
Address Pool	
Address Pool	<p>Specifies the L2TP VPN address pool.</p> <ul style="list-style-type: none"> Select an address pool from the drop-down list, and then click Edit to edit the selected address pool. Click New in the drop-down list to create a new address pool. <p>For more information about creating/editing address pools, see "Configuring an L2TP VPN Address Pool" .</p>
Information	Shows the start IP address, end IP address, and mask of the address pool.

L2TP over IPSec	
L2TP over IPSec	Select a referenced IPSec tunnel from the drop-down list. L2TP does not encrypt the data transmitted through the tunnel, so it cannot assure security during the transmission. You can use L2TP in combination with IPSec, and encrypt data by IPSec, thus assuring the security for the data transmitted through the L2TP tunnel..

- If necessary, click **Advanced Configuration** to configure the advanced functions.

In the **Parameters** tab, configure the corresponding options.

Security	
Tunnel Authentication	Click Enable to enable tunnel authentication to assure the security of the connection. The tunnel authentication can be launched by either LNS or LAC. The tunnel cannot be established unless the both ends are authenticated, i.e., the secret strings of the two ends are consistent.
AVP Hidden	Click Enable to enable AVP hidden. L2TP uses AVP (attribute value pair) to transfer and negotiate several L2TP parameters and attributes. By default AVP is transferred in plain text. For data security consideration, you can encrypt the data by the secret string to hide the AVP during the transmission.
Secret	Specifies the secret string that is used for LNS tunnel authentication.
Peer	Specifies the host name of LAC. If multiple LACs are connected to LNS, you can specify different secret strings for different LACs by this parameter.
Add	Click Add to add the configured secret and peer name pair to the list.
Client Connection	
Accept Client IP	Click Enable to allow the accepting of IP address specified by the client. By default the client IP is selected from the address pool, and allocated by LNS automatically. If this function is enabled, you can specify an IP address. However, this IP address must belong to the specified address pool, and be consistent with the username and role. If the specified IP is already in use, system will not allow the user to log on.
Multiple Login	Click Enable to allow a user to log on and be authenticated on different hosts simultaneously.

Hello Interval	Specifies the interval at which Hello packets are sent. LNS sends Hello packets to the L2TP client or LAC regularly, and will drop the connection to the tunnel if no response is returned after the specified period.
LNS Name	Specifies the local name of LNS.
Tunnel Windows	Specifies the window size for the data transmitted through the tunnel.
Control Packet Transmit Retry	Specifies the retry times of control packets. If no response is received from the peer after the specified retry times, system will determine the tunnel connection is disconnected.
PPP Configuration	
LCP Interval	Specifies parameters for LCP Echo packets used for PPP negotiation. The options are:
Transmit Retries	<ul style="list-style-type: none"> • Interval: Specifies the interval at which LCP Echo packets are sent. • Transmit Retry: Specifies the retry times for sending LCP Echo packets. If LNS has not received any response after the specified retry times, it will determine the connection is disconnected.
PPP Authentication	Specifies a PPP authentication protocol. The options are: <ul style="list-style-type: none"> • PAP: Uses PAP for PPP authentication. • CHAP: Uses CHAP for PPP authentication. This is the default option. • Any: Uses CHAP for PPP authentication by default. If CHAP is not supported, then uses PAP.

4. Click **Done** to save the settings.

Configuring an L2TP VPN Address Pool

LNS assigns the IP addresses in the address pool to users. After the client has established a connection to LNS successfully, LNS will choose an IP address along with other related parameters (such as DNS server address, WINS server address, etc) from the address pool, and assign them to the client.

L2TP provides fixed IP addresses by creating and implementing IP binding rules.

- The static IP binding rule binds the client user to a fixed IP address in the address pool. Once the client has established a connection successfully, system will assign the binding IP to the client.
- The IP-role binding rule binds the role to a specific IP range in the address pool. Once the client has established a connection successfully, system will assign an IP address within the IP range to the client.

When LNS is allocating IP addresses in the address pool, system will check the IP binding rule and determine how to assign IP addresses for the client based on the specific checking order below:

Notes: The IP addresses defined in the static IP binding rule and IP-role binding rule should not be overlapped.

To create an address pool, take the following steps:

1. Select **Network > VPN > L2TP VPN**.
2. At the top-right corner, click **Address Pool**.
3. In the pop-up window, click **New**.

In the **Basic Configuration** tab, configure the corresponding options.

Option	Description
Address Pool Name	Specifies the name of the address pool.
Start IP	Specifies the start IP of the address pool.
End IP	Specifies the end IP of the address pool.
Reserved Start IP	Specifies the reserved start IP of the address pool.
Reserved End IP	Specifies the reserved end IP of the address pool.
DNS1/2	Specifies the DNS server IP address for the address pool. It is optional. Up to 2 DNS servers can be configured for one address pool.
WINS1/2	Specifies the WIN server IP addresses for the address pool. It is optional. Up to 2 WIN servers can be configured for one address pool.

In the **IP User Binding** tab, configure the corresponding options.

Option	Description
--------	-------------

User	Type the user name into the User box.
IP	Type the IP address into the IP box.
Add	Click Add to add this IP user binding rule.
Delete	To delete a rule, select the rule you want to delete from the list and click Delete .

In the **IP Role Binding** tab, configure the corresponding options.

Option	Description
Role	Type the role name into the Role box.
Start IP	Type the start IP address into the Start IP box.
End IP	Type the end IP address into the End IP box.
Add	Click Add to add this IP role binding rule.
Delete	To delete a rule, select the rule you want to delete from the list and click Delete .
Up/Down/Top/Bottom	System will query for IP role binding rules by turn, and allocate the IP address according to the first matched rule. You can move the location up or down at your own choice to adjust the matching sequence accordingly.

4. Click **OK** to save the settings.

Viewing L2TP VPN Online Users

To view the L2TP VPN online users, take the following steps:

1. Select **Network > VPN > L2TP VPN**.
2. Select an L2TP VPN instance.
3. View the detailed information of the online users in the table.

Option	Description
Name	Displays the name of L2TP VPN.
Login Time	Displays the login time of the L2TP VPN online user.
Public IP	Displays the public IP of the L2TP VPN online user.
Private IP	Displays the private IP of the L2TP VPN online user.
Operation	Displays the executable operation of the L2TP VPN online user.

Chapter 9 Object

This chapter describes the concept and configuration of objects that will be referenced by other modules in system, including:

- **"Address"** : Contains address information, and can be used by multiple modules, such as policy rules, NAT rules, QoS, session limit rules, etc.
- **"Host Book"** : A collection of one domain name or several domain names.
- **"Service Book"** : Contains service information, and can be used by multiple modules, such as policy rules, NAT rules, QoS, etc.
- **"Application Book"** : Contains application information, and it can be used by multiple modules, such as policy rules, NAT rules, QoS, etc.
- **"SLB Server Pool "**: Describes SLB server configurations.
- **"Schedule"** : Specifies a time range or period. The functions (such as policy rules, QoS rules, host blacklist, connections between the PPPoE interface and Internet) that use the schedule will take effect in the time range or period specified by the schedule.
- **"AAA Server"** : Describes how to configure an AAA server.
- **"User"** : Contains information about the functions and services provided by a device, and users authenticated and managed by the device.
- **"Role"** : Contains role information that associates users to privileges. In function configurations, different roles are assigned with different services. Therefore, the mapped users can gain the corresponding services as well.
- **"Track Object"** : Tracks if the specified object (IP address or host) is reachable or if the specified interface is connected. This function is designed to track HA and interfaces.
- **"URL Filtering"**: URL filter controls the access to some certain websites and records log messages for the access actions.
- **"NetFlow"** : Collect the user's incoming traffic information according to the NetFlow profile, and send it to the server with NetFlow data analysis tool.

Address

IP address is an important element for the configurations of multiple modules, such as policy rules, NAT rules and session limit rules. Therefore, system uses an address book to facilitate IP address reference and flexible configuration. You can specify a name for an IP range, and only the name is referenced during configuration. The address book is the database in system that is used to store the mappings between IP ranges and the corresponding names. The mapping entry between an IP address and its name in the address book is known as an address entry.

System provides a global address book. You need to specify an address entry for the global address book. When specifying the address entry, you can replace the IP range with a DNS name. Interfaces of the configured IPs will be used as address entries and added to the address book automatically. You can use them for NAT conveniently. Furthermore, an address entry also has the following features:

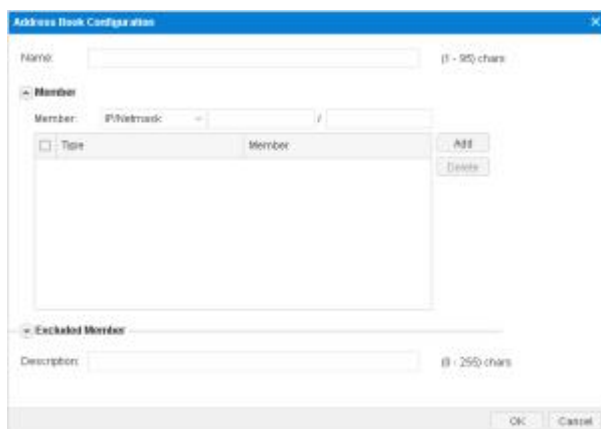

- All address books contain two default address entries named **Any** and **private_network**. The IP address of **Any** is 0.0.0.0/0, which is any IP address. **Any** can neither be edited nor deleted. The IP addresses of **private_network** are 10.0.0.0/8, 172.16.0.0/12, 192.168.0.0/16, that all private network address. The **private_network** can be edited and deleted.
- One address entry can contain another address entry in the address book.
- If the IP range of an address entry changes, FSOS will update other modules that reference the address entry automatically.

Address book supports IPv4 and IPv6 address. If IPv6 is enabled, you can configure IPv6 address entry.

Creating an Address Book

To create an address book, take the following steps:

1. Click **Object>Address Book**.
2. Click **New**.

In Address Book Configuration dialog box, enter the address entry configuration.

Basic	
Name	Type the address entry name into the Name box.
Type	Select the IP type, including IPv4 or IPv6. Only the IPv6 firmware supports to configure IPv6 type IP. If IPv6 is selected, all the IP/ netmask, IP range, address entry configured should be in the IPv6 format.
Member	
Member	<p>Select an address entry member from the drop-down list, and configure IP/netmask, IP range, Host name, Address entry, or Country/Region as needed.</p> <ul style="list-style-type: none"> • The Country/Region member is supported in the address entry of the IPv4 type. • Only the security policy and the policy-based route support the address entry with the Country/Region member added. • The address entry with the Country/Region member added does not support the Excluded Member settings.
Add	Click Add to add the configured member to the list below. If it is needed, repeat the above steps to add more members.
Delete	Delete the selected address entry from the list.
Excluded Member	
Member	<p>Specify the excluded member. Select an address entry member from the drop-down list, and configure IP/netmask, IP range, Host name or Address entry as needed.</p> <p>Note: Excluded members' address range need to be in the address range of the members, otherwise the configuration cannot be completed.</p>
Add	Click Add to add the configured excluded member to the list below. If needed, repeat the above steps to add more excluded members.
Delete	Delete the selected excluded member entry from the list.

3. Click **OK**.

Viewing Details

To view the details of an address entry, take the following steps, including the name, member, description and reference:

1. Click **Object>Address Book**.
2. In the Address Book dialog box, select an address entry from the member list, and view the details under the list.

Host Book

You can specify a name to be a collection of one domain name or several domain names, and reference this host book when configuring. Host book is the database to store the relationships of domain integrations and the specified names in system.

The entry of the relationship of domain integrations and the specified name is called host entry.

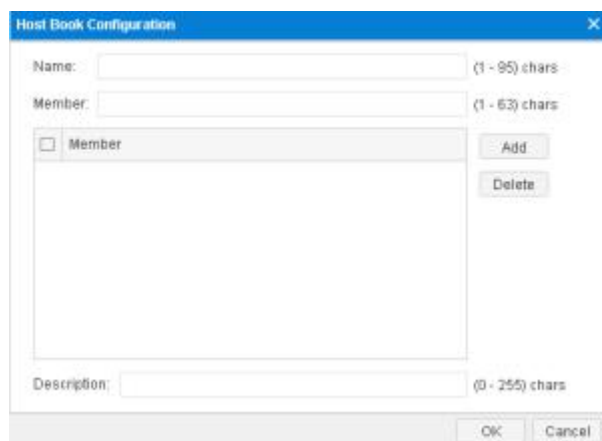

Notes:

- The maximum number of host entries is one fourth of the maximum number of address entries.
- Up to one host entry can be configured for each PBR rule.

Creating a Host Book

To create a host book, take the following steps:

1. Select **Object > Host Book**.
2. Click **New**.

The image shows a screenshot of the 'Host Book Configuration' dialog box. It has a blue title bar with the text 'Host Book Configuration' and a close button (X). The dialog contains several input fields and buttons:

- Name:** A text input field with a character count '(1 - 95) chars' to its right.
- Member:** A text input field with a character count '(1 - 63) chars' to its right.
- Member List:** A list box containing one entry 'Member' with a checkbox to its left. To the right of the list box are two buttons: 'Add' and 'Delete'.
- Description:** A text input field with a character count '(0 - 255) chars' to its right.
- Buttons:** At the bottom of the dialog are two buttons: 'OK' and 'Cancel'.

Configure the following options.

Option	Description
Name	Type a name for the host book.
Member	Specifies the host entry member. Enter IP address or domain name in the Member text box and then click Add . If needed, you can add multiple host entries in the host book. Select the host entry you want to delete and click Delete , then the selected entry will be removed.
Description	Type the description of host book.

3. Click **OK**.

Service Book

Service is an information stream designed with protocol standards. Service has some specific distinguishing features, like corresponding protocol, port number, etc. For example, the FTP service uses TCP protocol, and its port number is 21. Service is an essential element for the configuration of multiple FSOS modules including policy rules, NAT rules, QoS rules, etc.

System ships with multiple predefined services/service groups. Besides, you can also customize user-defined services/service groups as needed. All these service/service groups are stored in and managed by FSOS service book.

Predefined Service/Service Group

System ships with multiple predefined services, and identifies the corresponding application types based on the service ports. The supported predefined services may vary from different device models. Predefined service groups contain related predefined services to facilitate user configuration.

User-defined Service

Except for the above predefined services, you can also create your own user-defined services easily. The parameters that will be specified for the user-defined service entries include:

- Name
- Protocol type
- The source and destination port for TCP or UDP service, and the type and code value for ICMP service.

User-defined Service Group

You can organize some services together to form a service group, and apply the service group to FSOS policies directly to facilitate management. The service group has the following features:

- Each service of the service book can be used by one or more service groups.
- A service group can contain both predefined services and user-defined services.
- A service group can contain another service group. The service group of FSOS supports up to 8 layers of nests.

The service group also has the following limitations:

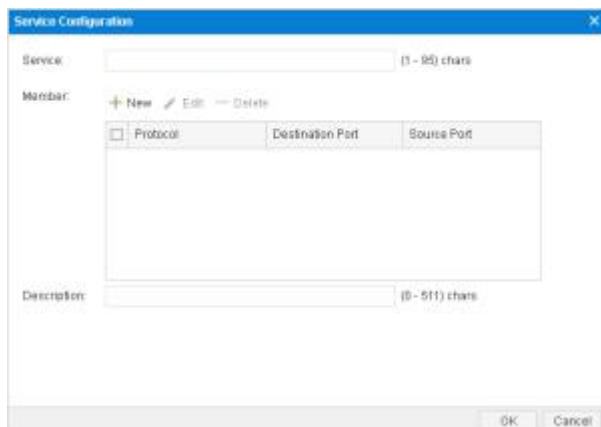

- The name of a service and service group should not be identical.
- A service group being used by any policy cannot be deleted. To delete such a service group, you must first end its relationship with the other modules.
- If a user-defined service is deleted from a service group, the service will also be deleted from all of the service groups using it.

Configuring a Service Book

This section describes how to configure a user-defined service and service group.

Configuring a User-defined Service

1. Select **Object > Service Book > Service**.
2. Click **New**.

Configure the following options.

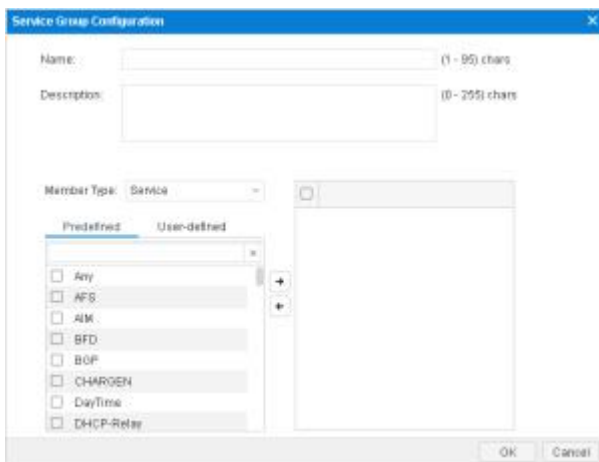

Service Configuration				
Service	Type the name for the user-defined service into the textbox.			
Member	<p>Specify a protocol type for the user-defined service. The available options include TCP, UDP, ICMP and Others. If needed, you can add multiple service items.</p> <p>Click New and the parameters for the protocol types are described as follows:</p>			
	<table border="1"> <tbody> <tr> <td>TCP/UDP</td> <td> <p>Destination port:</p> <ul style="list-style-type: none"> • Min - Specifies the minimum port number of the specified service entry. • Max - Specifies the maximum port number of the specified service entry. The value range is 0 to 65535. <p>Source port:</p> <ul style="list-style-type: none"> • Min - Specifies the minimum port number of the specified service entry. • Max - Specifies the maximum port number of the specified service entry. The value range is 0 to 65535. <p>Notes: The minimum port number cannot exceed the maximum port number.</p> </td> </tr> <tr> <td>ICMP</td> <td> <p>Type: Specifies an ICMP type for the service entry. The value range is 3 (Destination-Unreachable), 4 (Source Quench), 5 (Redirect), 8 (Echo), 11 (Time Exceeded), 12 (Parameter Problem), 13 (Timestamp) and 15 (Information).</p> <p>Min Code: Specifies a minimum value for ICMP code. The value range is 0 to 5.</p> <p>Max Code: Specifies a maximum value for</p> </td> </tr> </tbody> </table>	TCP/UDP	<p>Destination port:</p> <ul style="list-style-type: none"> • Min - Specifies the minimum port number of the specified service entry. • Max - Specifies the maximum port number of the specified service entry. The value range is 0 to 65535. <p>Source port:</p> <ul style="list-style-type: none"> • Min - Specifies the minimum port number of the specified service entry. • Max - Specifies the maximum port number of the specified service entry. The value range is 0 to 65535. <p>Notes: The minimum port number cannot exceed the maximum port number.</p>	ICMP
TCP/UDP	<p>Destination port:</p> <ul style="list-style-type: none"> • Min - Specifies the minimum port number of the specified service entry. • Max - Specifies the maximum port number of the specified service entry. The value range is 0 to 65535. <p>Notes: The minimum port number cannot exceed the maximum port number.</p>			
ICMP	<p>Type: Specifies an ICMP type for the service entry. The value range is 3 (Destination-Unreachable), 4 (Source Quench), 5 (Redirect), 8 (Echo), 11 (Time Exceeded), 12 (Parameter Problem), 13 (Timestamp) and 15 (Information).</p> <p>Min Code: Specifies a minimum value for ICMP code. The value range is 0 to 5.</p> <p>Max Code: Specifies a maximum value for</p>			

Service Configuration	
	<p>ICMP code. The value range is 0 to 5.</p> <p>Notes: The minimum port number cannot exceed the maximum port number.</p>
	<p>Others</p> <p>Protocol: Specifies a protocol number for the service entry. The value range is 1 to 255.</p>
Description	If it's needed, type the description for the service into the text box.

3. Click OK.

Configuring a User-defined Service Group

1. Select Object > Service Book > Service Group.
2. Click New.

Configure the following options.

Service Group Configuration	
Name	Type the name for the user-defined service group into the text box.
Description	If needed, type the description for the service into the text box.
Member Type	<p>Add services or service groups to the service group. System supports at most 8-layer nested service group.</p> <p>Expand Pre-defined Service or User-defined Service from the left pane, select services or service groups, and then click Add to add them to the right pane. To remove a selected service, select</p>

Service Group Configuration

it from the right pane, and then click **Remove**.

3. Click **OK**.

Viewing Details

To view the details of a service entry, take the following steps, including the name, protocol, destination port and reference:

1. Click **Object>Service Book > Service**.
2. In the service dialog box, select an address entry from the member list, and view the details under the list.

Application Book

Application has some specific features, like corresponding protocol, port number, application type, etc. Application is an essential element for the configuration of multiple device modules including policy rules, NAT rules, application QoS management, etc.

System ships with multiple predefined applications and predefined application groups. Besides, you can also customize user-defined application and application groups as needed. All of these applications and applications groups are stored in and managed by FSOS application book.

If IPv6 is enabled, IPv6 applications will be recognized by FSOS..

Editing a Predefined Application

You can view and use all the supported predefined applications and edit TCP timeout, but cannot delete any of them. To edit a predefined application, take the following steps:

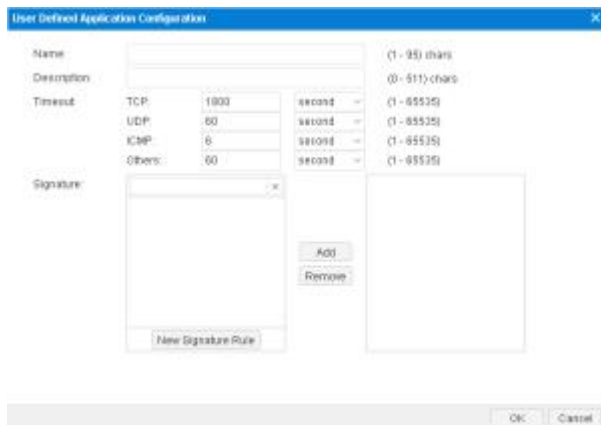

1. Select **Object > APP Book > Application**.
2. Select the application you want to edit from the application list, and click **Edit**.
3. In the Application Configuration dialog box, edit TCP timeout for the application.

Creating a User-defined Application

You can create your own user-defined applications. By configuring the customized application signature rules, system can identify and manage the traffic that crosses into the device, thus identifying the type of the traffic.

To create a user-defined application, take the following steps:

1. Select **Object > APP Book > Application**.
2. Click **New**.

Configure the following options.

Option	Description
Name	Specify the name of the user-defined application.
Description	Specify the description of the user-defined application.
Timeout	Configure the application timeout value. If not, system will use the default value of the protocol.
Signature	Select the signature of the application and then click Add . To create a new signature, see " Creating a Signature Rule ".

3. Click **OK**.

Creating a User-defined Application Group

To create a user-defined application group, take the following steps:

1. Select **Object > APP Book > Application Groups**
2. Click **New**.

Configure the following options.

Option	Description
Name	Specifies a name for the new application group.
Description	Specifies the description for the application group.
Member	Add applications or application groups to the application group. System supports at most 8-layer nested application group.

Option	Description
	Expand Application or Application Group from the left pane, select applications or application groups, and then click Add to add them to the right pane. To remove a selected application or application group, select it from the right pane, and then click Remove .

3. Click **OK**.

Creating an Application Filter Group

Application Filter Group allows you to create a group to filter applications according to application category, sub-category, technology, risk, and attributes.

To create an application filter group, take the following steps:

1. Select **Object > APP Book > Application Filters**.
2. Click **New**.
3. Type an application filter group name in the Name text box.
4. Specifies the filter condition. Choose the category, subcategory, technology, risk and characteristic by sequence in the drop-down list. You can click Clear Filter to clear all the selected filter conditions according to your need.
5. Click **OK**.

Creating a Signature Rule

By configuring the customized application signature rules, system can identify and manage the traffic that crosses into the device. When the traffic matches all of the conditions defined in the signature rule, it hits this signature rule. Then system identifies the application type.

If IPv6 is enabled, traffic of IPv6 address will be recognized by FSOS..

To create a new signature rule, take the following steps:

1. Select **Object > APP Book > Static Signature Rule**.
2. Click **New**.

Configure the following options.

Option	Description
Type	Select the IP address type, including IPv4 or IPv6.

Option	Description
	Only the IPv6 firmware supports to configure IPv6 type IP. If IPv6 is selected, traffic of IPv6 address will be recognized by FSOS.
Source	
Zone	Specify the source security zone of the signature rule.
Address	Specify the source address. You can use the Address Book type or the IP/Netmask type.
Destination	
Address	Specify the source address. You can use the Address Book type or the IP/Netmask type.
Protocol	
Enable	Select the Enable check box to configure the protocol of the signature rule.
Type	<p>When selecting TCP or UDP,</p> <ul style="list-style-type: none"> • Destination Port: Specify the destination port number of the user-defined application signature. If the destination port number is within a range, system will identify the value of min-port as the minimum port number and identify the value of max-port as the maximum port number. The range of destination port number is 0 to 66535. The port number cannot be 0. For example, the destination port number is in the range of 0 to 20, but it cannot be 0. • Source Port: Specify the source port number of the user-defined application signature. If the source port number is within a range, system will identify the value of min-port as the minimum port number and identify the value of max-port as the maximum port number. The range of source port number is 0 to 66535. <p>When selecting ICMP:</p> <ul style="list-style-type: none"> • Type: Specify the value of the ICMP type of the application signature. The options are as follows: 3 (Destination-Unreachable), 4 (Source Quench), 5

Option	Description
	<p>(Redirect), 8 (Echo), 11 (Time Exceeded), 12 (Parameter Problem), 13 (Timestamp), 15 (Information), and any (any represents all of the above values).</p> <ul style="list-style-type: none"> Min Code: Specify the value of the ICMP code of the application signature. The ICMP code is in the range of 0 to 5. The default value is 0-5. <p>When selecting Others:</p> <ul style="list-style-type: none"> Protocol: Specifies the protocol number of the application signature. The protocol number is in the range of 1 to 255.
Action	
App-Signature Rule	Select Enable to make this signature rule take effect after the configurations. Otherwise, it will not take effect.
Continue Dynamic Identification	Without selecting this check box, if the traffic satisfies the user-defined signature rule and system has identified the application type, system will not continue identifying the application. To be more accurate, you can select this check box to set the system to continue dynamically identification.

3. Click **OK**.

Viewing Details

To view the details of an application entry, including the name, category, risk and reference, take the following steps:

1. Click **Object>APP Book > Application**.
2. In the application dialog box, select an address entry from the member list, and view the details under the list.

SLB Server Pool

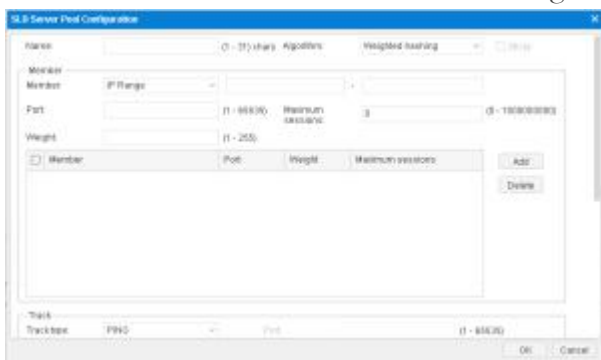

The SLB function uses the load balancing algorithm to distribute the traffic and this utilizes the resources of the intranet servers. You can use the following methods to balance the server load:

- Distribute the traffic to the specified port of each intranet server. This is applicable to the scenario that different intranet servers provide the same service via specified port at the same time.
- Distribute the traffic to different ports of an intranet server. This is applicable to the scenario that an intranet server provides the same service by running the same process at different ports.
- Combine the above two methods.

Configuring SLB Server Pool and Track Rule

To configure an SLB server pool and track rule, take the following steps:

1. Select **Object > SLB Server Pool**.
2. Click **New**. The SLB Server Pool Configuration dialog box appears.

In the SLB Server Pool Configuration dialog box, configure the following options.

Option	Description
Name	Specifies the name of the SLB server pool
Algorithm	Select an algorithm for load balancing.
Member	
Member	Specifies the member of the pool. You can type the IP range or the IP address and the netmask.
Port	Specifies the port number of the server.
Maximum Sessions	Specifies the allowed maximum sessions of the server. The value ranges from 0 to 1,000,000,000. The default value is 0, which represents no limitation.
Weight	Specifies the traffic forwarding weight during the load balancing.

Option	Description
	The value ranges from 1 to 255.
Add	Add the SLB address pool member to the SLB server pool. You can add up to 256 members.
Track	
Track Type	Selects a track type.
Port	<p>Specifies the port number that will be tracked. The value ranges from 0 to 65535.</p> <ul style="list-style-type: none"> When the members in the SLB server pool have the same IP address and different ports, you don't need to specify the port when configuring the track rule. System will track each IP address and its port in the SLB server pool. When there is a member whose port is not configured exists in the SLB sever pool, you must specify the port when configuring the track rule. System will track the specified port of the IP addresses in the SLB server pool. When the members in the SLB server pool are all configured with IP addresses and ports and these configured IP addresses are different from each other, you can select whether to specify the port when configuring the track rule. If specified, system will track the specified port of these IP addresses. If not, system will track the configured ports of the IP addresses of the members.
Interval	Specifies the interval between each Ping/TCP/UDP packet. The unit is second. The value ranges from 3 to 255.
Retries	Specifies a retry threshold. If no response packet is received after the specified times of retries, System will determine this track entry fails, i.e., the track entry is unreachable. The value range is 1 to 255.

Option	Description
Weight	Specifies a weight for the overall failure of the whole track rule if this track entry fails. The value range is 1 to 255.
Add	Click Add to add the configured track rule to the list.
Threshold	Types the threshold for the track rule into the Threshold box. The value range is 1 to 255. If the sum of weights for failed entries in the track rule exceeds the threshold, system will conclude that the track rule fails.
Description	Types the description for this track rule.

3. Click **OK** to save the settings.

Viewing Details of SLB Pool Entries

To view the details of the servers in the SLB pool, take the following steps:

1. Click **Object > SLB Server Pool**.
2. Select an SLB pool entry.
3. In the Server List tab at the bottom of this page, view the information of the servers that are in this SLB pool.
4. In the Monitoring tab, view the information of the track rules.
5. In the Referenced tab, view the DNAT rules that use the SLB pool.

Schedule

System supports a schedule. This function allows a policy rule to take effect in a specified time and controls the duration of the connection between a PPPoE interface and the Internet. The schedule consists of a periodic schedule and an absolute schedule. The periodic schedule specifies a time point or time range for periodic schedule entries, while the absolute schedule decides a time range in which the periodic schedule will take effect.

Periodic Schedule

Periodic schedule is the collection of periods specified by all of the schedule entries within the schedule. You can add up to 16 schedule entries to a periodic schedule. These entries can be divided into 3 types:

- **Daily:** The specified time of every day, such as Everyday 09:00 to 18:00.

- Days: The specified time of a specified day during a week, such as Monday Tuesday Saturday 09:00 to 13:30.
- Period: A continuous period during a week, such as from Monday 09:30 to Wednesday 15:00.

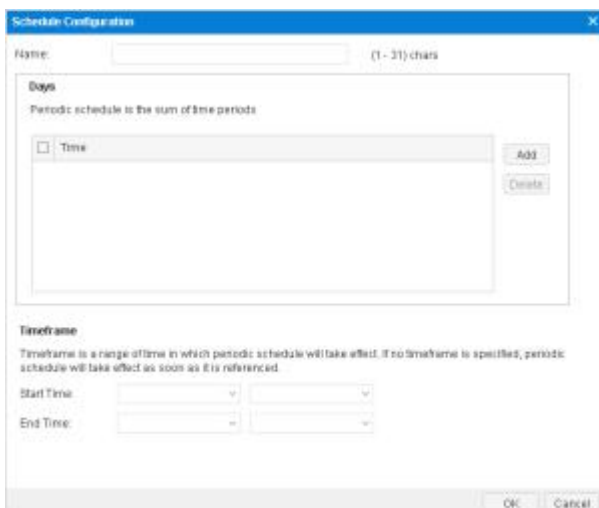

Absolute Schedule

An absolute schedule is a time range in which a periodic schedule will take effect. If no absolute schedule is specified, the periodic schedule will take effect as soon as it is used by some module.

Creating a Schedule

To create a schedule, take the following steps:

1. Select **Object > Schedule**.
2. Click **New**.

Configure the following options.

Schedule Configuration Dialog Box					
Name	Specifies a name for the new schedule.				
Add	Specifies a type for the periodic schedule in Add Periodic Schedules section. <table border="1" data-bbox="507 1742 1295 2027"> <thead> <tr> <th>Type</th> <th></th> </tr> </thead> <tbody> <tr> <td> <ul style="list-style-type: none"> • Daily - The specified time of every day. Click this radio button, and then, in the Time section, select a start time and end time from the Start time and End time dropdown list respectively. </td> <td></td> </tr> </tbody> </table>	Type		<ul style="list-style-type: none"> • Daily - The specified time of every day. Click this radio button, and then, in the Time section, select a start time and end time from the Start time and End time dropdown list respectively. 	
Type					
<ul style="list-style-type: none"> • Daily - The specified time of every day. Click this radio button, and then, in the Time section, select a start time and end time from the Start time and End time dropdown list respectively. 					

Schedule Configuration Dialog Box	
	<ul style="list-style-type: none"> Days - The specified time of a specified day during a week. Click this radio button, and then select a day/days in the Days and Time section, and finally select a start time and end time from the Start time and End time drop-down list respectively. Duration - A continuous period during a week. Click this radio button, and then in the Duration section select a start day/time and end day/time from the Start time and End time drop-down list respectively.
Preview	Preview the detail of the configured periodic schedule in the Preview section.
Delete	Select the entry you want to delete from the period schedule list below, and click Delete .
Absolute Schedule	The absolute schedule decides a time range in which the periodic schedule will take effect. Without configuring an absolute schedule, the periodic schedule will take effect as soon as it is used by some module.

3. Click **OK**.

AAA Server

An AAA server is a server program that handles user requests to access computer resources, and for an enterprise, this server provides authentication, authorization, and accounting (AAA) services. The AAA server typically interacts with network access and gateway servers and with databases and directories containing user information.

Here in system, authentication supports the following five types of AAA server:

- Local server: a local server is the firewall itself. The firewall stores user identity information and handles requests. A local server authentication is fast and cheap, but its storage space is limited by the firewall hardware size.
- External servers:

- [Radius Server](#)
- [LDAP Server](#)
- [Active-Directory Server](#)
- [TACACS+ Server](#)

According to the type of authentication, you need to choose different AAA servers:

- "802.1x" and "Configuring IPSec-XAUTH Address Pool" : Only local and Radius servers support these two types of authentication.
- Other authentication methods mentioned in this guide: all four servers can support the other authentication methods.

Configuring a Local AAA Server

1. Select **Object > AAA Server**.
2. Click **New > Local Server**, the **Local Server Configuration dialog box** prompts.

In the prompt, configure the following.

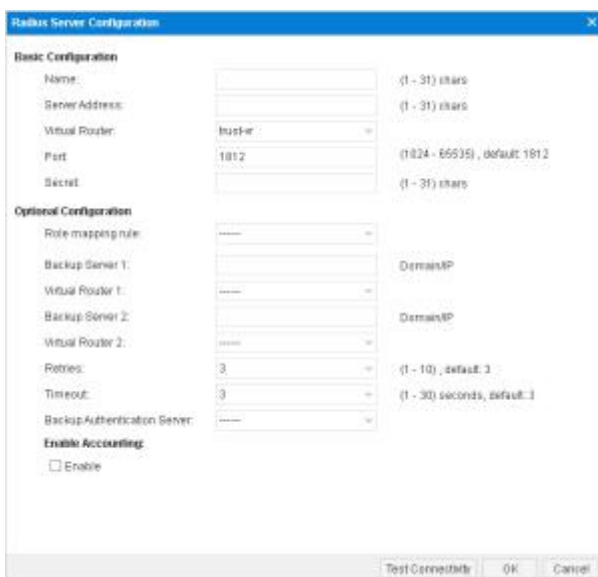

Option	Description
Name	Type the name for the new server into the text box.
Role mapping rule	Specifies a role mapping rule for the server. With this option selected, system will allocate a role for the users who have been authenticated to the server according to the specified role mapping rule.
Change Password	If needed, select the Enable checkbox. With this function enabled, system allows users to change their own passwords after the successful WebAuth or SCVPN authentication.
Backup Authentication Server	To configure a backup authentication server, select a server from the drop-down list. After configuring a backup authentication server for the local server, the backup authentication server will take over the authentication task when the primary server malfunctions or authentication fails on the primary server. The backup authentication server can be any existing local, Active-Directory, RADIUS or LDAP server defined in system.
Password Control	To prevent account security problem caused by not changing password for a long time, you can enable the password control

Option	Description
	<p>function to set the password validity check, the password expiry warning and the history password check.</p> <ul style="list-style-type: none"> • Select the History Password Check check box to enable the history password check function. With the function, system will verify the new password with the historical passwords when you change the password, ensuring the new password is different from the passwords set in the specified times. • Select the Validity Check check box to enable the password validity check function and configure the valid period of password. • Select the Password Expiry Warning check box to enable the password expiry warning function and configure the days how long users will be reminded of password expiry before it expires.

3. Click OK.

Configuring Radius Server

1. Select **Object > AAA Server**, and select **New > Radius Server**.
2. The Radius Sever dialog box opens.

In the prompt, configure the following.

Basic Configuration			
Name	Specifies a name for the Radius server.		
Server Address	Specifies an IP address or domain name for the Radius server.		
Virtual Router	Specifies a VR for the Radius server.		
Port	Specifies a port number for the Radius server. The value range is 1024 to 65535. The default value is 1812.		
Secret	Specifies a secret for the Radius server. You can specify at most 31 characters.		
Optional			
Role mapping rule	Specifies a role mapping rule for the server. With this option selected, system will allocate a role for the users who have been authenticated to the server according to the specified role mapping rule.		
Backup server 1/ Backup server 2	Specifies an IP address or domain name for backup server 1 or backup server 2.		
Virtual Router1/ Virtual Router2	Specifies a VR for the backup server.		
Retries	Specifies a retry time for the authentication packets sent to the AAA server. The value range is 1 to 10. The default value is 3.		
Timeout	Specifies a timeout for the server response. The value range is 1 to 30 seconds. The default value is 3.		
Backup Authentication Server	Specifies a backup authentication server. After configuring a backup authentication server for the Radius server, the backup authentication server will take over the authentication task when the primary server malfunctions or authentication fails on the primary server. The backup authentication server can be any existing local, Active-Directory, RADIUS or LDAP server defined in system.		
Enable Accounting	Select the Enable checkbox to enable accounting for the Radius server, and then configure options in the sliding out area.		
	<table border="1"> <tr> <td>Server Address</td> <td>Specifies an IP address or domain name for the accounting server.</td> </tr> </table>	Server Address	Specifies an IP address or domain name for the accounting server.
Server Address	Specifies an IP address or domain name for the accounting server.		

Basic Configuration	
Virtual Router	Specifies a VR for the accounting server.
Port	Specifies a port number for the accounting server. The value range is 1024 to 65535. The default value is 1813.
Password	Specifies a password for the accounting server.
Backup server 1/Backup server 2	Specifies an IP address or domain name for backup server 1 or backup server 2.
Virtual Router1/Virtual Router2	Specifies a VR for the backup server.

3. Click OK.

Configuring Active Directory Server

1. Select **Object > AAA Server**, and then select **New > Active Directory Server**.
2. The Active Directory Server dialog box opens.

In the prompt, configure the following.

Basic Configuration	
Name	Specifies a name for the Active Directory server.

Basic Configuration	
Server Address	Specifies an IP address or domain name for the Active Directory server.
Virtual Router	Specifies a VR for the Active Directory server.
Port	Specifies a port number for the Active Directory server. The value range is 1 to 65535. The default value is 389.
Base-dn	<p>Specifies a Base-dn for the AD server. The Base-dn is the starting point at which your search will begin when the AD server receives an authentication request.</p> <p>For the example of abc.xyz.com as described above, the format for the Base-dn is "dc=abc,dc=xyz,dc=com".</p>
Login-dn	<p>Specifies authentication characteristics for the Login-dn (typically a user account with query privilege pre-defined by the AD server).</p> <p>When the authentication mode is plain, the Login-dn should be configured. DN (Distinguished name) is a username of the AD server who has a privilege to read user information. The format of the DN is "cn=xxx, DC=xxx,...". For example, the server domain is abc.xyz.com, and the AD server admin name is administrator who locates in Users directory. Then the login-dn should be "cn=administrator,cn=users,dc=abc,dc=xyz,dc=com".</p>
sAMAccountName	<p>When the authentication mode is MD5, the sAMAccountName should be configured. sAMAccountName is a username of the AD server who has a privilege to read user information. The format of sAMAccountName is "xxx". For example, the AD server admin name is administrator, and then the sAMAccountName should be "administrator".</p>
Authentication Mode	<p>Specifies an authentication or synchronization method (either plain text or MD5). The default method is MD5.</p> <p>If the sAMAccountName is not configured after you specify the MD5 method, the plain method will be used in the process of synchronizing user from the server, and the MD5 method will be used in the process of authenticating the user.</p>

Basic Configuration	
Password	Specifies a password for the AD server.
Optional	
Role Mapping Rule	Specifies a role mapping rule for the server. With this option selected, system will allocate a role for users who have been authenticated to the server according to the specified role mapping rule.
Backup server 1/Backup server 2	Specifies an IP address or domain name for backup server 1 or backup server 2.
Virtual Router1/Virtual Router2	Specifies a VR for the backup server.
Authentication Base-DN	Specifies an authentication Base-dn for the AD server. All users in the Base-DN (including those directly under the user group) will be allowed to pass the authentication. The format of the DN is "OU=xxx, DC=xxx,...".
Synchronization Base-DN	Specifies a Synchronization Base-dn for the AD server. All users and user groups in the Base-DN will be synchronized to the local. The format of the DN is "OU=xxx, DC=xxx,...".
Synchronization	Check the checkbox to enable the synchronization function; clear the checkbox to disable the synchronization function, and the system will stop synchronizing and clear the existing user information. By default, system will synchronize the user information on the configured Active-Directory server with the local server every 30 minutes.
Automatic Synchronization	Click the radio button to specify the automatic synchronization.
Interval Synchronization	Specifies the time interval for automatic synchronization. The value range is 30 to 1440 minutes. The default value is 30.
Daily Synchronization	Specifies the time when the user information is synchronized everyday. The format is HH:MM, HH and MM indicates hour and minute respectively.
Once Synchronization	If this parameter is specified, system will synchronize automatically when the

Basic Configuration	
	configuration of Active-Directory server is modified. After executing this command , system will synchronize the user information immediately.
Synchronous Operation Mode	Specifies user synchronization mode, including Group Synchronization and OU Synchronization. By default, the user information will be synchronized with the local server based on the group.
OU maximum depth	Specifies the maximum depth of OU to be synchronized. The value range is 1 to 12, and the default value is 12. OU structure that exceeds the maximum depth will not be synchronized, but users that exceed the maximum depth will be synchronized to the specified deepest OU where they belong to. If the total characters of the OU name for each level(including the "OU=" string and punctuation) is more than 128, OU information that exceeds the length will not be synchronized with the local server.
User Filter	Specifies the user-filter conditions. System can only synchronize and authenticate users that are in accordance with the filtering condition on the authentication server. The length is 0 to 120 characters. For example, if the condition is configured to "memberOf=CN=Admin,DC=test,DC=com" , system only can synchronize or authenticate user whose DN is "memberOf=CN=Admin,DC=test,DC=com" . The commonly used operators are: =(equals a value)、 &(and) 、 (or)、 !(not)、 *(Wildcard: when matching zero or more characters)、 ~=(fuzzy query.)、 >=Be greater than or equal to a specified value in lexicographical order.)、 <=(Be less than or equal to a specified value in lexicographical order.).
Security Agent	Select the Enable check box to enable the Security Agent. With this function enabled, system will be able to obtain the mappings between the usernames of the domain users and IP addresses from the AD server, so that the domain users can gain access to network resources. In this way " Single Sign-On " is implemented. Besides, by making use of the obtained mappings, system can also

Basic Configuration					
	<p>implement other user-based functions, like security statistics, logging, behavior auditing, etc. To enable the Security Agent on the AD server, you first need to install and run the Security Agent on the server. Afterwards, when a domain user is logging in or logging off, the Security Agent will log the user's username, IP address, current time, and other information, and it will add the mapping between the username and the IP address to system. In this way the system can obtain every online user's IP address.</p> <table border="1"> <tr> <td>Agent Port</td> <td>Specify the monitoring port. FSOS communicates with the AD Agent through this port. The range is 1025 to 65535. The default value is 6666. This port must be matched with the configured port of AD Agent, or system will fail to communicate with the AD Agent.</td> </tr> <tr> <td>Disconnecti on Timeout</td> <td>Specifies the disconnection timeout. The value range is 0 to 1800 seconds. The default value is 300. The value of 0 indicates never timeout.</td> </tr> </table>	Agent Port	Specify the monitoring port. FSOS communicates with the AD Agent through this port. The range is 1025 to 65535. The default value is 6666. This port must be matched with the configured port of AD Agent, or system will fail to communicate with the AD Agent.	Disconnecti on Timeout	Specifies the disconnection timeout. The value range is 0 to 1800 seconds. The default value is 300. The value of 0 indicates never timeout.
Agent Port	Specify the monitoring port. FSOS communicates with the AD Agent through this port. The range is 1025 to 65535. The default value is 6666. This port must be matched with the configured port of AD Agent, or system will fail to communicate with the AD Agent.				
Disconnecti on Timeout	Specifies the disconnection timeout. The value range is 0 to 1800 seconds. The default value is 300. The value of 0 indicates never timeout.				
Backup Authentication Server	Specifies a backup authentication server. After configuring a backup authentication server for the Radius server, the backup authentication server will take over the authentication task when the primary server malfunctions or authentication fails on the primary server. The backup authentication server can be any existing local, Active-Directory, RADIUS or LDAP server defined in system.				

3. Click OK.

Configuring LDAP Server

1. Select **Object > AAA Server**, and then select **New > LDAP Server**.
2. The LDAP Server dialog box opens.

In the prompt, configure the following.

Basic Configuration	
Server Name	Specifies a name for the LDAP server.
Server Address	Specifies an IP address or domain name for the LDAP server.
Virtual Router	Specifies a VR for the LDAP server.
Port	Specifies a port number for the LDAP server. The value range is 1 to 65535. The default value is 389.
Base-dn	Specifies the details for the Base-dn. The Base-dn is the starting point at which your search will begin when the LDAP server receives an authentication request.
Login-dn	Specifies authentication characteristics for the Login-dn (typically a user account with query privileges pre-defined by the LDAP server).
Authid	Specifies the Authid, which is a string of 1 to 63 characters and is case sensitive.
Authentication Mode	Specifies an authentication or synchronization method (either plain text or MD5). The default method is MD5. If the Authid is not configured after you specify the MD5 method, the plain method will be used in the process of synchronizing user from the server, and the MD5 method will be used in the process of authenticating user.
Password	Specifies a password for the LDAP server. This should correspond to the password for Admin DN.

Basic Configuration							
Optional							
Role Mapping Rule	Specifies a role mapping rule for the server. With this option selected, system will allocate a role for the users who have been authenticated to the server according to the specified role mapping rule.						
Backup server 1/Backup server 2	Specifies an IP address or domain name for backup server 1 or backup server 2.						
Virtual Router1/Virtual Router2	Specifies a VR for the backup server.						
Authentication Base-DN	Specifies an authentication Base-dn for the AD server. All users in the Base-DN (including those directly under the user group) will be allowed to pass the authentication. The format of the DN is "OU=xxx, DC=xxx,...".						
Synchronization Base-DN	Specifies a Synchronization Base-dn for the AD server. All users and user groups in the Base-DN will be synchronized to the local. The format of the DN is "OU=xxx, DC=xxx,...".						
Synchronization	Check the checkbox to enable the synchronization function; clear the checkbox to disable the synchronization function, and system will stop synchronizing and clear the existing user information. By default, system will synchronize the user information on the configured LDAP server with the local every 30 minutes.						
Automatic Synchronization	Click the radio button to specify the automatic synchronization. <table border="0" style="width: 100%; margin-top: 10px;"> <tr> <td style="width: 30%;">Interval Synchronization</td> <td>Specifies the time interval for automatic synchronization. The value range is 30 to 1440 minutes. The default value is 30.</td> </tr> <tr> <td>Daily Synchronization</td> <td>Specifies the time when the user information is synchronized everyday. The format is HH:MM, HH and MM indicates hour and minute respectively.</td> </tr> <tr> <td>Once Synchronization</td> <td>If this parameter is specified, system will synchronize automatically when the configuration of LDAP server is modified. After executing this command , system will</td> </tr> </table>	Interval Synchronization	Specifies the time interval for automatic synchronization. The value range is 30 to 1440 minutes. The default value is 30.	Daily Synchronization	Specifies the time when the user information is synchronized everyday. The format is HH:MM, HH and MM indicates hour and minute respectively.	Once Synchronization	If this parameter is specified, system will synchronize automatically when the configuration of LDAP server is modified. After executing this command , system will
Interval Synchronization	Specifies the time interval for automatic synchronization. The value range is 30 to 1440 minutes. The default value is 30.						
Daily Synchronization	Specifies the time when the user information is synchronized everyday. The format is HH:MM, HH and MM indicates hour and minute respectively.						
Once Synchronization	If this parameter is specified, system will synchronize automatically when the configuration of LDAP server is modified. After executing this command , system will						

Basic Configuration	
	synchronize user information immediately.
Synchronous Operation Mode	Specifies the user synchronization mode, including Group Synchronization and OU Synchronization. By default, the user information will be synchronized with the local server based on the group.
OU maximum depth	<p>Specifies the maximum depth of OU to be synchronized. The value range is 1 to 12, and the default value is 12.</p> <p>OU structure that exceeds the maximum depth will not be synchronized, but users that exceed the maximum depth will be synchronized to the specified deepest OU where they belong to. If the total characters of the OU name for each level(including the “OU=” string and punctuation) is more than 128, OU information that exceeds the length will not be synchronized with the local server.</p>
User Filter	<p>Specifies the user filters. System can only synchronize and authenticate users that match the filters on the authentication server. The length is 0 to 120 characters. For example, if the condition is configured to “((objectclass=inetOrgperson)(objectclass=person))”, system only can synchronize or authenticate users which are defined as inetOrgperson or person. The commonly used operators are as follows: =(equals a value)、 &(and) 、 (or)、 !(not)、 *(Wildcard: when matching zero or more characters)、 ~ =(fuzzy query.)、 >=(Be greater than or equal to a specified value in lexicographical order.)、 <=(Be less than or equal to a specified value in lexicographical order.).</p>
Naming Attribute	Specifies a naming attribute for the LDAP server. The default naming attribute is uid.
Group Naming Attribute	Specifies a naming attribute of group for the LDAP server. The default naming attribute is uid.
Member Attribute	Specifies a member attribute for the LDAP server. The default member attribute is uniqueMember.
Group Class	Specifies a group class for the LDAP server. The default class is groupofuniquenames.
Backup	Specifies a backup authentication server. After configuring a

Basic Configuration	
Authentication Server	backup authentication server for the LDAP server, the backup authentication server will take over the authentication task when the primary server malfunctions or authentication fails on the primary server. The backup authentication server can be any existing local, Active-Directory, RADIUS or LDAP server defined in system.

3. Click OK.

Configuring TACACS+ Server

1. Select Object > AAA Server.
2. Click New > TACACS+ Server, and the TACACS+ Server Configuration dialog box will appear.

Configure values in the TACACS+ Server Configuration dialog box.

Basic Configuration	
Server Name	Enter a name for the TACACS+ server.
Server Address	Specify the IP address or host name for the TACACS+ server.
Virtual Router	Specify the VRouter of TACACS+ server.
Port	Enter port number for the TACACS+ server. The default value is 49. The value range is 1 to 65535.
Secret	Enter the shared secret to connect the TACACS+ server.
Optional	
Role mapping rule	Select a role mapping rule for the server. With this option selected, system will allocate a role for the users who have been authenticated to the server according to the specified role

Basic Configuration	
	mapping rule.
Backup Server 1 (2)	Enter the domain name or IP address for the backup TACACS+ server.
Virtual Router 1 (2)	Select the VRouter for the backup server.

Connectivity Test

When AAA server parameters are configured, you can test if they are correct by testing server connectivity.

To test server connectivity, take the following steps:

1. Select **Object > AAA Server**, and click **New**.
2. Select your AAA server type, which can be Radius, AD, LDAP or TACACS+. The local server does not need the connectivity test.
3. After filling out the fields, click **Test Connectivity**.
4. For Radius or TACACS+ server, enter a username and password in the popped <Test Connectivity> dialog box. If the server is AD or LDAP, the login-dn and secret is used to test connectivity.
5. Click **Test Connectivity**. If "Test connectivity success" message appears, the AAA server settings are correct.

If there is an error message, here are the causes:

- Connect AAA server timeout: Wrong server address, port or virtual router.
- AAA server configuration error: Secret is wrong.
- Wrong name or password: Username or password for testing is wrong.

User

User refers to the user who uses the functions and services provided by the device, or who is authenticated or managed by the device. The authenticated users consist of local user and external user. The local users are created by administrators. They belong to different local authentication servers, and

are stored in system's configuration files. The external users are stored in external servers, such as AD server or LDAP server. System supports User Group to facilitate user management. Users belonging to one local authentication server can be allocated to different user groups, while one single user can belong to different user groups simultaneously; similarly, user groups belonging to one local authentication server can be allocated to different user groups, while one single user group can belong to different user groups simultaneously. The following diagram uses the default AAA server, Local, as an example and shows the relationship between users and user groups:

As shown above, User1, User2 and User3 belong to UserGroup1, while User3 also belongs to UserGroup2, and UserGroup2 also contains User4, User5 and UserGroup1.

Configuring a Local User

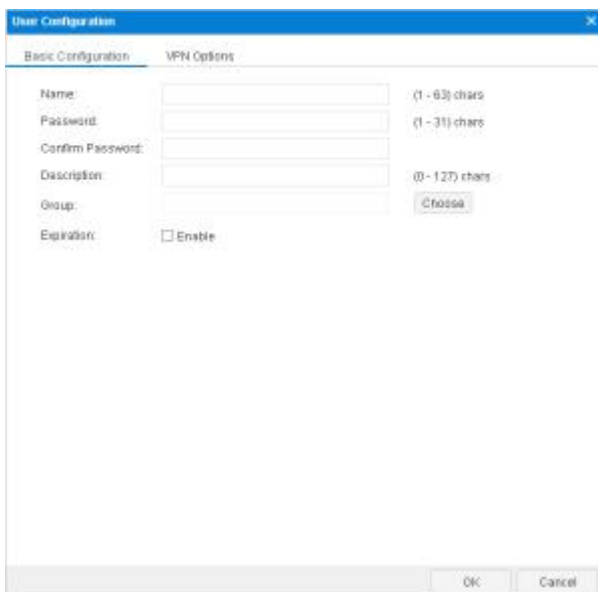

This section describes how to configure a local user and user group.

- Click the "Local server" drop-down box in the upper left corner of the page to switch the local user's server.
- Red **Expired**, orange **Will expire within a week** and yellow **Will expire within a month** colors are used to mark the expired users, expired within a week, expired within a month in the list.

Creating a Local User

To create a local user, take the following steps:

1. Select **Object > User > Local User**.
2. Click **New > User**.

In the Basic Configuration tab in User Configuration dialog box, configure the following.

Option	Description
Name	Specifies a name for the user.
Password	Specifies a password for the user.
Confirm password	Type the password again to confirm.
Mobile+country code	Specifies the user's mobile number. When users log into the SCVPN client, system will send the verification code to the mobile number.
Description	If needed, type the description of the user.
Group	Add the user to a selected usergroup. Click Choose , and in the Choose User Group dialog box, select the usergroup you want and click Add .
Expiration	Select the Enable check box to enable expiration for the user, and then specify a date and time. After expiration, the user cannot be authenticated, therefore cannot be used in system. By default expiration is not enabled.

In the VPN Options tab, configure network parameters for the PnPVPN client.

Option	Description
IKE ID	Specifies a IKE ID type for dial-up VPN users. If FQDN or ASN1 is selected, type the ID's content in the text box below.
DHCP Start IP	Specifies a start IP for the DHCP address pool.
DHCP End	Specifies an end IP for the DHCP address pool.

Option	Description
IP	
DHCP Netmask	Specifies a netmask for the DHCP address pool.
DHCP Gateway	Specifies a gateway for the DHCP address pool. The IP address of the gateway corresponds to the IP address of PnPVPN client's Intranet interface and PC's gateway address. The PC's IP address is determined by the segment and netmask configured in the above DHCP address pool. Therefore, the gateway's address and DHCP address pool should be in the same segment.
DNS1	Specifies an IP address for the DNS server. You can specify one primary DNS server (DNS1) and up to three alternative DNS servers.
DNS2	
DNS3	
DNS4	
WINS1	Specifies an IP address for the WINS server. You can specify one primary WINS server (WINS1) and one alternative WINS server.
WINS2	
Tunnel IP 1	Specifies an IP address for the master PnPVPN client's tunnel interface. Select the Enable SNAT check box to enable SNAT.
Tunnel IP 2	Specifies an IP address for the backup PnPVPN client's tunnel interface.

3. Click **OK**.

Creating a User Group

To create a user group, take the following steps:

1. Select **Object > User > Local User**.
2. Click **New > User Group**.
3. Type the name of the user group into the Name box.
4. Specify members for the user group. Expand **User** or **User Group** in the Available list, select a user or user group and click **Add** to add it to the Selected list on the right. To delete a selected user or user group, select it in the Selected list and then click **Remove**. One user group can contain multiple users or user groups, but system only supports up to 5 layers of nested user groups and does not support the loopback nest. Therefore, a user group should not nest the upper-layer user group it belongs to.

5. Click **OK**.

Import User Password List

Import user binding list to system, take the following steps:

1. Select **Object>User> Local User**.
2. Click **Import User Password List**, and the **Import User Password List** dialog box pops up.
3. Click **Browse** to select the file name needed to be imported.
4. Click **OK** to finish import.

Export User Password List

Export user binding list from system to local, take the following steps:

1. Select **Object > User > Local User**.
2. Click **Export User Password List**, and the **Export User Password List** dialog box pops up, and select the saved position in local.
3. Click **OK** to finish export.

Notes:

- The user password in the import/export file is in encrypted text;
- Please try to keep the import file format consistent with the export file.
- When importing, if the same user name exists under the same server, the original user password will be overwritten.

Configuring a LDAP User

This section describes how to configure a LDAP user.

Synchronizing Users

To synchronize users in a LDAP server, firstly, you need to configure a LDAP server, refer to "[Configuring LDAP Server](#)". To synchronize users:

1. Select **Object > User > LDAP User**.
2. Select a server from the LDAP Server drop-down list, and click **Sync Users**.

Notes: By default, after creating a LDAP server, system will synchronize the users of the LDAP server automatically, and then continue to synchronize every 30 minutes.

Configuring an Active Directory User

This section describes how to configure an active directory (AD) user.

Synchronizing Users

To synchronize users in an AD server to the device, first you need to configure an AD server ,refer to "[Configuring Active Directory Server](#)". To synchronize users, take the following steps:

1. Select **Object > User > AD User**.
2. Select an AD server from the Active Directory Server drop-down list, and click **Sync Users**.

Notes: By default, after creating an AD server, system will synchronize the users of the AD server automatically, and then continue to synchronize every 30 minutes.

Configuring a IP-User Binding

Adding User Binding

To bind an IP or MAC address to a user, take the following steps:

1. Select **Object > User > IP-User Binding** .
2. Click **Add User Binding**.

Configure the following options.

User	
AAA Server	Select an AAA server from the drop-down list.
User	Select a user for the binding from the drop-down list.

User	
Binding Type	
Binding Type	<p>By specifying the binding type, you can bind the user to a IP address or MAC address.</p> <ul style="list-style-type: none"> • IP - If IP is selected, type the IP address into the IP text box. And select a VR from the Virtual Router drop-down list. Select the Check WebAuth IP-User Mapping Relationship check box to apply the IP-User mapping only to the check for IP-user mapping during Web authentication if needed. • MAC - If MAC is selected, type the MAC address into the MAC text box. And select a VR from the Virtual Router drop-down list.

3. Click **OK**.

Import Binding

Import user binding list to system, take the following steps:

1. Select **Object>User> IP-User Binding**.
2. Click **Import** , and the **Import User Binding List** dialog box pops up.
3. Click **Browse** to select the file name needed to be imported.
4. Click **OK** to finish import.

Export Binding

Export user binding list from system to local, take the following steps:

1. Select **Object>User> IP-User Binding**.
2. Select the exported user category(include local, LDAP, AD and all users) in the **Export** drop-down list to pop up the export dialog box, and select the saved position in local.
3. Click **OK** to finish export.

Role

Roles are designed with certain privileges. For example, a specific role can gain access to some specified network resources, or make exclusive use of some bandwidth. In FSOS, users and privileges are not directly associated. Instead, they are associated by roles.

The mappings between roles and users are defined by role mapping rules. In function configurations, different roles are assigned with different services. Therefore, the mapped users can gain the corresponding services as well.

System supports role combination, i.e., the AND, NOT or OR operation on roles. If a role is used by different modules, the user will be mapped to the result role generated by the specified operation.

System supports the following role-based functions:

- Role-based policy rules: Implements access control for users of different types.
- Role-based QoS: Implements QoS for users of different types.
- Role-based statistics: Collects statistics on bandwidth, sessions and new sessions for users of different types.
- Role-based session limits: Implements session limits for specific users.
- SCVPN role-based host security detection: Implements control over accesses to specific resources for users of different types.
- Role-based PBR: Implements routing for users of different types.

Configuring a Role

Creating a Role

To create a role, take the following steps:

1. Select **Object > Role > Role**.
2. Click **New**.

Configure the following options.

Option	Description
--------	-------------

Option	Description
Role Name	Type the role name into the Role Name box.
Description	Type the description for the role into the Description box.

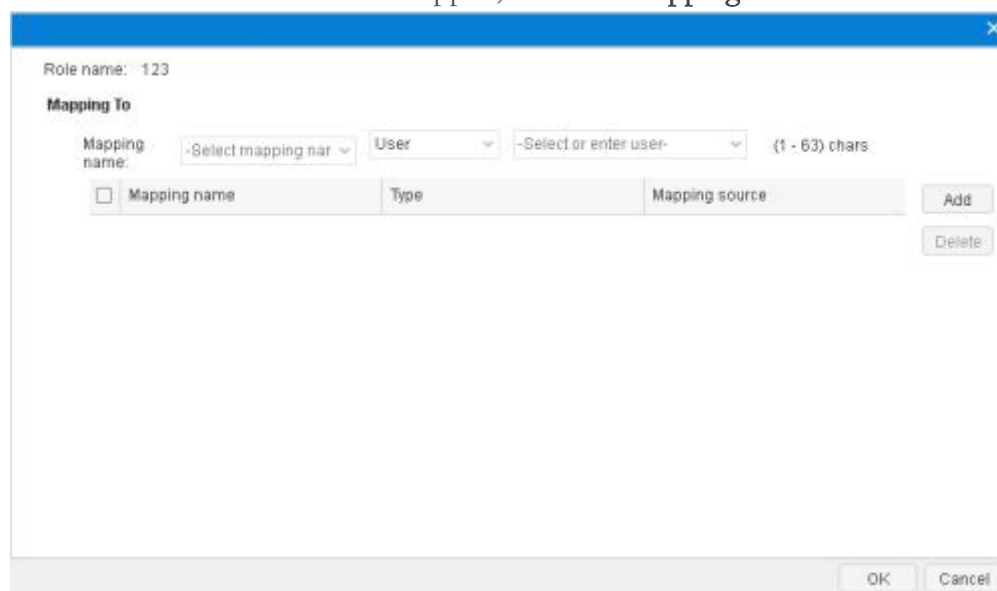

3. Click **OK**.

Mapping to a Role Mapping Rule

You can map the role to user, user group, CN or OU through this function or [Creating a Role Mapping Rule](#). After [Creating a Role Mapping Rule](#), you can click Mapping To to map the selected role again.

To map the selected role again, take the following steps:

1. Select **Object > Role > Role**.
2. Select the role need to be mapped, and click **Mapping To**.

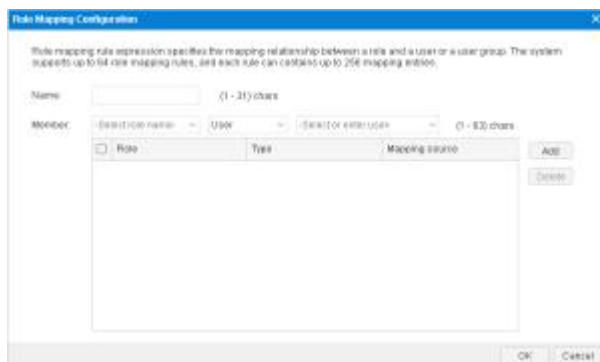

3. In the Mapping name section, select a created mapping rule name from the first drop-down list (For detailed information of creating a role mapping role, see [Creating a Role Mapping Rule](#).), and then select a user, user group, certificate name (the CN field of USB Key certificate), organization unit (the OU field of USB Key certificate) or any from the second drop-down list. If User, User group, CN or OU is selected, also select or enter the corresponding user name, user group name, CN or OU into the box behind.
4. Click **Add** to add to the role mapping list.
5. If needed, repeat Step 3 and Step 4 to add more mappings. To delete a role mapping, select the role mapping you want to delete from the mapping list, and click **Delete**.
6. Click **OK**.

Creating a Role Mapping Rule

To create a role mapping rule, take the following steps:

1. Select **Object > Role > Role Mapping**.
2. Click **New**.

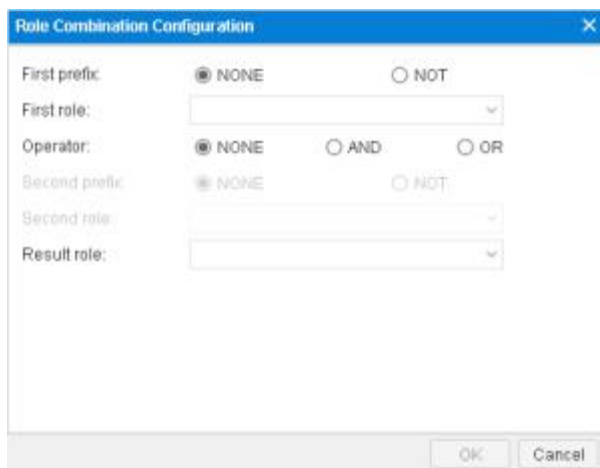

3. Type the name for the rule mapping rule into the Name box.
4. In the Member section, select a role name from the first drop-down list, and then select a user, user group, certificate name (the CN field of USB Key certificate) or organization unit (the OU field of USB Key certificate) from the second drop-down list. If User, User group, CN or OU is selected, also select or enter the corresponding user name, user group name, CN or OU into the box behind.
5. Click **Add** to add to the role mapping list.
6. If needed, repeat Step 4 and Step 5 to add more mappings. To delete a role mapping, select the role mapping you want to delete from the mapping list, and click **Delete**.
7. Click **OK**.

Creating a Role Combination

To create a role combination, take the following steps:

1. Select **Object > Role > Role Combination**.
2. Click **New**.

Configure the following options.

Option	Description
First Prefix	Specifies a prefix for the first role in the role regular expression.
First Role	Select a role name from the First Role drop-down list to specify a name for the first role in the role regular expression.
Operator	Specifies an operator for the role regular expression.
Second Prefix	Specifies a prefix for the second role in the role regular expression.
Second Role	Select a role name from the Second Role drop-down list to specify a name for the second role in the role regular expression.
Result Role	Select a role name from the Result Role drop-down list to specify a name for the result role in the role regular expression.

3. Click **OK**.

Track Object

The devices provide the track object to track if the specified object (IP address or host) is reachable or if the specified interface is connected. This function is designed to track HA and interfaces.

Creating a Track Object

To create a track object, take the following steps:

1. Select **Object > Track Object**.

2. Click **New**.

Configure the following options.

Option	Description
Name	Specifies a name for the new track object.
Threshold	Type the threshold for the track object into the text box. If the sum of weights for failed entries in the track object exceeds the threshold, system will conclude that the whole track object fails.
Track Type	<p>Select a track object type. One track object can only be configured with one type.</p> <p>Select Interface radio button:</p> <ul style="list-style-type: none"> • Click Add in Add Track Members section and then configure the following options in the Add Interfaces dialog box: <ul style="list-style-type: none"> • Interface - Select a track interface from the drop-down list. • Weight - Specifies a weight for the interface, i.e. the weight for overall failure of the whole track object if this track entry fails. <p>Select HTTP/Ping/ARP/DNS/TCP radio button:</p> <ul style="list-style-type: none"> • Click Add, select a packet type from the drop-down list, and then configure the following options in the Add HTTP/Ping/ARP/DNS/TCP Member dialog box: <ul style="list-style-type: none"> • IP Type - Specifies the IP type for the

Option	Description
	<p>track object when the track is implemented by HTTP/DNS/TCP packets.</p> <ul style="list-style-type: none"> • IP/Host - Specifies an IP address or host name for the track object when the track is implemented by HTTP/Ping/TCP packets. IP - Specifies an IP address for the track object when the track is implemented by ARP/NDP packets. DNS - Specifies an IP address for the track object when the track is implemented by DNS packets. • Weight - Specifies a weight for overall failure of the whole track object if this track entry fails. • Retries: Specifies a retry threshold. If no response packet is received after the specified times of retries, system will determine this track entry fails, i.e., the track entry is unreachable. The value range is 1 to 255. The default value is 3. • Interval - Specifies an interval for sending packets. The value range is 1 to 255 seconds. The default value is 3. • Egress Interface - Specifies an egress interface from which HTTP/Ping/ARP/DNS/TCP packets are sent. • Source Interface- Specifies a source interface for HTTP/Ping/ARP/DNS/TCP packets.
	<p>Select Traffic Quality radio button:</p> <ul style="list-style-type: none"> • Click Add in Add Track Members section and then configure the following options in the Add Traffic Quality Member dialog box: <ul style="list-style-type: none"> • Interface - Specifies the name of the

Option	Description
	<p>tracked interface.</p> <ul style="list-style-type: none"> • Interval - Specifies the duration of per track period. The unit is second. The value range is 1 to 255. The default value is 3. After a track period is finished, system will reset the tracked value of new session. • Retries - Specifies the threshold value which concludes the track entry is failed. The value range is 1 to 255. The default value is 3. • Weight - Specifies how important this track failure is to the judgment of track object failure. The value range is 1 to 255. The default value is 255. • Low Watermark - Specifies the failure threshold value of new session success rate. The value range is 0 to 100. The default value is 30. During a track period, when the new session success rate is below the specified low watermark, system will conclude the track is failed. • High Watermark- Specifies the failure threshold value of new session success rate. The value range is 0 to 100. The default value is 50. During a track period, when the new session success rate exceeds the specified low watermark, system will conclude the track is successful. <p>Note: During a track period, when the new session success rate is equal to or exceeds the low watermark, and is equal to or below the low watermark, system will keep the previous track state.</p>
HA sync	Select this check box to enable HA sync function. The primary device will synchronize its information with the backup device.

3. Click **OK**. The created track object will be displayed in the track object list.

URL Filtering

URL filtering controls the access to some certain websites and records log messages for the access actions. URL filtering helps you control the network behaviors in the following aspects:

- Access control to certain category of websites, such as gambling and pornographic websites.
- Access control to certain category of websites during the specified period. For example, forbid to access IM websites during the office hours.
- Access control to the website whose URL contains the specified keywords. For example, forbid to access the URL that contains the keyword of game.

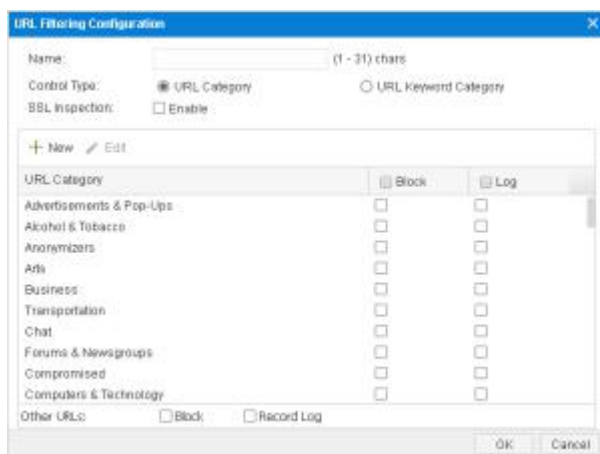

Configuring URL Filtering

Configuring URL filtering contains two parts:

- Create a URL filtering rule
- Bind a URL filtering rule to a security zone or policy rule

Part 1: Creating a URL filter rule

1. Select **Object > URL Filter**.
2. Click **New**.

In the URL Filter Rule Configuration dialog box, configure the following options.

Option	Description
Name	Specifies the name of the rule.
Control Type	Control types are URL Category and URL Keyword Category . You can select one type for each URL filter rule.

Option	Description
	<p>URL Category controls the access to some certain category of website. The options are:</p> <ul style="list-style-type: none"> • SSL inspection: Select the Enable check box to enable SSL negotiation packets inspection. For HTTPS traffic, system can acquire the domain name of the site which you want to access from the SSL negotiation packets after this feature is configured. Then, system will perform URL filter in accordance with the domain name. If SSL proxy is configured at the same time, SSL negotiation packets inspection method will be preferred for URL filter. • New: Create a new URL category. For more information about URL categories, see <i>URL Filter > User-defined URL DB</i> in the FSOS WebUI User Guide. • Edit: Select a URL category from the list, and click Edit to edit the selected URL category. • URL category: Shows the name of pre-defined and user-defined URL categories in the VSYS. • Block: Select the check box to block access to the corresponding URL category. • Log: Select the check box to log access to the corresponding URL category. • Other URLs: Specifies the actions to the URLs that are not in the list, including Block Access and Record Log. <p>URL Keyword Category controls the access to the website whose URL contains the specific keywords. Click the URL Keyword Category option to configure. The options are:</p> <ul style="list-style-type: none"> • New: Creates new keyword categories. For more information about keyword category, see <i>URL Filter > Keyword Category</i> in the FSOS WebUI User Guide. • Edit: Select a URL keyword category from the list, and click Edit to edit the selected URL keyword

Option	Description
	<p>categories.</p> <ul style="list-style-type: none"> • Keyword category: Shows the name of the configured keyword categories. • Block: Selects the check box to block access to the website whose URL contains the specified keywords. • Log: Selects the check box to log the access to the website whose URL contains the specified keywords. • Other URLs: Specifies the actions to the URLs that do not contain the keywords in the list, including Block Access and Record Log.

3. Click **OK** to save the settings.

Part 2: Binding a URL filtering rule to a security zone or security policy rule

The URL filtering configurations are based on security zones or policies.

- If a security zone is configured with the URL filtering function, system will perform detection on the traffic that is destined to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the URL filtering function, system will perform detection on the traffic that is destined to the policy rule you specified, and then respond.
- The threat protection configurations in a policy rule are superior to that in a zone rule if they are specified at the same time, and the URL filtering configurations in a destination zone are superior to that in a source zone if they are specified at the same time.
- To perform the URL filtering function on the HTTPS traffic, see the policy-based URL filtering.

To create the zone-based URL filtering, take the following steps:

1. Create a zone. For more information about how to create this, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog box, select the Threat Protection tab.
3. Enable the threat protection that you need, and select the URL filtering rules from the profile drop-down list below; you can click **Add Profile** from the profile drop-down list below to create a URL filtering rule. For more information, see "[Part 1: Creating a URL filter rule](#)".

4. Click **OK** to save the settings.

To create the policy-based URL filtering, take the following steps:

1. Configure a security policy rule. For more information, see "[Configuring a Security Policy Rule](#)".
2. In the Protection tab, select the **Enable** check box of URL Filtering.
3. From the **Profile** drop-down list, select a URL filtering rule. You can also click **Add Profile** to create a new URL filtering rule.
4. To perform the URL filtering function on the HTTPS traffic, you need to enable the SSL proxy function for this security policy rule. System will decrypt the HTTPS traffic according to the SSL proxy profile and then perform the URL filtering function on the decrypted traffic.

According to the various configurations of the security policy rule, system will perform the following actions:

Policy Rule Configurations	Actions
SSL proxy enabled URL filtering disabled	System decrypts the HTTPS traffic according to the SSL proxy profile but it does not perform the URL filtering function on the decrypted traffic.
SSL proxy enabled URL filtering enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the URL filtering function on the decrypted traffic.
SSL proxy disabled URL filtering enabled	System performs the URL filtering function on the HTTP traffic according to the URL filtering profile. The HTTPS traffic will not be decrypted and system will transfer it.

If the SSL proxy and URL filtering functions are enabled on a security policy rule but the control type of the selected URL filtering rule is the Web surfing record, the system will not record the GET and POST methods and the posted contents via HTTPS.

If the zone which the security policy rule binds with is also configured with a URL filtering, system will perform the following actions:

Policy Rule Configurations	Zone Configurations	Actions
SSL proxy enabled URL filtering disabled	URL filtering enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the URL filtering function on the decrypted traffic according to the URL filter rule of the zone.
SSL proxy enabled URL filtering enabled	URL filtering enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the URL filtering function on the decrypted traffic according to the URL filtering rule of the policy rule.
SSL proxy disabled URL filtering enabled	URL filtering enabled	System performs the URL filtering function on the HTTP traffic according to the URL filtering rule of the policy rule. The HTTPS traffic will not be decrypted and system will transfer it.

5. Click **OK** to save the settings.

If necessary, you can go on to configure the functions of ["Predefined URL DB"](#) , ["URL Lookup"](#) , and ["Warning Page"](#) .

Object	Description
Predefined URL DB	The predefined URL database includes dozens of categories and tens of millions of URLs and you can use it to specify the URL categories.
URL Lookup	Use the URL lookup function to inquire URL information from the URL database, including the URL category and the category type.
Warning Page	<ul style="list-style-type: none"> Block warning: When your network access is blocked, a warning page will prompt in the Web browser. Audit warning: When your network access is audited, a warning page will prompt in the Web browser.

Notes:

- Only after canceling the binding can you delete the URL filtering rule.
- To get the latest URL categories, you are recommended to update the URL database first. For more information about URL database, see "[Predefined URL DB](#)".
- You can export the log messages to specified destinations. For more information about log messages, see "[Log Configuration](#)".

Viewing URL Hit Statistics

The URL access statistics includes the following parts:

- **Summary:** The statistical information of the top 10 user/IPs, the top 10 URLs, and the top 10 URL categories during the specified period of time are displayed.
- **User/IP:** The user/IP and detailed hit count are displayed.
- **URL:** The URL and detailed hit count are displayed.
- **URL Category:** The URL category and detailed hit count and traffic are displayed.

To view the URL hit statistics, see "[URL Hit](#)" in Monitor.

- To view the URL hit statistics, enable **URL Hit** in "[Monitor Configuration](#)".
- To view the traffic of the URL category, enable **URL Hit** and **URL Category Bandwidth** in "[Monitor Configuration](#)".

Viewing Web Surfing Records

To view the Web surfing records, view "[URL Logs](#)". Before you view the Web surfing records, see "[Log Configuration](#)" to enable URL Log function.

Configuring Objects

Objects mean the items referenced during URL Filtering profiles configurations. When using URL filtering function, you need to configure the following objects:

Object	Description
Predefined URL DB	The predefined URL database includes dozens of categories and tens of millions of URLs and you can use it to specify the URL categories.

Object	Description
User-defined URL DB	The user-defined URL database is defined by you and you can use it to specify the URL category.
URL Lookup	Use the URL lookup function to inquire URL information from the URL database.
Keyword Category	Use the keyword category function to customize the keyword categories.
Warning Page	<ul style="list-style-type: none"> Block warning: When your network access is blocked, a warning page will prompt in the Web browser. Audit warning: When your network access is audited, a warning page will prompt in the Web browser.

Predefined URL DB

System contains a predefined URL database.

Notes: The predefined URL database is controlled by a license . Only after a URL license is installed, the predefined URL database can be used.

The predefined URL database provides URL categories for the configurations of a URL filtering. It includes dozens of categories and tens of millions of URLs .

When identifying the URL category, the user-defined URL database has a higher priority than the predefined URL database.

Configuring Predefined URL Database Update Parameters

By default, system updates predefined URL database everyday. You can change the update parameters according to your own requirements. Besides, you can update the predefined URL database from your local disk.

To change the update parameters, take the following steps:

1. Select **System > Upgrade Management > Signature Database Update**.
2. In the URL category database update section, you can view the current version of the database, perform the remote update, configure the remote update, and perform the local

update.

3. Select **Enable Auto Update** to enable the automatic update function and then continue to specify the frequency and time. Click **OK** to save your settings.
4. Click **Configure Update Server** to configure the update server URL. In the pop-up dialog box, specify the URL or IP address of the update server, and select the virtual router that can connect to the server. To restore the URL settings to the default ones, click **Restore Default**.
5. Click **Configure Proxy Server**, then enter the IP addresses and ports of the main proxy server and the backup proxy server. When the device accesses the Internet through a HTTP proxy server, you need to specify the IP address and the port number of the HTTP proxy server. With the HTTP proxy server specified, various signature databases can update normally.
6. Click **OK** to save the settings.

Upgrading Predefined URL Database Online

To upgrade the URL database online, take the following steps:

1. Select **System > Upgrade Management > Signature Database Update**.
2. In the URL category database update section, click **Update** to update the predefined URL database.

Upgrading Predefined URL Database from Local

To upgrade the predefined URL database from local, take the following steps:

1. **System > Upgrade Management > Signature Database Update**
2. In the URL category database update section, click **Browse** to select the URL database file from your local disk.
3. Click **Upload** to update the predefined URL database.

Notes: You can not upgrade the predefined URL database from local in non-root VSYS.

User-defined URL DB

Besides categories in predefined URL database, you can also create user-defined URL categories, which provides URL categories for the configurations of URL filtering. When identifying the URL category, the user-defined URL database has a higher priority than the predefined URL database.

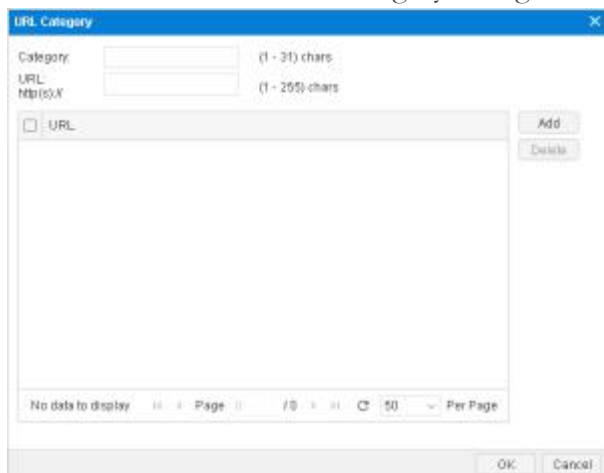

System provides three predefined URL categories: custom1, custom2, custom3. You can import your own URL lists into one of the predefined URL categories.

Notes: You can not import your own URL lists into one of the predefined URL category in non-root VSYS.

Configuring User-defined URL DB

To configure a user-defined URL category, take the following steps:

1. Select **Object > URL Filtering**.
2. At the top-right corner, select **Configuration > User-defined URL DB**. The User-defined URL DB dialog box will appear.
3. Click **New**. The URL Category dialog box will appear.

4. Type the category name in the **Category** box. URL category name cannot only be a hyphen (-). And you can create at most 16 user-defined categories.
5. Type a URL into the **URL http(s):/** box.
6. Click **Add** to add the URL and its category to the table.
7. To edit an existing one, select it and then click **Edit**. After editing it, click **Add** to save the changes.
8. Click **OK** to save the settings.

Importing User-defined URL

System supports to batch imported user-defined URL lists into the predefined URL category named custom1/2/3. To import user-defined URL, take the following steps:

1. Select **Object > URL Filtering**.
2. At the top-right corner, select **Configuration > User-defined URL DB**. The User-defined URL DB dialog box will appear.
3. Select one of the predefined URL category(custom1/2/3), and then click **Import**.
4. In the Batch Import URL dialog box, click **Browse** button to select your local URL file. The file should be less than 1 M, and have at most 1000 URLs. Wildcard is supported to use once in the URL file, which should be located at the start of the address.
5. Click **OK** to finish importing.

Clearing User-defined URL

In the predefined URL category named custom1/2/3, clear a user-defined URL, take the following steps:

1. Select **Object > URL Filtering**.
2. At the top-right corner, select **Configuration > User-defined URL DB**. The User-defined URL DB dialog box will appear.
3. Select one of the predefined URL categories(custom1/2/3), and then click **Clear**. The URL in the custom 1/2/3 will be cleared from the system.

URL Lookup

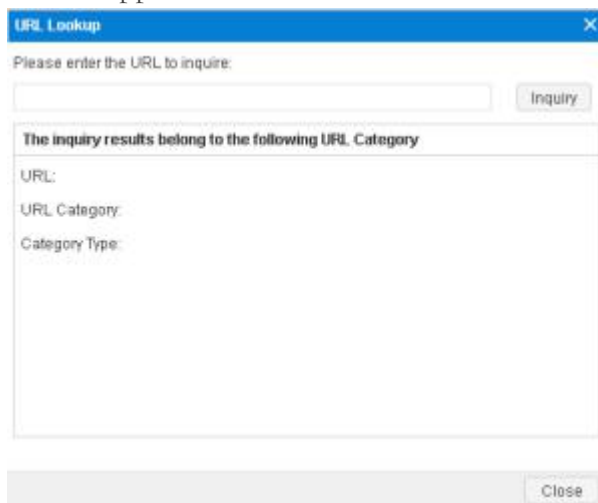

You can inquire a URL to view the details by URL lookup, including the URL category and the category type.

Inquiring URL Information

To inquiry URL information, take the following steps:

1. Select **Object > URL Filtering**.

- At the top-right corner, click **Configuration > URL Lookup**. The URL Lookup dialog box will appear.

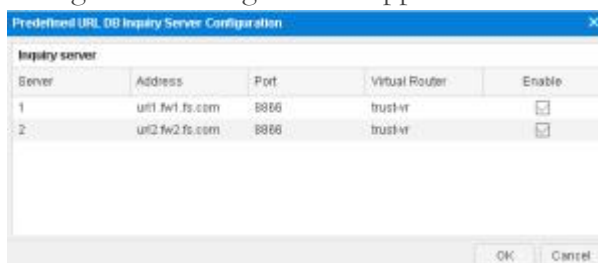

- Type the URL into the **Please enter the URL to inquire** box.
- Click **Inquire**, and the results will be displayed at the bottom of the dialog box.

Configuring URL Lookup Servers

URL lookup server can classify an uncategorized URL (URL is neither in predefined URL database nor in user-defined URL database) you have accessed, and then add it to the URL database during database updating. By default, the URL lookup servers are enabled.

To configure a URL lookup server, take the following steps:

- Select **Object > URL Filtering**.
- At the top-right corner, Select **Configuration > Predefined URL DB**. The Predefined URL DB dialog box will appear.
- Click **Inquiry Server Configuration**. The Predefined URL DB Inquiry Server Configuration dialog box will appear.

- In the Inquiry server section, double-click the cell in the IP/Port/Virtual Router column of Server1/2 and type a new value.
- Select the check box in the **Enable** column to enable this URL lookup server.

6. Click **OK** to save the settings.

Keyword Category

You can customize the keyword category and use it in the URL filtering function.

After configuring a URL filtering rule, system will scan traffic according to the configured keywords and calculate the trust value for the hit keywords. The calculating method is: adding up the results of *times* * *trust value* of each keyword that belongs to the category. Then system compares the sum with the threshold 100 and performs the following actions according to the comparison result:

- If the sum is larger than or equal to category threshold (100), the configured category action will be triggered;
- If more than one category action can be triggered and there is block action configured, the final action will be Block;
- If more than one category action can be triggered and all the configured actions are Permit, the final action will be Permit.

For example, a URL filtering rule contains two keyword categories C1 with action block and C2 with action permit. Both of C1 and C2 contain the same keywords K1 and K2. Trust values of K1 and K2 in C1 are 20 and 40. Trust values of K1 and K2 in C2 are 30 and 80.

If system detects 1 occurrence of K1 and K2 each on a URL, then C1 trust value is $20*1 + 40*1 = 60 < 100$, and C2 trust value is $30*1 + 80*1 = 110 > 100$. As a result, the C2 action is triggered and the URL access is permitted.

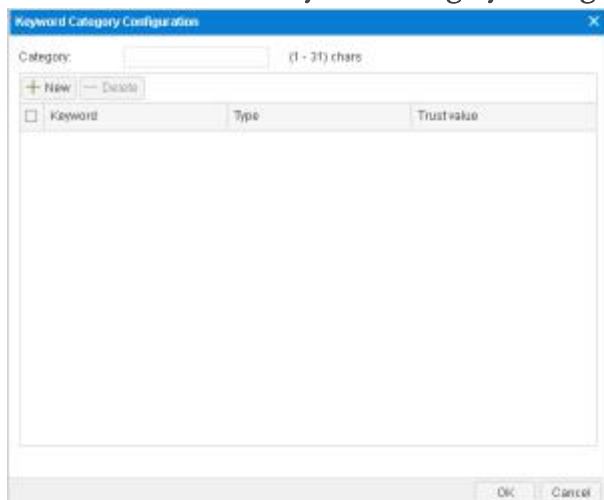

If system detects 3 occurrences of K1 and 1 occurrence of K2 on a URL, then C1 trust value is $20*3 + 40*1 = 100$, and C2 trust value C2 is $30*3 + 80*1 = 170 > 100$. Conditions for both C1 and C2 are satisfied, but the block action for C1 is triggered, so the web page access is denied.

Configuring a Keyword Category

To configure a keyword category, take the following steps:

1. Select **Object > URL Filtering**.
2. At the top-right corner, select **Configuration > Keyword Category**. The Keyword Category dialog box will appear.

3. Click **New**. The **Keyword Category Configuration** dialog box will appear.

4. Type the category name.
5. Click **New**. In the slide area, specify the keyword, character matching method (simple/regular expression), and trust value (100 by default).
6. Click **Add** to add the keyword to the list below.
7. Repeat the above steps to add more keywords.
8. To delete a keyword, select the keyword you want to delete from the list and click **Delete**.
9. Click **OK** to save your settings.

Warning Page

The warning page shows the user block information and user audit information.

Configuring Block Warning

If the internet behavior is blocked by the URL filtering function, the Internet access will be denied. The information of Access Denied will be shown in your browser, and some web surfing rules will be shown to you on the warning page at the same time. According to the different network behaviors, the default block warning page includes the following two situations:

- Visiting a certain type of URL.

- Visiting the URL that contains a certain type of keyword category.

The block warning function is disabled by default. To configure the block warning function, take the following steps:

1. Click **Object > URL Filtering**.
2. At the top-right corner, select **Configuration > Warning Page**. The Warning Page dialog box will appear.

3. In the Block Warning section, select **Enable**.
4. Configure the display information in the blocking warning page.

Option	Description
Default	Use the default blocking warning page as shown above.
Redirect page	Redirect to the specified URL. Type the URL in the URL http:// box. You can click Detection to verify whether the URL is valid.
Custom	Customize the blocking warning page. Type the title in the Title box and the description in the Description box. You can click Preview to preview the blocking warning page.

5. Click **OK** to save the settings.

Configuring Audit Warning

After enabling the audit warning function, when your network behavior matches the configured URL filtering rule, your HTTP request will be redirected to a warning page where the audit and privacy protection information is displayed. See the picture below:

The audit warning function is disabled by default. To configure the audit warning function, take the following steps:

1. Select **Object > URL Filtering**.
2. At the top-right corner, select **Configuration > Warning Page**. The Warning Page dialog box will appear.
3. In the Audit Warning section, select **Enable**.
4. Configure the display information in the audit warning page.

Option	Description
Default	Use the audit blocking warning page as shown above.
Custom	Customize the audit blocking warning page. Type the title in the Title box and the description in the Description box. You can click Preview to preview the audit warning page.

5. Click **OK** to save the settings.

Configuring the URL Blacklist/Whitelist

You can further control the access to some websites by configuring URL blacklists and whitelists.

- After the URL blacklist is configured, when you send an access request to the specified URL in the blacklist, the system will block the request.
- After the URL whitelist is configured, when you send an access request to the specified URL in the whitelist, system will not perform URL filtering for the access request and let the request pass
- The URL blacklist, the URL whitelist and the URL filtering rule all configured with URL categories, the matching priority for URL category filtering is: the URL blacklist > the URL whitelist > the URL filtering rule.

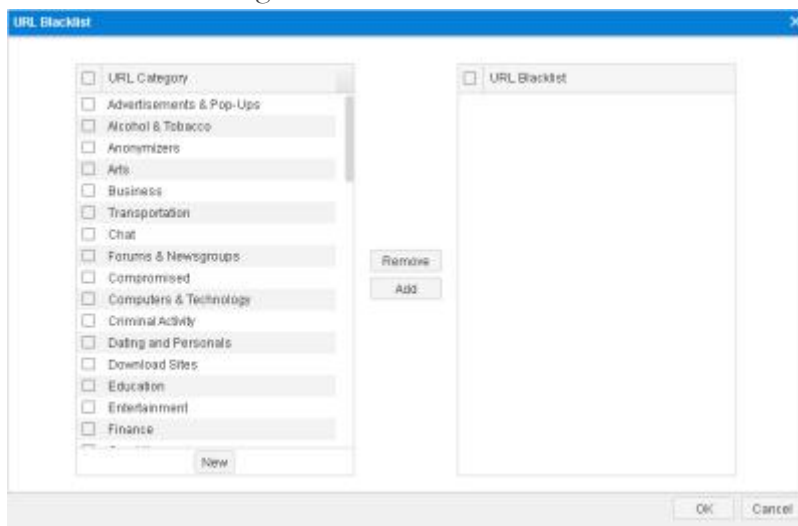

Notes:

- An URL category can only be referenced by an object (URL blacklist, URL whitelist or URL filtering profile). For example, when the URL category "Advertisement" has been added to the URL blacklist, this URL category cannot be added to the URL whitelist, and it will not be referenced in the URL filtering profile
- Non-root VSYS does not support the URL blacklist\whitelist function, and the URL blacklist/whitelist configuration under root VSYS does not take effect and has no effect on non-root VSYS.

Configuring the URL Blacklist

To configure the URL blacklist, take the following steps:

1. Click **Object > URL Filtering > URL Blacklist/Whitelist**.
2. Select <URL Blacklist> tab to open the URL blacklist page, which displays all URL categories that have been added to the URL blacklist and the corresponding URL type and description.
3. Click **Set** to open the URL Blacklist dialog box, and add the URL category to the URL blacklist in the dialog box.

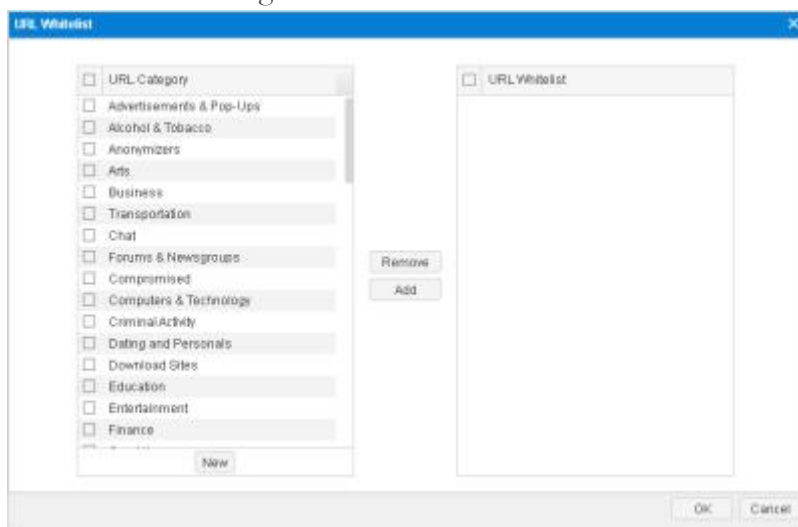

4. The "URL category" on the left contains all URL categories that can be referenced (predefined URL DB and user-defined URL DB). You can also click **New** to create a new URL category. For specific steps, see [Configuring User-defined URL DB](#).
5. In the "URL category" on the left, select the URL category that needs to be added to the URL blacklist, and click the **Add** to add the URL category entry to the "URL blacklist" list.

6. If you need to delete the URL category entry in the URL blacklist, in the "URL blacklist" list on the right, select the URL category entry you want to delete and click **Remove**.
7. Click **OK**.

Configuring the URL Whitelist

To configure the URL whitelist, take the following steps:

1. Click **Object > URL Filtering > URL Blacklist/Whitelist**.
2. Select <URL Whitelist> tab to open the URL whitelist page, which displays all URL categories that have been added to the URL whitelist and the corresponding URL type and description.
3. Click **Set** to open the URL Whitelist dialog box, and add the URL category to the URL whitelist in the dialog box.

4. The "URL category" on the left contains all URL categories that can be referenced (predefined URL DB and user-defined URL DB). You can also click **New** to create a new URL category. For specific steps, see [Configuring User-defined URL DB](#).
5. In the "URL category" on the left, select the URL category that needs to be added to the URL whitelist, and click the **Add** to add the URL category entry to the "URL whitelist" list.
6. If you need to delete the URL category entry in the URL whitelist, in the "URL whitelist" list on the right, select the URL category entry you want to delete and click **Remove**.
7. Click **OK**.

Data Security

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

The data security function allows you to flexibly configure control rules to comprehensively control and audit (by behavior logs and content logs) on user network behavior.

Data security can audit and filter in the following network behaviors:

Function	Description
File filter	Checks the files transported through HTTP, FTP, SMTP, POP3 protocols and control them according to the file filter rules.
Content filter	<ul style="list-style-type: none"> • Web content :Controls the network behavior of visiting the webpages that contain certain keywords, and log the actions. • Web posting: Controls the network behavior of posting on websites and posting specific keywords, and logs the posting action and posted content. • Email filter: Controls and audit SMTP mails : <ul style="list-style-type: none"> • Control and audit all the behaviors of sending emails; • Control and audit the behaviors of sending emails that contain specific sender, recipient, keyword or attachment. • HTTP/FTP control: Controls and audits the actions of HTTP and FTP applications: <ul style="list-style-type: none"> • FTP methods, including Login, Get, and Put; • HTTP methods, including Connect, Get, Put, Head, Options, Post, and Trace;
Network Behavior Record	Audits the IM applications behaviors and record log messages for the access actions.

Configuring Objects

Objects mean the items referenced during Content Filter rules. When using the data security function, you need to configure the following objects:

Object	Description
Predefined URL DB	The predefined URL database includes dozens of categories and tens of millions of URLs and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
User-defined URL DB	The user-defined URL database is defined by yourself and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
URL Lookup	Use the URL lookup function to inquire URL information from the URL database.
Keyword Category	Use the keyword category function to customize the keyword categories. You can use it to specify the keyword for the URL category/Web posting/email filter functions.
Warning Page	<ul style="list-style-type: none"> • Block warning: When your network access is blocked, you will be prompted with a warning page in the Web browser. • Audit warning: When your network access is audited, you will be prompted with a warning page in the Web browser.
Bypass	Domains that are not controlled by the internet behavior control rules.

Object	Description
Domain	
Exempt User	Users that are not controlled by the internet behavior control rules.

Predefined URL DB

The system contains a predefined URL database.

Notes: The predefined URL database is controlled by a license controlled. Only after a URL license is installed, the predefined URL database can be used.

The predefined URL database provides URL categories for the configurations of Web content/Web posting. It includes dozens of categories and tens of millions of URLs .

When identifying the URL category of a URL, the user-defined URL database has a higher priority than the predefined URL database.

Configuring Predefined URL Database Update Parameters

By default, the system updates predefined URL database everyday. You can change the update parameters according to your own requirements. Besides, you can update the predefined URL database from your local disk.

To change the update parameters:

1. Select **System > Upgrade Management > Signature Database Update**.
2. In the URL category database update section, you can view the current version of the database, perform the remote update, configure the remote update, and perform the local update.
 
3. Select **Enable Auto Update** to enable the automatic update function. And then continue to specify the frequency and time. Click **OK** to save your settings.
4. Click **Configure Update Server** to configure the update server URL. In the pop-up dialog, specify the URL or IP address of the update server, and select the virtual router that can connect to the server. To restore the URL settings to the default ones, click **Restore Default**.

5. Click **Configure Proxy Server**, then enter the IP addresses and ports of the main proxy server and the backup proxy server. When the device accesses the Internet through a HTTP proxy server, you need to specify the IP address and the port number of the HTTP proxy server. With the HTTP proxy server specified, various signature database can update normally.
6. Click **OK** to save the settings.

Upgrading Predefined URL Database Online

To upgrade the URL database online:

1. Select **System > Upgrade Management > Signature Database Update**.
2. In the URL category database update section, click **Update** to update the predefined URL database.

Upgrading Predefined URL Database from Local

To upgrade the predefined URL database from local:

1. **System > Upgrade Management > Signature Database Update**
2. In the URL category database update section, click **Browse** to select the URL database file from your local disk.
3. Click **Upload** to update the predefined URL database.

User-defined URL DB

Besides categories in predefined URL database, you can also create user-defined URL categories, which provides URL categories for the configurations of Web content/Web posting. When identifying the URL category, the user-defined URL database has a higher priority than the predefined URL database.

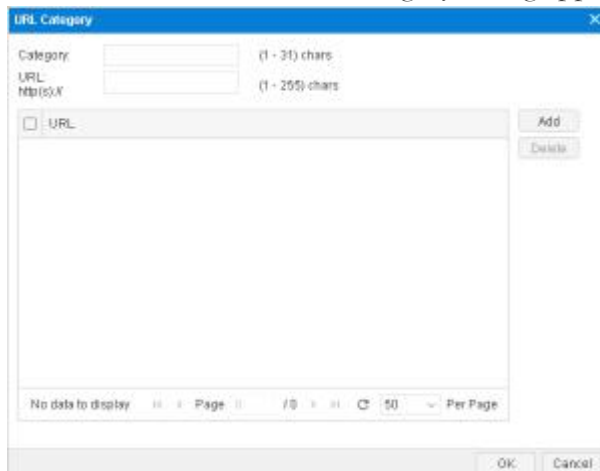

System provides three predefined URL categories: custom1, custom2, custom3. You can import your own URL lists into one of the predefined URL category.

Configuring User-defined URL DB

To configure a user-defined URL category:

1. Select **Object > Data Security > Content Filter > Web Content/Web Posting**.
2. At the top-right corner, select **Configuration > User-defined URL DB**. The User-defined URL DB dialog appears.

3. Click **New**. The URL Category dialog appears.

4. Type the category name in the **Category** box. URL category name cannot only be a hyphen (-). And you can create at most 16 user-defined categories.
5. Type a URL into the **URL http(s):/** box.
6. Click **Add** to add the URL and its category to the table.
7. To edit an existing one, select it and then click **Edit**. After editing it, click **Add** to save the changes.
8. Click **OK** to save the settings.

Importing User-defined URL

System supports to batch import user-defined URL lists into the predefined URL category named custom1/2/3. To import user-defined URL:

1. Select **Object > URL Filter**.
2. At the top-right corner, select **Configuration > User-defined URL DB**. The User-defined URL DB dialog appears.
3. Select one of the predefined URL category(custom1/2/3), and then click **Import**.
4. In the Batch Import URL dialog, click **Browse** button to select your local URL file. The file should be less than 1 M, and has at most 1000 URLs. Wildcard is supported to use once in the URL file, which should be located at the start of the address.
5. Click **OK** to finish importing.

Clearing User-defined URL

In the predefined URL category named custom1/2/3, clear user-defined URL:

1. Select **Object > URL Filter**.
2. At the top-right corner, select **Configuration > User-defined URL DB**. The User-defined URL DB dialog appears.
3. Select one of the predefined URL category(custom1/2/3), and then click **Clear**, the URL in the custom 1/2/3 will be cleared from the system.

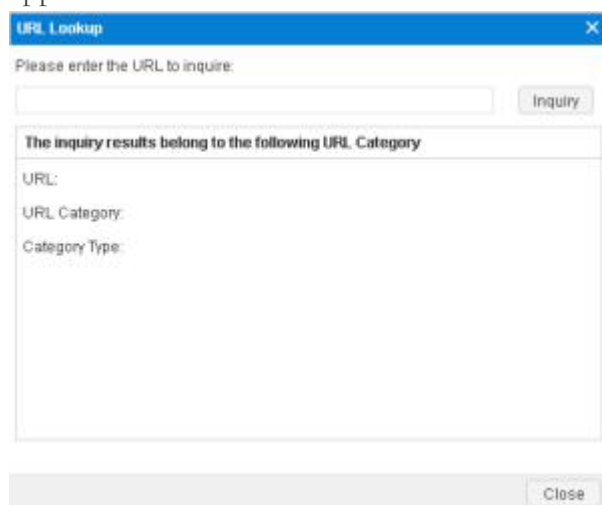

URL Lookup

You can inquire a URL to view the details by URL lookup, including the URL category and the category type.

Inquiring URL Information

To inquiry URL information:

1. Select **Object > Data Security>Content Filter> Web Content/Web Posting**.
2. At the top-right corner, click **Configuration > URL Lookup**. The URL Lookup dialog appears.

3. Type the URL into the **Please enter the URL to inquire** box.
4. Click **Inquire**, and the results will be displayed at the bottom of the dialog.

Configuring URL Lookup Servers

URL lookup server can classify an uncategorized URL (URL is neither in predefined URL database nor in user-defined URL database) you have accessed, and then add it to the URL database during database updating. By default, the URL lookup servers are enabled.

To configure a URL lookup server:

1. Select **Object > Data Security>Content Filter> Web Content/Web Posting**.

2. At the top-right corner, Select **Configuration > Predefined URL DB**. The Predefined URL DB dialog appears.
3. Click **Inquiry Server Configuration**. The Predefined URL DB Inquiry Server Configuration dialog appears.

4. In the Inquiry server section, double-click the cell in the IP/Port/Virtual Router column of Server1/2 and type a new value.
5. Select the check box in the **Enable** column to enable this URL lookup server.
6. Click **OK** to save the settings.

Keyword Category

You can customize the keyword category and use it in the internet behavior control function.

After configuring a internet behavior control rule, the system will scan traffic according to the configured keywords and calculate the trust value for the hit keywords. The calculating method is: adding up the results of $times * trust\ value$ of each keyword that belongs to the category. Then the system compares the sum with the threshold 100 and performs the following actions according to the comparison result:

- If the sum is larger than or equal to category threshold (100), the configured category action will be triggered;
- If more than one category action can be triggered and there is block action configured, the final action will be Block;
- If more than one category action can be triggered and all the configured actions are Permit, the final action will be Permit.

For example, a web content rule contains two keyword categories C1 with action block and C2 with action permit. Both of C1 and C2 contain the same keywords K1 and K2. Trust values of K1 and K2 in C1 are 20 and 40. Trust values of K1 and K2 in C2 are 30 and 80.

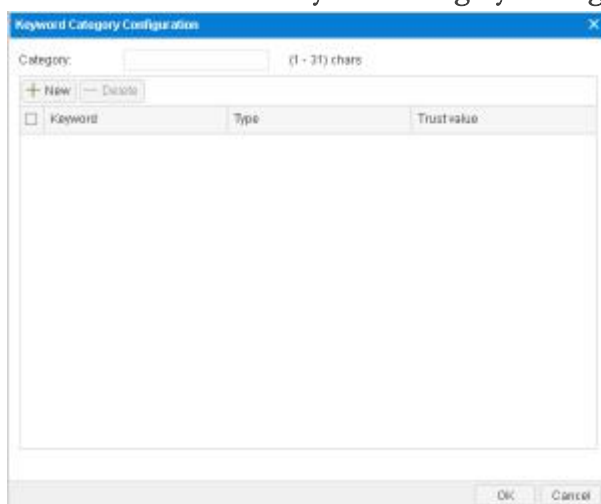

If the system detects 1 occurrence of K1 and K2 each on a web page, then C1 trust value is $20*1 + 40*1=60 < 100$, and C2 trust value is $30*1 + 80*1=110 > 100$. As a result, the C2 action is triggered and the web page access is permitted.

If the system detects 3 occurrences of K1 and 1 occurrence of K2 on a web page, then C1 trust value is $20*3+40*1=100$, and C2 trust value C2 is $30*3+80*1=170>100$. Conditions for both C1 and C2 are satisfied, but the block action for C1 is triggered, so the web page access is denied.

Configuring a Keyword Category

To configure a keyword category:

1. Select **Object > Data Security>Content Filter> Web Content/Web Posting/Email Filter**.
2. At the top-right corner, Select **Configuration > Keyword Category**. The Keyword Category dialog appears.
3. Click **New**. The **Keyword Category Configuration** dialog appears.

4. Type the category name.
5. Click **New**. In the slide area, specify the keyword, character matching method (simple/regular expression), and trust value (100 by default).
6. Click **Add** to add the keyword to the list below.
7. Repeat the above steps to add more keywords.
8. To delete a keyword, select the keyword you want to delete from the list and click **Delete**.
9. Click **OK** to save your settings.

Warning Page

The warning page shows the user block information and user audit information.

Configuring Block Warning

If the internet behavior is blocked by the internet behavior control function, the Internet access will be denied. The information of Access Denied will be shown in your browser, and some web surfing rules will be shown to you on the warning page at the same time. See the picture below:

After enabling the block warning function, block warning information will be shown in the browser when one of the following actions is blocked:

- Visiting the web page that contains a certain type of keyword category
- Posting information to a certain type of website or posting a certain type of keywords
- HTTP actions of Connect, Get, Put, Head, Options, Post, and Trace. HTTP binary file download, such as .bat, .com. Downloading ActiveX and Java Applet.

The block warning function is enabled by default. To configure the block warning function:

1. Click **Object > Data Security > Content Filter > Web Content/Web Posting/Email Filter/HTTP/FTP Control**.
2. At the top-right corner, Select **Configuration > Warning Page**. The Warning Page dialog appears.

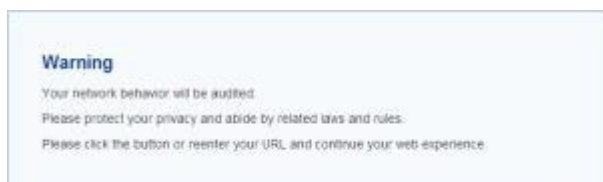

3. In the Block Warning section, select **Enable**.
4. Configure the display information in the blocking warning page.

Option	Description
Default	Use the default blocking warning page as shown above.
Redirect page	Redirect to the specified URL. Type the URL in the URL http:// box. You can click Detection to verify whether the URL is valid.
Custom	Customize the blocking warning page. Type the title in the Title box and the description in the Description box. You can click Preview to preview the blocking warning page.

5. Click **OK** to save the settings.

Configuring Audit Warning

After enabling the audit warning function, when your internet behavior matches the configured internet behavior rules, your HTTP request will be redirected to a warning page, on which the audit and privacy protection information is displayed. See the picture below:

The audit warning function is disabled by default. To configure the audit warning function:

1. Select **Object > Data Security>Content Filter> Web Content/Web Posting/Email Filter/HTTP/FTP Control**.
2. At the top-right corner, Select **Configuration > Warning Page**. The Warning Page dialog appears.
3. In the Audit Warning section, select **Enable**.
4. Click **OK** to save the settings.

Bypass Domain

Regardless of internet behavior control rules, requests to the specified bypass domains will be allowed unconditionally.

To configure a bypass domain:

1. Select **Object > Data Security>Content Filter> Web Content/Web Posting/Email Filter/HTTP/FTP Control**.

- At the top-right corner, Select **Configuration > Bypass Domain**. The Bypass Domain dialog appears.

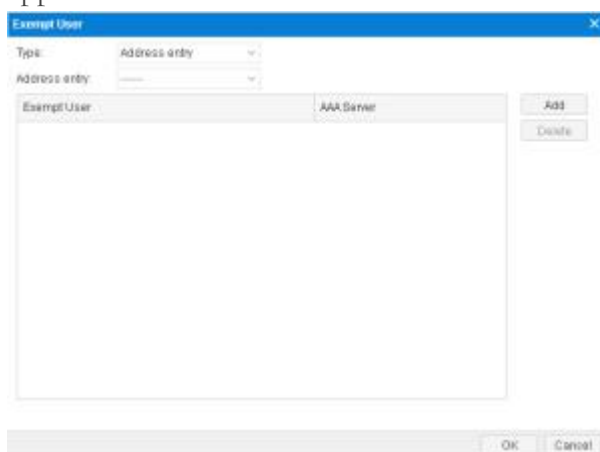

- In the text box, type the domain name.
- Click **Add**. The domain name will be added to the system and displayed in the bypass domain list.
- Click **OK** to save the settings.

Exempt User

The Exempt User function is used to specify the users who will not be controlled by the internet behavior control rules. The system supports the following types of exempt user: IP, IP range, role, user, user group, and address entry.

To configure the exempt user:

- Select **Object > Data Security > Content Filter > Web Content/Web Posting/Email Filter/HTTP/FTP Control**.
- At the top-right corner, Select **Configuration > Exempt User**. The Exempt User dialog appears.

3. Select the type of the user from the **Type** drop-down list.
4. Configure the corresponding options.
5. Click **Add**. The user will be added to the system and displayed in the exempt user list.
6. Click **OK** to save the settings.

File Filter

The file filter function checks the files transported through HTTP, FTP, SMTP, POP3 protocols and control them according to the file filter rules.

- Be able to check and control the files transported through GET and POST methods of HTTP, FTP, SMTP, and POP3.
- Support file type filter conditions.
- Support block, log, and permit actions.

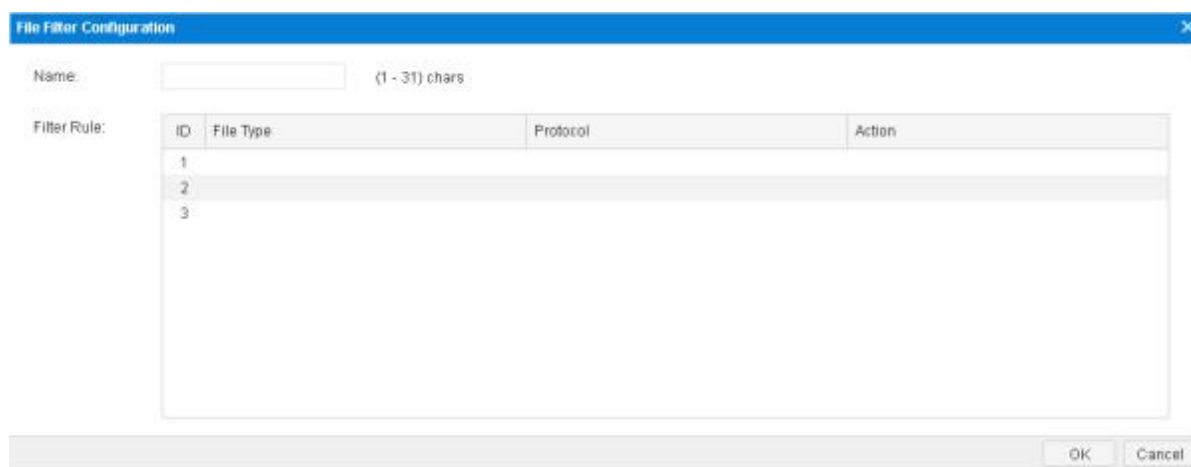

After you bind the file filter profile to a policy rule, the system will process the traffic that matches the rule according to the profile.

Creating File Filter Rule

Use the file filter rule to specify the protocol that you want to check, the filter conditions, and the actions.

To create a file filter rule:

1. Select **Object > Data Security > File Filter**.
2. Click **New**.

ID	File Type	Protocol	Action
1			
2			
3			

3. In the dialog box, enter values.

Option	Description
Name	Specifies the name of the file filter rule.
Filter Rule	
ID	<p>The ID of file filter rule item.</p> <p>If one filter rule item is configured with the block action and the file happens to match this rule, then the system will block the uploading/downloading of this file.</p>
File Type	<p>Specify the file type. Click on the column's cells and select from the drop-down menu. You can specify more than one file types. To control the file type that not supported, you can use the UNKNOWN type.</p> <p>When the transmitted file is a particular type, the system will trigger the actions. The file filter function can identify the following file types:</p> <p>7Z, AI, APK, ASF, AVI, BAT, BMP, CAB, CATPART, CDR, CIN, CLASS, CMD, CPL, DLL, DOC, DOCX, DPX, DSN, DWF, DWG, DXF, EDIT, EMF, EPS, EPUB, EXE, EXR, FLA, FLV, GDS, GIF, GZ, HLP, HTA, HTML, IFF, ISO, JAR, JPG, KEY, LNK, LZH, MA, MB, MDB, MDI, MIF, MKV, MOV, MP3, MP4, MPEG, MPKG, MSI, NUMBERS, OCX, PAGES, PBM, PCL, PDF, PGP, PIF, PL, PNG, PPT, PPTX, PSD, RAR, REG, RLA, RMVB, RPF, RTF, SGI, SH, SHK, STP, SVG, SWF, TAR, TDB, TIF, TORRENT, TXT, VBE, WAV, WEBM, WMA, WMF, WMV, WRI, WSF, XLS, XLSX, XML, XPM, ZIP, UNKNOWN</p>
Protocol	<p>Specifies the protocols. http-get represents to check the files transported through the GET method of HTTP. http-post represents to check the files transported through the POST method of HTTP. ftp represents to check the files transported through FTP. smtp represents to check the files transported through SMTP. pop3 represents to check the files transported through POP3. You can specify more than one protocol types. This option is required.</p>
Action	<p>Specify the action to control the files that matches the filter conditions. You can specify block or log. This option is required.</p>

4. Click **OK**.

Content Filter

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

Includes:

- **"Web Content"** : Controls the network behavior of visiting the webpages that contain certain keywords, and log the actions.
- **"Web Posting"** : Controls the network behavior of posting on websites and posting specific keywords, and logs the posting action and posted content.
- **"Email Filter"** :Controls and audit SMTP mails :
 - Control and audit all the behaviors of sending emails.
 - Control and audit the behaviors of sending emails that contain specific sender, recipient, keyword or attachment.
- **"HTTP/FTP Control"** :Controls and audits the actions of HTTP and FTP applications:
 - FTP methods, including Login, Get, and Put.
 - HTTP methods, including Connect, Get, Put, Head, Options, Post, and Trace.

Web Content

The web content function is designed to control the network behavior of visiting the websites that contain certain keywords. For example, you can configure to block the access to website that contains the keyword "gamble", and record the access action and website information in the log.

Configuring Web Content

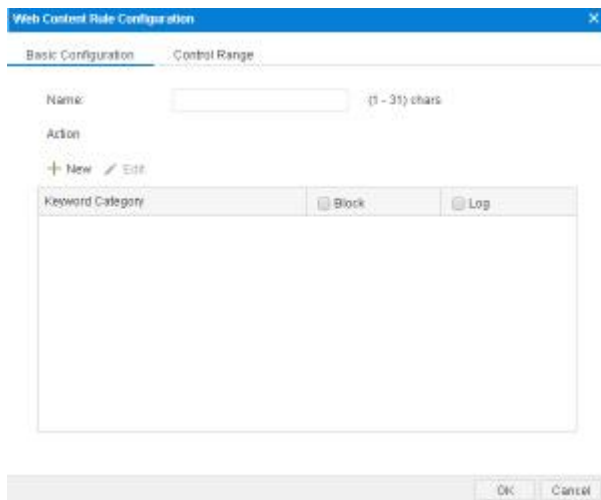

Configuring Web Content contains two parts:

- Create a Web Content rule
- Bind a Web Content rule to a security zone or policy rule

Part 1: Creating a web content rule

1. Select **Object > Data Security > Content Filter > Web Content**.

2. Click **New**.

In the Web Content Rule Configuration dialog box, enter values.

Option	Description
Name	Rule Name
Action	<p>Defines the action when a keyword is matched.</p> <ul style="list-style-type: none"> • New: Creates new keyword categories. For more information about keyword category, see "Configuring Objects". • Edit: Edits selected keyword category. • Keyword category: Shows the name of configured keyword categories. • Block: Select the check box to block the web pages containing the corresponding keywords. • Log: Select the check box to record log messages when visiting the web pages containing the corresponding keywords. • Record contents: Select the check box to record the keyword context. This option is available only when the device has a storage media (SD card, U disk, or storage module provided by FS) with the NBC license installed.
Control Range	Specify the coverage of this rule. By default, the rule applies to all website.

Option	Description
	<ol style="list-style-type: none"> 1. Click Control Range. 2. Select or unselect the websites you want to monitor and control. 3. Click OK.

3. Click **OK**.

Part 2: Binding a Web Content rule to a security zone or security policy rule

The Web content configurations are based on security zones or policies.

- If a security zone is configured with the Web content function, the system will perform detection on the traffic that is destined to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the Web content function, the system will perform detection on the traffic that is destined to the policy rule you specified, and then response.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the Web content configurations in a destination zone is superior to that in a source zone if specified at the same time.

To realize the zone-based Web Content:

1. Create a zone. For more information about how to create, refer to "[Security Zone](#)" on [Page 37](#).
2. In the Zone Configuration dialog, select Data Security tab.
3. Enable the threat protection you need, and select a Web content rules from the profile drop-down list below; or you can click **Add Profile** from the profile drop-down list below, to create a Web content rule, see [Creating a Web content rule](#).
4. Click **OK** to save the settings.

To realize the policy-based Web content:

1. Configure a security policy rule. See "[Configuring a Security Policy Rule](#)".
2. In the Data Security tab, select the **Enable** check box of Web Content.

3. From the **Profile** drop-down list, select a Web Content rule. You can also click **Add Profile** to create a new Web Content rule.
4. Click **OK** to save the settings.

If necessary, you can configure some additional features by going to the right top corner and click **Configuration**.

Option	Description
Predefined URL DB	The predefined URL database includes dozens of categories and tens of millions of URLs and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
User-defined URL DB	The user-defined URL database is defined by yourself and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
URL Lookup	Use the URL lookup function to inquire URL information from the URL database.
Warning Page	<ul style="list-style-type: none"> • Block warning: When your network access is blocked, you will be prompted with a warning page in the Web browser. • Audit warning: When your network access is audited, you will be prompted with a warning page in the Web browser.
Bypass Domain	Domains that are not controlled by the internet behavior control rules.
Exempt User	Users that are not controlled by the internet behavior control rules.

Notes:

- To ensure you have the latest URL database, it is better to update your database first. Refer to "[Configuring Objects](#)".
- You can export logs to a designated destination. Refer to "[Log Configuration](#)".

- By default, a rule will immediately take effect after you click **OK** to complete configuration.

Viewing Monitored Results of Keyword Blocking in Web Content

If you have configured email filter with keyword blocking, you can view the monitored results of blocking those words.

Select **Monitor > Keyword Block > Web Content**, you will see the monitored results. For more about monitoring, refer to "[Web Content](#)".

Viewing Logs of Keyword Blocking in Web Content

To see the system logs of keyword blocking in web content, please refer to the "[Content Filter Logs](#)".

Web Posting

The web posting function can control the network behavior of posting on websites and posting specific keywords, and can log the posting action and posting content. For example, forbid the users to post information containing the keyword X, and record the action log.

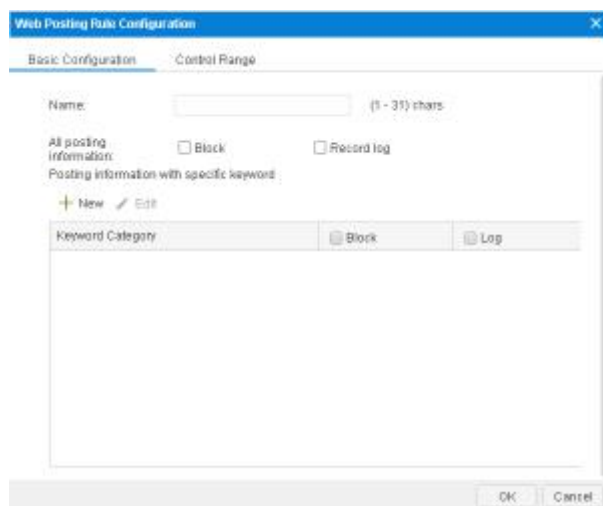

Configuring Web Posting

Configuring Web Posting contains two parts:

- Create a web posting rule
- Bind a web posting rule to a security zone or policy rule

Part 1: Creating a web posting rule

1. Select **Object > Data Security > Content Filter > Web Posting**.
2. Click **New**.

In the Web Posting Rule Configuration dialog, enter values.

Option	Description
Name	Specifies the rule name.
All posting information	<p>The action applies to all web posting content.</p> <ul style="list-style-type: none"> • Block: Select to block all web posting behaviors. • Record Log: Select to record all logs about web posting.
Posting information with specific keyword	<p>Controls the action of posting specific keywords. The options are:</p> <ul style="list-style-type: none"> • New: Creates new keyword categories. For more information about keyword category, see "Keyword Category". • Edit: Edits selected keyword category. • Keyword category: Shows the name of configured keyword categories. • Block: Blocks the posting action of the corresponding keywords. • Log: Records log messages when posting the corresponding keywords.
Control Range	<p>Specify the coverage of this rule. By default, the rule applies to all website.</p> <ol style="list-style-type: none"> 1. Click Control Range. 2. Select or unselect the websites you want to monitor and control. 3. Click OK.

3. Click **OK**.

Part 2: Binding a Web Posting rule to a security zone or security policy rule

The web posting configurations are based on security zones or policies.

- If a security zone is configured with the web posting function, the system will perform detection on the traffic that is destined to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the web posting function, the system will perform detection on the traffic that is destined to the policy rule you specified, and then response.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the web posting configurations in a destination zone is superior to that in a source zone if specified at the same time.

To realize the zone-based web posting:

1. Create a zone. For more information about how to create, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog, select Data Security tab.
3. Enable the threat protection you need, and select a Web content rules from the profile drop-down list below; or you can click **Add Profile** from the profile drop-down list below, to create a Web content rule, see [Creating a web posting rule](#).
4. Click **OK** to save the settings.

To realize the policy-based web posting:

1. Configure a security policy rule. See "[Configuring a Security Policy Rule](#)".
2. In the Data Security tab, select the **Enable** check box of web posting.
3. From the **Profile** drop-down list, select a web posting rule. You can also click **Add Profile** to create a new web posting rule.
4. Click **OK** to save the settings.

If necessary, you can configure some additional features by going to the right top corner and click **Configuration**.

Option	Description
Predefined URL DB	The predefined URL database includes dozens of categories and tens of millions of URLs and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
User-defined URL DB	The user-defined URL database is defined by yourself and you

Option	Description
	can use it to specify the URL category and URL range for the URL category/Web posting functions.
URL Lookup	Use the URL lookup function to inquire URL information from the URL database.
Warning Page	<ul style="list-style-type: none"> Block warning: When your network access is blocked, you will be prompted with a warning page in the Web browser. Audit warning: When your network access is audited, you will be prompted with a warning page in the Web browser.
Bypass Domain	Domains that are not controlled by the internet behavior control rules.
Exempt User	Users that are not controlled by the internet behavior control rules.

Notes:

- To ensure you have the latest URL database, it is better to update your database first. Refer to "[Configuring Objects](#)".
- If there is an action conflict between setting for "all websites" and "specific keywords", when a traffic matches both rules, the "deny" action shall prevail.
- You can export logs to a designated destination. Refer to "[Log Configuration](#)".
- By default, a rule will immediately take effect after you click **OK** to complete configuration.

Viewing Monitored Results of Keyword Blocking in Web Posts

If you have configured web posting rule with keyword blocking, you can view the monitored results of blocking those words.

Select **Monitor > Keyword Block > Web Posting**, you will see the monitored results. For more about monitoring, refer to "[Keyword Block](#)".

Viewing Logs of Keyword Blocking in Web Posts

To see the system logs of keyword blocking in web posts, please refer to the ["Content Filter Logs"](#).

Email Filter

The email filter function is designed to control the email sending actions according to the sender, receiver, email content and attachment, and record the sending log messages. Both the SMTP emails and the web mails can be controlled.

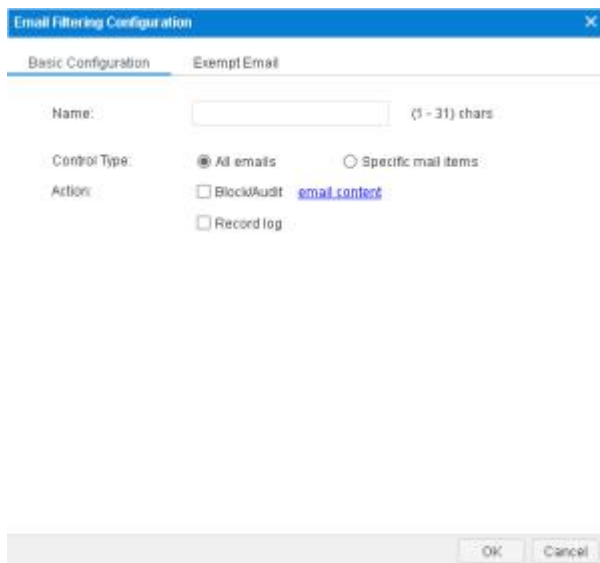

Configuring Email Filter

Configuring email filter contains two parts:

- Create an email filter rule
- Bind an email filter rule to a security zone or policy rule

Part 1: Creating an email filter rule

1. Select **Object > Data Security > Content Filter > Email Filtering Log**.
2. Click **New**.

In the dialog box, enter values.

Option	Description
Name	Specifies the rule name.
Control Type	<p>All emails - This option applies to all the sending emails.</p> <ul style="list-style-type: none"> • Record Log - Select this check box if you want all emails to be logged.

Option	Description		
	<p>Specific mail items - This option applies to specific mail items.</p> <p>To configure the email sender:</p> <ol style="list-style-type: none"> 1. Click Sender. 2. In the prompt, enter sender's email address. 3. Click Add. 4. You may select to block the sender or keep a record. 5. Click OK. <p>To configure the email receiver:</p> <ol style="list-style-type: none"> 1. Click Recipient. 2. In the prompt, enter email receiver's email address. 3. Click Add. 4. You may select to block the receiver or keep a record. 5. Click OK. <p>To configure the email content keywords:</p> <ol style="list-style-type: none"> 1. Click email content. 2. In the prompt, click Add. See the Keyword Category part in "Configuring Objects". 3. You may select to block the email containing keywords or keep a record. <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <table border="0"> <tr> <td style="padding-right: 10px;">Other emails</td> <td>Select an action for emails other than which are added above.</td> </tr> </table> </div>	Other emails	Select an action for emails other than which are added above.
Other emails	Select an action for emails other than which are added above.		
Exempt Email			
Exempt Email	<p>To configure mail addresses that do not follow the regulations of email filter:</p> <ol style="list-style-type: none"> 1. Click Exempt Email. 		

Option	Description
	<ol style="list-style-type: none"> <li data-bbox="639 275 1286 353">2. In the prompt, enter emails that do not obey email filter. <li data-bbox="639 389 1150 423">3. Click Add, and you can add more. <li data-bbox="639 459 855 492">4. Click OK.

Part 2: Binding an Email filter rule to a security zone or security policy rule

The email filter configurations are based on security zones or policies.

- If a security zone is configured with the email filter function, the system will perform detection on the traffic that is destined to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the email filter function, the system will perform detection on the traffic that is destined to the policy rule you specified, and then response.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the email filter configurations in a destination zone is superior to that in a source zone if specified at the same time.

To realize the zone-based email filter:

1. Create a zone. For more information about how to create, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog, select Threat Protection tab.
3. Enable the threat protection you need, and select an email filter rules from the profile drop-down list below; or you can click **Add Profile** from the profile drop-down list below, to create an email filter rule, see [Creating an email filter rule](#).
4. Click **OK** to save the settings.

To realize the policy-based email filter:

1. Configure a security policy rule. See "[Configuring a Security Policy Rule](#)".
2. In the Protection tab, select the **Enable** check box of email filter.
3. From the **Profile** drop-down list, select an email filter rule. You can also click **Add Profile** to create a new email filter rule.
4. Click **OK** to save the settings.

If needed, you can also configure SSL proxy, keyword category, warning page, bypass domain and user exempt user.

To configure those features, click **Configuration** on the right top corner of the Email Filtering Log list page.

Option	Description
Keyword Category	Use the keyword category function to customize the keyword categories. You can use it to specify the keyword for the URL category/Web posting/email filter functions.
Warning Page	<ul style="list-style-type: none"> Block warning: When your network access is blocked, you will be prompted with a warning page in the Web browser. Audit warning: When your network access is audited, you will be prompted with a warning page in the Web browser.
Bypass Domain	Domains that are not controlled by the internet behavior control rules.
Exempt User	Users that are not controlled by the internet behavior control rules.

Notes:

- If an email filter rule has added all three of Audit/Block Sender, Receiver and email content, the rule will take effect when one of them is hit.
- You can export logs to a designated destination. Refer to "[Log Configuration](#)".
- By default, a rule will immediately take effect after you click **OK** to complete configuration.

Viewing Monitored Results of Email Keyword Blocking

If you have configured email filter with keyword blocking, you can view the monitored results of blocking those words.

Select **Monitor > Keyword Block > Email Content**, you will see the monitored results. For more about monitoring, refer to "[Email Content](#)".

Viewing Logs of Emails Keyword Blocking

To see the system logs of email's keywords, please refer to the ["Content Filter Logs"](#).

HTTP/FTP Control

The HTTP/FTP control function is designed to control and audit (record log messages) the actions of HTTP and FTP applications, including:

- Behavior control and audit of controlling the actions of Login, Get, and Put action in FTP;
- Behavior control and audit of controlling the actions of Connect, Get, Put, Head, Options, Post, Trace, Delete in HTTP.

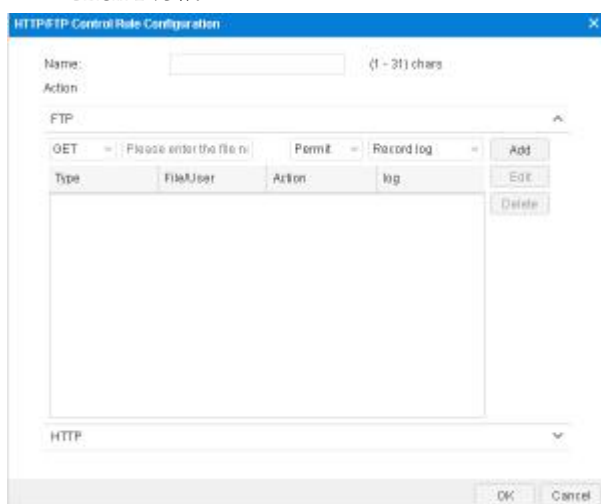

Configuring HTTP/FTP Control

Configuring HTTP/FTP behavior control contains two parts:

- Create an HTTP/FTP behavior control rule
- Bind an HTTP/FTP behavior control rule to a security zone or policy rule

Part 1: Creating an HTTP/FTP behavior control rule

1. Select **Object > Data Security > Content Filter > HTTP/FTP Control**.
2. Click **New**.

In the HTTP/FTP Control Rule Configuration dialog box, enter values.

Option	Description
Name	Specifies the rule name.
Action	

Option	Description
FTP	<p>Controls the FTP methods, including Login, Get, and Put. Expand FTP, and configure the FTP control options.</p> <ul style="list-style-type: none"> • From the first drop-down list, select the method to be controlled, it can be GET, PUT, or Login. • Type the file name (for the method of GET or PUT) or user name (for the method of Login) into the next box. • From the second drop-down list, select the action. It can be Block or Permit. • From the third drop-down list, specify whether to record the log messages. • Click Add. • Repeat Step 1 to 5 to add more control entries. To edit/delete a control entry, select the entry from the list, and then click Edit or Delete.
HTTP	<p>Controls the HTTP methods, including Connect, GET, PUT, Head, Options, Post, Trace, and Delete. Expand HTTP, and configure the HTTP control options.</p> <ul style="list-style-type: none"> • From the first drop-down list, select the method to be controlled, it can be Connect, GET, PUT, Head, Options, Post, Trace, or Delete. • Type the domain name into the next box. • From the second drop-down list, select the action. It can be Block or Permit. • From the third drop-down list, specify whether to record the log messages. • Click Add. • Repeat Step 1 to 5 to add more control entries. To edit/delete a control entry, select the entry from the list, and then click Edit or Delete.

3. Click **OK**.

Part 2: Binding a HTTP/FTP behavior control rule to a security zone or security policy rule

The HTTP/FTP behavior control configurations are based on security zones or policies.

- If a security zone is configured with the HTTP/FTP behavior control function, the system will perform detection on the traffic that is destined to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the HTTP/FTP behavior control function, the system will perform detection on the traffic that is destined to the policy rule you specified, and then response.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the HTTP/FTP behavior control configurations in a destination zone is superior to that in a source zone if specified at the same time.

To realize the zone-based HTTP/FTP behavior control:

1. Create a zone. For more information about how to create, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog, select Data Security tab.
3. Enable the threat protection you need, and select an email filter rules from the profile drop-down list below; or you can click **Add Profile** from the profile drop-down list below, to create a HTTP/FTP behavior control rule, see [Creating a HTTP/FTP behavior control rule](#).
4. Click **OK** to save the settings.

To realize the policy-based HTTP/FTP behavior control:

1. Configure a security policy rule. See "[Configuring a Security Policy Rule](#)".
2. In the Data Security tab, select the **Enable** check box of HTTP/FTP behavior control.
3. From the **Profile** drop-down list, select a HTTP/FTP behavior control rule. You can also click **Add Profile** to create a new HTTP/FTP behavior control rule.
4. Click **OK** to save the settings.

If necessary, you can configure some additional features by going to the right top corner and click **Configuration**.

Option	Description
--------	-------------

Option	Description
Predefined URL database	The predefined URL database includes dozens of categories and tens of millions of URLs and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
User-defined URL database	The user-defined URL database is defined by yourself and you can use it to specify the URL category and URL range for the URL category/Web posting functions.
URL lookup	Use the URL lookup function to inquire URL information from the URL database.
Keyword category	Customizes keyword categories as needed.
Warning Page	<ul style="list-style-type: none"> Block warning: When your network access is blocked, you will be prompted with a warning page in the Web browser. Audit warning: When your network access is audited, you will be prompted with a warning page in the Web browser.
Bypass Domain	Domains that are not controlled by the internet behavior control rules.
Exempt User	Users that are not controlled by the internet behavior control rules.

Notes:

- You can export logs to a designated destination. Refer to "[Log Configuration](#)".
- By default, a rule will immediately take effect after you click **OK** to complete configuration.

Viewing Logs of HTTP/FTP Behavior Control

To see the system logs of HTTP/FTP behavior control, please refer to the "[Content Filter Logs](#)".

Network Behavior Record

Network behavior record function audits the IM applications behaviors and record log messages for the access actions, includes:

- Audits the QQ, WeChat and sinaweibo user behaviors.
- Log the access behaviors.

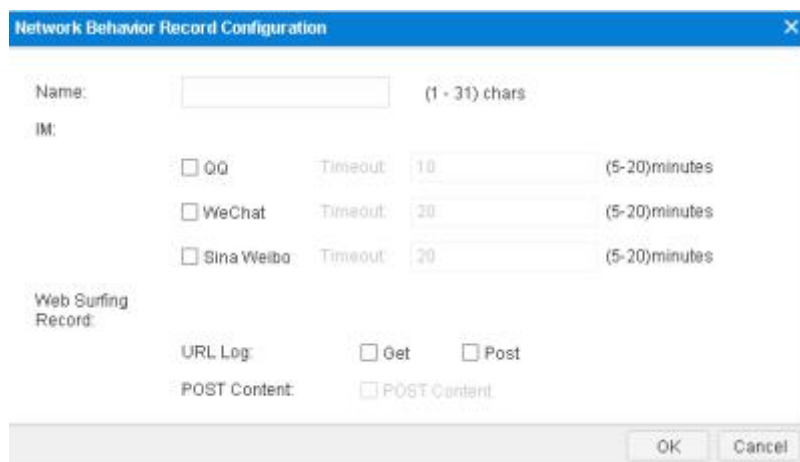

Configuring Network Behavior Recording

Configuring network behavior record contains two parts:

- Create a network behavior record rule
- Bind a network behavior record rule to a security zone or policy rule

Part 1: Creating a NBR rule

1. Select **Object > Data Security > Network Behavior Record**.
2. Click **New**.

In the Network Behavior Record Configuration dialog box, enter values.

Option	Description
Name	Rule Name
IM	
QQ	To audits the QQ behavior. <ol style="list-style-type: none"> 1. Select the QQ checkbox. 2. Timeout: Specifies the timeout value. The unit is minute. The default value is 10. During the timeout period, the IM user traffic of the same UID will not

Option	Description
	trigger the new logs and after the timeout reaches, it will trigger new logs.
WeChat	<p>To audits the WeChat behavior.</p> <ol style="list-style-type: none"> 1. Select the Wechat checkbox. 2. Timeout: Specifies the timeout value. The unit is minute. The default value is 20. During the timeout period, the IM user traffic of the same UID will not trigger the new logs and after the timeout reaches, it will trigger new logs.
Sina Weibo	<p>To audits the sina weibo behavior.</p> <ol style="list-style-type: none"> 1. Select the Sina Weibo checkbox 2. Timeout: Specifies the timeout value. The unit is minute. The default value is 20. During the timeout period, the IM user traffic of the same UID will not trigger the new logs and after the timeout reaches, it will trigger new logs.
Web Surfing Record	
URL Log	<p>logs the GET and POST methods of HTTP.</p> <ul style="list-style-type: none"> • Get: Records the logs when having GET methods. • Post: Records the logs when having POST methods.
POST Content	Post Content: Records the posted content.

3. Click **OK**.

Part 2: Binding a network behavior record rule to a security zone or security policy rule

The network behavior record configurations are based on security zones or policies.

- If a security zone is configured with the network behavior record function, the system will perform detection on the traffic that is destined to the binding zone specified in the rule, and then do according to what you specified.

- If a policy rule is configured with the network behavior record function, the system will perform detection on the traffic that is destined to the policy rule you specified, and then response.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the network behavior record configurations in a destination zone is superior to that in a source zone if specified at the same time.

To realize the zone-based network behavior record:

1. Create a zone. For more information about how to create, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog, select Data Security tab.
3. Enable the threat protection you need, and select a network behavior record rules from the profile drop-down list below; or you can click **Add Profile** from the profile drop-down list below, to create a network behavior record rule, see [Creating a network behavior record rule](#).
4. Click **OK** to save the settings.

To realize the policy-based network behavior record:

1. Configure a security policy rule. See "[Configuring a Security Policy Rule](#)".
2. In the Data Security tab, select the **Enable** check box of network behavior record.
3. From the **Profile** drop-down list, select a network behavior record rule. You can also click **Add Profile** to create a new network behavior record rule.
4. Click **OK** to save the settings.

Notes:

- You can export logs to a designated destination. Refer to "[Log Configuration](#)".
- By default, a rule will immediately take effect after you click **OK** to complete configuration

Viewing Logs of Network Behavior Recording

To see the logs of network behavior recording, please refer to the "[Network Behavior Record Logs](#)".

NetFlow

NetFlow is a data exchange method, which records the source /destination address and port numbers of data packets in the network. It is an important method for network traffic statistics and analysis.

NetFlow supports the NetFlow Version 9. With this function configured, the device can collect user's ingress traffic according to the NetFlow profile, and send it to the server with NetFlow data analysis tool, so as to detect, monitor and charge traffic.

Related Topics:

- ["Configuring NetFlow"](#)

Configuring NetFlow

The NetFlow configurations are based on interfaces.

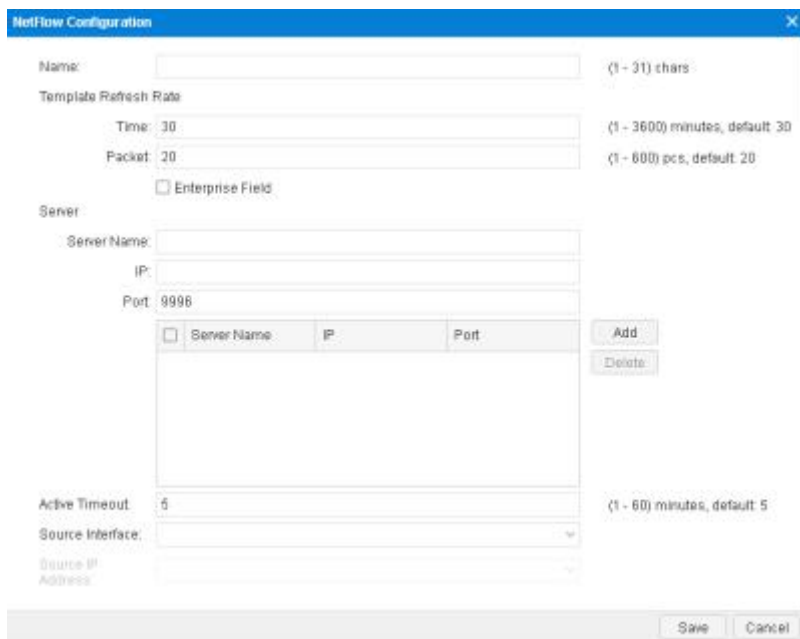

To configure the interface-based NetFlow, take the following steps:

1. Click **Object > NetFlow > Configuration**. Select **Enable** check box to enable the NetFlow function.
2. Click **Object > NetFlow > Profile** to [create a NetFlow rule](#) .
3. Bind the NetFlow rule to an interface. Click **Network > Interface**. Select the interface you want to bind or click **New** to [create a new interface](#). In the Interface Configuration dialog box, select the **Basic** tab and then select a NetFlow rule from the **NetFlow configuration** drop-down list.

Configuring a NetFlow Rule

To configure the NetFlow rule, take the following steps:

1. Click **Object > NetFlow > Profile**.
2. Click **New** to create a new NetFlow rule. To edit an existing one, select the check box of this rule and then click **Edit**.

In the NetFlow Configuration dialog box, configure the following options

Option	Description
Name	Enter the name of the NetFlow rule.
Template Refresh Rate	<p>You can configure the NetFlow template refresh rate by time or number of packets, after which system will refreshes the NetFlow rule.</p> <ul style="list-style-type: none"> Time: Specifies the time after which system refreshes the NetFlow rule. The range is 1 to 3600 minutes. The default value is 30 minutes. Packets: Specifies the number of packets. When the number of NetFlow packets exceeds the specified value, system will refreshes the NetFlow rule. The range is 1 to 600. The default value is 20.
Enterprise Field	Select the Enterprise Field check box, and the collected NetFlow traffic information will contain enterprise field information.
Server	<p>To configure the NetFlow server, take the following steps:</p> <ol style="list-style-type: none"> Type the server name, IP address and port number into the Server Name, IP and Port box respectively.

Option	Description
	<ol style="list-style-type: none"> Click Add to add a NetFlow server which will be displayed in the list below. Repeat the above steps to add more servers. You can add up to 2 servers. To delete a server, select the server check box you want to delete from the list and click Delete.
Active Timeout	<p>The active timeout value is the time after which the device will send the collected NetFlow traffic information to the specified server once.</p> <p>Type the active timeout value into the Active Timeout box. The range is 1 to 60 minutes. The default value is 5 minutes.</p>
Source Interface	Select the source interface for sending NetFlow traffic information in the Source Interface drop-down list.
Source IP Address	After specifying the source interface, the system will automatically acquire and display the management IP address or the secondary IP address of the source interface in the drop-down list.

- Click **OK** to save the settings.

NetFlow Global Configurations

To configure the NetFlow global configurations, take the following steps:

- Select **Object > NetFlow > Configuration**.
- Select the **Open NetFlow** check box of NetFlow to enable the NetFlow function. Clear the check box to disable the NetFlow function. The NetFlow function will take effect after rebooting.

Chapter 10 Policy

The Policy module provides the following functions:

- **Security policy:** Security policy is the basic function of devices that are designed to control the traffic forwarding between security zones/segments. By default all traffic between security zones/segments will be denied.
- **NAT:** When the IP packets pass through the devices or routers, the devices or routers will translate the source IP address and/or the destination IP address in the IP packets.
- **iQoS:** iQoS is used to provide different priorities to different traffic, in order to control the delay and flapping, and decrease the packet loss rate. iQoS can assure the normal transmission of critical business traffic when the network is overloaded or congested.
- **Session limit:** The session limit function limits the number of sessions and controls the session rate to the source IP address, destination IP address, specified IP address, service, or role/user/user group, thereby protecting from DoS attacks and control the bandwidth of applications, such as IM or P2P.
- **ARP Defense:** The ARP defense is used to protect your network against various ARP attacks.
- **Internet behavior control:** The Internet behavior control allows you to flexibly configure control rules to comprehensively control and audit (by behavior logs and content logs) on user network behavior.
- **Global blacklist:** After adding the IP addresses or services to the global blacklist, system will perform the block action to the IP address and service until the block duration ends.

Security Policy

Security policy is the basic function of devices that is designed to control the traffic forwarding between security zones/segments. Without security policy rules, the devices will deny all traffic between security zones/segments by default. After configuring the security policy rule, the device can identify what traffic between security zones or segments will be permitted, and the others will be denied.

The basic elements of policy rules:

- The source zone and address of the traffic
- The destination zone and address of the traffic
- The service type of the traffic

- Actions that the devices will perform when processing the specific type of traffic, including Permit, Deny, Tunnel, From tunnel, WebAuth, and Portal server.

Generally a security policy rule consists of two parts: filtering conditions and actions. You can set the filtering conditions by specifying traffic's source zone/address, destination zone/address, service type, and user. Each policy rule is labeled with a unique ID which is automatically generated when the rule is created. You can also specify a policy rule ID at your own choice. All policy rules in system are arranged in a specific order. When traffic flows into a device, the device will query for policy rules by turn, and processes the traffic according to the first matched rule.

The max global security policy rule numbers may vary in different models.

Security policy supports IPv4 and IPv6 address. If IPv6 is enabled, you can configure IPv6 address entry for the policy rule.

This section contains the following contents:

- Configure a security policy rule
- Manage the security policy rules: enable/disable a policy rule, clone a policy rule, adjust security rule position, configure default action, view and clear policy hit count, hit count check, and rule redundancy check.
- Configure a security policy group
- View and search the security policy rules/ security policy groups

Configuring a Security Policy Rule

To configure a security policy rule, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. At the top-left corner, click **New**. The Policy Configuration dialog box will appear.

In the **Basic** tab, configure the corresponding options.

Option	Description
Name	Type the name of the security policy.
Type	Select the IP type, including IPv4 or IPv6. Only the IPv6 firmware can configure the IPv6 type. If IPv6 is selected, all of the IPv6/prefix, IP range, and address should be configured in the IPv6 format.

Option	Description
Source Information	
Zone	Specifies a source zone.
Address	<p>Specifies the source addresses.</p> <ol style="list-style-type: none"> 1. Select an address type from the Address drop-down list. 2. Select or type the source addresses based on the selected type. 3. Click  to add the addresses to the right pane. 4. After adding the desired addresses, click the blank area in this dialog box to complete the source address configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Address Book type, you can click Add to create a new address entry. • The default address configuration is any. To restore the configuration to this default one, select the any check box.
User	<p>Specifies a role, user or user group for the security policy rule.</p> <ol style="list-style-type: none"> 1. From the User drop-down menu, select the AAA server where the users and user groups reside. To specify a role, select Role from the AAA Server drop-down list. 2. Based on the type of AAA server, you can execute one or more actions: search a user/user group/role, expand the user/user group list, enter the name of the user/user group. 3. After selecting users/user groups/roles, click  to add the them to the right pane. 4. After adding the desired objects, click the blank area in this dialog box to complete the user configuration.
Destination	
Zone	Specifies a destination zone.
Address	Specifies the destination addresses.

Option	Description
	<ol style="list-style-type: none"> 1. Select an address type from the Address drop-down list. 2. Select or type the destination addresses based on the selected type. 3. Click <input type="button" value="➤"/> to add the addresses to the right pane. 4. After adding the desired addresses, click the blank area in this dialog box to complete the destination address configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Address Book type, you can click Add to create a new address entry. • The default address configuration is any. To restore the configuration to this default one, select the any check box.
Other Information	
Service	<p>Specifies a service or service group.</p> <ol style="list-style-type: none"> 1. From the Service drop-down menu, select a type: Service, Service Group. 2. You can search the desired service/service group, expand the service/service group list. 3. After selecting the desired services/service groups, click <input type="button" value="➤"/> to add them to the right pane. 4. After adding the desired objects, click the blank area in this dialog box to complete the service configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • To add a new service or service group, click Add. • The default service configuration is any. To restore the configuration to this default one, select the any check box.
Applicatio	Specifies an application/application group/application filters.

Option	Description
n	<ol style="list-style-type: none"> 1. From the Application drop-down menu, you can search the desired application/application group/application filter, expand the list of applications/application groups/application filters. 2. After selecting the desired applications/application groups/application filters, click  to add them to the right pane. 3. After adding the desired objects, click the blank area in this dialog box to complete the application configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • To add a new application group, click New AppGroup. • To add a new application filter, click New AppFilter.
Action	
Action	<p>Specifies an action for the traffic that is matched to the policy rule, including:</p> <ul style="list-style-type: none"> • Permit - Select Permit to permit the traffic to pass through. • Deny - Select Deny to deny the traffic. • WebAuth - Performs Web authentication on the matched traffic. Select WebAuth from the drop-down list after selecting the Secured Connection option, and then select an authentication server from the following drop-down list. • From tunnel (VPN) - For the traffic from a peer to local, if this option is selected, system will first determine if the traffic originates from a tunnel. Only such traffic will be permitted. Select From tunnel (VPN) from the drop-down list after selecting the Secured Connection option, and then select a tunnel from the following drop-down list. • Tunnel (VPN) - For the traffic from local to a peer, select this option to allow the traffic to pass through the VPN

Option	Description
	<p>tunnel. Select Tunnel (VPN) from the drop-down list after selecting the Secured Connection option, and then select a tunnel from the following drop-down list.</p> <ul style="list-style-type: none"> • Portal server - Performs portal authentication on the matched traffic. Select Portal server from the drop-down list after selecting the Secured Connection option, and then type the URL address of the portal server.
Enable Web Redirect	<p>Enable the Web redirect function to redirect the HTTP request from clients to a specified page automatically. With this function enabled, system will redirect the page you are requesting over HTTP to a prompt page.</p> <ol style="list-style-type: none"> 1. Select the Enable Web Redirect check box. 2. Type a redirect URL into the Notification page URL box. <p>When using Web redirect function, you need to configure the Web authentication function. For more configurations, see "User Online Notification".</p>

In the Protection tab, configure the corresponding options.

Option	Description
Antivirus	Specifies an antivirus profile. The combination of security policy rule and antivirus profile enables the devices to implement fine-grained application layer policy control.
IPS	Specifies an IPS profile. The combination of security policy rule and IPS profile enables the devices to implement fine-grained application layer policy control.
URL Filtering	Specifies a URL filter profile. The combination of security policy rule and URL filter profile enables the devices to implement fine-grained application layer policy control.
Sandbox	Specifies a sandbox profile. The combination of security policy rule and sandbox profile enables the devices to implement fine-grained application layer policy control.
Botnet C&C Prevention	Specifies a botnet C&C prevention profile. The combination of security policy rule and botnet C&C prevention profile enables the devices to implement fine-grained application layer policy control.

Option	Description
	control.

In the **Data Security** tab, configure the corresponding options.

Option	Description
File Filter	Specifies a file filter profile. The combination of security policy rule and file filter profile enables the devices to implement fine-grained application layer policy control.
Content Filter	<ul style="list-style-type: none"> • Web Content: Specifies a web content profile. The combination of security policy rule and Web Content profile enables the devices to implement fine-grained application layer policy control. • Web Posting: Specifies a web posting profile. The combination of security policy rule and web posting profile enables the devices to implement fine-grained application layer policy control. • Email Filter: Specifies an email filter profile. The combination of security policy rule and email filter profile enables the devices to implement fine-grained application layer policy control. • HTTP/FTP Control: Specifies a HTTP/FTP control profile. The combination of security policy rule and HTTP/FTP control profile enables the devices to implement fine-grained application layer policy control.
Network Behavior Record	Specifies a NBR profile. The combination of security policy rule and NBR profile enables the devices to implement fine-grained application layer policy control.

In the **Options** tab, configure the corresponding options.

Option	Description
Schedule	<p>Specifies a schedule when the security policy rule takes effect. Select a desired schedule from the Schedule drop-down list. This option supports fuzzy search. After selecting the desired schedules, click the blank area in this dialog box to complete the schedule configuration.</p> <p>To create a new schedule, click New Schedule.</p>

Option	Description
Log	<p>You can log policy rule matching in the system logs according to your needs.</p> <ul style="list-style-type: none"> • For the policy rules of Permit, logs will be generated in two conditions: the traffic that is matched to the policy rules starts and ends its session. • For the policy rules of Deny, logs will be generated when the traffic that is matched to the policy rules is denied. <p>Select one or more check boxes to enable the corresponding log types.</p> <ul style="list-style-type: none"> • Deny - Generates logs when the traffic that is matched to the policy rules is denied. • Session start - Generates logs when the traffic that is matched to the policy rules starts its session. • Session end - Generates logs when the traffic that is matched to the policy rules ends its session.
SSL Proxy	<p>Specifies a SSL proxy profile. The combination of security policy rule and SSL proxy profile enables the devices to decrypt the HTTPS traffic.</p>
Position	<p>Select a rule position from the Position drop-down list. Each policy rule is labeled with a unique ID or name. When traffic flows into a device, the device will query for the policy rules by turn, and processes the traffic according to the first matched rule. However, the policy rule ID is not related to the matching sequence during the query. The sequence displayed in policy rule list is the query sequence for policy rules. The rule position can be an absolute position, i.e., at the top or bottom, or a relative position, i.e., before or after an ID or a name.</p>
Description	<p>Type descriptions into the Description box.</p>

4. Click **OK** to save your settings.

Managing Security Policy Rules

Managing security policy rules include the following matters: enable/disable a policy rule, clone a policy rule, adjust security rule position, configure default action, view and clear policy hit count, hit count check, and rule redundancy check.

Enabling/Disabling a Policy Rule

By default the configured policy rule will take effect immediately. You can terminate its control over the traffic by disabling the rule.

To enable/disable a policy rule:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Select the security policy rule that you want to enable/disable.
4. Click **...**, and then select **Enable** or **Disable** to enable or disable the rule.

The disabled rule will not display in the list. Click **...**, and then select **Show Disabled Policies** to show them.

Cloning a Policy Rule

When there are a large number of policy rules in system, to create a policy rule which is similar to an configured policy rule easily, you can copy the policy rule and paste it to the specified location.

To clone a policy rule, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Select the security policy rule that you want to clone and click **Copy**.
4. Click **Paste**. In the pop-up, select the desired position. Then the rule will be cloned to the desired position.

Adjusting Security Policy Rule Position

To adjust the rule position, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Select the check box of the security policy whose position will be adjusted.

4. Click **Move**.
5. In the pop-up menu, type the rule ID or name , and click **Before ID** , **After ID** , **Before Name** or **After Name**. Then the rule will be moved before or after the specified ID or name.

Configuring Default Action

You can specify a default action for the traffic that is not matched with any configured policy rule. System will process the traffic according to the specified default action. By default system will deny such traffic.

To specify a default policy action, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Click ... and select **Default Policy Action**.

In the Default Policy Action dialog box, configure the following options.

Option	Description
Hit count	Shows the statistics on policy matching.
Default action	Specify a default action for the traffic that is not matched with any configured policy rule. <ul style="list-style-type: none"> • Click Permit to permit the traffic to pass through. • Click Deny to deny the traffic.
Log	Configure to generate logs for the traffic that is not matched with any configured policy rule. By default system will not generate logs for such traffic. To enable log, select the Enable check box, and system will generate logs for such traffic.

4. Click **OK** to save your changes.

Viewing and Clearing Policy Hit Count

System supports statistics on policy hit counts, i.e., statistics on the matching between traffic and policy rules. Each time the inbound traffic is matched with a certain policy rule, the hit count will increase by 1 automatically.

To view a policy hit count, click **Policy > Security Policy**. In the policy rule list, view the statistics on policy hit count under the Hit Count column.

To clear a policy hit count, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Click **...** and select **Clearing Policy Hit Count**.

In the Clearing Hit Count dialog box, configure the following options.

Option	Description
All policies	Clears the hit counts for all policy rules.
Default policy	Clears the hit counts for the default action policy rules.
Policy ID	Clears the hit counts for a specified ID policy rule.
Name	Clears the hit counts for a specified name policy rule.

4. Click **OK** to perform the hit count clearing.

Hit Count Check

System supports to check policy rule hit counts.

To check hit count, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Click **...** and select **Hit Count Check**. After the check, the policy rules whose hit count is 0 will be highlighted. That means that the policy rule is not used in system.

Rule Redundancy Check

In order to make the rules in the policy effective, system provides a method to check the conflicts among rules in a policy. With this method, administrators can check whether the rules overshadow each other.

To start a rule redundancy check, take the following steps:

1. Select **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy**.
3. Click **...** and select **Redundancy Check**. After the check, system will highlight the policy rule which is overshadowed.

Notes: Status will be shown below the policy list when redundancy check is started. It is not recommended to edit a policy rule during the redundancy check. You can click  to stop the check manually.

Schedule Validity Check

In order to make sure that the policies based on schedule are effective, system provides a method to check the validity of policies. After checking the policy, the invalid policies based on schedule will be highlighted by yellow.

To check schedule validity:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy** to enter the **Security Policy** page.
3. Click **...** and select **Schedule Validity Check**. After check, system will highlight the invalid policy based on schedule by yellow. Meanwhile, you can view the validity status in the policy list.

ID	Name	Source			Destination		Service
		Zone	Address	User	Zone	Address	
1	policy1	any	any		any	any	any
2	policy2	any	any		any	any	any

Showing Disabled Policies

To show disabled policies:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy** to enter the **Security Policy** page.
3. Click **...** and select **Show Disabled Policies**. The disabled policies will be highlighted by green in the policy list.

ID	Name	Zone	Address	User	Zone	Address	Service	Application	Action	Session
7		any	any		any	any	DNS			
8		any	any	USER/DIRM	any	any	any			
5		any	any		any	any	any			
4	policy	zone	address		any	any	any			
1		any	any		any	any	DNS			
2		any	any	USER/DIRM	any	any	any			
3		any	any		any	any	any			

Notes:

- By default(the "Schedule Validity Check" and "Show Disabled Policies" are not selected), the policy list only displays the enabled policies which are not highlighted.
- When you select both "Schedule Validity Check" and "Show Disabled Policies", the policy is managed as follows:

- The policy list will display the "Validity" column, which shows the validity status of policies.
- The invalid policy based on schedule will be highlighted by yellow no matter if the policy is disabled or not.
- If the valid policy based on schedule is disabled, it will be highlighted by green.

Configuring a Policy Group

You can organize some policy rules together to form a policy group, and configure the policy group directly.

Configuring a security policy group include the following matters: creating a policy group, deleting a policy group, enable/disable a policy group, add/delete a policy rule member, edit a policy group and show disabled policy group.

Creating a Policy Group

To create a policy group, take the following steps:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.
3. Click **New**,the Policy Group Configuration dialog box will appear.

In the Policy Group Configuration dialog, configure the corresponding options.

Option	Description
Name	Specifies the name of the policy group. The length is 1 to 95 characters.
Description	Specifies the new description. You can enter at most 255 characters.
Add Policy	In the policy rules list, select the security policy rule that you want to add to the policy group.

4. Click **OK** to save your settings.

Deleting a Policy Group

To delete a policy group, take the following steps:

1. Select **Policy > Security Policy** .

2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.
3. Select the check box of the policy group that you want to delete, and click **Delete**.

Enabling/Disabling a Policy Group

By default the configured policy group will take effect immediately.

To enable/disable a policy group, take the following steps:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.
3. Select the check box of the policy group that you want to enable or disable, and click the enable button under **Status** column. The enabled state is displayed as  , and the disabled state is displayed as  .

Adding/Deleting a Policy Rule Member

To add a policy rule member to the policy group, take the following steps:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.
3. In the policy group list, click the "+" in front of the policy group item to expand the member list of the policy group.
4. Click **Add Members** button to open **Policy Group-Add policy** dialog box, which displays the list of policy rules that are not added to policy group.
5. Select the check box of the policy rules that you want to add to the policy group.
6. Click **OK** to save your settings.

Notes: A policy rule only can be added to a policy group.

To delete a policy rule member to the policy group, take the following steps:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.

3. In the policy group list, click the "+" in front of the policy group item to expand the member list of the policy group.
4. Select the check box of the policy group that needs to be deleted, and click **Delete** .

Editing a Policy Group

To modify the name or description of policy group, take the following steps:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.
3. Select the check box of the policy group that you want to edit, and click **Edit**.
4. Modify the name or description of policy group in the **Policy Group Configuration** dialog.

Showing Disabled Policy Group

To show disabled policy groups, take the following steps:

1. Select **Policy > Security Policy** .
2. At the top-right corner of list, click **Policy Group** to enter the **Security Policy Group** page.
3. Select the check box of **Show Disabled Policy Group**. The disabled policy group will be displayed in the policy group list, otherwise the policy group list will show only the enabled policy group.

Viewing and Searching Security Policy Rules/ Policy Groups

You can view and search the policy rules or policy groups in the policy/ policy group list.

Viewing the Policy/ Policy Group

View the security policy rules in the policy rule list.

	Name	Zone	Address	User	Destination	Service	Application	Action	Session	Protection
1		any	any		any	any				
2		any	any		any	any				

- Each column displays the corresponding configurations.
- Click the  button under Session column in the Policy list, and then the **Session Detail** dialog box will appear. You can view the current session status of the selected policy.

- Hover over your mouse on the configuration in a certain column. Then based on the configuration type, the WebUI displays either the  icon or the detailed configurations.
 - You can view the detailed configurations directly.
 - You can click the  icon. Based on the configuration type, the WebUI displays **Filter** or **Detail**.
 - Click **Detail** to see the detailed configurations.
 - Click **Filter**, the filter condition of the configuration you are hovering over with your mouse appears on the top of the list, and then you can filter the policy according to the filter condition. For detailed information of filtering policy rules, see [Searching Security Policy Rules/ Policy Groups](#).

View the policy groups in the policy group list.

ID	Name	Zone	Address	User	Zone	Address	Service	Application	Status
7		any	any		any	any	DNS		<input checked="" type="checkbox"/>
6		any	any	UNKNOWN	any	any	any		<input type="checkbox"/>
5		any	any		any	any	any		<input type="checkbox"/>

- Each column displays the corresponding configurations.
- You can view the current policy group status in **Status** column. The enabled state is displayed as , and the disabled state is displayed as .

Searching Security Policy Rules/ Policy Groups

Use the Filter to search for the policy rules that match the filter conditions.

1. Click **Policy > Security Policy**.
2. At the top-right corner of list, click **Policy/ Policy Group** to enter the **Security Policy/ Security Policy Group** page.
3. At the top-right corner of the **Security Policy/ Security Policy Group** page, click **Filter**. Then a new row appears at the top.

4. Click **+Filter** to add a new filter condition. Then select a filter condition from the drop-down menu and enter a value.
5. Press **Enter** to search for the policy rules that matches the filter conditions.
6. Repeat the above two steps to add more filter conditions. The relationship between each filter condition is **AND**.
7. To delete a filter condition, hover your mouse on that condition and then click the  icon. To close the filter, click the  icon on the right side of the row.

Save the filter conditions.

1. After adding the filter conditions, click the **+ Filter** after the next arrow, in the drop-down menu, click **Save Filters**.
2. Specifies the name of the filter condition to save, the maximum length of name is 32 characters, and the name supports only Chinese and English characters and underscores.
3. Click the **Save** button on the right side of the text box.
4. To use the saved filter condition, double click the name of the saved filter condition.
5. To delete the saved filter condition, click  on the right side of the filter condition.

Notes:

- You can add up to 20 filter conditions as needed.
- After the device has been upgraded, the saved filter condition will be cleared.

User Online Notification

The system provides the policy-based user online notification function. The user online notification function integrates WebAuth function and Web redirect function.

After configuring the user online notification function, system redirects your HTTP request to a new notification page when you visit the Internet for the first time. In the process, a prompt page (see the picture below) will be shown first, and after you click **continue** on this page, system will redirect your request to the specified notification page. If you want to visit your original URL, you need to type the URL address into the Web browser.

Please click 'Continue' button to access Internet

Before you enable the user online notification function, you must configure the WebAuth function. For more information about configuring WebAuth function, view "[Web Authentication](#)".

Configuring User Online Notification

To configure the user online notification function, take the following steps:

1. Select **Policy > Security Policy**.
2. Select the security policy rule with which you want to enable the user online notification function. Generally, it is recommended to select the security policy rule which is under the WebAuth policy rule and whose action is permit to transmit the HTTP traffic.
3. Click **Edit**.
4. In the Basic Configuration tab, select the **Enable Web Redirect** check box and type the notification URL into the **Notification page URL** box.
5. Click **OK** to save the settings.

Configuring the Parameters of User Online Notification

The parameters are:

- **Idle time:** The time that an online user stays online without traffic transmitting. If the idle time is exceeded, the HTTP request will be redirected to the user online notification page again.
- **Background picture:** You can change the background picture on the prompt page.

To configure the parameters, take the following steps:

1. Select **Policy > Security Policy**.
2. Select the security policy rule with the user online notification function enabled.
3. Click **...** and select **Web Redirect Configuration**.
4. Type the idle time value into the **Idle time** box. The range is 0 to 1440 minutes.

5. Change the background picture of the prompt page. Click **Browse** to choose the picture you want, and then click **Upload**. The uploaded picture must be zipped and named as logo.jpg, with the suggested size of 120px*40px.

Viewing Online Users

After configuring the user online notification function, you can get the information of online users from the Online Notification Users dialog box.

1. Select **Policy > Security Policy**.
2. Click **...** and select **Web Redirect IP List**.
3. In the **Web Redirect IP List** dialog box, view the following information.

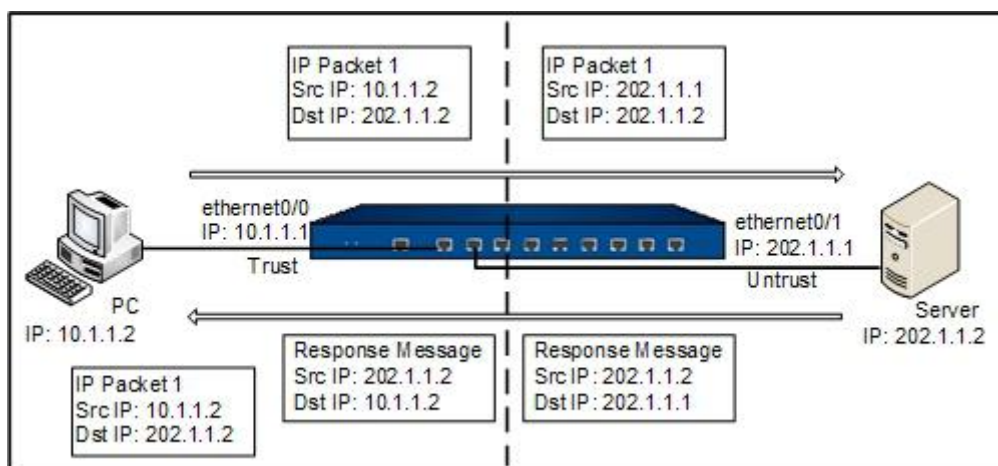

Option	Description
IP address	The IP address of the online user.
Sessions	Session number of the online user.
Interface	The source interface of the online user.
Lifetime (s)	The period of time during which the user is staying online.
Expiration (s)	The idle time of the user.

NAT

NAT, Network Address Translation, translates the IP address within an IP packet header to another IP address. When the IP packets pass through the devices or routers, the devices or routers will translate the source IP address and/or the destination IP address in the IP packets. In practice, NAT is mostly used to allow the private network to access the public network, vice versa.

Basic Translation Process of NAT

When a device is implementing the NAT function, it lies between the public network and the private network. The following diagram illustrates the basic translation process of NAT.

As shown above, the device lies between the private network and the public network. When the internal PC at 10.1.1.2 sends an IP packet (IP packet 1) to the external server at 202.1.1.2 through the device, the device checks the packet header. Finding that the IP packet is destined to the public network, the device translates the source IP address 10.1.1.2 of packet 1 to the public IP address 202.1.1.1 which can get routed on the Internet, and then forwards the packet to the external server. At the same time, the device also records the mapping between the two addresses in its NAT table. When the response packet of IP packet 1 reaches the device, the device checks the packet header again and finds the mapping records in its NAT table, and replaces the destination address with the private address 10.1.1.2. In this process, the device is transparent to the PC and the Server. To the external server, it considers that the IP address of the internal PC is 202.1.1.1 and knows nothing about the private address 10.1.1.2. Therefore, NAT hides the private network of enterprises.

Implementing NAT

The devices translate the IP address and port number of the internal network host to the external network address and port number, and vice versa. This is the translation between the "private IP address + port number" and "public IP address + port number".

The devices achieve the NAT function through the creation and implementation of NAT rules. There are two types of NAT rules, which are source NAT rules (SNAT Rule) and destination NAT rules (DNAT Rule). SNAT translates source IP addresses, thereby hiding the internal IP addresses or sharing the limited IP addresses; DNAT translates destination IP addresses, and usually the IP addresses of internal servers (such as the WWW server or SMTP server) protected by the device is translated to public IP addresses.

Configuring SNAT

To create an SNAT rule, take the following steps:

1. Select **Policy > NAT > SNAT**.
2. Click **New**. The SNAT Configuration dialog box will appear.

In the **Basic** tab, configure the following options.

Requirements	
Virtual Router	Specifies a VRouter for the SNAT rule. The SNAT rule will take effect when the traffic flows into this VRouter and matches the SNAT rule conditions.
Source Address	Specifies the source IP address of the traffic, including: <ul style="list-style-type: none"> Address Entry - Select an address entry from the drop-down list. IP Address - Type an IP address into the box. IP/Netmask - Type an IP address and its netmask into the box.
Destination Address	Specifies the destination IP address of the traffic, including: <ul style="list-style-type: none"> Address Entry - Select an address entry from the drop-down list. IP Address - Type an IP address into the box. IP/Netmask - Type an IP address and its netmask into the box.
Ingress Traffic	Specifies the ingress traffic, the default value is all traffic. <ul style="list-style-type: none"> All traffic - Specifies all traffic as the ingress traffic. Traffic from any ingress interfaces will continue to match this SNAT rule. Ingress Interface - Specifies the ingress interface of traffic. Select an interface from the drop-down list. When the interface is specified, only the traffic from this interface will continue to match this SNAT rule, while traffic from other interfaces will not.
Egress	Specifies the egress traffic, the default value is all traffic. <ul style="list-style-type: none"> All traffic - Specifies all traffic as the egress traffic. Traffic from all egress interfaces will continue to match this SNAT rule. Egress Interface - Specifies the egress interface of traffic. Select an interface from the drop-down list. When

Requirements	
	<p>the interface is specified, only the traffic from this interface will continue to match this SNAT rule, while traffic from other interfaces will not.</p> <ul style="list-style-type: none"> • Next Virtual Router - Specifies the next virtual router of traffic. Select a virtual router from the drop-down list.
Service	<p>Specifies the service type of the traffic from the drop-down list. To create a new service or service group, click New Service or New Group.</p>
Translated to	
Translated	<p>Specifies the translated NAT IP address, including:</p> <ul style="list-style-type: none"> • Egress IF IP - Specifies the NAT IP address to be an egress interface IP address. • Specified IP - Specifies the NAT IP address to be a specified IP address. After selecting this option, continue to specify the available IP address in the Address drop-down list. • No NAT - Do not implement NAT.
Mode	<p>Specifies the translation mode, including:</p> <ul style="list-style-type: none"> • Static - Static mode means one-to-one translation. This mode requires the translated address entry to contain the same number of IP addresses as that of the source address entry. • Dynamic IP - Dynamic IP mode means multiple-to-one translation. This mode translates the source address to a specific IP address. Each source address will be mapped to a unique IP address, until all specified addresses are occupied. • Dynamic port - Called PAT. Multiple source addresses will be translated to one specified IP address in an address entry. <ul style="list-style-type: none"> • If Sticky is enabled, all sessions from an

Requirements	
	<p>IP address will be mapped to the same fixed IP address. Click the Enable check box behind Sticky to enable Sticky. You can also track if the public address after NAT is available, i.e., use the translated address as the source address to track if the destination website or host is accessible. Select the Enable check box behind Track to enable the function, and select a track object from the drop-down list.</p> <ul style="list-style-type: none"> • If Round-robin is enabled, all sessions from an IP address will be mapped to the same fixed IP address. Click the Enable check box behind Round-robin to enable Round-robin. • If Sticky and Round-robin are not enabled, the first address in the address entry will be used first; when the port resources of the first address are exhausted, the second address will be used. <p>Note: The Sticky function and the Round-robin function are mutually exclusive and cannot be configured at the same time.</p>
Others	
HA Group	Specifies the HA group that the SNAT rule belongs to. The default setting is 0.
Description	Types the description.

In the Advanced tab, configure the corresponding options.

Option	Description
NAT Log	Select the Enable check box to enable the log function for this SNAT rule. The system will generate log information when there is traffic matching this NAT rule.
Position	Specifies the position of the rule. Each SNAT rule has a unique ID. When the traffic is flowing into the device, the device will search the SNAT rules in order, and then implement NAT on the source IP of the traffic

Option	Description
	<p>according to the first matched rule. The sequence of the ID shown in the SNAT rule list is the order of the rule matching. Select one of the following items from the drop-down list:</p> <ul style="list-style-type: none"> • Bottom - The rule is located at the bottom of all the rules in the SNAT rule list. By default, system will put the newly-created SNAT rule at the bottom of all SNAT rules. • Top - The rule is located at the top of all the rules in the SNAT rule list. • Before ID - Type the ID number into the text box. The rule will be located before the ID you specified. • After ID - Type the ID number into the text box. The rule will be located after the ID you specified.
ID	<p>Specifies the method you get the rule ID. Each rule has its unique ID. It can be automatically assigned by system or manually assigned by yourself. If you select Manually assign, type an ID number into the box behind.</p>

3. Click **OK** to save the settings.

Enabling/Disabling a SNAT Rule

By default the configured SNAT rule will take effect immediately. You can terminate its control over the traffic by disabling the rule.

To enable/disable a policy rule:

1. Select **Policy > NAT > SNAT**.
2. Select the SNAT rule that you want to enable/disable.
3. Click **Enable** or **Disable** to enable or disable the rule.

Adjusting Priority

Each SNAT rule has a unique ID. When the traffic flows into the device, the device will search the SNAT rules in order and then implement NAT on the source IP of the traffic according to the first matched rule. The sequence of the ID shown in the SNAT rule list is the order of the rule matching.

To adjust priority, take the following steps:

1. Select **Policy > NAT > SNAT**.
2. Select the rule you want to adjust its priority and click **Priority**.
3. In the Priority dialog box, move the selected rule to:
 - **Top:** The rule is moved to the top of all of the rules in the SNAT rule list.
 - **Bottom:** The rule is moved to the bottom of all of the rules in the SNAT rule list. By default, system will put the newly-created SNAT rule at the bottom of all of the SNAT rules.
 - **Before ID:** Specifies an ID number. The rule will be moved before the ID you specified.
 - **After ID:** Specifies an ID number. The rule will be moved after the ID you specified.
4. Click **OK** to save the settings.

Copying/Pasting a SNAT Rule

When there are a large number of NAT rules in system, to create a NAT rule which is similar to an configured NAT rule easily, you can copy the NAT rule and paste it to the specified location.

To copy/paste a SNAT rule, take the following steps:

1. Select **Policy > NAT > SNAT**.
2. Select the SNAT rule that you want to clone and click **Copy**.
3. Click **Paste**. In the pop-up, select the desired position. Then the rule will be cloned to the desired position.
 - **Top:** The rule is pasted to the top of all the rules in the SNAT rule list.
 - **Bottom:** The rule is pasted to the bottom of all the rules in the SNAT rule list.
 - **Before the Rule Selected:** The rule will be pasted before the Rule being selected.
 - **After the Rule Selected:** The rule will be pasted after the Rule being selected.

Exporting NAT444 Static Mapping Entries

You can export the NAT444 static mapping entries to a file. The exported file contains the ID, source IP address, translated IP address, start port, end port, and the protocol information.

To export the NAT444 static mapping entries, take the following steps:

1. Select **Policy > NAT > SNAT**.
2. Click **Export NAT444 Static Mapping Entries**.
3. Select a location to store the file and click **Save**.

The exported file is CSV format. It is recommended to export the file through the management interface.

Hit Count

The system supports statistics on SNAT rule hit counts, i.e., statistics on the matching between traffic and SNAT rules. Each time the inbound traffic is matched to a certain SNAT rule, the hit count will increment by 1 automatically.

To view a SNAT rule hit count, click **Policy > NAT > SNAT**. In the SNAT rule list, view the statistics on SNAT rule hit count under the Hit Count column.

Clearing NAT Hit Count

To clear a SNAT rule hit count, take the following steps:

1. Select **Policy > NAT > SNAT**.
2. Click **Hit Count**, and select **Clearing NAT Hit Count** in the pop-up list.
3. In the **Clearing NAT Hit Count** dialog box, configure the following options:
 - **All NAT**: Clears the hit counts for all NAT rules.
 - **NAT ID**: Clears the hit counts for a specified NAT rule ID.
4. Click **OK**.

Hit Count Check

System supports to check policy rule hit counts.

To check hit count, take the following steps:

1. Select **Policy > NAT > SNAT**.

2. Click **Hit Count**, and select **Hit Count Check** in the pop-up list. After the check, the NAT rules whose hit count is 0 will be highlight, that is to say, the NAT rule is not used in system.

Configuring DNAT

DNAT translates destination IP addresses, usually the IP addresses of internal servers (such as the WWW server or SMTP server) protected by the device is translated to the public IP addresses.

Configuring an IP Mapping Rule

To configure an IP mapping rule, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Click **New** and select **IP Mapping**.

In the IP Mapping Configuration dialog box, configure the corresponding options.

Requirements	
Virtual Router	Specifies a VRouter for the DNAT rule. The DNAT rule will take effect when the traffic flows into this VRouter and matches the DNAT rule conditions.
Destination Address	Specifies the destination IP address of the traffic, including: <ul style="list-style-type: none"> • Address Entry - Select an address entry from the drop-down list. • IP Address - Type an IP address into the box. • IP/Netmask - Type an IP address and its netmask into the box.
Mapping	
Mapped to	Specifies the translated NAT IP address, including Address Entry , IP Address , and IP/Netmask . The number of the translated NAT IP addresses you specified must be the same as the number of the destination IP addresses of the traffic.
Others	
HA Group	Specifies the HA group that the DNAT rule belongs to. The default setting is 0.
Description	Types the description.

3. Click **OK** to save the settings.

Configuring a Port Mapping Rule

To configure a port mapping rule, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Click **New** and select **Port Mapping**.

In the Port Mapping Configuration dialog, configure the corresponding options.

Requirements	
Virtual Router	Specifies a VRouter for the DNAT rule. The DNAT rule will take effect when the traffic flows into this VRouter and matches the DNAT rule conditions.
Destination Address	Specifies the destination IP address of the traffic, including: <ul style="list-style-type: none"> • Address Entry - Select an address entry from the drop-down list. • IP Address - Type an IP address into the box. • IP/Netmask - Type an IP address and its netmask into the box.
Service	Specifies the service type of the traffic from the drop-down list. To create a new service or service group, click New Service or New Group .
Mapping	
Mapped to	Specifies the translated NAT IP address, including Address Entry , IP Address , and IP/Netmask . The number of the translated NAT IP addresses you specified must be the same as the number of the destination IP addresses of the traffic.
Port Mapping	Types the translated port number of the Intranet server. The available range is 1 to 65535.
Others	
HA Group	Specifies the HA group that the DNAT rule belongs to. The default setting is 0.
Description	Types the description.

3. Click **OK** to save the settings.

Configuring an Advanced NAT Rule

You can create a DNAT rule and configure the advanced settings, or you can edit the advanced settings of an existing DNAT rule.

To create a DNAT rule and configure the advanced settings, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Click **New** and select **Advanced Configuration**. To edit the advanced settings of an existing DNAT rule, select it and click **Edit**. The **DNAT configuration** dialog box will appear.

In the **Basic** tab, configure the following options.

Requirements	
Virtual Router	Specifies a VRouter for the DNAT rule. The DNAT rule will take effect when the traffic flows into this VRouter and matches the DNAT rule conditions.
Source Address	Specifies the source IP address of the traffic, including: <ul style="list-style-type: none"> • Address Entry - Select an address entry from the drop-down list. • IP Address - Type an IP address into the box. • IP/Netmask - Type an IP address and its netmask into the box.
Destination Address	Specifies the destination IP address of the traffic, including: <ul style="list-style-type: none"> • Address Entry - Select an address entry from the drop-down list. • IP Address - Type an IP address into the box. • IP/Netmask - Type an IP address and its netmask into the box.
Service	Specifies the service type of the traffic from the drop-down list. To create a new service or service group, click Add .
Translated to	
Action	Specifies the action for the traffic you specified, including: <ul style="list-style-type: none"> • NAT - Implements NAT for the eligible traffic. • No NAT - Do not implement NAT for the

Requirements	
	eligible traffic.
Translate to	When selecting the NAT option, you need to specify the translated IP address. The options include Address Entry, IP Address, IP/Netmask , and SLB Server Pool . For more information about the SLB Server Pool, view "SLB Server Pool".
Translate Service Port to	
Port	Select Enable to translate the port number of the service that matches the conditions above.
Load Balance	Select Enable to enable the function. Traffic will be balanced to different Intranet servers.
Others	
Redirect	Select Enable to enable the function. When the number of this Translate to is different from the Destination Address of the traffic or the Destination Address address is any , you must enable the redirect function for this DNAT rule.
HA Group	Specifies the HA group that the DNAT rule belongs to. The default setting is 0.
Description	Types the description.

In the **Advanced** tab, configure the following options.

Track Server	
Track Ping Packets	After enabling this function, system will send Ping packets to check whether the Intranet servers are reachable.
Track TCP Packets	After enabling this function, System will send TCP packets to check whether the TCP ports of Intranet servers are reachable.
TCP Port	Specifies the TCP port number of the monitored Intranet server.
Others	
NAT Log	Enable the log function for this DNAT rule to generate the log information when traffic matches this NAT rule.
Position	Specifies the position of the rule. Each DNAT rule has a unique ID. When the traffic is flowing into the device, the device will search the DNAT rules by sequence, and then implement DNAT on the source IP of the traffic according to the first

Track Server	
	<p>matched rule. The sequence of the ID shown in the DNAT rule list is the order of the rule matching. Select one of the following items from the drop-down list:</p> <ul style="list-style-type: none"> • Bottom - The rule is located at the bottom of all of the rules in the DNAT rule list. By default, the system will put the newly-created DNAT rule at the bottom of all of the SNAT rules. • Top - The rule is located at the top of all of the rules in the DNAT rule list. • Before ID - Type the ID number into the text box. The rule will be located before the ID you specified. • After ID - Type the ID number into the text box. The rule will be located after the ID you specified.
ID	<p>The ID number is used to distinguish between NAT rules. Specifies the method you get the rule ID. It can be automatically assigned by system or manually assigned by yourself.</p>

3. Click **OK** to save the settings.

Enabling/Disabling a DNAT Rule

By default the configured DNAT rule will take effect immediately. You can terminate its control over the traffic by disabling the rule.

To enable/disable a policy rule, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Select the DNAT rule that you want to enable/disable.
3. Click **Enable** or **Disable** to enable or disable the rule.

Copying/Pasting a DNAT Rule

When there are a large number of NAT rules in system, to create a NAT rule which is similar to an configured NAT rule easily, you can copy the NAT rule and paste it to the specified location.

To copy/paste a DNAT rule, take the following steps:

1. Select **Policy > NAT > DNAT**.

2. Select the DNAT rule that you want to clone and click **Copy**.
3. Click **Paste**. In the pop-up, select the desired position. Then the rule will be cloned to the desired position.
 - **Top:** The rule is pasted to the top of all of the rules in the DNAT rule list.
 - **Bottom:** The rule is pasted to the bottom of all of the rules in the DNAT rule list.
 - **Before the Rule Selected:** The rule will be pasted before the Rule selected.
 - **After the Rule Selected:** The rule will be pasted after the Rule selected.

Adjusting Priority

Each DNAT rule has a unique ID. When the traffic is flowing into the device, the device will search the DNAT rules in order, and then implement NAT of the source IP of the traffic according to the first matched rule. The sequence of the ID shown in the DNAT rule list is the order of the rule matching.

To adjust priority, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Select the rule you want to adjust its priority and click **Priority**.
3. In the Priority dialog box, move the selected rule to:
 - **Top:** The rule is moved to the top of all of the rules in the DNAT rule list.
 - **Bottom:** The rule is moved to the bottom of all of the rules in the DNAT rule list. By default, system will put the newly-created DNAT rule at the bottom of all of the DNAT rules.
 - **Before ID:** Specifies an ID number. The rule will be moved before the ID you specified.
 - **After ID:** Specifies an ID number. The rule will be moved after the ID you specified.
4. Click **OK** to save the settings.

Hit Count

The system supports statistics on DNAT rule hit counts, i.e., statistics on the matching between traffic and DNAT rules. Each time the inbound traffic is matched to a certain DNAT rule, the hit count will increment by 1 automatically.

To view a DNAT rule hit count, click **Policy > NAT > DNAT**. In the DNAT rule list, view the statistics on DNAT rule hit count under the Hit Count column.

Clearing NAT Hit Count

To clear a DNAT rule hit count, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Click **Hit Count**, and select **Clearing NAT Hit Count** in the pop-up list.
3. In the **Clearing NAT Hit Count** dialog box, configure the following options:
 - **All NAT:** Clears the hit counts for all NAT rules.
 - **NAT ID:** Clears the hit counts for a specified NAT rule ID.
4. Click **OK**.

Hit Count Check

System supports to check policy rule hit counts.

To check hit count, take the following steps:

1. Select **Policy > NAT > DNAT**.
2. Click **Hit Count**, and select **Hit Count Check** in the pop-up list. After the check, the NAT rules whose hit count is 0 will be highlighted. This shows that the NAT rule is not being used in system.

NAT Hit Analysis

System supports to check the NAT rule hit counts, with the statistics of the first hit time, the last hit time, and the days since last hit, you can identify the NAT rules that need to be cleared. You can view the specified NAT rules by setting up filters.

To check the hit counts, take the following steps:

1. Select **Policy > NAT > SNAT Hit Analysis** or **Policy > NAT > DNAT Hit Analysis**.
2. Select filter conditions from the **+Filter** drop-down list, and configure filter conditions as needed.

Configure the options as follows.

Option	Description
--------	-------------

Option	Description
Virtual Router	Specifies the virtual router of NAT rule.
ID	Specifies the ID of NAT rule.
Days Since First Hit>	Specifies the day after the first hit. Then the NAT rules which were hit before the specified day will be displayed.
Unhit Rules	Specifies the rules that were never hit.
Days Since Last Hit>	Specifies the day after the last hit. Then the NAT rules before the specified day will be displayed.
Days Since NAT Created>	Specifies the day after the NAT rule is created. Then the NAT rules before the specified day will be displayed.

3. Click **Analyze** button to view the latest result of NAT Hit Analysis.
4. Click **+** icon in front of NAT rule ID to view the details of the NAT rule.
5. Click  icon on the left side of **+Filter** to save the selected filters. Click **Save Filters**, type the name of the filters and click **Save**. After saved, the combined filters can be selected directly in the drop-down list.
6. To delete a filter condition, hover your mouse on that condition and then click  icon. To delete all filter conditions, click the  icon on the right side of the row.

Notes: "Virtual Router" are required in the filter condition.

To clear a policy hit count, take the following steps:

1. Select **Policy > NAT > SNAT Hit Analysis** or **Policy > NAT > DNAT Hit Analysis**.
2. Click **Clear**.

In the Clearing NAT Hit Count dialog box, configure the following options.

Option	Description
All NATs	Clears the hit counts of all NAT rules.
NAT ID	Clears the hit counts of a specified ID NAT rule.

3. Click **OK**.

You can also perform other operations:

- Click  icon to delete the NAT rule.

- Click  icon to disable the NAT rule.

SLB Server

View SLB server status: After you enabling the track function (PING track, TCP track, or UDP track), system will list the status and information of the intranet servers that are tracked.

View SLB server pool status: After you enabling the server load balancing function, system will monitor the intranet servers and list the corresponding status and information.

Viewing SLB Server Status

To view the SLB server status, take the following steps:

1. Select **Policy > NAT > SLB Server Status**.
2. You can set the filtering conditions according to the virtual router, SLB server pool, and server address and then view the information.

Option	Description
Server	Shows the IP address of the server.
Port	Shows the port number of the server.
Status	Shows the status of the server.
Current Sessions	Shows the number of current sessions.
DNAT	Shows the DNAT rules that uses the server.
HA Group	Shows the HA group that the server belongs to.

Viewing SLB Server Pool Status

To view the SLB server pool status, take the following steps:

1. Select **Policy > NAT > SLB Server Pool Status**.
2. You can set the filtering conditions according to the virtual router, algorithm, and server pool name and then view the information.

Option	Description
Name	Shows the name of the server pool name.
Algorithm	Shows the algorithm used by the server pool.
DNAT	Shows the DNAT rules that use the server.
Abnormal	Shows the number of abnormal servers and the total number of

Option	Description
Server/All Servers	the servers.
Current Sessions	Shows the number of current sessions.

iQoS

System provides iQoS (intelligent quality of service) which guarantees the customer's network performance, manages and optimizes the key bandwidth for critical business traffic, and helps the customer greatly in fully utilizing their bandwidth resources.

iQoS is used to provide different priorities to different traffic, in order to control the delay and flapping, and decrease the packet loss rate. iQoS can assure the normal transmission of critical business traffic when the network is overloaded or congested. iQoS is controlled by license. To use iQoS, apply and install the iQoS license.

Implement Mechanism

The packets are classified and marked after entering system from the ingress interface. For the classified and marked traffic, system will smoothly forward the traffic through the shaping mechanism, or drop the traffic through the policing mechanism. If the shaping mechanism is selected to forward the traffic, the congestion management and congestion avoidance mechanisms will give different priorities to different types of packets so that the packets of higher priority can pass through the gateway earlier to avoid network congestion.

In general, implementing iQoS includes:

- **Classification and marking mechanism:** Classification and marking is the process of identifying the priority of each packet. This is the first step of iQoS.
- **Policing and shaping mechanisms:** Policing and shaping mechanisms are used to identify traffic violation and make responses. The policing mechanism checks the traffic in real time and takes immediate actions according to the settings when it discovers a violation. The shaping mechanism works together with queuing mechanism. It makes sure that the traffic will never exceed the defined flow rate so that the traffic can go through that interface smoothly.
- **Congestion management mechanism:** Congestion management mechanism uses the queuing theory to solve problems in the congested interfaces. As the data rate can be different among different networks, congestion may happen to both wide area network (WAN) and local area network (LAN). Only when an interface is congested will the queuing theory begin to work.

- Congestion avoidance mechanism: Congestion avoidance mechanism is a supplement to the queuing algorithm, and it also relies on the queuing algorithm. The congestion avoidance mechanism is designed to process TCP-based traffic.

Pipes and Traffic Control Levels

System supports two-level traffic control: level-1 control and level-2 control. In each level, the traffic control is implemented by pipes.

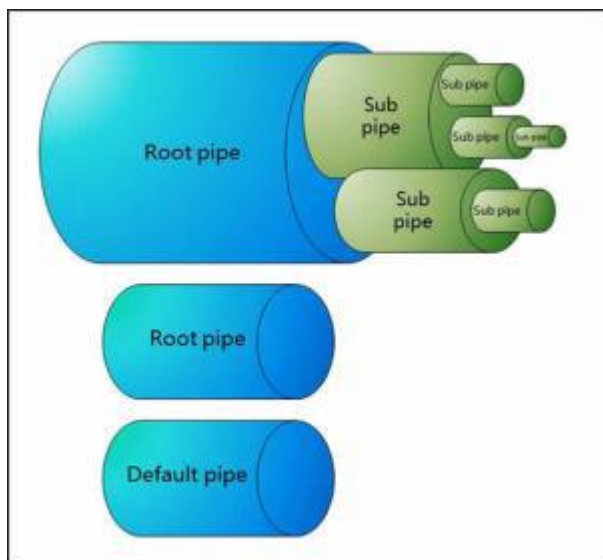

Pipes

By configuring pipes, the devices implement iQoS. Pipe, which is a virtual concept, represents the bandwidth of transmission path. System classifies the traffic by using the pipe as the unit, and controls the traffic crossing the pipes according to the actions defined for the pipes. For all traffic crossing the device, they will flow into virtual pipes according to the traffic matching conditions they match. If the traffic does not match any condition, they will flow into the default pipe predefined by the system.

Pipes, except the default pipe, include two parts of configurations: traffic matching conditions and traffic management actions:

- Traffic matching conditions: Defines the traffic matching conditions to classify the traffic crossing the device into matched pipes. System will limit the bandwidth to the traffic that matches the traffic matching conditions. You can define multiple traffic matching conditions to a pipe. The logical relation between each condition is OR. When the traffic matches a traffic matching condition of a pipe, it will enter this pipe. If the same conditions are configured in different root pipes, the traffic will first match the root pipe listed at the top of the Level-1 Control list in the Policy > iQoS page.
- Traffic management actions: Defines the actions adopted to the traffic that has been classified to a pipe. The data stream control includes the forward control and the backward control. Forward control controls the traffic that flows from the source to the destination; backward control controls the traffic flows from the destination to the source.

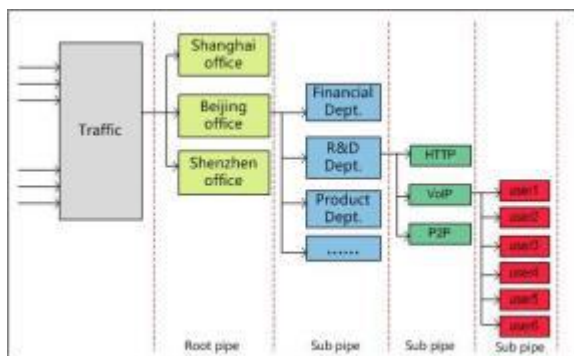

To provide flexible configurations, system supports the multiple-level pipes. Configuring multiple-level pipes can limit the bandwidth of different applications of different users. This can ensure the bandwidth for the key services and users. Pipes can be nested to at most four levels. Sub pipes cannot be nested to the default pipe. The logical relation between pipes is shown as below:

- You can create multiple root pipes that are independent. At most three levels of sub pipes can be nested to the root pipe.
- For the sub pipes at the same level, the total of their minimum bandwidth cannot exceed the minimum bandwidth of their upper-level parent pipe, and the total of their maximum bandwidth cannot exceed the maximum bandwidth of their upper-level parent pipe.
- If you have configured the forward or backward traffic management actions for the root pipe, all sub pipes that belong to this root pipe will inherit the configurations of the traffic direction set on the root pipe.
- The root pipe that is only configured the backward traffic management actions cannot work.

The following chart illustrates the application of multiple-level pipes in a company. The administrator can create the following pipes to limit the traffic:

1. Create a root pipe to limit the traffic of the office located in Beijing.
2. Create a sub pipe to limit the traffic of its R&D department.
3. Create a sub pipe to limit the traffic of the specified applications so that each application has its own bandwidth.
4. Create a sub pipe to limit the traffic of the specified users so that each user owns the defined bandwidth when using the specified application.

Traffic Control Levels

System supports two-level traffic control: level-1 control and level-2 control. In each level, the traffic control is implemented by pipes. Traffic that is dealt with by level-1 control flows into the level-2 control, and then system performs the further management and control according to the pipe configurations of level-2 control. After the traffic flowing into the device, the process of iQoS is shown as below:

According to the chart above, the process of traffic control is described below:

1. The traffic first flows into the level-1 control, and then system classifies the traffic into different pipes according to the traffic matching conditions of the pipe of level-1 control. The traffic that cannot match any pipe will be classified into the default pipe. If the same conditions are configured in different root pipes, the traffic will first match the root pipe listed at the top of the Level-1 Control list in the **Policy > iQoS** page. After the traffic flows into the root pipe, system classifies the traffic into different sub pipes according to the traffic matching conditions of each sub pipe.
2. According to the traffic management actions configured for the pipes, system manages and controls the traffic that matches the traffic matching conditions.
3. The traffic dealt with by level-1 control flows into the level-2 control. System manages and controls the traffic in level-2 control. The principles of traffic matching, management and control are the same as the one of the level-1 control.
4. Complete the process of iQoS.

Enabling iQoS

To enable iQoS, take the following steps:

1. Select **Policy > iQoS > Configuration**.
2. Select the **Enable iQoS** check box.

Enable iQoS

Level-1 Control

Enable NAT IP matching ⓘ

Level-2 Control

Enable NAT IP matching ⓘ

Apply Cancel

3. If you select the **Enable NAT IP matching** check box in **Level-1 Control** or **Level-2 Control**, system will use the IP addresses between the source NAT and the destination NAT as the matching items. If the matching is successful, system will limit the speed of these IP addresses.

Notes: Before enabling NAT IP matching, you must config the NAT rules. Otherwise, the configuration will not take effect.

4. Click **Apply** to save the configurations.

Pipes

By using pipes, devices implement iQoS. Pipes in different traffic control levels will take effect in different stages.

Configuring pipes includes the following sections:

1. Create the traffic matching conditions, which are used to capture the traffic that matches these conditions. If configuring multiple traffic matching conditions for a pipe, the logical relation between each condition is OR.
2. Create a white list according to your requirements. System will not control the traffic in the white list. Only root pipe and the default pipe support the white list.

3. Specify the traffic management actions, which are used to deal with the traffic that is classified into a pipe.
4. Specify the schedule. The pipe will take effect during the specified time period.

Basic Operations

Select **Policy > iQoS > Policy** to open the Policy page.

Pipe Name	Mode	Action	Schedule	Condition	Whitelist
rootpipe		Forward Pipe Bandwidth: 1000 Kbps Priority: 7			
subpipe		Forward Min Bandwidth: 100 Kbps Max Bandwidth: 500 Kbps Priority: 7			
subpipe		Forward Min Bandwidth: 50 Kbps Max Bandwidth: 50 Kbps Priority: 7			
Default Pipe		Forward Pipe Bandwidth: 1000 Kbps Limited by IP-Source IP (Min Bandwidth: 10...			

You can perform the following actions in this page:

- Disable the level-2 traffic control: Click **Disable second level control**. The pipes in the level-2 traffic control will not take effect. The Level-2 Control tab will not appear in this page.
- View pipe information: The pipe list displays the name, mode, action, schedule, and the description of the pipes.
 - Click the icon to expand the root pipe and display its sub pipes.
 - Click the icon of the root pipe or the sub pipe to view the condition settings.
 - Click the icon of the root pipe to view the white list settings.
 - represents the root pipe is usable, represents the root pipe is unusable, represents the sub pipe is unusable, represents the sub pipe is unusable, the gray text represents the pipe is disabled.
- Create a root pipe: Select the Level-1 Control or Level-2 Control tab, then click **New** in the menu bar to create a new root pipe.
- Create a sub pipe: Click the icon of the root pipe or the sub pipe to create the corresponding sub pipe.
- Click **Enable** in the menu bar to enable the selected pipe. By default, the newly-created pipe will be enabled.
- Click **Disable** in the menu bar to disable the selected pipe. The disabled pipe will not take effect.
- Click **Delete** to delete the selected pipe. The default pipe cannot be deleted.

Configuring a Pipe

To configure a pipe, take the following steps:

1. According to the methods above, create a root pipe or sub pipe. The Pipe Configuration page appears.
2. In the **Basic** tab, specify the basic pipe information.

Option	Description
Parent Pipe/Control Level	Displays the control level or the parent pipe of the newly created pipe.
Pipe Name	Specify a name for the new pipe.
Description	Specify the description of this pipe.
Mode	Shape, Policy, or Monitor. <ul style="list-style-type: none"> • The Shape mode can limit the data transmission rate and smoothly forward the traffic. This mode supports the bandwidth borrowing and priority adjusting for the traffic within the root pipe. • The Policy mode will drop the traffic that exceeds the bandwidth limit. This mode does not support the bandwidth borrowing and priority adjusting, and cannot guarantee the minimum bandwidth. • The Monitor mode will monitor the matched traffic, generate the statistics, and will not control the traffic. • Bandwidth borrowing: All of the sub pipes in a root pipe can lend their idle bandwidth to the pipes that are lacking bandwidth. The prerequisite is that their bandwidth must be enough to forward the traffic in their pipes. • Priority adjusting: When there is traffic congestion, system will arrange the traffic to enter the waiting queue. You can set the traffic to have higher priority and system will deal with the traffic in order of precedence.

3. In the Condition tab, click **New**.

In the Condition Configuration tab, configure the corresponding options.

Option	Description
Source Information	

Option	Description
Zone	Specify the source zone of the traffic. Select the zone name from the drop-down menu.
Interface	Specify the source interface of the traffic. Select the interface name from the drop-down menu.
Address	<p>Specify the source address of the traffic.</p> <ol style="list-style-type: none"> 1. Select an address type from the Address drop-down list. 2. Select or type the source addresses based on the selected type. 3. Click  to add the addresses to the right pane. 4. After adding the desired addresses, click the blank area in this dialog box to complete the address configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Address Book type, you can click Add to create a new address entry. • The default address configuration is any. To restore the configuration to this default one, select the any check box.
Destination Information	
Zone	Specify the destination zone of the traffic. Select the zone name from the drop-down menu.
Interface	Specify the destination interface of the traffic. Select the interface name from the drop-down menu.
Address	<p>Specify the destination address of the traffic.</p> <ol style="list-style-type: none"> 1. Select an address type from the Address drop-down list. 2. Select or type the source addresses based on the selected type. 3. Click  to add the addresses to the right pane.

Option	Description
	<p>4. After adding the desired addresses, click the blank area in this dialog box to complete the address configuration.</p> <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • When selecting the Address Book type, you can click Add to create a new address entry. • The default address configuration is any. To restore the configuration to this default one, select the any check box.
User Information	<p>Specify a user or user group that the traffic belongs to.</p> <ol style="list-style-type: none"> 1. From the User drop-down menu, select the AAA server where the users and user groups reside. 2. Based on different types of AAA server, you can execute one or more actions: search a user/user group/role, expand the user/user group list, and enter the name of the user/user group. 3. After selecting users/user groups/roles, click <input type="button" value="➔"/> to add them to the right pane. 4. After adding the desired objects, click the blank area in this dialog box to complete the user information configuration.
Service	<p>Specify a service or service group that the traffic belongs to.</p> <ol style="list-style-type: none"> 1. From the Service drop-down menu, select a type: Service, Service Group. 2. You can search the desired service/service group, expand the service/service group list. 3. After selecting the desired services/service groups, click <input type="button" value="➔"/> to add them to the right pane. 4. After adding the desired objects, click the blank area in this dialog box to complete the service

Option	Description
	<p>configuration.</p> <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • To add a new service or service group, click Add. • The default service configuration is any. To restore the configuration to this default one, select the any check box.
Application	<p>Specify an application, application group, or application filters that the traffic belongs to.</p> <ol style="list-style-type: none"> 1. From the Application drop-down menu, you can search the desired application/application group/application filter, expand the list of applications/application groups/application filters. 2. After selecting the desired applications/application groups/application filters, click <input type="checkbox"/> to add them to the right pane. 3. After adding the desired objects, click the blank area in this dialog to complete the application configuration. <p>You can also perform other operations:</p> <ul style="list-style-type: none"> • To add a new application group, click New AppGroup. • To add a new application filter, click New AppFilter.
URL Category	<p>Specifies the URL category that the traffic belongs to.</p> <p>After the user specifies the URL category, the system matches the traffic according to the specified category.</p> <ol style="list-style-type: none"> 1. In the "URL category" drop-down menu, the user can select one or more URL categories, up to 8 categories. 2. After selecting the desired filters, click the blank

Option	Description
	<p>area in this dialog to complete the configuration.</p> <p>To add a new URL category, click the "New" button, the page will pop up "URL category" dialog box. In this dialog box, the user can configure the category name and URL.</p> <p>Select a URL category, click the "Edit" button, the page will pop up "URL category" dialog box. In this dialog box, the user can edit the URL in the category.</p>
Advanced	
VLAN	Specify the VLAN information of the traffic.
TOS	<p>Specify the TOS fields of the traffic; or click Configure to specify the TOS fields of the IP header of the traffic in the TOS Configuration dialog box.</p> <ul style="list-style-type: none"> • Precedence: Specify the precedence. • Delay: Specify the minimum delay. • Throughput: Specify the maximum throughput. • Reliability: Specify the highest reliability. • Cost: Specify the minimum cost. • Reserved: Specify the normal service.

4. If you are configuring root pipes, you can specify the white list settings based on the description of configuring conditions.
5. In the Action tab, configuring the corresponding actions.

Forward (From source to destination)	
<p>The following configurations control the traffic that flows from the source to the destination. For the traffic that matches the conditions, system will perform the corresponding actions.</p>	
Pipe Bandwidth	<p>When configuring the root pipe, specify the pipe bandwidth.</p> <p>When configuring the sub pipe, specify the maximum bandwidth and the minimum bandwidth of the pipe:</p> <ul style="list-style-type: none"> • Min Bandwidth: Specify the minimum bandwidth. If you want this minimum bandwidth to be

	<p>reserved and cannot be used by other pipes, select Enable Reserved Bandwidth.</p> <ul style="list-style-type: none"> • Max Bandwidth: Specify the maximum bandwidth.
Limit type	<p>Specify the maximum bandwidth and minimum bandwidth of the pipe for each user/IP:</p> <ul style="list-style-type: none"> • Type: Select the type of the bandwidth limitation: No Limit, Limit Per IP, or Limit Per User. <ul style="list-style-type: none"> • No Limit represents that system will not limit the bandwidth for each IP or each user. • Limit Per IP represents that system will limit the bandwidth for each IP. In the Limit by section, select Source IP to limit the bandwidth of the source IP in this pipe; or select Destination IP to limit the bandwidth of the destination IP in this pipe. • Limit Per User represents that system will limit the bandwidth for each user. In the Limit by section, specify the minimum/maximum bandwidth of the users. • When configuring the root pipe, you can select the Enable Average Bandwidth check box to make each source IP, destination IP, or user to share an average bandwidth.
Limit by	<p>When the Limit type is Limit Per IP or Limit Per User, you need to specify the minimum bandwidth or the maximum bandwidth:</p> <ul style="list-style-type: none"> • Min Bandwidth: Specify the minimum bandwidth. • Max Bandwidth: Specify the maximum bandwidth. • Delay: Specify the delay time, whose value ranges from 1 second to 3600 seconds. The maximum bandwidth limit of each IP/ user is not effective within

	the delay time range.
Advanced	
Priority	Specify the priority for the pipes. Select a number, between 0 and 7, from the drop-down menu. The smaller the value is, the higher the priority is. When a pipe has higher priority, system will first deal with the traffic in it and borrow the extra bandwidth from other pipes for it. The priority of the default pipe is 7.
TOS	<p>Specify the TOS fields of the traffic; or click Configure to specify the TOS fields of the IP header of the traffic in the appeared TOS Configuration page.</p> <ul style="list-style-type: none"> • Precedence: Specify the precedence. • Delay: Specify the minimum delay. • Throughput: Specify the maximum throughput. • Reliability: Specify the highest reliability. • Cost: Specify the minimum monetary cost. • Reserved: Specify the normal service.
Limit Opposite Bandwidth	Select the Limit Opposite Bandwidth check box to configure the value of limit-strength. The smaller the value, the smaller the limit.
Backward (From condition's destination to source)	
The following configurations control the traffic that flows from the destination to the source. For the traffic that matches the conditions, system will perform the corresponding actions.	
Pipe Bandwidth	<p>When configuring the root pipe, specify the pipe bandwidth.</p> <p>When configuring the sub pipe, specify the maximum bandwidth and the minimum bandwidth of the pipe:</p> <ul style="list-style-type: none"> • Min Bandwidth: Specify the minimum bandwidth. If you want this minimum bandwidth to be reserved and cannot be used by other pipes, select Enable Reserved Bandwidth. • Max Bandwidth: Specify the maximum

	bandwidth.
Limit type	<p>Specify the maximum bandwidth and minimum bandwidth of the pipe for each user/IP:</p> <ul style="list-style-type: none"> • Type: Select the type of the bandwidth limitation: No Limit, Limit Per IP, or Limit Per User. <ul style="list-style-type: none"> • No Limit represents that system will not limit the bandwidth for each IP or each user. • Limit Per IP represents that system will limit the bandwidth for each IP. In the Limit by section, select Source IP to limit the bandwidth of the source IP in this pipe; or select Destination IP to limit the bandwidth of the destination IP in this pipe. • Limit Per User represents that system will limit the bandwidth for each user. In the Limit by section, specify the minimum/maximum bandwidth of the users. • When configuring the root pipe, you can select the Enable Average Bandwidth check box to make each source IP, destination IP, or user to share an average bandwidth.
Limit by	<p>When the Limit type is Limit Per IP or Limit Per User, you need to specify the minimum bandwidth or the maximum bandwidth:</p> <ul style="list-style-type: none"> • Min Bandwidth: Specify the minimum bandwidth. • Max Bandwidth: Specify the maximum bandwidth. • Delay: Specify the delay time, whose value ranges from 1 second to 3600 seconds. The maximum bandwidth limit of each IP/ user is not effective within the delay time range.
Advanced	

Priority	Specify the priority for the pipes. Select a number, between 0 and 7, from the drop-down menu. The smaller the value is, the higher the priority is. When a pipe has higher priority, system will first deal with the traffic in it and borrow the extra bandwidth from other pipes for it. The priority of the default pipe is 7.
TOS	Specify the TOS fields of the traffic; or click Configure to specify the TOS fields of the IP header of the traffic in the appeared TOS Configuration page. <ul style="list-style-type: none"> • Precedence: Specify the precedence. • Delay: Specify the minimum delay. • Throughput: Specify the maximum throughput. • Reliability: Specify the highest reliability. • Cost: Specify the minimum monetary cost. • Reserved: Specify the normal service.
Limit Opposite Bandwidth	Select the Limit Opposite Bandwidth check box to configure the value of limit-strength. The smaller the value, the smaller the limit.

6. In the Schedule tab, configure the time period when the pipe takes effect. Select the schedule from the drop-down list, or create a new one.
7. Click **OK** to save the settings.

Viewing Statistics of Pipe Monitor

To view the statistics of pipe monitor, see "[iQoS Monitor](#)".

Session Limit

The devices support zone-based session limit function. You can limit the number of sessions and control the session rate to the source IP address, destination IP address, specified IP address, applications or role/user/user group, thereby protecting from DoS attacks and controlling the bandwidth of applications, such as IM or P2P.

Configuring a Session Limit Rule

To configure a session limit rule, take the following steps:

1. Select **Policy > Session Limit**.
2. Click **New**. The Session Limit Configuration dialog box will appear.
3. Select the zone where the session limit rule is located.
4. **Configure the limit conditions.**

IP	
Select the IP check box to configure the IP limit conditions.	
IP	Select the IP radio button and then select an IP address entry. <ul style="list-style-type: none"> • Select All IPs to limit the total number of sessions to all IP addresses. • Select Per IP to limit the number of sessions to each IP address.
Source IP	Select the Source IP radio button and specify the source IP address entry and destination IP address entry. When the session's source IP and destination IP are both within the specified range, system will limit the number of session as follows: <ul style="list-style-type: none"> • When you select Per Source IP, system will limit the number of sessions to each source IP address. • When you select Per Destination IP, system will limit the number of sessions to each destination IP address.
Protocol	
Protocol	Limits the number of sessions to the protocol which has been set in the textbox.
Application	
Application	Limits the number of sessions to the selected application.
Role/User/User Group	
Select the Role/User/User Group check box to configure the corresponding limit conditions.	

IP	
Role	Select the Role radio button and a role from the Role drop-down list to limit the number of sessions of the selected role.
User	Select the User radio button and a user from the User drop-down list to limit the number of sessions of the selected user.
User Group	<p>Select the User Group radio button and a user group from the User Group drop-down list to limit the number of sessions of the selected user group.</p> <ul style="list-style-type: none"> • Next to the User Group radio button, select All Users to limit the total number of sessions to all of the users in the user group. • Next to the User Group radio button, select Per User to limit the number of sessions to each user.
Schedule	
Schedule	Select the Schedule check box and choose a schedule you need from the drop-down list to make the session limit rule take effect within the time period specified by the schedule.

5. Configure the limit types.

Session Type	
Session Number	Specify the maximum number of sessions. The value range is 0 to 1048576. The value of 0 indicates no limitation.
New Connections/5s	Specify the maximum number of sessions created per 5 seconds. The value range is 1 to 1048576.

6. Click **OK** to save your settings.

7. Click **Switch Mode** to select a matching mode. If you select **Use the Minimum Value** and an IP address matches multiple session limit rules, the maximum number of sessions of this IP address is limited to the minimum number of sessions of all matched session limit rules; if you select **Use the Maximum Value** and an IP address matches multiple session limit rules, the maximum number of sessions of this IP address is the maximum number of sessions of all matched session limit rules.

Clearing Statistic Information

After configuring a session limit rule, the sessions which exceed the maximum number of sessions will be dropped. You can clear the statistical information of the dropped sessions of specified session limit rule according to your need.

To clear statistic information, take the following steps:

1. Select **Policy > Session Limit**.
2. Select the rule whose session's statistical information you want to clear.
3. Click **Clear**.

Share Access

Share access means multiple endpoints access network with the same IP. The function of share access can block access from unknown device and allocate bandwidth for users, so as to prevent possible risks and ensure good online experience.

Configuring Share Access Rules

To configure a share access rule, take the following steps:

1. Select **Policy > Share Access**.
2. Click **New**. The Share Access Configuration dialog box will appear.

Option	Description
Name	Specifies the name of share access rule.
Source Zone	Specify the source zone of share access.
Source Address	Specify the source IP address segment of share access.
Schedule	Specify the schedule of share access. The share access rule takes effect in the period specified by the schedule. If the schedule is not configured, the share access rule will always be effective.
Maximum Endpoint	Specify the maximum number of share access endpoints. The range is 1-15. The default value is 2.
Action	<p>When the number of endpoints with the same IP address exceeds the maximum allowed to be shared by system, the IP address of the endpoints will be processed according to the specified action.</p> <ul style="list-style-type: none"> • Log Only: When the number of shared access

Option	Description
	<p>endpoints exceeds the maximum, system will only record logs of the IP address out of limit, without affecting the normal connection of the access endpoints.</p> <ul style="list-style-type: none"> • Warning: When the number of shared access endpoints exceeds the maximum, system will send warnings to endpoints out of limit and record logs during the specified control duration. <ul style="list-style-type: none"> • Control Duration: Specify the control duration of warning. The range is 30-3600s. The default value is 60s. After the duration is over, the system will re-detect whether the number of access endpoints exceeds the maximum.
Endpoint Timeout	Specify the timeout time of endpoint. After the timeout time, when the endpoint no longer accesses network with the IP, system will clear the endpoint information. The range is 300-86400s. The default value is 600s.

ARP Defense

FSOS provides a series of ARP defense functions to protect your network against various ARP attacks, including:

- **ARP Learning:** Devices can obtain IP-MAC bindings in an Intranet from ARP learning, and add them to the ARP list. By default this function is enabled. The devices will always keep ARP learning on, and add the learned IP-MAC bindings to the ARP list. If any IP or MAC address changes during the learning process, the devices will add the updated IP-MAC binding to the ARP list. If this function is disabled, only IP addresses in the ARP list can access the Internet.
- **MAC Learning:** Devices can obtain MAC-Port bindings in an Intranet from MAC learning, and add them to the MAC list. By default this function is enabled. The devices will always keep MAC learning on, and add the learned MAC-Port bindings to the MAC list. If any MAC address or port changes during the learning process, the devices will add the updated MAC-Port binding to the MAC list.
- **IP-MAC-Port Binding:** If IP-MAC, MAC-Port or IP-MAC-Port binding is enabled, packets that are not matched to the binding will be dropped to protect against ARP spoofing or

MAC address list attacks. The combination of ARP and MAC learning can achieve the effect of "real-time scan + static binding", and make the defense configuration more simple and effective.

- **ARP Inspection:** Devices support ARP Inspection for interfaces. With this function enabled, FSOS will inspect all ARP packets passing through the specified interfaces, and compare the IP addresses of the ARP packets with the static IP-MAC bindings in the ARP list and IP-MAC bindings in the DHCP Snooping list.
- **DHCP Snooping:** With this function enabled, system can create a binding relationship between the MAC address of the DHCP client and the allocated IP address by analyzing the packets between the DHCP client and server.
- **Host Defense:** With this function enabled, the system can send gratuitous ARP packets for different hosts to protect them against ARP attacks.

Configuring ARP Defense

Configuring Binding Settings

Devices support IP-MAC binding, MAC-Port binding and IP-MAC-Port binding to reinforce network security control. The bindings obtained from ARP/MAC learning and ARP scan are known as dynamic bindings, and those manually configured are known as static bindings.

Adding a Static IP-MAC-Port Binding

To add a static IP-MAC-Port binding, take the following steps:

1. Select **Policy > ARP Defense > IP-MAC Binding**.
2. Click **New**.

In the IP-MAC Binding Configuration, configure the corresponding settings.

Option	Description
MAC	Specify a MAC address.
IP	Select the Enable check box to enable the IP-MAC binding, and specify an IP address.
Port	Select the Enable check box to enable the port binding, select a port from the drop-down list behind.
VLAN ID	If the port belongs to a VLAN, select the VLAN ID from the VLAN ID drop-down list.
Virtual Router	Select the virtual router that the binding item belongs to. By default, the binding item belongs to trust-vr.

Option	Description
Description	Specify the description for this item.
Authenticated ARP	Select Enable to enable the authenticated ARP function.

3. Click **OK** to save the settings.

Obtaining a Dynamic IP-MAC-Port Bindings

Devices can obtain dynamic IP-MAC-Port binding information from:

- ARP/MAC learning
- IP-MAC scan

To configure the ARP/MAC learning, take the following steps:

1. Select **Policy > ARP Defense > IP-MAC Binding**.
2. Select **Others** and click **ARP/MAC Learning** from the pop-up menu.
3. In the ARP/MAC Learning Configuration dialog box, select the interface that you want to enable the ARP/MAC learning function.
4. Click **Enable** and then select **ARP Learning** or **MAC Learning** in the pop-up menu. The system will enable the selected function on the interface you select.
5. Close the dialog box and return to the IP-MAC Binding tab.

To configure the ARP scan, take the following steps:

1. Select **Policy > ARP Defense > IP-MAC Binding**.
2. Select **Binding Configuration** and then click **IP-MAC Scan** from the pop-up menu.
3. In the IP-MAC Scan dialog box, enter the start IP and the end IP.
4. Click **OK** to start scanning the specified IP addresses. The result will display in the table in the IP-MAC binding tab.

Bind the IP-MAC-Port Binding Item

To bind the IP-MAC-Port binding item, take the following steps:

1. Select **Policy > ARP Defense > IP-MAC Binding**.

2. Select **Binding Configuration** and then click **Bind All** from the pop-up menu.
3. In the **Bind All** dialog box, select the binding type.
4. Click **OK** to complete the configurations.

To unbind an IP-MAC-Port binding item:

1. Select **Policy > ARP Defense > IP-MAC Binding**.
2. Select **Binding Configuration** and then click **Unbind All** from the pop-up menu.
3. In the **Unbind All** dialog box, select the unbinding type.
4. Click **OK** to complete the configurations.

Importing/Exporting Binding Information

To import the binding information, take the following steps:

1. Select **Policy > ARP Defense > IP-MAC Binding**.
2. Select **Others** and then click **Import** from the pop-up menu.
3. In the Import dialog box, click **Browse** to select the file that contains the binding information. Only the UTF-8 encoding file is supported.

To export the binding information, take the following steps:

1. Select **Policy > ARP Defense > IP-MAC Binding**.
2. Select **Others** and then click **Export** from the pop-up menu.
3. Choose the binding information type.
4. Click **OK** to export the binding information to a file.

Configuring ARP Inspection

Devices support ARP Inspection for interfaces. With this function enabled, system will inspect all the ARP packets passing through the specified interfaces, and compare the IP addresses of the ARP packets with the static IP-MAC bindings in the ARP list and IP-MAC bindings in the DHCP Snooping list:

- If the IP address is in the ARP list and the MAC address matches, the ARP packet will be forwarded;
- If the IP address is in the ARP list but the MAC address does not match, the ARP packet will be dropped;

- If the IP address is not in the ARP list, continue to check if the IP address is in the DHCP Snooping list;
- If the IP address is in the DHCP Snooping list and the MAC address also matches, the ARP packet will be forwarded;
- If the IP address is in the DHCP Snooping list but the MAC address does not match, the ARP packet will be dropped;
- If the IP address is not in the DHCP Snooping, the ARP packet will be dropped or forwarded according to the specific configuration.

Both the VSwitch and VLAN interface of the system support ARP Inspection. This function is disabled by default.

To configure ARP Inspection of the VSwitch interface, take the following steps:

1. Select **Policy > ARP Defense > ARP Inspection**.
2. System already lists the existing VSwitch interfaces.
3. Double-click the item of a VSwitch interface.
4. In the Interface Configuration dialog box, select the **Enable** check box.
5. To drop the traffic whose sender's IP address is not in the ARP table, select **Drop**. To forward the traffic whose sender's IP address is not in the ARP table, select **Forward**.
6. Click **OK** to save the settings and close the dialog box.
7. For the interfaces belonging to the VSwitch interface, you can set the following options:
 - If you do not need the ARP inspection in the interface, in the Advanced Options section, double-click the interface and select **Do Not Inspect** option in the pop-up dialog box.
 - Configure the number of ARP packets received per second. When the ARP packet rate exceeds the specified value, the excessive ARP packets will be dropped. The value range is 0 to 10000. The default value is 0, i.e., no rate limit.
8. Click **OK** to save the settings.

To configure the ARP inspection of the VLAN interface, take the following steps:

1. Select **Policy > ARP Defense > ARP Inspection**.
2. Click **New**.

3. In the Interface Configuration dialog box, specify the VLAN ID.
4. To drop the traffic whose sender's IP address is not in the ARP table, select **Drop**. To forward the traffic whose sender's IP address is not in the ARP table, select **Forward**.
5. For the interfaces belongs to the VLAN, you can set the following options:
 - If you do not need the ARP inspection in the interface, in the Advanced Options section, double-click the interface and select **Do Not Inspect** option in the pop-up dialog box.
 - Configure the number of ARP packets received per second. When the ARP packet rate exceeds the specified value, the excessive ARP packets will be dropped. The value range is 0 to 10000. The default value is 0, i.e., no rate limit.
6. Click **OK** to save the settings.

Configuring DHCP Snooping

DHCP, Dynamic Host Configuration Protocol, is designed to allocate appropriate IP addresses and related network parameters for sub networks automatically. DHCP Snooping can create a binding relationship between the MAC address of the DHCP client and the allocated IP address by analyzing the packets between the DHCP client and the server. When ARP Inspection is also enabled, the system will check if an ARP packet passing through can be matched to any binding on the list. If not, the ARP packet will be dropped. In the network that allocates addresses via DHCP, you can prevent against ARP spoofing attacks by enabling ARP inspection and DHCP Snooping.

DHCP clients look for the server by broadcasting, and only accept the network configuration parameters provided by the first reachable server. Therefore, an unauthorized DHCP server in the network might lead to DHCP server spoofing attacks. The devices can prevent DHCP server spoofing attacks by dropping DHCP response packets on related ports.

Besides, some malicious attackers send DHCP requests to a DHCP server in succession by forging different MAC addresses, and eventually lead to IP address unavailability to legal users by exhausting all the IP address resources. This kind of attacks is commonly known as DHCP Starvation. The devices can prevent against such attacks by dropping request packets on related ports, setting rate limit or enabling validity check.

The VSwitch interface of the system supports DHCP snooping. This function is disabled by default.

To configure DHCP snooping, take the following steps:

1. Select **Policy > ARP Defense > DHCP Snooping**.
2. Click **DHCP Snooping Configuration**.

3. In the Interface tab, select the interfaces that need the DHCP snooping function.
4. Click **Enable** to enable the DHCP snooping function.
5. In the Port tab, configure the DHCP snooping settings:
 - **Validity check:** Check if the client's MAC address of the DHCP packet is the same as the source MAC address of the Ethernet packet. If not, the packet will be dropped. Select the interfaces that need the validity check and then click **Enable** to enable this function.
 - **Rate limit:** Specify the number of DHCP packets received per second on the interface. If the number exceeds the specified value, system will drop the excessive DHCP packets. The value range is 0 to 10000. The default value is 0, i.e., no rate limit. To configure the rate limit, double-click the interface and then specify the value in the **Rate** text box in the pop-up Port Configuration dialog box.
 - **Drop:** In the Port Configuration dialog box, if the **DHCP Request** check box is selected, the system will drop all of the request packets sent by the client to the server; if the **DHCP Response** check box is selected, system will drop all the response packets returned by the server to the client.
6. Click **OK** to save the settings.

Viewing DHCP Snooping List

With DHCP Snooping enabled, system will inspect all of the DHCP packets passing through the interface, and create and maintain a DHCP Snooping list that contains IP-MAC binding information during the process of inspection. Besides, if the VSwitch, VLAN interface or any other Layer 3 physical interface is configured as a DHCP server, the system will create IP-MAC binding information automatically and add it to the DHCP Snooping list even if DHCP Snooping is not enabled. The bindings in the list contain information like legal users' MAC addresses, IPs, interfaces, ports, lease time, etc.

To view the DHCP snooping list, take the following steps:

1. Select **Policy > ARP Defense > DHCP Snooping**.
2. In the current page, you can view the DHCP snooping list.

Configuring Host Defense

Host Defense is designed to send gratuitous ARP packets for different hosts to protect them against ARP attacks.

To configure host defense, take the following steps:

1. Select **Policy > ARP Defense > Host Defense**.
2. Click **New**.

In the Host Defense dialog box, configure the corresponding options.

Sending Settings	
Interface	Specify an interface that sends gratuitous ARP packets.
Excluded Port	Specify an excluded port, i.e., the port that does not send gratuitous ARP packets. Typically it is the port that is connected to the proxied host.
Host	
IP	Specify the IP address of the host that uses the device as a proxy.
MAC	Specify the MAC address of the host that uses the device as a proxy.
Sending Rate	Specify a gratuitous ARP packet that sends rate. The value range is 1 to 10/sec. The default value is 1.

3. Click **OK** to save your settings and return to the Host Defense page.
4. Repeat Step 2 and Step 3 to configure gratuitous ARP packets for more hosts. You can configure the device to send gratuitous ARP packets for up to 16 hosts.

SSL Proxy

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

To assure the security of sensitive data when being transmitting over networks, more and more websites adopt SSL encryption to protect their information. The device provides the SSL proxy function to decrypt HTTPS traffic. The SSL proxy function works in the following two scenarios:

The first scenario, the device works as the gateway of Web clients. The SSL proxy function replaces the certificates of encrypted websites with the SSL proxy certificate to get the encrypted information and send the SSL proxy certificates to the client's Web browser. During the process, the device acts as a SSL client and SSL server to establish connections to the Web server and Web browser respectively. The SSL proxy certificate is generated by using the device's local certificate and re-signing the website certificate. The process is described as below:

The second scenario, the device works as the gateway of Web servers. The device with SSL proxy enabled can work as the SSL server, use the certificate of the Web server to establish the SSL connection with Web clients (Web browsers), and send the decrypted traffic to the internal Web server.

Work Mode

There are three work modes. For the first scenario, the SSL proxy function can work in the "Client Inspection - Proxy" mode ; for the second scenario, the SSL proxy function can work in the "Server Inspection - Offload" mode and "Server Inspection - Proxy" mode.

When the SSL proxy function works in the "Client Inspection - Proxy" mode, it can perform the SSL proxy on specified websites.

For the websites that do not need SSL proxy, it dynamically adds the IP address and port of the websites to a bypass list, and the HTTPS traffic will be bypassed.

For the websites proxied by the SSL proxy function, the device will check the parameters of the SSL negotiation. When a parameter matches an item in the checklist, the corresponding HTTPS traffic can be blocked or bypassed according to the action you specified.

- If the action is Block, the HTTPS traffic will be blocked by the device.
- If the action is Bypass, the HTTPS traffic will not be decrypted. Meanwhile, the device will dynamically add the IP address and port number of the Website to the bypass list, and the HTTPS traffic will be bypassed.

The device will decrypte the HTTPS traffic that are not blocked or bypassed.

When the SSL proxy function works in the "Server Inspection - Offload" mode, it will proxy the SSL connections initialized by Web clients, decrypt the HTTPS traffic, and send the HTTPS traffic as plaintext to the Web server.

When the SSL proxy function works in the "Server Inspection - Proxy" mode, it will proxy the SSL connections initialized by Web clients, decrypt the HTTPS traffic, and re-encrypt the traffic and send it to the Web server.

You can integrate SSL proxy function with the followings:

- Integrate with the application identification function. Devices can decrypte the HTTPS traffic encrypted using SSL by the applications and identify the application. After the application identification, you can configure the policy rule, QoS, session limit, policy-based route.
- Integrate with the Web content function, Web post function, and email filter function. Devices can audit the actions that access the HTTPS website.

- Integrate with AV, IPS, and URL. Devices can perform the AV protection, IPS protection, and URL filtering on the decrypted HTTPS traffic.

Working as Gateway of Web Clients

To implement the SSL proxy, you need to bind a SSL proxy profile to the policy rule. After binding the SSL proxy profile to a policy rule, system will use the SSL proxy profile to deal with the traffic that matches the policy rule. To implement the SSL proxy, take the following steps:

1. Configure the corresponding parameters of SSL negotiation, including the following items: specify the PKI trust domain of the device certificates, obtain the CN value of the subject field from the website certificate, and import a device certificate to the Web browser.
2. Configure a SSL proxy profile, including the following items: choose the work mode, set the website list (use the CN value of the Subject field of the website certificate), configure the actions to the HTTPS traffic when its SSL negotiation matches the item in the checklist, enable the audit warning page, and so on.
3. Bind a SSL proxy profile to a proper policy rule. The device will decrypt the HTTPS traffic that matches the policy rule and is not blocked or bypassed by the device.

Configuring SSL Proxy Parameters

Configuring SSL proxy parameters includes the following items:

- Specify the PKI trust domain of the device certificate
- Obtain the CN value of the website certificate
- Import a device certificate to a Web browser

Specifying the PKI Trust Domain of Device Certificate

By default, the certificate of the default trust domain `trust_domain_ssl_proxy_2048` will be used to generate the SSL proxy certificate with the Web server certificate together, and then system will issue the generated SSL proxy certificate to the client. You can specify another PKI trust domain in system as the trust domain of the device certificate. The specified trust domain must have a CA certificate, local certificate, and the private key of the local certificate. To specify a trust domain, take the following steps:

1. Click **Policy > SSL Proxy**.
2. At the top-right corner of the page, click **Trust Domain Configuration**.
3. Select a trust domain from the Trust domain drop-down list.

- The trust domain of trust_domain_ssl_proxy uses RSA and the modulus size is 1024 bits.
 - The trust domain of trust_domain_ssl_proxy_2048 uses RSA and the modulus size is 2048 bits.
4. Click **OK** to save the settings.

Obtaining the CN Value

To get the CN value in the Subject field of the website certificate, take the following steps (take www.gmail.com as the example):

1. Open the IE Web browser, and visit https://www.gmail.com.
2. Click the **Security Report** button () next to the URL.
3. In the pop-up dialog box, click **View certificates**.
4. In the Details tab, click **Subject**. You can view the CN value in the text box.

Importing Device Certificate to Client Browser

In the proxy process, the SSL proxy certificate will be used to replace the website certificate. However, there is no SSL proxy certificate's root certificate in the client browser, and the client cannot visit the proxy website properly. To address this problem, you have to import the root certificate (certificate of the device) to the browser.

To export the device certificate to local PC firstly, take the following steps:

1. Export the device certificate to local PC. Select **System > PKI**.
2. In the Management tab in the PKI Management dialog box, configure the options as below:
 - Trust domain: trust_domain_ssl_proxy or trust_domain_ssl_proxy_2048
 - Content: CA certificate
 - Action: Export
3. Click **OK** and select the path to save the certificate. The certificate will be saved to the specified location.

Then, import the device certificate to the client browser. Take Internet Explorer as an example:

1. Open IE.

2. From the toolbar, select **Tools > Internet Options**.
3. In the **Content** tab, click **Certificates**.
4. In the Certificates dialog box, click the **Trusted Root Certification Authorities** tab.
5. Click **Import**. Import the certificate following the Certificate Import Wizard.

Configuring a SSL Proxy Profile

Configuring a SSL proxy profile includes the following items: choose the work mode, set the website list (use the CN value of the Subject field of the website certificate), configure the actions to the HTTPS traffic when its SSL negotiation matches the item in the checklist, enable the audit warning page, and so on. System supports up to 32 SSL proxy profiles and each profile supports up to 10,000 statistic website entries.

To configure a SSL proxy profile, take the following steps:

1. Click **Policy > SSL Proxy**.
2. At the top-left corner, click **New** to create a new SSL proxy profile.

In the Basic tab, configure the settings.

Option	Description
Name	Specify the name of the SSL proxy profile.
Description	Add the description.
Mode	When the device works as the gateway of Web clients, the SSL proxy function can work in the "Client Inspection - Proxy" mode.
Common Name	Set the website list based on the work mode. When the SSL proxy is in the "Client Inspection - Proxy" mode, set the websites that will not be proxied by the SSL proxy function and the device will perform the SSL proxy on other websites. To set the website list, specify the CN value of the subject field of the website certificate and then click Add .
Warning	Select Enable to enable the warning page. When the HTTPS traffic is decrypted by the SSL proxy function, the request to a HTTPS website will be redirected to a warning page of SSL proxy. In this page, system notifies the users that their access to

Option	Description
	HTTPS websites are being monitored and asks the users to protect their privacy.

In the Decryption Configuration tab, configure the settings.

Option	Description
	After system completes the SSL negotiation, the traffic that is not blocked or bypassed will be decrypted. When the parameters match multiple items in the checklist and you configure difference actions to different items, the Block action will take effect. The corresponding HTTPS traffic will be blocked.
Key Modulus	Specify the key pair modulus size of the private/public keys that are associated with the SSL proxy certificate. You can select 1024 bits or 2048 bits.
Encryption mode check	
Unsupported version	<p>Check the SSL protocol version used by the server.</p> <ul style="list-style-type: none"> When the SSL protocol used by the SSL server is not supported in system, you can select Block to block its HTTPS traffic, or select Bypass to bypass its HTTPS traffic. When the SSL protocol used by the SSL server is supported, it will continue to check other items.
Unsupported encryption algorithms	<p>Check the encryption algorithm used by the server.</p> <ul style="list-style-type: none"> When the encryption algorithm used by the SSL server is not supported in system, you can select Block to block its HTTPS traffic, or select Bypass to bypass its HTTPS traffic. When the encryption algorithm used by the SSL server is supported, it will continue to check other items.
Unknown Error	<p>Check the unknown error.</p> <ul style="list-style-type: none"> When SSL negotiation fails and the cause of failure can't be confirmed, you can select Block to block its HTTPS traffic, or select Bypass to bypass its

Option	Description
	<p>HTTPS traffic.</p> <ul style="list-style-type: none"> When system do not need check unknown failure, it will continue to check other items.
Blocking SSL version	When the SSL server uses the specified version of SSL protocol, system can block its HTTPS traffic.
Blocking encryption algorithm	When the SSL server uses the specified encryption algorithm, system can block its HTTPS traffic.
Server certificate check	
Expired certificate	Check the certificate used by the server. When the certificate is overdue, you can select Block to block its HTTPS traffic, or select Bypass to bypass its HTTPS traffic, or select Decrypt to decrypt the HTTPS traffic.

- Click **OK** to save the settings.

Working as Gateway of Web Servers

To implement SSL proxy, you need to bind a SSL proxy profile to the policy rule. After binding the SSL proxy profile to a policy rule, system will use the SSL proxy profile to deal with the traffic that matches the policy rule. To implement SSL proxy, take the following steps:

- Configure a SSL proxy profile includes the following items: choose the work mode, specify the trust domain of the Web server certificate and the HTTP port number of the Web server.
- Bind a SSL proxy profile to a proper policy rule. The device will decrypt the HTTPS traffic that matches the policy rule.

Configuring a SSL Proxy Profile

Configuring a SSL proxy profile includes the following items: choose the work mode, specify the trust domain of the Web server certificate and the HTTP port number of the Web server.

To configure a SSL proxy profile, take the following steps:

- Click **Policy > SSL Proxy**.
- At the top-left corner, click **New** to create a new SSL proxy profile.

In the **Basic** tab, configure the settings.

Option	Description
Name	Specify the name of the SSL proxy profile.
Description	Add the description.
Mode	<p>When the device works as the gateway of Web servers, the SSL proxy function can work in the "Server Inspection - Offload" mode.</p> <ul style="list-style-type: none"> When the SSL proxy function works in the "Server Inspection - Offload" mode, it will proxy the SSL connections initialized by Web clients, decrypt the HTTPS traffic, and send the HTTPS traffic as plaintext to the Web server.
Service Port	Specify the HTTP port number of the Web server. In Server Inspection - Offload Mode, the default port number is 80. In the Server Inspection - Proxy Mode, the default port number is 443.
Server Trust Domain	<p>Since the device will work as the SSL server and use the certificate of the Web server to establish the SSL connection with Web clients (Web browsers), you need to import the certificate and the key pair into a trust domain in the device. For more information about importing the certificate and the key pair, see "PKI".</p> <p>After you complete the importing, select the trust domain used by this SSL Profile.</p>
Warning	Select Enable to enable the warning page. When the HTTPS traffic is decrypted by the SSL proxy function, the request to a HTTPS website will be redirected to a warning page of SSL proxy. In this page, system notifies the users that their access to HTTPS websites are being monitored and asks the users to protect their privacy.

- Click **OK** to save the settings.

Binding an SSL Proxy Profile to a Policy Rule

After binding the SSL proxy profile to a policy rule, system will process the traffic that is matched to the rule according to the profile configuration. To bind the SSL proxy profile to a policy rule, see "[Security Policy](#)".

Global Blacklist

After adding the IP addresses or services to the global blacklist, system will perform the block action to the IP address and service until the block duration ends. You can manually add IP addresses or services to the blacklist and system can also automatically add the IP addresses or services to the blacklist after you configure the IPS module.

Configuring global blacklist includes IP block settings and service block settings, and both IPv4 and IPv6 address are supported.

Configuring IP Block Settings

To configure the IP block settings, take the following steps:

1. Select **Policy > Global Blacklist > IP Block**.
2. Click **New**. The Block IP Configuration dialog box will appear.

Configure the corresponding options.

Option	Description
Virtual Router	Select the virtual router that the IP address belongs to.
Type	Select the address type, including IPv4 and IPv6.
IP	Type the IP address that you want to block. This IP address can be not only the source IP address, but also the destination IP address.
Duration	Type the duration that the IP address will be blocked. The unit is second. The value ranges from 60 to 3600. The default value is 60.

3. Click **OK** to save the settings.

Configuring Service Block Settings

To configure the service block settings, take the following steps:

1. Select **Policy > Global Blacklist > Service Block**.
2. Click **New**. The Block Service Configuration dialog box will appear.

Configure the corresponding options.

Option	Description
--------	-------------

Option	Description
Virtual Router	Select the virtual router that the IP address belongs to.
Type	Select the address type, including IPv4 and IPv6.
Source IP	Type the source IP address of the blocked service. The service block function will block the service from the source IP address to the destination IP address.
Destination IP	Type the destination IP address of the blocked service.
Destination Port	Type the port number of the blocked service.
Protocol	Select the protocol of the blocked service.
Duration	Type the duration that the IP address will be blocked. The unit is second. The value ranges from 60 to 3600. The default value is 60.

3. Click **OK** to save the settings.

Chapter 11 Threat Prevention

Threat prevention is a device that can detect and block network threats. By configuring the threat prevention function, FS devices can defend network attacks and reduce losses of the internal network.

Threat protections include:

- **Anti Virus:** It can detect the common file types and protocol types which are most likely to carry the virus and protect the network from them.. FS devices can detect protocol types of POP3, HTTP, SMTP, IMAP4 and FTP, and the file types of archives (including GZIP, BZIP2, TAR, ZIP and RAR-compressed archives), PE , HTML, MAIL, RIFF and JPEG.
- **Intrusion Prevention:** It can detect and protect mainstream application layer protocols (DNS, FTP, POP3, SMTP, TELNET, MYSQL, MSSQL, ORACLE, NETBIOS), against web-based attacks and common Trojan attacks.
- **Attack Defense:** It can detect various types of network attacks, and take appropriate actions to protect the Intranet against malicious attacks, thus assuring the normal operation of the Intranet and systems.
- **Perimeter Traffic Filtering:** It can filter the perimeter traffic based on known IP of black/white list, and take block action on the malicious traffic that hits the blacklist.

The threat protection configurations are based on security zones and policies.

- If a security zone is configured with the threat protection function, system will perform detection on the traffic that is matched to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the threat protection function, system will perform detection on the traffic that is matched to the policy rule you specified, and then respond.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the threat protection configurations in a destination zone is superior to that in a source zone if specified at the same time.

Anti Virus

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

The system is designed with an Anti-Virus that is controlled by licenses to provide an AV solution featuring high speed, high performance and low delay. With this function configured in FSOS, FS

devices can detect various threats including worms, Trojans, malware, malicious websites, etc., and proceed with the configured actions.

Anti Virus function can detect the common file types and protocol types which are most likely to carry the virus and protect the network from them. FS devices can detect protocol types of POP3, HTTP, HTTPS, SMTP, IMAP4 and FTP, and the file types of archives (including GZIP, BZIP2, TAR, ZIP and RAR-compressed archives), PE , HTML, MAIL, RIFF and JPEG.

If IPv6 is enabled, Anti Virus function will detect files and protocols based on IPv6.

The virus signature database includes over 10,000 signatures, and supports both daily auto update and real-time local update. See "[Security Policy](#)".

Notes: Anti Virus is controlled by license. To use Anti Virus, apply and install the Anti Virus (AV) license.

Configuring Anti-Virus

This chapter includes the following sections:

- Preparation for configuring Anti-Virus function
- Configuring Anti-Virus function
- Configuring Anti-Virus global parameters

Preparing

Before enabling Anti-Virus, make the following preparations:

1. Make sure your system version supports Anti-Virus.
2. Import an Anti-Virus license and reboot. The Anti-Virus will be enabled after the rebooting.

Notes:

- You need to update the Anti-Virus signature database before enabling the function for the first time. To assure a proper connection to the default update server, you need to configure a DNS server for FSOS before updating.
- If Anti-Virus is enabled, the max amount of concurrent sessions will decrease by half.

Configuring Anti-Virus Function

The Anti-Virus configurations are based on security zones or policies.

- If a security zone is configured with the Anti-Virus function, system will perform detection on the traffic that is matched to the binding zone specified in the rule, and then do according to what you specified.
- If a policy rule is configured with the threat protection function, system will perform detection on the traffic that is matched to the policy rule you specified, and then respond.
- The threat protection configurations in a policy rule is superior to that in a zone rule if specified at the same time, and the threat protection configurations in a destination zone is superior to that in a source zone if specified at the same time.
- To perform the Anti-Virus function on the HTTPS traffic, see the policy-based Anti-Virus.

To realize the zone-based Anti-Virus, take the following steps:

1. Create a zone. For more information, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog, select Threat Protection tab.
3. Enable the threat protection you need and select an Anti-Virus rule from the profile drop-down list below; or you can click **Add Profile** from the profile drop-down list. To create an Anti-Virus rule, see [Configuring Anti-Virus Rule](#).
4. Click **OK** to save the settings.

To realize the zone-based Anti-Virus, take the following steps:

1. Create a security policy rule. For more information, refer to "[Security Policy](#)".
2. In the Policy Configuration dialog box, select the Protection tab.
3. Select the **Enable** check box of **Antivirus**. Then select an Anti-Virus rule from the Profile drop-down list, or you can click **Add Profile** from the Profile drop-down list to create an Anti-Virus rule. For more information, see [Configuring Anti-Virus Rule](#).
4. To perform the Anti-Virus function on the HTTPS traffic, you need to enable the SSL proxy function for the above specified security policy rule. System will decrypt the HTTPS traffic according to the SSL proxy profile and then perform the Anti-Virus function on the decrypted traffic.

According to the various configurations of the security policy rule, system will perform the following actions:

Policy Rule Configurations	Actions

Policy Rule Configurations	Actions
SSL proxy enabled Anti-Virus disabled	System decrypts the HTTPS traffic according to the SSL proxy profile but it does not perform the Anti-Virus function on the decrypted traffic.
SSL proxy enabled Anti-Virus enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the Anti-Virus function on the decrypted traffic.
SSL proxy disabled Anti-Virus enabled	System performs the Anti-Virus function on the HTTP traffic according to the Anti-Virus profile. The HTTPS traffic will not be decrypted and the system will transfer it.

If the destination zone or the source zone specified in the security policy rule are configured with Anti-Virus as well, system will perform the following actions:

Policy Rule Configurations	Zone Configurations	Actions
SSL proxy enabled Anti-Virus disabled	Anti-Virus enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the Anti-Virus function on the decrypted traffic according to the Anti-Virus rule of the zone.
SSL proxy enabled Anti-Virus enabled	Anti-Virus enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the Anti-Virus function on the decrypted traffic according to the Anti-Virus rule of the policy rule.
SSL proxy disabled Anti-Virus	Anti-Virus enabled	System performs the Anti-Virus function on the HTTP traffic according to the Anti-Virus rule of the policy rule. The HTTPS traffic will not be decrypted and system will transfer it.

Policy Rule Configurations	Zone Configurations	Actions
enabled		

5. Click **OK** to save the settings.

Configuring an Anti-Virus Rule

To configure an Anti-Virus rule, take the following steps:

1. Select **Object > Antivirus > Profile**.
2. Click **New**.

In the Anti-Virus Rules Configuration dialog box, enter the Anti-Virus rule configurations.

Option	Description
Name	Specifies the rule name.
File Types	Specifies the file types you want to scan. It can be GZIP, JPEG, MAIL, RAR, HTML .etc
Protocol Types	<p>Specifies the protocol types (HTTP, SMTP, POP3, IMAP4, FTP) you want to scan and specifies the action the system will take after the virus is found.</p> <ul style="list-style-type: none"> • Fill Magic - Processes the virus file by filling magic words, i.e., fills the file with the magic words (Virus is found, cleaned) from the beginning to the ending part of the infected section. • Log Only - Only generates log. • Warning - Pops up a warning page to prompt that a virus has been detected. This option is only effective to the messages transferred over HTTP. • Reset Connection - If virus has been detected, system will reset connections to the files.
Malicious Website Access Control	Select the check box behind Malicious Website Access Control to enable the function.
Action	Specifies the action the system will take after the malicious

Option	Description
	website is found. <ul style="list-style-type: none"> • Log Only - Only generates log. • Reset Connection - If a malicious website has been detected, system will reset connections to the files. • Warning - Pops up a warning page to prompt that a malicious website has been detected. This option is only effective to the messages transferred over HTTP.
Enable label E-mail	If an email transferred over SMTP is scanned, you can enable label email to scan the email and its attachment(s). The scanning results will be included in the mail body, and sent with the email. If no virus has been detected, the message of "No virus found" will be labeled; otherwise information related to the virus will be displayed in the email, including the filename, result and action. Type the end message content into the box. The range is 1 to 128.

3. Click **OK**.

Notes: By default, according to virus filtering protection level, system comes with three default virus filtering rules: `predef_low`, `predef_middle`, `predef_high`. The default rule is not allowed to edit or delete.

Configuring Anti-Virus Global Parameters

To configure the AV global parameters, take the following steps:

1. Select **Object > Antivirus > Configuration**.

In AV Global Configuration section, enter the AV global configurations.

Option	Description
Antivirus	Select/clear the Enable check box to enable/disable Anti-Virus.
Max Decompression Layer	By default FSOS can scan the files of up to 5 decompression layers. To specify a decompression layer, select a value from the drop-down list. The value range is 1 to 5. Notes: For compressed files containing docx, pptx, xlsx, jar, and apk formats, when Exceed Action is specified as Reset Connection , the maximum compression layers should be

Option	Description
	added one more layer to prevent download failure.
Exceed Action	<p>Specifies an action for the compressed files that exceed the max decompression layer. Select an action from the drop-down list:</p> <ul style="list-style-type: none"> • Log Only - Only generates logs but will not scan the files. This action is enabled by default. • Reset Connection - If a virus has been detected, FSOS will reset connections for the files.
Encrypted Compressed File	<p>Specifies an action for encrypted compressed files:</p> <ul style="list-style-type: none"> • ----- - Will not take any special anti-virus actions against the files, but might further scan the files according to the configuration. • Log Only - Only generates logs but will not scan the files. • Reset Connection - Resets connections for the files.

2. Click **OK**.

Intrusion Prevention System

IPS, Intrusion Prevention System, is designed to monitor various network attacks in real time and take appropriate actions (like block) against the attacks according to your configuration.

The IPS can implement a complete state-based detection which significantly reduces the false positive rate. Even if the device is enabled with multiple application layer detections, enabling IPS will not cause any noticeable performance degradation. Besides, FSOS will update the signature database automatically everyday to assure its integrity and accuracy.

- IPS will support IPv6 address if the IPv6 function is enabled.
- By integrating with the SSL proxy function, IPS can monitor the HTTPS traffic.

The protocol detection procedure of IPS consists of two stages: signature matching and protocol parse.

- **Signature matching:** IPS abstracts the interested protocol elements of the traffic for signature matching. If the elements are matched to the items in the signature database, system

will process the traffic according to the action configuration. This part of detection is configured in the **Select Signature** section.

- Protocol parse: IPS analyzes the protocol part of the traffic. If the analysis results show the protocol part containing abnormal contents, system will process the traffic according to the action configuration. This part of detection is configured in the **Protocol Configuration** section.

Notes: Intrusion Prevention System is controlled by a license. To use Threat protection, apply and install the Intrusion Prevention System (IPS) license.

Signatures

The IPS signatures are categorized by protocols, and identified by a unique signature ID. The signature ID consists of two parts: protocol ID (1st bit or 1st and 2nd bit) and attacking signature ID (the last 5 bits). For example, in ID 605001, "6" identifies a Telnet protocol, and "00120" is the attacking signature ID. The 1st bit in the signature ID identifies protocol anomaly signatures, while the others identify attacking signatures. The mappings between IDs and protocols are shown in the table below:

ID	Protocol	ID	Protocol	ID	Protocol	ID	Protocol
1	DNS	7	Other-TCP	13	TFTP	19	NetBIOS
2	FTP	8	Other-UDP	14	SNMP	20	DHCP
3	HTTP	9	IMAP	15	MySQL	21	LDAP
4	POP3	10	Finger	16	MSSQL	22	VoIP
5	SMTP	11	SUNRPC	17	Oracle	-	-
6	Telnet	12	NNTP	18	MSRPC	-	-

In the above table, Other-TCP identifies all the TCP protocols other than the standard TCP protocols listed in the table, and Other-UDP identifies all the UDP protocols other than the standard UDP protocols listed in the table.

Configuring IPS

This chapter includes the following sections:

- Preparation for configuring IPS function
- Configuring IPS function

Preparation

Before enabling IPS, make the following preparations:

1. Make sure your system version supports IPS.
2. Import an Intrusion Prevention System (IPS) license and reboot. The IPS will be enabled after the rebooting.

Notes: If IPS is enabled, the max amount of concurrent sessions will decrease by half.

Configuring IPS Function

The IPS configurations are based on security zones or policies.

- To perform the IPS function on the HTTPS traffic, see the policy-based IPS.

To realize the zone-based IPS, take the following steps:

1. Create a zone. For more information, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog box, select Threat Protection tab.
3. Enable the IPS you need and select an IPS rules from the profile drop-down list below, or you can click **Add Profile** from the profile drop-down list below. To create an IPS rule, see [Configuring an IPS Rule](#).
4. Click a direction (Inbound, Outbound, Bi-direction). The IPS rule will be applied to the traffic that is matched with the specified security zone and direction.

To realize the policy-based IPS, take the following steps:

1. Create a policy rule. For more inform action, refer to "[Security Policy](#)".
2. In the Policy Configuration dialog box, select the Protection tab.
3. Select the **Enable** check box of **IPS**. Then select an IPS rule from the Profile drop-down list, or you can click **Add Profile** from the Profile drop-down list to create an IPS rule. For more information, see [Configuring an IPS Rule](#).
4. To perform the IPS function on the HTTPS traffic, you need to enable the SSL proxy function for the above specified security policy rule. System will decrypt the HTTPS traffic according to the SSL proxy profile and then perform the IPS function on the decrypted traffic.

According to the various configurations of the security policy rule, system will perform the following actions:

Policy Rule Configurations	Actions
SSL proxy enabled IPS disabled	System decrypts the HTTPS traffic according to the SSL proxy profile but it does not perform the IPS function on the decrypted traffic.
SSL proxy enabled IPS enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the IPS function on the decrypted traffic.
SSL proxy disabled IPS enabled	System performs the IPS function on the HTTP traffic according to the IPS profile. The HTTPS traffic will not be decrypted and system will transfer it.

If the destination zone or the source zone specified in the security policy rule is configured with IPS as well, system will perform the following actions:

Policy Rule Configurations	Zone Configurations	Actions
SSL proxy enabled IPS disabled	IPS enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the IPS function on the decrypted traffic according to the IPS rule of the zone.
SSL proxy enabled IPS enabled	IPS enabled	System decrypts the HTTPS traffic according to the SSL proxy profile and performs the IPS function on the decrypted traffic according to the IPS rule of the policy rule.
SSL proxy disabled IPS enabled	IPS enabled	System performs the IPS function on the HTTP traffic according to the IPS rule of the policy rule. The HTTPS traffic will not be decrypted and system will transfer it.

5. Click **OK** to save the settings.

Configuring an IPS Rule

System has three default IPS rules: **predef_default** , **predef_loose** and **predef_critical**.

- The **predef_default** rule includes all the IPS signatures and its default action is reset.
- The **predef_loose** includes all the IPS signatures and its default action is log only.

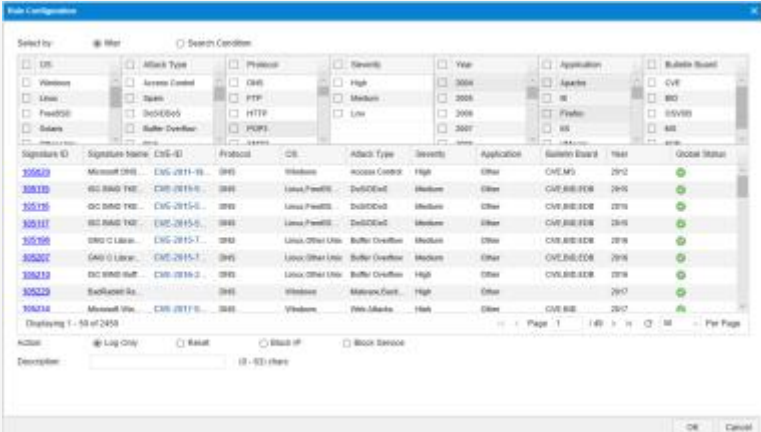

- The **predef_critical** includes all the IPS signatures with high severity and its default action is log only.

To configure an IPS rule, take the following steps:

1. Select **Object > Intrusion Prevention System > Profile**.
2. Click **New** to create a new IPS rule. To edit an existing one, select the check box of this rule and then click **Edit**. To view it, click the name of this rule.
3. Type the name into the Rule name box.
4. In the **Select Signature** area, the existing signature sets and their settings will be displayed in the table. Select the desired signature sets. You can also manage the signature sets, including New, Edit, and Delete.

Click **New** to create a new signature set rule.

Option	Description
<p>Creating a new signature set contains:</p> <ul style="list-style-type: none"> • Select By: Select the method of how to choose the signature set. There are two methods: Filter and Search Condition. • Action: Specify the action performed on the abnormal traffic that match the signature set. • Description: Specify the description of signature. 	
Select By	
Filter	<p>System categorizes the signatures according to the following aspects (aka main categories): affected OS, attack type, protocol, severity, released year, affected application, and bulletin board. A signature can be in several subcategories of one main category. For example, the signature of ID 105001 is in the Linux subcategory, the FreeBSD subcategory, and Other Linux subcategory at the same time.</p>  <p>With Filter selected, system displays the main categories and subcategories above. You can select the subcategories to choose the signatures in this subcategory. As shown below,</p>

Option	Description																																																																																																														
	<p>after selecting the Web Attack subcategory in the Attack Type main category, system will choose the signatures related to this subcategory. To view the detailed information of these chosen signatures, you can click the ID in the table.</p>  <p>The screenshot shows the 'Rule Configuration' window with search filters for OS (Windows, Linux) and Severity (High). The resulting table lists signatures with columns for Signature ID, Signature Name, CVE-ID, Protocol, OS, Attack Type, Severity, Application, Severity Base, Year, and Global Status.</p> <table border="1" data-bbox="536 582 1300 761"> <thead> <tr> <th>Signature ID</th> <th>Signature Name</th> <th>CVE-ID</th> <th>Protocol</th> <th>OS</th> <th>Attack Type</th> <th>Severity</th> <th>Application</th> <th>Severity Base</th> <th>Year</th> <th>Global Status</th> </tr> </thead> <tbody> <tr> <td>205619</td> <td>Microsoft DNS</td> <td>CVE-2011-81</td> <td>SNMP</td> <td>Windows</td> <td>Access Control</td> <td>High</td> <td>Other</td> <td>CVEBASE</td> <td>2012</td> <td>Active</td> </tr> <tr> <td>205110</td> <td>DC BMSD TNS</td> <td>CVE-2015-0...</td> <td>SNMP</td> <td>Linux, FreeBSD</td> <td>DoS/DoS</td> <td>Medium</td> <td>Other</td> <td>CVEBASE</td> <td>2016</td> <td>Active</td> </tr> <tr> <td>205110</td> <td>DC BMSD TNS</td> <td>CVE-2015-0...</td> <td>SNMP</td> <td>Linux, FreeBSD</td> <td>DoS/DoS</td> <td>Medium</td> <td>Other</td> <td>CVEBASE</td> <td>2016</td> <td>Active</td> </tr> <tr> <td>205111</td> <td>DC BMSD TNS</td> <td>CVE-2015-0...</td> <td>SNMP</td> <td>Linux, FreeBSD</td> <td>DoS/DoS</td> <td>Medium</td> <td>Other</td> <td>CVEBASE</td> <td>2016</td> <td>Active</td> </tr> <tr> <td>205108</td> <td>SNMP Linux</td> <td>CVE-2015-1...</td> <td>SNMP</td> <td>Linux, Other Unix</td> <td>Buffer Overflow</td> <td>Medium</td> <td>Other</td> <td>CVEBASE</td> <td>2016</td> <td>Active</td> </tr> <tr> <td>205207</td> <td>CAO Linux</td> <td>CVE-2015-1...</td> <td>SNMP</td> <td>Linux, Other Unix</td> <td>Buffer Overflow</td> <td>Medium</td> <td>Other</td> <td>CVEBASE</td> <td>2016</td> <td>Active</td> </tr> <tr> <td>205213</td> <td>DC BMSD TNS</td> <td>CVE-2016-0...</td> <td>SNMP</td> <td>Linux, Other Unix</td> <td>Buffer Overflow</td> <td>High</td> <td>Other</td> <td>CVEBASE</td> <td>2016</td> <td>Active</td> </tr> <tr> <td>205219</td> <td>Exchange S...</td> <td>CVE-2016-0...</td> <td>SNMP</td> <td>Windows</td> <td>Malware, Conf.</td> <td>High</td> <td>Other</td> <td>CVEBASE</td> <td>2017</td> <td>Active</td> </tr> <tr> <td>205218</td> <td>Microsoft Win...</td> <td>CVE-2017-0...</td> <td>SNMP</td> <td>Windows</td> <td>Den. Search Condition	<p>Enter the information of the signatures and press Enter to search the signatures. System will perform the fuzzy matching in the following field: attack ID, attack name, description, and CVE-ID.</p>																																																																																																														

Option	Description
	<div data-bbox="536 248 1139 591" style="border: 1px solid #ccc; padding: 5px; margin-bottom: 10px;"> </div> <p>In the search results displayed in the table, select the check box of the desired signatures. Then click <input type="button" value=">"/> to add them to the right pane. The ID displayed in the right pane are the ones that are included in this signature set.</p> <p>To add all signatures in the left to the right, click <input type="button" value=">>"/>.</p> <p>Use <input type="button" value="<"/> or <input type="button" value="<<"/> to cancel the selected signatures or all signatures in the right.</p>
Action	
Log Only	Record a log.
Reset	Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs.
Block IP	Block the IP address of the attacker. Specify a block duration. The value range is 60 to 3600 seconds, and the default value is 60.
Block Service	Block the service of the attacker. Specify a block duration. The value range is 60 to 3600 seconds, and the default value is 60.
	<p>Note: You create several signature sets and some of them contain a particular signature. If the actions of these signature sets are different and the attack matches this particular signature , system will adopt the following rules:</p> <ul style="list-style-type: none"> • Always perform the stricter action on the attack. The signature set with stricter action will be matched. The strict level is: Block IP > Block Service > Rest > Log Only. If one signature set is Block IP with 15s and the other is Block Service with 30s, the final action will be Block IP with 30s.

Option	Description
	<ul style="list-style-type: none"> The action of the signature set created by Search Condition has higher priority than the action of the signature set created by Filter.

- Click **OK** to complete signature set configurations.
- In the Protocol Configuration area, click . The protocol configurations specify the requirements that the protocol part of the traffic must meet. If the protocol part contains abnormal contents, system will process the traffic according to the action configuration. System supports the configurations of HTTP, DNS, FTP, MSRPC, POP3, SMTP, SUNRPC, and Telnet.

In the HTTP tab, select the Protocol tab, and configure the following settings:

Option	Description
HTTP	<p>Max Scan Length: Specify the maximum length of scanning when scanning the HTTP packets.</p> <p>Protocol Anomaly Detection: Select Enable to analyze the HTTP packets. If abnormal contents exist, you can:</p> <ul style="list-style-type: none"> Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. <p>Banner Detection: Select the Enable check box to enable protection against HTTP server banners.</p> <ul style="list-style-type: none"> Banner information - Type the new information into the box that will replace the original server banner information. <p>Max URI Length: Specify a max URI length for the HTTP protocol. If the URI length exceeds the limitation, you can:</p> <ul style="list-style-type: none"> Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration.

Option	Description
	Allowed Methods: Specify the allowed HTTP methods.

To protect the Web server, select **Web Server** in the **HTTP** tab.

Protecting the Web server means system can detect the following attacks: SQL injection, XSS injection, external link check, ACL, and HTTP request flood and take actions when detecting them. A pre-defined Web server protection rule named **default** is built in. By default, this protection rule is enabled and cannot be disabled or deleted.

Configure the following settings to protect the Web server:

Option	Description
Name	Specify the name of the Web server protection rule.
Configure Domain	<p>Specify domains protected by this rule.</p> <p>Click the link and the Configure Domain dialog box will appear.</p> <p>Enter the domain names in the Domain text box. At most 5 domains can be configured. The traffic to these domains will be checked by the protection rule.</p> <p>The domain name of the Web server follows the longest match rule from the back to the front. The traffic that does not match any rules will match the default Web server. For example, you have configured two protection rules: rule1 and rule2. The domain name in rule1 is abc.com. The domain name in rule2 is email.abc.com. The traffic that visits news.abc.com will match rule1, the traffic that visits www.email.abc.com will match rule2, and the traffic that visits www.abc.com.cn will match the default protection rule.</p>
CC URL Limit	<p>Select the Enable check box to enable the Web Server CC URL Restriction feature. When this function is enabled, system will block the traffic of this IP address, whose access frequency exceeds the threshold.</p> <ul style="list-style-type: none"> o Threshold: Specifies the maximum number of times a single source IP accesses the URL path per minute. When the frequency of a source IP address exceeds this threshold, system will block the flow of the IP. The value ranges from 1 to 65535 times per minute. o Block IP duration: Specifies the time to block IP. The

Option	Description
	<p>default is 60 seconds, in the range of 60 to 3600 seconds. Over this time, system will release the blocked IP, this IP can re-visit the Web server.</p> <ul style="list-style-type: none"> o URL Path: Click the link and the Configure URL Path dialog appears. Enter the URL path in the URL text box to add or delete. After the configuration, all paths that contain the name of the path are also counted. System accesses the frequency statistics for HTTP requests that access these paths. If the access frequency of the HTTP request exceeds the threshold, the source IP of the request is blocked, and the IP will not be able to access the Web server. For example: configure '/home/ab', system will perform a frequency check on the 'access/home/ab/login' and '/home/BC/login' HTTP requests. URL path does not support the path format which contains the host name or domain name, for example: you can not configure www.baidu.com/home/login.html, you should configure '/home / login.html', and 'www.baidu.com' should be configured in the corresponding Web server domain name settings. You can configure up to 32 URL paths. The length of each path is in the range of 1-255 characters.
SQL Injection Protection	<p>Select the Enable check box to enable SQL injection check.</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. • Sensitivity: Specifies the sensitivity for the SQL injection protection function. The higher the sensitivity is, the lower the false negative rate is. • Check point: Specifies the check point for the SQL injection check. It can be Cookie, Cookie2, Post, Referer or URI.

Option	Description
XSS Injection Protection	<p>Select the Enable check box to enable XSS injection check for the HTTP protocol.</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. • Sensitivity: Specifies the sensitivity for the XSS injection protection function. The higher the sensitivity is, the lower the false negative rate is. • Check point: Specifies the check point for the XSS injection check. It can be Cookie, Cookie2, Post, Referer or URI.
External Link Check	<p>Select the Enable check box to enable external link check for the Web server. This function controls the resource reference from the external sites.</p> <ul style="list-style-type: none"> • External link exception: Click this link, and the External Link Exception Configuration dialog box will appear. All the URLs configured on this dialog box can be linked by the Web sever. At most 32 URLs can be specified for one Web server. • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs.
Referer check	<p>Select the check box to enable referer checking. System checks the headers of the HTTP packets and obtains the source site of the HTTP request. If the source site is in the Header Exception list, system will release it; otherwise, log or reset the connection. Thus controlling the Web site from other sites and to prevent chain of CSRF (Cross Site Request Forgery cross-site request spoofing) attacks occur.</p> <ul style="list-style-type: none"> • External link exception: Click the 'External link

Option	Description
	<p>exception ' to open the <External link exception> dialog box, where the configured URL can refer to the other Web site. Each Web server can be configured with up to 32 URLs.</p> <ul style="list-style-type: none"> • Action: Specify the action for the HTTP request for the chaining behavior, either "Log only" or "Reset". “
Iframe check	<p>Select the checkbox to enable iframe checking. System will identify if there are hidden iframe HTML pages by this function, then log it or reset its link.</p> <p>After iframe checking is enabled, system checks the iframe in the HTML page based on the specified iframe height and width, and when any height and width is less than or equal to the qualified value, system will identify as a hidden iframe attack, record, or reset connection that occurred.</p> <ul style="list-style-type: none"> • Height: Specifies the height value for the iframe, range from 0 to 4096. • Width: Specifies the width value of the iframe, range from 0 to 4096. • Action: Specify the action for the HTTP request that hides iframe behavior, which is 'Only logged' or 'Reset'. Log Only - Record a log. Reset - Reset connections (TCP) or sends destination unreachable packets (UDP) and also generate logs.
ACL	<p>Select the Enable check box to enable access control for the Web server. The access control function checks the upload paths of the websites to prevent the malicious code uploading from attackers.</p> <ul style="list-style-type: none"> • ACL: Click this link, the ACL Configuration dialog appears. Specify websites and the properties on this dialog. "Static" means the URI can be accessed statically only as the static resource (images and text), otherwise, the access will handle as the action specified (log only/reset); "Block" means the resource of the website is not allowed to access. • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends destination unreachable packets

Option	Description
	(UDP) and also generate logs.
HTTP Request Flood Protection	<p>Select the Enable check box to enable the HTTP request flood protection. Both IPv4 and IPv6 address are supported.</p> <ul style="list-style-type: none"> • Request threshold: Specifies the request threshold. • For the protected domain name, when the number of HTTP connecting request per second reaches the threshold and this lasts 20 seconds, system will treat it as a HTTP request flood attack, and will enable the HTTP request flood protection. • For the protected full URL, when the number of HTTP connecting request per second towards this URL reaches the threshold and this lasts 20 seconds, system will treat it as a HTTP request flood attack towards this URL, and will enable the HTTP request flood protection. • Full URL: Enter the full URLs to protect particular URLs. Click this link to configure the URLs, for example, www.example.com/index.html. When protecting a particular URL, you can select a statistic object. When the number of HTTP connecting request per second by the object reaches the threshold and this lasts 20 seconds, system will treat it as a HTTP request flood attack by this object, and will enable the HTTP request flood protection. <ul style="list-style-type: none"> • x-forwarded-for: Select None, system will not use the value in x-forwarded-for as the statistic object. Select First, system will use the first value of the x-forwarded-for field as the statistic object. Select Last, system will use the last value of the x-forwarded-for field as the statistic object. Select All, system will use all values in x-forwarded-for as the statistic object. • x-real-ip: Select whether to use the value in the x-real-ip field as the statistic field. <p>When the HTTP request flood attack is discovered, you can make</p>

Option	Description
	<p>the system take the following actions:</p> <ul style="list-style-type: none"> • Authentication: Specifies the authentication method. System judges the legality of the HTTP request on the source IP through the authentication. If a source IP fails on the authentication, the current request from the source IP will be blocked. The available authentication methods are: <ul style="list-style-type: none"> • Auto (JS Cookie): The Web browser will finish the authentication process automatically. • Auto (Redirect): The Web browser will finish the authentication process automatically. • Manual (Access Configuration): The initiator of the HTTP request must confirm by clicking OK on the returned page to finish the authentication process. • Manual (CAPTCHA): The initiator of the HTTP request must be confirmed by entering the authentication code on the returned page to finish the authentication process. • Crawler-friendly: If this check box is selected, system will not authenticate to the crawler. • Request limit: Specifies the request limit for the HTTP request flood protection. After configuring the request limit, system will limit the request rate of each source IP. If the request rate is higher than the limitation specified here and the HTTP request flood protection is enabled, system will handle the exceeded requests according to the action specified (Block IP/Reset). To record a log, select the Record log check box. • Proxy limit: Specifies the proxy limit for the HTTP request flood protection. After configuring the proxy limit, system will check whether each source belongs to the each source IP proxy server. If belongs to, according to configuration to limit the request rate. If the request rate is higher than the limitation specified here and the HTTP

Option	Description
	<p>request flood protection is enabled, system will handle the exceeded requests according to the action specified (Block IP/Reset). To record a log, select the Record log check box.</p> <ul style="list-style-type: none"> White List: Specifies the white list for the HTTP request flood protection. The source IP added to the white list will not check the HTTP request flood protection.

In the DNS tab, configure the following settings:

Option	Description
DNS	<p>Max Scan Length: Specify the maximum length of scanning when scanning the DNS packets.</p> <p>Protocol Anomaly Detection: Select Enable to analyze the DNS packets. If abnormal contents exist, you can:</p> <ul style="list-style-type: none"> Action: Log Only - Record a log. Rest - Reset connections (TCP) or send the destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration.

In the FTP tab, configure the following settings:

Option	Description
FTP	<p>Max Scan Length: Specify the maximum length of scanning when scanning the FTP packets.</p> <p>Protocol Anomaly Detection: Select Enable to analyze the FTP packets. If abnormal contents exist, you can:</p> <ul style="list-style-type: none"> Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends the destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. <p>Banner Detection: Select the Enable check box to enable</p>

Option	Description
	<p>protection against FTP server banners.</p> <ul style="list-style-type: none"> • Banner Information: Type the new information into the box that will replace the original server banner information. <p>Max Command Line Length: Specifies a max length (including carriage return) for the FTP command line. If the length exceeds the limits, you can:</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends the destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. <p>Max Response Line Length: Specifies a max length for the FTP response line. If the length exceeds the limits, you can:</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends the destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. <p>Action for Brute-force: If the login attempts per minute fail for the times specified by the threshold, system will identify the attempts as an intrusion and take an action according to the configuration. Select the Enable check box to enable brute-force. Non-root VSYS does not support this option.</p> <ul style="list-style-type: none"> • Login Threshold per Min - Specifies a permitted authentication/login failure count per minute. • Block IP - Block the IP address of the attacker and specify a block duration. • Block Service - Block the service of the attacker and specify a block duration. • Block Time - Specifies the block duration.

In the MSRPC tab, configure the following settings:

Option	Description
MSRPC	<p>Max Scan Length: Specify the maximum length of scanning when scanning the MSRPC packets.</p> <p>Protocol Anomaly Detection: Select Enable to analyze the MSRPC packets. If abnormal contents exist, you can:</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends the destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. <p>Max bind length: Specifies a max length for MSRPC's binding packets. If the length exceeds the limits, you can:</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. Rest - Reset connections (TCP) or sends the destination unreachable packets (UDP) and also generate logs. Block IP - Block the IP address of the attacker and specify a block duration. Block Service - Block the service of the attacker and specify a block duration. <p>Max request length: Specifies a max length for MSRPC's request packets. If the length exceeds the limits, you can:</p> <ul style="list-style-type: none"> • Action: Log Only - Record a log. 7. Click **Save** to complete the protocol configurations.
8. Click **OK** to complete the IPS rule configurations.

IPS Global Configuration

Configuring the IPS global settings includes:

- Enable the IPS function
- Specify how to merge logs
- Specify the work mode

Click **Object > Intrusion Prevention System > Configuration** to configure the IPS global settings.

Option	Description
IPS	Select/clear the Enable check box to enable/disable the IPS function.
Log Aggregate Type	System can merge IPS logs which have the same protocol ID, the same VSYS ID, the same Signature ID, the same log ID, and the same merging type. Thus it can help reduce the number of logs and avoid receiving redundant logs. The function is disabled by default.

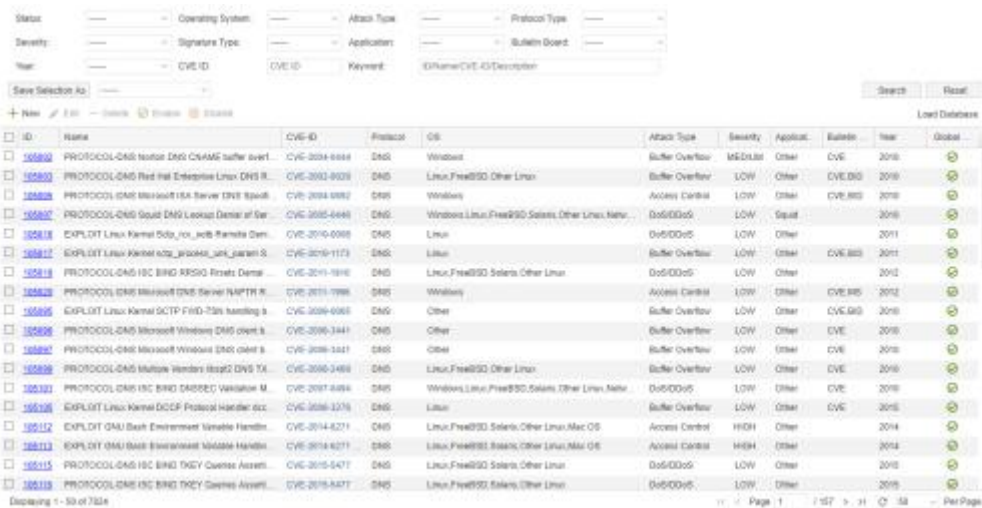

Option	Description
	Select the merging types in the drop-down list: <ul style="list-style-type: none"> • ---- - Do not merge any logs. • Source IP - Merge the logs with the same Source IP. • Destination IP - Merge the logs with the same Destination IP. • Source IP, Destination IP - Merge the logs with the same Source IP and the same Destination IP.
Aggregate Time	Specifies the time granularity for IPS threat log of the same merging type (specified above) to be stored in the database. At the same time granularity, the same type of log is only stored once. It ranges from 10 to 600 seconds.
Mode	Specifies a working mode for IPS: <ul style="list-style-type: none"> • IPS - If attacks have been detected, FSOS will generate logs, and will also reset connections or block attackers. This is the default mode. • Log only - If attacks have been detected, FSOS will only generate logs, but will not reset connections or block attackers.

After the configurations, click **OK** to save the settings.

Notes: Non-root VSYS does not support IPS global configuration.

Signature List

Select **Object > Intrusion Prevention System > Signature List**. You can see the signature list.

The upper section is for searching signatures. The lower section is for managing signatures.

Searching Signatures

In the upper section, set the search conditions and then click **Search** to search the signatures that match the condition.

To clear all search conditions, click **Reset**. To save the search conditions, click **Save Selection As** to name this set of search conditions and save it.

Managing Signatures

You can view signatures, create a new signature, load the database, delete a signature, edit a signature, enable a signature, and disable a signature.

- View signatures: In the signature list, click the ID of a signature to view the details.
- Create a new signature: click **New**.

In the Basic Configuration tab, configure the following settings:

Option	Description
Name	Specifies the signature name.
Description	Specifies the signature descriptions.
Protocol	Specifies the affected protocol.
Flow	Specifies the direction. <ul style="list-style-type: none"> • To_Server means the package of attack is from the server to the client. • To_Client means the package of attack is from

Option	Description
	<p>the client to the server.</p> <ul style="list-style-type: none"> Any includes To_Server and To_Client.
Source Port	<p>Specifies the source port of the signature.</p> <ul style="list-style-type: none"> Any - Any source port. Included - The source port you specified should be included. It can be one port, several ports, or a range. Specifies the port number in the text box, and use "," to separate. Excluded - The source port you specified should be excluded. It can be one port, several ports, or a range. Specifies the port number in the text box, and use "," to separate.
Destination Port	<p>Specifies the destination port of the signature.</p> <ul style="list-style-type: none"> Any - Any destination port. Included - The destination port you specified should be included. It can be one port, several ports, or a range. Specifies the port number in the text box, and use "," to separate. Excluded - The destination port you specified should be excluded. It can be one port, several ports, or a range. Specifies the port number in the text box, and use "," to separate.
Dsize	<p>Specifies the payload message size. Select "----", ">", "<" or "=" from the drop-down list and specifies the value in the text box. "----" means no setting of the parameters.</p>
Severity	<p>Specifies the severity of the attack.</p>
Attack Type	<p>Select the attack type from the drop-down list.</p>
Application	<p>Select the affected applications. "----" means all applications.</p>
Operating System	<p>Select the affected operating system from the drop-down list. "----" means all the operating systems.</p>
Bulletin Board	<p>Select a bulletin board of the attack.</p>
Year	<p>Specifies the released year of attack.</p>

Option	Description
Detection Filter	<p>Specifies the frequency of the signature rule.</p> <ul style="list-style-type: none"> • Track - Select the track type from the drop-down list. It can be by_src or by_dst. System will use the statistic of the source IP or the destination IP to check whether the attack matches this rule. • Count - Specifies the maximum times the rule occurs in the specified time. If the attacks exceed the Count value, system will trigger rules and act as specified. • Seconds - Specifies the interval value of the rule occurs.

In the Content tab, click **New** to specify the content of the signature:

Option	Description
Content	<p>Specifies the signature content. Select the following check box if needed:</p> <ul style="list-style-type: none"> • HEX - Means the content is hexadecimal. • Case Insensitive - Means the content is not case sensitive. • URI - Means the content needs to match URI field of HTTP request.
Relative	<p>Specifies the signature content location.</p> <ul style="list-style-type: none"> • If Beginning is selected, system will search from the header of the application layer packet. <ul style="list-style-type: none"> • Offset: System will start searching after the offset from the header of the application layer packet. The unit is byte. • Depth: Specifies the scanning length after the offset. The unit is byte. • If Last Content is selected, system will search from the content end position. <ul style="list-style-type: none"> • Distance: System will start searching after

Option	Description
	<p>the distance from the former content end position. The unit is byte.</p> <ul style="list-style-type: none"> • Within: Specifies the scanning length after the distance. The unit is byte.

- **Load the database:** After you create a new signature, click **Load Database** to make the newly created signature take effect.
- **Edit a signature:** Select a signature and then click **Edit**. You can only edit the user-defined signature. After editing the signature, click **Load Database** to make the modifications take effect.
- **Delete a signature:** Select a signature and then click **Delete**. You can only delete the user-defined signature. After deleting the signature, click **Load Database** to make the deletion take effect.
- **Enable/Disable signatures:** After selecting signatures, click **Enable** or **Disable**.

Notes: Non-root VSYS does not support signature list.

Configuring IPS White list

The device detects the traffic in the network in real time. When a threat is detected, the device generates alarms or blocks threats. With the complexity of the network environment, the threat of the device will generate more and more warning, too much threat to the user can not start making the alarm, and many of them are false positives. By providing IPS whitelist, the system no longer reports alarms or blocks to the whitelist, thus reducing the false alarm rate of threats. The IPS whitelist consists of source address, destination address, and threat ID, and the user selects at least one item for configuration.

To configure an IPS white list :

1. Select **Object> Intrusion Prevention System >Whitelist**
2. Click **New**.

In the WhiteList Configuration dialog , enter the White List configurations.

Option	Description
Name	Specifies the white-list name.
Type	Select the address type, including IPv4 or IPv6.
Source Address	Specifies the source address of the traffic to be matched by IPS.
Destination	Specifies the destination address of the traffic to be matched by

Option	Description
Address	IPS.
Signature ID	Select the signature ID from the drop-down list. A whitelist can be configured with a maximum of one threat ID. When the threat ID is not set, the traffic can be filtered based on the source and destination IP address. When user have configured threat ID, the source address, destination address and threat ID must be all matched successfully before the packets can be released.

3. Click **OK**.

Attack-Defense

There are various inevitable attacks in networks, such as compromise or sabotage of servers, sensitive data theft, service intervention, or even direct network device sabotage that causes service anomaly or interruption. Security gates, belonging to a category of network security devices, must be designed with attack defense functions to detect various types of network attacks, and take appropriate actions to protect the Intranet against malicious attacks, thus assuring the normal operation of the Intranet and systems.

Devices provide attack defense functions based on security zones, and can take appropriate actions against network attacks to assure the security of your network systems.

ICMP Flood and UDP Flood

An ICMP Flood/UDP Flood attack sends huge amounts of ICMP messages (such as ping)/UDP packets to a target within a short period and requests for a response. Due to the heavy load, the attacked target cannot complete its normal transmission task.

ARP Spoofing

LAN transmits network traffic based on MAC addresses. ARP spoofing attacks occur by filling in the wrong MAC address and IP address to make a wrong corresponding relationship of the target host's ARP cache table. This will lead to the wrong destination host IP packets, and the packet network's target resources will be stolen.

SYN Flood

Due to resource limitations, a server will only permit a certain number of TCP connections. SYN Flood just makes use of this weakness. During the attack an attacker will craft a SYN packet, set its source address to a forged or non-existing address, and initiate a connection to a server. Typically the server should reply the SYN packet with SYN-ACK, while for such a carefully crafted SYN packet, the client

will not send any ACK for the SYN-ACK packet, leading to a half-open connection. The attacker can send large amount of such packets to the attacked host and establish an equally large number of half-open connections until timeout. As a result, resources will be exhausted and normal accesses will be blocked. In the environment of unlimited connections, SYN Flood will exhaust all the available memory and other resources of the system.

WinNuke Attack

A WinNuke attack sends OOB (out-of-band) packets to the NetBIOS port (139) of a Windows system, leading to NetBIOS fragment overlap and host crash. Another attacking vector is ICMP fragment. Generally an ICMP packet will not be fragmented; so many systems cannot properly process ICMP fragments. If your system receives any ICMP fragment, it's almost certain that the system is under attack.

IP Address Spoofing

IP address spoofing is a technology used to gain unauthorized access to computers. An attacker sends packets with a forged IP address to a computer, and the packets are disguised as if they were from a real host. For applications that implement validation based on IP addresses, such an attack allows unauthorized users to gain access to the attacked system. The attacked system might be compromised even if the response packets cannot reach the attacker.

IP Address Sweep and Port Scan

This kind of attack makes a reconnaissance of the destination address and port via scanners, and determines the existence from the response. By IP address sweeping or port scanning, an attacker can determine which systems are alive and connected to the target network, and which ports are used by the hosts to provide services.

Ping of Death Attack

Ping of Death is designed to attack systems by some over-sized ICMP packets. The field length of an IP packet is 16 bits, which means the max length of an IP packet is 65535 bytes. For an ICMP response packet, if the data length is larger than 65507 bytes, the total length of ICMP data, IP header (20 bytes) and ICMP header (8 bytes) will be larger than 65535 bytes. Some routers or systems cannot properly process such a packet, and might result in crash, system down or reboot.

Teardrop Attack

Teardrop attack is a denial of service attack. It is a attack method based on morbid fragmented UDP packets, which works by sending multiple fragmented IP packets to the attacker (IP fragmented packets include the fragmented packets of which packet, the packet location, and other information). Some operating systems contain overlapping offset that will crash, reboot, and so on when receiving fragmented packets.

Smurf Attack

Smurf attacks consist of two types: basic attack and advanced attack. A basic Smurf attack is used to attack a network by setting the destination address of ICMP ECHO packets to the broadcast address of the attacked network. In such a condition all the hosts within the network will send their own response to the ICMP request, leading to network congestion. An advanced Smurf attack is mainly used to attack a target host by setting the source address of ICMP ECHO packets to the address of the attacked host, eventually leading to host crash. Theoretically, the more hosts in a network, the better the attacking effect will be.

Fraggle Attack

A fraggle attack is basically the same with a smurf attack. The only difference is the attacking vector of fraggle is UDP packets.

Land Attack

During a Land attack, an attacker will carefully craft a packet and set its source and destination address to the address of the server that will be attacked. In such a condition the attacked server will send a message to its own address, and this address will also return a response and establish a Null connection. Each of such connections will be maintained until timeout. Many servers will crash under Land attacks.

IP Fragment Attack

An attacker sends the victim an IP datagram with an offset smaller than 5 but greater than 0, which causes the victim to malfunction or crash.

IP Option Attack

An attacker sends IP datagrams in which the IP options are abnormal. This attack intends to probe the network topology. The target system will break down if it is incapable of processing error packets.

Huge ICMP Packet Attack

An attacker sends large ICMP packets to crash the victim. Large ICMP packets can cause memory allocation error and crash the protocol stack.

TCP Flag Attack

An attacker sends packets with defective TCP flags to probe the operating system of the target host. Different operating systems process unconventional TCP flags differently. The target system will break down if it processes this type of packets incorrectly.

DNS Query Flood Attack

The DNS server processes and replies to all DNS queries that it receives. A DNS flood attacker sends a large number of forged DNS queries. This attack consumes the bandwidth and resources of the DNS server, which prevents the server from processing and replying legal DNS queries.

TCP Split Handshake Attack

When a client establishes TCP connection with a malicious TCP server, the TCP server will respond to a fake SYN packet and use this fake one to initialize the TCP connection with the client. After establishing the TCP connection, the malicious TCP server switches its role and becomes the client side of the TCP connection. Thus, the malicious traffic might enter into the intranet.

Configuring Attack Defense

To configure the Attack Defense based on security zones, take the following steps:

1. Create a zone. For more information, refer to "[Security Zone](#)".
2. In the Zone Configuration dialog box, select Threat Protection tab.
3. To enable the Attack Defense functions, select the **Enable** check box, and click **Configure**.

In the Attack Defense dialog box, enter the Attack Defense configurations.

Option	Description
Whitelist	<p>IP address or IP range in the whitelist is exempt from attack defense check.</p> <p>click Configure, in the Whitelist Configuration dialog box, enter the configurations:</p> <ul style="list-style-type: none"> • Type - Specifies the address type, source or destination. • IP/Netmask - Specifies the IP address and netmask and click Add to add to the whitelist. • Address entry - Specifies the address entry and click Add to add to the whitelist.
Select All	<p>Enable all: Select this check box to enable all the Attack Defense functions for the security zone.</p> <p>Action: Specifies an action for all the Attack Defense functions, i.e., the defense measure system will be taken if any attack has</p>

Option	Description
	<p>been detected.</p> <ul style="list-style-type: none"> • Drop - Drops packets. This is the default action. • Alarm - Gives an alarm but still permits packets to pass through. • --- - Do not specify global actions.
Flood Attack Defense	<p>Click the  button to expand the information of all flood attack defenses. Select the Flood Attack Defense check box to enable all flood attack defenses.</p> <p>ICMP Flood: Select this check box to enable ICMP flood defense for the security zone.</p> <ul style="list-style-type: none"> • Threshold - Specifies a threshold for inbound ICMP packets. If the number of inbound ICMP packets matched to one single IP address per second exceeds the threshold, system will identify the traffic as an ICMP flood and take the specified action. The value range is 1 to 50000. The default value is 1500. • Action - Specifies an action for ICMP flood attacks. If the default action Drop is selected, system will only permit the specified number (threshold) of IMCP packets to pass through during the current and the next second, and also give an alarm. All the excessive packets of the same type will be dropped during this period. <p>UDP Flood: Select this check box to enable UDP flood defense for the security zone.</p> <ul style="list-style-type: none"> • Src threshold - Specifies a threshold for outbound UDP packets. If the number of outbound UDP packets originating from one single source IP address per second exceeds the threshold, system will identify the traffic as a UDP flood and take the specified action. The value range is 1 to 50000. The default value is 1500. • Dst threshold - Specifies a threshold for inbound

Option	Description
	<p>UDP packets. If the number of inbound UDP packets destined to one single port of one single destination IP address per second exceeds the threshold, system will identify the traffic as a UDP flood and take the specified action. The value range is 1 to 50000. The default value is 1500.</p> <ul style="list-style-type: none"> • Action - Specifies an action for UDP flood attacks. If the default action Drop is selected, system will only permit the specified number (threshold) of UDP packets to pass through during the current and the next second, and also give an alarm. All the excessive packets of the same type will be dropped during this period. • Session State Check - Select this check box to enable the function of session state check. After the function is enabled, system will not check whether there is UDP Flood attack in the backward traffic of UDP packet of the identified sessions.
	<p>DNS Query Flood: Select this check box to enable DNS query flood defense for the security zone.</p> <ul style="list-style-type: none"> • Src threshold - Specifies a threshold for outbound DNS query packets. If the number of outbound DNS query packets originating from one single IP address per second exceeds the threshold, FSOS will identify the traffic as a DNS query flood and take the specified action. • Dst threshold - Specifies a threshold for inbound DNS query packets. If the number of inbound DNS query packets matched to one single IP address per second exceeds the threshold, FSOS will identify the traffic as a DNS query flood and take the specified action. • Action - Specifies an action for DNS query flood attacks. If the default action Drop is selected, FSOS will only permit the specified number (threshold) of DNS query packets to pass through during the current and

Option	Description
	<p>next second, and also give an alarm. All the excessive packets of the same type will be dropped during this period; if Alarm is selected, FSOS will give an alarm but still permit the DNS query packets to pass through.</p> <p>Recursive DNS Query Flood: Select this check box to enable recursive DNS query flood defense for the security zone.</p> <ul style="list-style-type: none"> • Src threshold - Specifies a threshold for outbound recursive DNS query packets. If the number of outbound DNS query packets originating from one single IP address per second exceeds the threshold, FSOS will identify the traffic as a DNS query flood and take the specified action. • Dst threshold - Specifies a threshold for inbound recursive DNS query packets. If the number of inbound DNS query packets destined to one single IP address per second exceeds the threshold, FSOS will identify the traffic as a DNS query flood and take the specified action. • Action - Specifies an action for recursive DNS query flood attacks. If the default action Drop is selected, FSOS will only permit the specified number (threshold) of recursive DNS query packets to pass through during the current and next second, and also give an alarm. All the excessive packets of the same type will be dropped during this period; if Alarm is selected, FSOS will give an alarm but still permit the recursive DNS query packets to pass through. <p>SYN Flood: Select this check box to enable SYN flood defense for the security zone.</p> <ul style="list-style-type: none"> • Src threshold - Specifies a threshold for outbound SYN packets (ignoring the destination IP address and port number). If the number of outbound SYN packets originating from one single source IP address per second exceeds the threshold, FSOS will identify the traffic as a SYN flood. The value range is 0

Option	Description
	<p>to 50000. The default value is 1500. The value of 0 indicates the Src threshold is void.</p> <ul style="list-style-type: none"> • Dst threshold - Specifies a threshold for inbound SYN packets destined to one single destination IP address per second. <ul style="list-style-type: none"> • IP-based - Click IP-based and then type a threshold value into the box behind. If the number of inbound SYN packets matched to one single destination IP address per second exceeds the threshold, FSOS will identify the traffic as a SYN flood. The value range is 0 to 50000. The default value is 1500. The value of 0 indicates the Dst threshold is void. • Port-based - Click Port-based and then type a threshold value into the box behind. If the number of inbound SYN packets matched to one single destination port of the destination IP address per second exceeds the threshold, FSOS will identify the traffic as a SYN flood. The value range is 0 to 50000. The default value is 1500. The value of 0 indicates the Dst threshold is void. After clicking Port-based, you also need to type an address into or select an IP Address or Address entry from the Dst address combo box to enable port-based SYN flood defense for the specified segment. The SYN flood attack defense for other segments will be IP based. The value range for the mask of the Dst address is 24 to 32. • Action - Specifies an action for SYN flood attacks. If the default action Drop is selected, FSOS will only permit the specified number (threshold) of SYN packets to pass through during the current and the next second, and also give an alarm. All the excessive packets of the same type will be dropped during this period. Besides if Src threshold and Dst threshold are also configured, FSOS will first detect if the traffic is a

Option	Description
	<p>destination SYN flood attack: if so, FSOS will drop the packets and give an alarm, if not, FSOS will continue to detect if the traffic is a source SYN attack.</p>
ARP Spoofing	<p>Click the  button to expand the information of the ARP spoofing. Select the ARP Spoofing check box to enable all ARP spoofing defenses.</p> <p>Max IP number per MAC: Select this check box to check the max IP number per MAC. Specifies whether system will check the IP number per MAC in the ARP table. If the parameter is set to 0, system will not check the IP number; if it is set to a value other than 0, system will check the IP number, and if the IP number per MAC is larger than the parameter value, system will take the specified action. The value range is 0 to 1024.</p> <p>ARP Send Rate: Select this check box to check the ARP send rate. Specifies if FSOS will send gratuitous ARP packet(s). If the parameter is set to 0 (the default value), FSOS will not send any gratuitous ARP packet; if it is set to a value other than 0, FSOS will send gratuitous ARP packet(s), and the number sent per second is the specified parameter value. The value range is 0 to 10.</p> <p>Reverse Query: Select this check box to enable Reverse query. Select this check box to enable Reverse query. When FSOS receives an ARP request, it will log the IP address and reply with another ARP request; and then FSOS will check if any packet with a different MAC address will be returned, or if the MAC address of the returned packet is the same as that of the ARP request packet.</p>
MS-Windows Defense	<p>Click the  button to expand the information of MS-Windows defense. Select the MS-Windows Defense check box to enable MS-Windows defense.</p> <p>Win Nuke Attack: Select this check box to enable WinNuke</p>

Option	Description
	<p>attack defense for the security zone. If any WinNuke attack has been detected, system will drop the packets and give an alarm.</p>
<p>Scan/Spoof Defense</p>	<p>Click the  button to expand the information of Scan/Spoof Defense. Select the Scan/Spoof Defense check box to enable all scan/spoof defenses.</p> <p>IP Address Spoof: Select this check box to enable IP address spoof defense for the security zone. If any IP address spoof attack has been detected, FSOS will drop the packets and give an alarm.</p> <p>IP Address Sweep: Select this check box to enable IP address sweep defense for the security zone.</p> <ul style="list-style-type: none"> • Threshold - Specifies a time threshold for IP address sweep. If over 10 TCP SYN packets are sent to different ports within the period specified by the threshold, FSOS will identify them as a port scan attack. The value range is 1 to 5000 milliseconds. The default value is 1. • Action - Specifies an action for IP address sweep attacks. If the default action Drop is selected, FSOS will only permit 10 TCP SYN packets destined to different ports to pass through and drops the other packets of the same type during the specified period (threshold), and also gives an alarm. <p>Port Scan: Select this check box to enable port scan defense for the security zone.</p> <ul style="list-style-type: none"> • Threshold - Specifies a time threshold for port scan. Option	Description
	<ul style="list-style-type: none"> • Threshold - Specifies a size threshold for ICMP packets. If the size of any inbound ICMP packet is larger than the threshold, FSOS will identify it as a large ICMP packet and take the specified action. The value range is 1 to 50000 bytes. The default value is 1024. • Action - Specifies an action for large ICMP packet attacks. The default action is Drop.
Proxy	<p>Click the  button to expand the information of proxy defense. Select the Proxy check box to enable all proxy defenses.</p> <p>SYN Proxy: Select this check box to enable SYN proxy for the security zone. SYN proxy is designed to defend against SYN flood attacks in combination with SYN flood defense. When both SYN flood defense and SYN proxy are enabled, SYN proxy will act on the packets that have already passed detections for SYN flood attacks.</p> <ul style="list-style-type: none"> • Proxy trigger rate - Specifies a min number for SYN packets that will trigger SYN proxy or SYN-Cookie (if the Cookie check box is selected). If the number of inbound SYN packets matched to one single port of one single destination IP address per second exceeds the specified value, FSOS will trigger SYN proxy or SYN-Cookie. The value range is 1 to 50000. The default value is 1000. • Cookie - Select this check box to enable SYN-Cookie. SYN-Cookie is a stateless SYN proxy mechanism that enables FSOS to enhance its capacity of processing multiple SYN packets. Therefore, you are advised to expand the range between "Proxy trigger rate" and "Max SYN packet rate" appropriately. • Max SYN packet rate - Specifies a max number for SYN packets that are permitted to pass through per second by SYN proxy or SYN-Cookie (if the Cookie check box is selected). If the number of inbound SYN packets destined to one single port of one single

Option	Description
	<p>destination IP address per second exceeds the specified value, FSOS will only permit the specified number of SYN packets to pass through during the current and the next second. All the excessive packets of the same type will be dropped during this period. The value range is 1 to 1500000. The default value is 3000.</p> <ul style="list-style-type: none"> • Timeout - Specifies a timeout for half-open connections. The half-open connections will be dropped after timeout. The value range is 1 to 180 seconds. The default value is 30.
Protocol Anomaly Report	<p>Click the  button to expand the information of protocol anomaly report. Select the Protocol Anomaly Report check box to enable the function of all protocol anomaly reports.</p> <p>TCP Anomalies: Select this check box to enable TCP option anomaly defense for the security zone.</p> <ul style="list-style-type: none"> • Action - Specifies an action for TCP option anomaly attacks. The default action is Drop. <p>TCP Split Handshake: Select this check box to enable TCP split handshake defense for the security zone.</p> <ul style="list-style-type: none"> • Action - Specifies an action for TCP split handshake attacks. The default action is Drop.

4. To restore the system default settings, click **Restore Default**.
5. Click **OK**.

Perimeter Traffic Filtering

Perimeter Traffic Filtering can filter the perimeter traffic based on known risk IP list, and take logging/block action on the malicious traffic that hits the risk IP list.

The risk IP list includes the following three types:

- IP Reputation list: Retrieve the risk IP (such as Botnet, Spam, Tor nodes, Compromised, Brute-forcer, and so on.) list from the Perimeter Traffic Filtering signature database.

- User-defined black/white list : According to the actual needs of users, the specified IP address is added to a user-defined black/white list.

Notes:

- You need to update the IP reputation database before enabling the IP Reputation function for the first time. By default, system will update the database at the certain time everyday, and you can modify the updating settings according to your own requirements, see "[Upgrading System](#)".
- Perimeter Traffic Filtering is controlled by license. To use Threat protection, apply and install the PTF license.

Enabling Perimeter Traffic Filtering

To realize the zone-based Perimeter Traffic Filtering, take the following steps:

1. Create a zone. For more information , refer to "[Security Zone](#)";
2. In the Zone Configuration dialog box, select Threat Protection tab.
3. Select the **Enable** check box after the **Perimeter Traffic Filtering**.
4. Specifies an action for the malicious traffic that hits the blacklist. Select the **User-defined** , **Pre-defined** or **IP Reputation** check box , and select the action from drop-down list:
 - Log Only: Only generates logs if the malicious traffic hits the blacklist. This is the default option.
 - Drop: Drop packets if the malicious traffic hits the blacklist.

Configuring User-defined Black/White List

To configure the user-defined black/white list , take the following steps:

1. Select **Object > Perimeter Traffic Filtering**.
2. Click **New**.

In **Perimeter Traffic Filtering Configuration** dialog box, enter the user-defined black/white list configuration.

Option	Description
IP	Specify the IP address for the user-defined black/white list.
mask	Specify the netmask of the IP address.

Option	Description
Black/White List	Select the radio button to add the IP address to the blacklist or whitelist .

3. Click **OK**.

Searching Black/White List

To search the black/white list, take the following steps:

1. Select **Object > Perimeter Traffic Filtering**.
2. Click **Search**.
3. Enter the IP address and click **Search**. The results will be displayed in this dialog box.

Chapter 12 Monitor

The monitor section includes the following functions:

- **Monitor:** The Monitor function statistically analyzes the devices and displays the statistics in a bar chart, line chart, tables, and so on, which helps the users have information about the devices.
- **WAP traffic distribution:** Displays the history result (In the past 24 hours and the last 30 days) of WAP traffic distribution, including requests and responses.
- **Report:** Through gathering and analyzing the device traffic data, traffic management data, threat data, monitor data and device resource utilization data, the function provides the all-around and multi-dimensional statistics.
- **Log:** Records various system logs, including system logs, threat logs, session logs, NAT logs, NBC logs and configuration logs.

Monitor

System can monitor the following objects.

- **User Monitor:** Displays the application statistics within the specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month) The statistics include the application traffic and applications' concurrent sessions.
- **Application Monitor:** Displays the statistics of applications, application categories, application subcategories, application risk levels, application technologies, application characteristics within the specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month). The statistics include the application traffic and applications' concurrent sessions.
- **Cloud Application Monitor:** Displays statistics of cloud based applications, including their traffic, new sessions and concurrent sessions.
- **Share Access Monitor:** Displays the access terminal statistics of specified filter condition(Virtual router, IP, host number), including operation system , online time, login time and last online time of users.
- **Device Monitor:** Displays the device statistics within the specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month), including the total traffic, interface traffic, zone traffic, CPU/memory status, sessions, Online IP and hardware status.
- **URL Hit:** If system is configured with "[URL Filtering](#)", the predefined stat-set of URL Hit can gather statistics on user/IPs, URLs and URL categories.

- **Link Status Monitor:** Displays the traffic statistics of the interfaces that have been bound within the specified period .
- **Application Block:** If system is configured with "Security Policy" the application block can gather statistics on the applications and user/IPs.
- **Keyword Block:** If system is configured with "Web Content", "Email Filter", "Web Posting", the predefined stat-set of Keyword Block can gather statistics on the Web keyword, Web keywords, email keywords, posting keywords and users/IPs.
- **Authenticated User:** If system is configured with "Web Authentication", "Single Sign-On", "SSL VPN", "L2TP VPN" the auth user can gather statistics on the authenticated users.
- **Monitor Configuration:** Enable or disable some monitor items as needed.
- **User Defined Monitor:** Provides a more flexible approach to view the statistics.

Notes: If IPv6 is enabled, system will count the total traffic/sessions/AD/URLs/applications of IPv4 and IPv6 address. Only User Monitor/Application Monitor/Cloud Application Monitor/Device Monitor/URL Hit/Application Block/User-defined Monitor support IPv6 address.

User Monitor

This feature may vary slightly on different platforms . If there is a conflict between this guide and the actual page, the latter shall prevail.

User monitor displays the application statistics within the specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month). The statistics include the application traffic and applications' concurrent sessions.

If IPv6 is enabled, system will support to monitor both IPv4 and IPv6 address.

Notes: Non-root VSYS also supports user monitor, but does not support address book statistics.

Summary

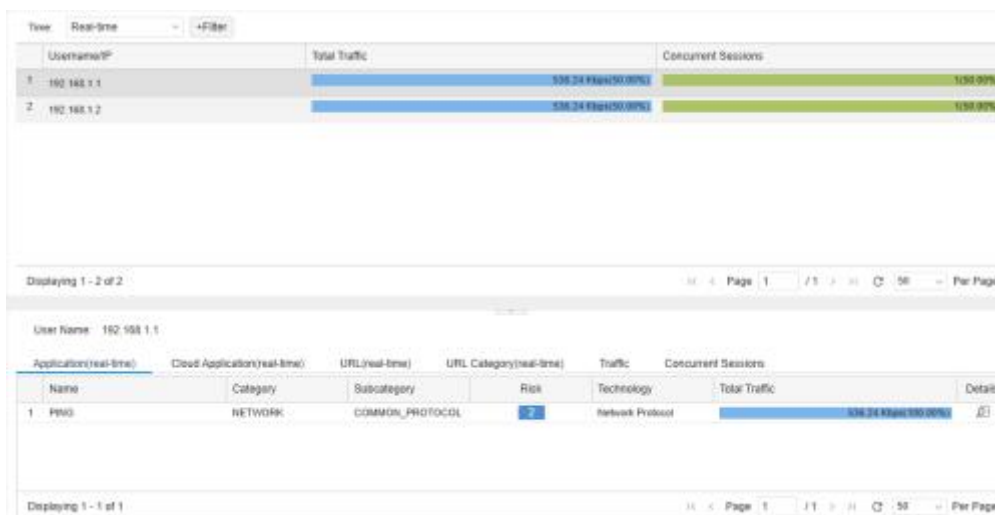

Summary displays the user traffic/concurrent sessions ranking during a specified period or of specified interfaces/zones. Click **Monitor > User Monitor > Summary**.

- Select a different [Statistical_Period](#) to view the statistical information in that period of time.
- Click  to refresh the monitoring data in this page.
- Hover your mouse over a bar to view the user 's average upstream traffic, downstream traffic, total traffic or concurrent sessions .
- When displaying the user traffic statistics, the Upstream and Downstream legends are used to select the statistical objects in the bar chart.

User Details

Click **Monitor > User Monitor > User Details**.

Username/IP	Total Traffic	Concurrent Sessions
1 192.168.1.1	536.24 Kbps(100.00%)	1358(100%)
2 192.168.1.2	536.24 Kbps(100.00%)	1358(100%)

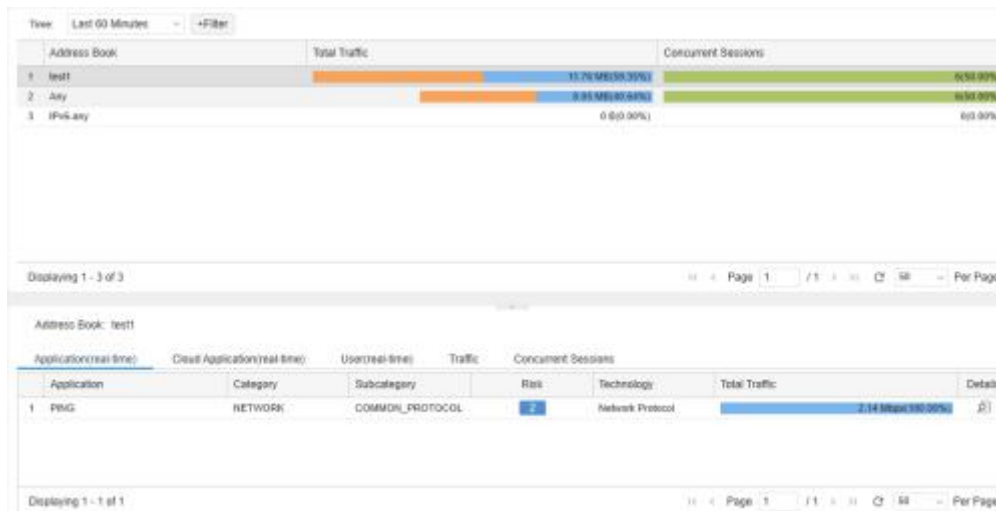

User Name: 192.168.1.1								
Application(real-time)		Cloud Application(real-time)		URL(real-time)		URL Category(real-time)	Traffic	Concurrent Sessions
Name	Category	Subcategory	Risk	Technology	Total Traffic		Details	
1 PWD	NETWORK	COMMON_PROTOCOL	2	Network Protocol	536.24 Kbps(100.00%)			

- Click  to select the condition in the drop-down list to search the desired users.
- To view the detailed information of a certain user , select the user entry in the list.
 - Application(real-time): Select the Application (real-time)tab and display the detailed information of the category, subcategory, risk level, technology, upstream traffic, downstream traffic, total traffic. Click **Details** in the list to view the line chart.
 - Cloud Application: Select the Cloud Application tab to display the cloud application information of selected user.
 - Traffic: Select the Traffic tab to display the traffic trends of selected user .
 - Concurrent Sessions: Select the Concurrent Sessions tab to display the concurrent sessions trends of selected user .
- Frame a region's trends with the mouse. You can enlarge the scope of the displayed time period. Click  to restore the default size of the trend.

- Within the user entry list, hover your cursor over a user entry, and there is a  button to its right. Click this button and select **Add to Black List**.

Address Book Details

Click **Monitor>User Monitor>Address Book Details**.

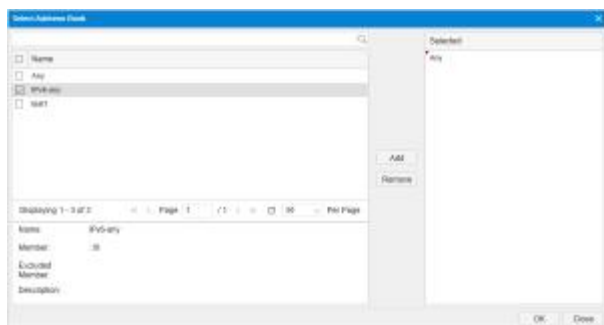

- Click  to select the condition in the drop-down list to search the desired address entry.
- To view the detailed information of a address entry, select the address entry in the list.
 - Application (real-time): Select the Application (real-time) tab to displays the detailed information of the upstream traffic, downstream traffic, and total traffic. Click **Details** in the list to view the line chart.
 - Cloud Application: Select the Cloud Application tab to display the cloud application information of selected address book.
 - Traffic: Select the Traffic tab to display the traffic trends of selected address entry.
 - Concurrent Sessions: Select the Concurrent Sessions tab to display the concurrent sessions trends of selected address entry.

The monitor address is a database that stores the users' address which is used for the statistics.

Monitor Address Book

The monitor address is a database that stores the user 's address which is used for statistics.

Click **Monitor > User Monitor> Select Address Book**, and Click  at the top left corner.

In this dialog box, you can perform the following actions:

- Select the address entry check box, and click **Add** to add a new address entry entry to the **Selected** list.
- In the **Selected** list, select the address entry and click **Remove** for the address entry not be counted.
- Below the list shows the details of the selected address entry.

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click the time button on the top right corner of each tab to set the time cycle.

- Real-time: Displays the current statistical information.
- Last Hour: Displays the statistical information within the latest 1 hour.
- Last Day: Displays the statistical information within the latest 1 day.
- Last Month: Displays the statistical information within the latest 1 month.

Application Monitor

This feature may vary slightly on different platforms. If there is a conflict between this guide and the actual page, the latter shall prevail.

Application monitor displays the statistics of applications, application categories, application subcategories, application risk levels, application technologies, and application characteristics within the specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month). The statistics include the application traffic and applications' concurrent sessions.

If IPv6 is enabled, system will support to monitor both IPv4 and IPv6 address.

Notes: Non-root VSYS also supports application monitor, but does not support to monitor application group.

Summary

The summary displays the following contents during a specified period:

- The concurrent sessions of top 10 hot and high-risk applications.
- The traffic/concurrent sessions of top 10 applications.
- The traffic/concurrent sessions of top 10 application categories.
- The traffic/concurrent sessions of top 10 application subcategories.
- The traffic/concurrent sessions organized by application risk levels.
- The traffic/concurrent sessions organized by application technologies.
- The traffic/concurrent sessions organized by application characteristics.

Click **Monitor>Application Monitor>Summary**.

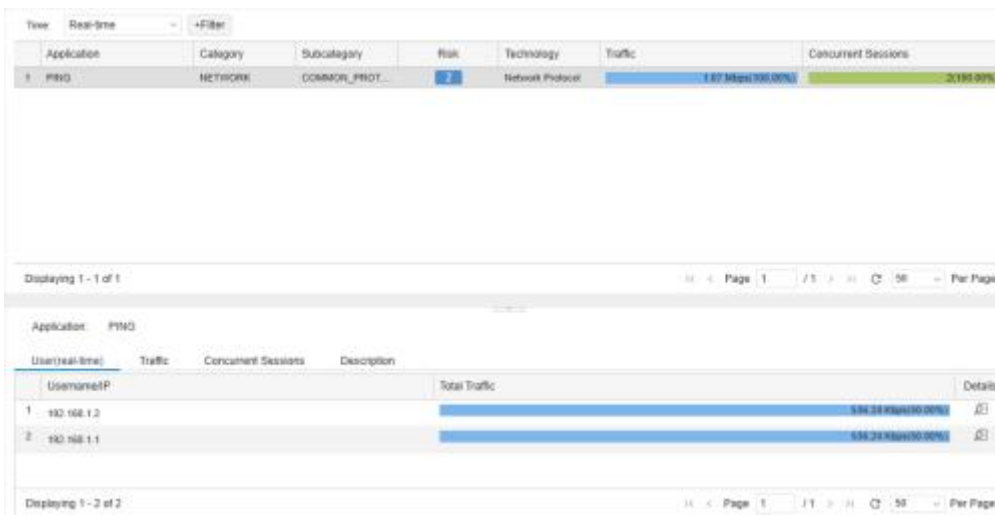

- Select different [Statistical Period](#) to view the statistical information in different periods of time.
- From the drop-down menu, specify the type of statistics: Traffic or Concurrent Sessions.

- Click  to refresh the monitoring data in this page.
- Hover your mouse over a bar or a pie graph to view the concrete statistical values of total traffic or concurrent sessions .

Application Details

Click **Monitor > Application Monitor > Application Details**.

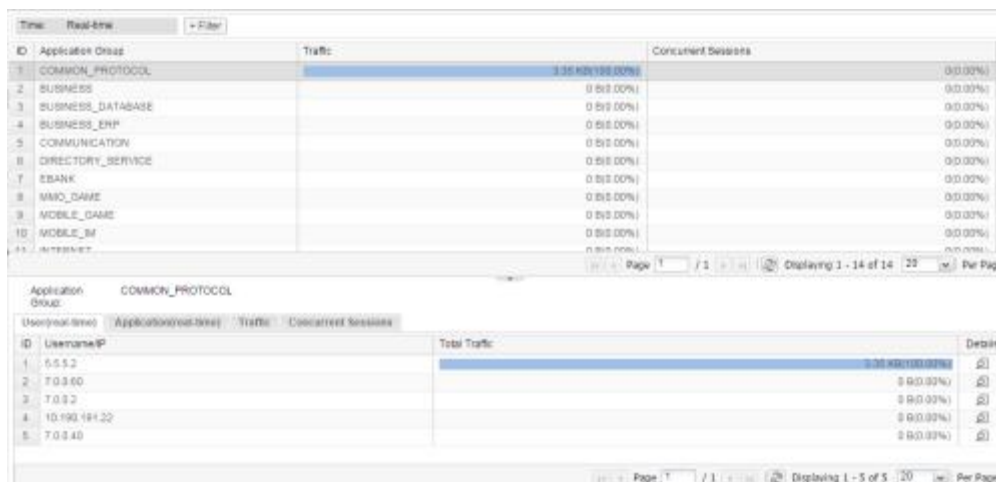

The screenshot shows the Application Monitor interface. At the top, there is a 'Time' dropdown menu set to 'Real-time' and a '+Filter' button. Below this is a table with columns: Application, Category, Subcategory, Risk, Technology, Traffic, and Concurrent Sessions. The first row shows 'PING' with a risk level of 2, technology of 'Network Protocol', traffic of '1.67 Mbps (100.00%)', and concurrent sessions of '2 (100.00%)'. Below the table, there is a pagination bar showing 'Displaying 1 - 1 of 1' and 'Page 1 / 1'.

Below the main table, there is a detailed view for the 'PING' application. It has tabs for 'Users(real-time)', 'Traffic', 'Concurrent Sessions', and 'Description'. The 'Users(real-time)' tab is selected, showing a table with columns: User, IP, Total Traffic, and Details. The table has two rows: '1' with IP '192.168.1.2' and '2' with IP '192.168.1.1'. Both rows show '554.21 Kbps (100.00%)' for total traffic. Below this is another pagination bar showing 'Displaying 1 - 2 of 2' and 'Page 1 / 1'.

- Click the **Time** drop-down menu to select different [Statistical_Period](#) to view the statistical information in that periods of time.
- Click  button and select **Application** in the drop-down menu. You can search the desired application by entering the keyword of the application's name in the text field.
- To view the detailed information of a certain application, select the application entry in the list.
 - **Users(real-time):** Select the Users (real-time) tab to displays the detailed information of users who are using the selected application. Click  in details column to see the trends of upstream traffic, downstream traffic, total traffic .
 - **Traffic:** Select the Traffic tab to display the traffic trends of selected application.
 - **Concurrent Sessions:** Select the Concurrent Sessions tab to display the concurrent sessions trends of the selected application.
 - **Description:** Select the Description tab to displays the detailed information of the selected application.

Group Details

Click **Monitor>Application Monitor>Group Details**.

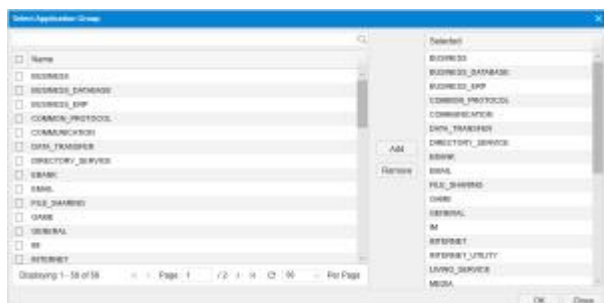

The screenshot displays the 'Group Details' page in the NSG Series Firewalls WebUI. At the top, there is a 'Time' dropdown menu set to 'Real-time' and a '+ Filter' button. Below this is a table listing application groups. The first group, 'COMMON_PROTOCOL', is selected and highlighted in blue. The table has columns for 'ID', 'Application Group', 'Traffic', and 'Concurrent Sessions'. The 'COMMON_PROTOCOL' row shows a traffic volume of '3.30 KB(0.00%)' and '0(0.00%)' concurrent sessions. Below the main table, there is a section for the selected application group, 'COMMON_PROTOCOL'. It has tabs for 'User(real-time)', 'Application(real-time)', 'Traffic', and 'Concurrent Sessions'. The 'User(real-time)' tab is active, showing a table with columns for 'ID', 'Username/IP', 'Total Traffic', and 'Details'. The table lists five users with their respective IP addresses and traffic volumes, all showing '0(0.00%)' traffic. A 'Details' icon is visible in the 'Details' column for each user entry. At the bottom of the page, there is a pagination control showing 'Page 1 / 1' and 'Displaying 1 - 14 of 14' items.

- Click **Time** drop-down menu to select a different [Statistical_Period](#) to view the statistical information in that periods of time.
- Click **+ Filter** button and select **Application Group** in the drop-down menu. You can search the desired application group by entering the keyword of the application group name in the text field.
- To view the detailed information of a certain application group, select the application group entry in the list.
 - **User(real-time)**: Select the Users(real-time) tab to display the detailed information of users who are using the selected application group. Click  in details column, you can see the trends of the upstream traffic, downstream traffic, total traffic .
 - **Application(real-time)**: Select the Application(real-time) tab to display the detailed information of applications in use which belongs to the selected application group. Click  in details column to see the trends of the upstream traffic, downstream traffic, total traffic of the selected application.
 - **Traffic**: Select the Traffic tab to display the traffic trends of selected application group.
 - **Concurrent Sessions**: Select the Concurrent Sessions tab to display the concurrent sessions trends of the selected application group.
 - **Description**: Select the Description tab to display the detailed description of the selected application.

Select Application Group

Click **Monitor>Application Monitor>Select Application Group**. Click **Select Application Group** on the top left corner to configure the application groups required to be counted in the **Select Application Group** dialog box. There are global application groups in the left column.

In this dialog box, you can perform the following actions:

- Select the application groups check box, and click **Add** to add a new application groups entry to the **Selected** list.
- In the **Selected** list, select the application group entries and click **Remove** for the application group entries not to be counted.

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click **Real-time** on the top right corner of each tab to set the time cycle.

- **Real-time**: Displays the current statistical information.
- **Last 60 Minutes**: Displays the statistical information within the latest 1 hour.
- **Last 24 Hours**: Displays the statistical information within the latest 1 day.
- **Last 30 Days**: Displays the statistical information within the latest 1 month.

Cloud Application Monitor

This feature may vary slightly on different platforms and not be available in VSYS on a part of platforms. If there is a conflict between this guide and the actual page, the latter shall prevail.

A cloud application is an application program that functions in the cloud. It resides entirely on a remote server and is delivered to users through the Internet.

Cloud application monitor page displays the statistics of cloud applications and users within a specified period (realtime, latest 1 hour, latest 1 day, latest 1 month), including application traffic, user number, and usage trend.

If IPv6 is enabled, system will support to monitor both IPv4 and IPv6 address.

Summary

The summary displays the following contents during a specified period:

- Top 10 cloud application rank by traffic/concurrent session number with in a specified period (realtime, latest 1 hour, latest 1 day, latest 1 month).
- Top 10 cloud application user rank.

Click **Monitor > Cloud Application Monitor> Summary**.

- By selecting different filters, you can view the statistics of different time period.
- By selecting the drop-down menu of trafficor concurrent sessions, you can view your intended statistics.
- Click the update  icon to update the displayed data.
 - Hover your cursor over bar or pie chart to view exact data. Click the **Details** link on hover box, and you will jump to the **Cloud Application Details** page.

Cloud Application Details

Click **Monitor > Cloud Application Monitor>Cloud Application Details**.

- Click the Time drop-down menu to select different time period to view the statistics in that period.
- Click the **Filter** button, and select **Application**. In the new text box, enter the name of your intended application.
- To view the detailed information of a certain application group, select the application group entry in the list.
 - **User(real-time)**: Select the Users(real-time)tab to display the detailed information of users who are using the selected application group. Click  in details column to see the trends of the upstream traffic, downstream traffic, total traffic .
 - **Application(real-time)**: Select the Application(real-time) tab to display the detailed information of applications in use which belongs to the selected application . Click  in details column to see the trends of the upstream traffic, downstream traffic, total traffic of the selected application.
 - **Traffic**: Select the Traffic tab to display the traffic trends of selected application.

- **Concurrent Sessions:** Select the Concurrent Sessions tab to display the concurrent sessions trends of the selected application.
- **Description:** Select the Description tab to display the detailed description of the selected application.

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click **Real-time** on the top right corner of each tab to set the time cycle.

- **Real-time:** Displays the current statistical information.
- **Last 60 Minutes:** Displays the statistical information within the latest 1 hour.
- **Last 24 Hours:** Displays the statistical information within the latest 1 day.
- **Last 30 Days:** Displays the statistical information within the latest 1 month.

Share Access Monitor

To detect the users' private behavior of shared access to the Internet, system supports to analyze the User-agent filed of HTTP packet, a share access detect method which is based on the application characteristic. The share access detect page can display the share access information with specified filter condition.

Click **Monitor> Share Access**.

	Source IP	Rule Name	Source Zone	Endpoint Number	Status
1	172.30.9.209	regression	trust	14	Logging
2	172.30.9.201	regression	trust	12	Logging
3	10.180.201.13	regression	mgf	1	Normal
4	10.88.15.91	regression	mgf	1	Normal
5	169.254.254.254	regression	internal-zone	1	Normal

- Click  **Filter**, and click  **+ Filter** to select the condition in the drop-down list to search for the share access.
- **Source IP:** Displays the endpoints statistics of the specified source IP.
- **Rule Name:** Displays the endpoints statistics of the specified share access rule.
- **Source Zone:** Displays the endpoints statistics of the specified source zone.
- **Endpoint Number:** Displays the endpoints statistics of the specified endpoint number.
- **Status:** Displays the endpoints statistics of the specified status.

Move the mouse to **Endpoint Number** list, click  button, and then click **Details**, you will view the list of **Endpoint info** and **First Detection Time**.

Source IP	Rule Name	Source Zone	Endpoint Number	Status
1 172.30.0.200	regression	trust	14	Logging
2 172.30.0.201	regression	int	Endpoint Info	Details
3 10.180.201.13	regression	FW	Cherry Mobile/Flare XL Plus/An...	Normal
4 10.88.15.91	regression	FW	Samsung/SM-G935F/Android	Normal
5 10.254.254.254	regression	int	Samsung/SM-G935F/Android	Normal
			Samsung/SM-G930T1/Android	
			Samsung/SM-G930F/Android	
			Samsung/SM-G928W/Android	
			Samsung/SM-G928P/Android	
			Samsung/SM-G925R7/Android	
			Samsung/SM-G920T/Android

			Samsung/SM-G900A9/Android	
			Huawei/WA9-LX1/Android	

iQoS Monitor

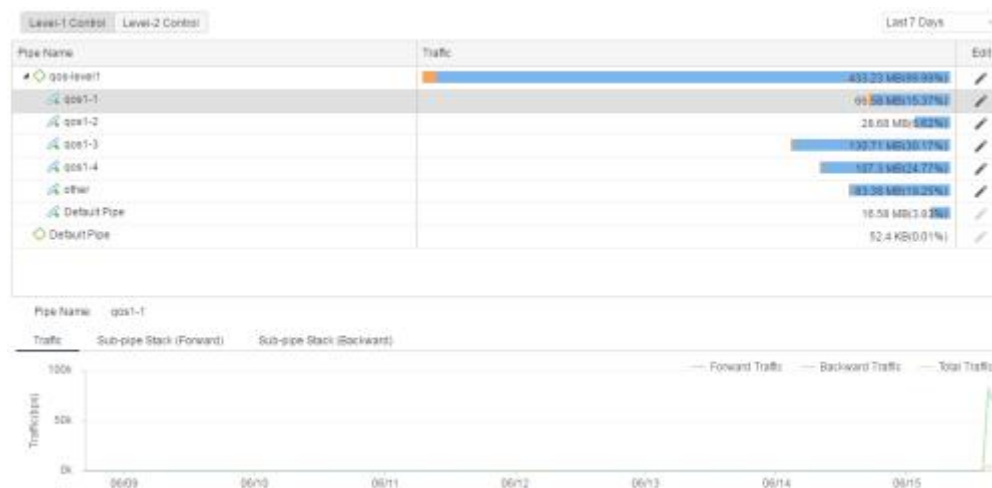

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

When the iQoS policy is configured and the function of iQoS is enabled, you can view the real-time traffic details or traffic trends of pipes and sub-pipes in Level-1 Control or Level-2 Control.

Notes: The iQoS monitor function is controlled by license, To use the function, install the iQoS license. For more information on license, please refer to the [License](#) .

iQoS Details

Click **Monitor > iQoS Monitor** and enter the iQoS page. The pipe name and total traffic will be displayed in the list.

- Select the **Level-1 Control** or **Level-2 Control** button to display the pipe traffic of the selected level.

- In the drop-down list, select **Last 60 Minutes**, **Last 24 Hours**, **Last 7 Days** or **Last 30 Days** to display the pipe traffic of the selected period. The maximum period is 30 days.
- Click to expand sub-pipes.
- Click Edit to edit the selected pipe.
- Hover your mouse over the colorful lines of Traffic to view the forward traffic and backward traffic.

The traffic details of the selected pipe will be displayed at the bottom of the page, including application, user, traffic, sub-pipe stack (forward) and sub-pipe stack (backward).

- **Traffic:** Displays the trends of forward traffic, backward traffic and total traffic of pipes. Hover you mouse over the lines to view the forward traffic, backward traffic and total traffic in real time. When you click Forward Traffic, Backward Traffic or Total Traffic in the top right corner of trend chart, it will turn grey and the corresponded line will be hidden; when you click it again, it will turn black and the line will appear.
- **Sub-pipe Stack (Forward):** Displays the trends of forward traffic of sub-pipes. Hover you mouse over the lines to view the top 5 traffic and other forward traffic of sub-pipes in real time. When you click the name of the specified sub-pipe in the top right corner of trend chart, it will turn grey and the corresponded line will be hidden; when you click it again, it will turn black and the line will appear.
- **Sub-pipe Stack (Backward):** Displays the trends of backward traffic of sub-pipes. Hover you mouse over the lines to view the top 5 backward traffic and other backward traffic of sub-pipes in real time. When you click the name of the specified sub-pipe in the top right corner of trend chart, it will turn grey and the corresponded line will be hidden; when you click it again, it will turn black and the line will appear.

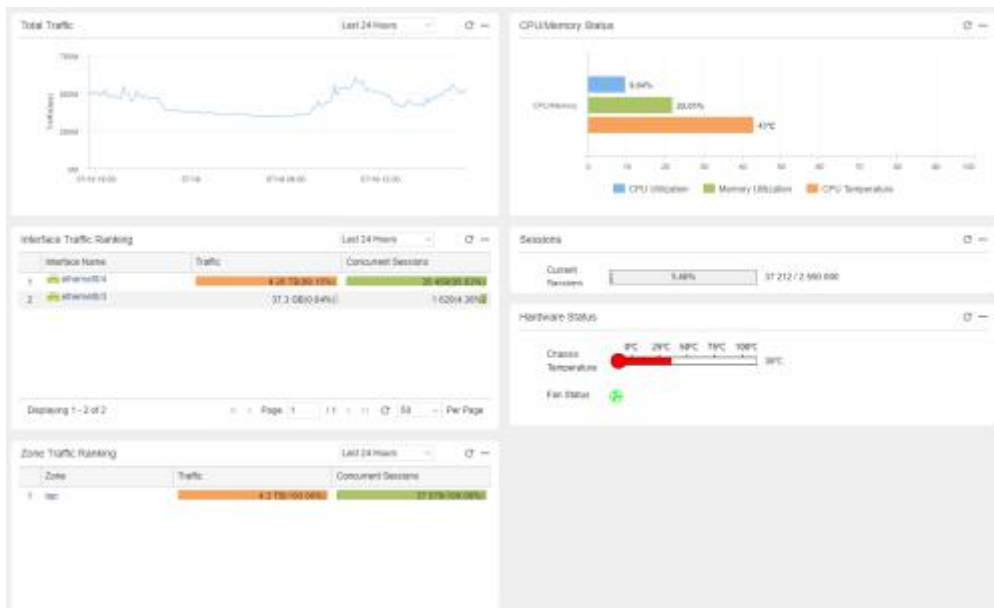

Device Monitor

This feature may vary slightly on different platforms. If there is a conflict between this guide and the actual page, the latter shall prevail.

The Device page displays the device statistics within the specified period, including the total traffic, interface traffic, zone traffic, CPU/memory status, sessions, hardware status and online IP.

Summary

The summary displays the device statistics within last 24 hours. Click **Monitor>Device Monitor>Summary**.

- Total traffic: Displays the total traffic within the specified statistical period.
 - Hover your mouse over the chart to view the total traffic statistics at a specific point in time.
 - Select a different [Statistical Period](#) to view the statistical information in that period of time.
 - If IPv6 is enabled, the device traffic will show the total traffic of IPv4 and IPv6.
- Interface traffic: Displays the upstream traffic, downstream traffic, total traffic and concurrent sessions of interface within the specified statistical period by rank.
 - Click **Traffic In**, **Traffic Out**, **Traffic**, or **Concurrent Sessions**. System displays the interface traffic according to the value(from large to small) of the specified object. By default, the interface traffic is displayed according to the total traffic value of interface.
 - Select a different [Statistical Period](#) to view the statistical information in that period of time.
 - Click the interface name to view the [Detailed Information](#).
 - If IPv6 is enabled, the interface traffic will show the traffic of IPv4 and IPv6.
- Zone traffic: Displays the upstream traffic, downstream traffic, total traffic and concurrent sessions of zone within the specified statistical period by rank.
 - Click **Traffic In**, **Traffic Out**, **Traffic**, or **Concurrent Sessions**. System displays the zone traffic according to the value(from large to small) of the specified object. By default, the zone traffic is displayed according to the total traffic value of zone.

- Select a different [Statistical Period](#) to view the statistical information in that period of time.
- Click the zone name to view the [Detailed Information](#).
- Hardware status: Displays the real-time hardware status, including storage, chassis temperature and fan status.
 - Storage: Displays the percentage of disk space utilization.
 - Internal Storage: Displays the percentage of hard disk utilization. Only partial platforms support this function.
 - Hover your mouse over the utilization to view the current utilization, the used storage size and the total storage size.
 - Chassis temperature: Displays the current CPU/chassis temperature.
 - Fan status: Displays the operation status of the fan. Green indicates normal, and red indicates error or a power supply module is not used.
- Sessions: Displays the current sessions utilization.
- CPU/memory status: Displays current CPU utilization, memory utilization and CPU temperature statistics.
 - Click legends of **CPU Utilization**, **Memory Utilization** or **CPU Temperature** to specify the histogram statistical objects. By default, it displays statistics of all objects.

Statistical Period

System supports the predefined time cycle. Select statistical period from the drop-down menu

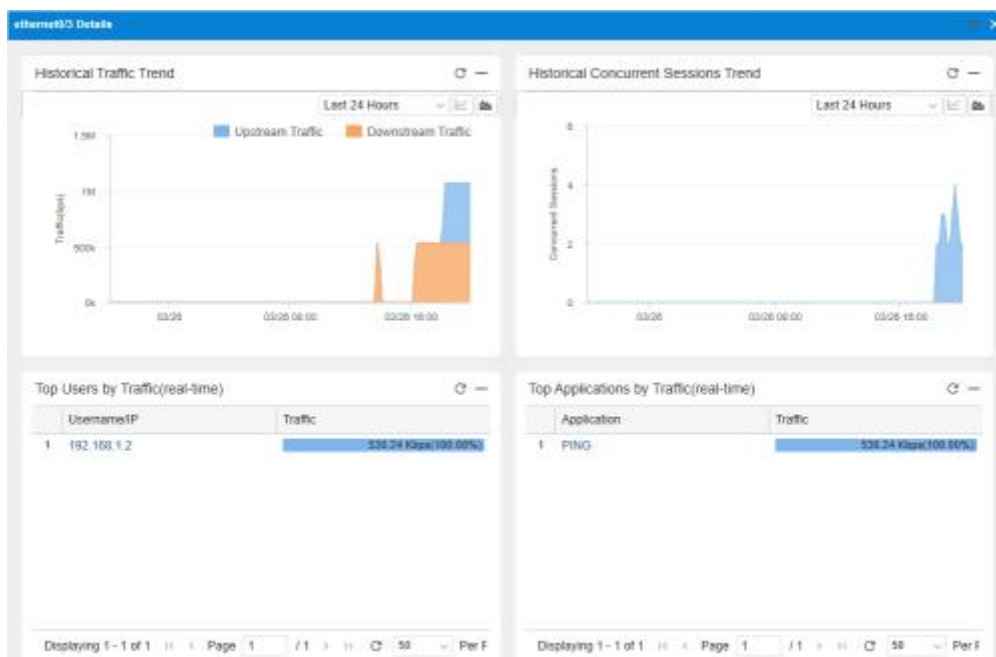

at the top right corner of some statistics page to set the time cycle.

- Real-time: Displays the current statistical information.
- Last 60 Minutes: Displays the statistical information within the latest 1 hour.
- Last 24 Hours: Displays the statistical information within the latest 1 day.
- Last 30 Days: Displays the statistical information within the latest 1 month.

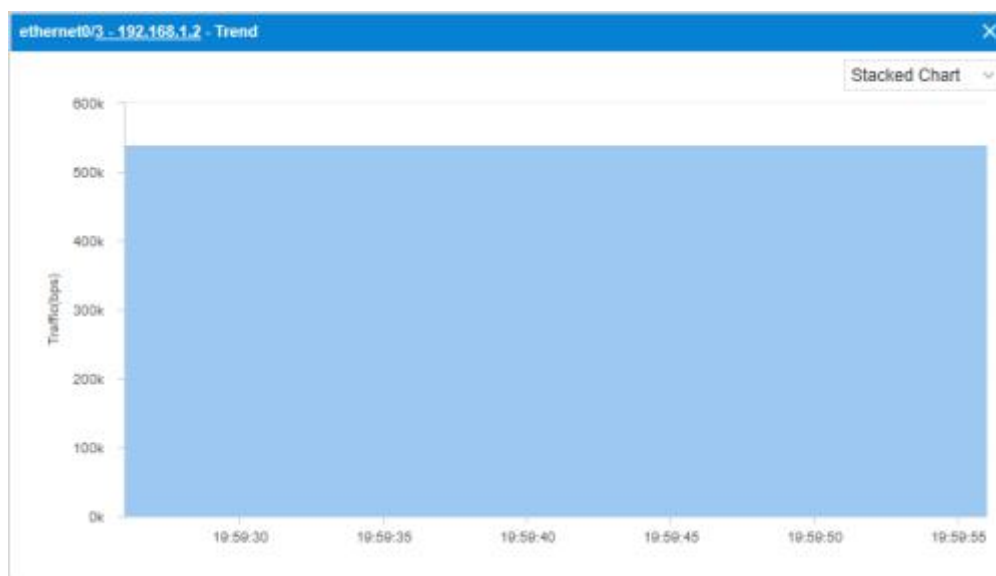

Detailed Information

The detailed information page displays detailed statistics of certain monitored objects. In addition, in the detailed information page, hover your mouse over the chart that represents a certain object to view the statistics of history trend and other information.

For example, click **ethernet0/0** in the Interface Traffic , and the detailed information of ethernet0/0 appears.

- Icon and are used to switch the line chart and stacked chart, which display the history trend of sessions and concurrent sessions.
- In traffic trend section, click legends of **Traffic In** or **Traffic Out** to specify the statistical objects. By default, it displays all statistical objects.
- In the User or Application section, click **Username/IP** or **Application** to display the real-time trend of the specified user or application. For example, the user traffic trend is shown as below.

- Select line chart or stacked chart from the pop-up menu Stacked Chart at the top right corner .
- Hover your mouse over the chart to view the session statistics at a specific point in time.

Online IP

Click **Monitor>Device>Online IP** to view the historical trend of the number of online users. You can select the statistical period as last 60 minutes, last 24 hours or last 30 days.

- Hover your mouse over the line to view online users information.

URL Hit

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

If the "[URL Filtering](#)" function is enabled in the security policy rule, the predefined stat-set of URL filter can gather statistics on user/IPs, URLs and URL categories.

If IPv6 is enabled, system will support to monitor both IPv4 and IPv6 address.

Summary

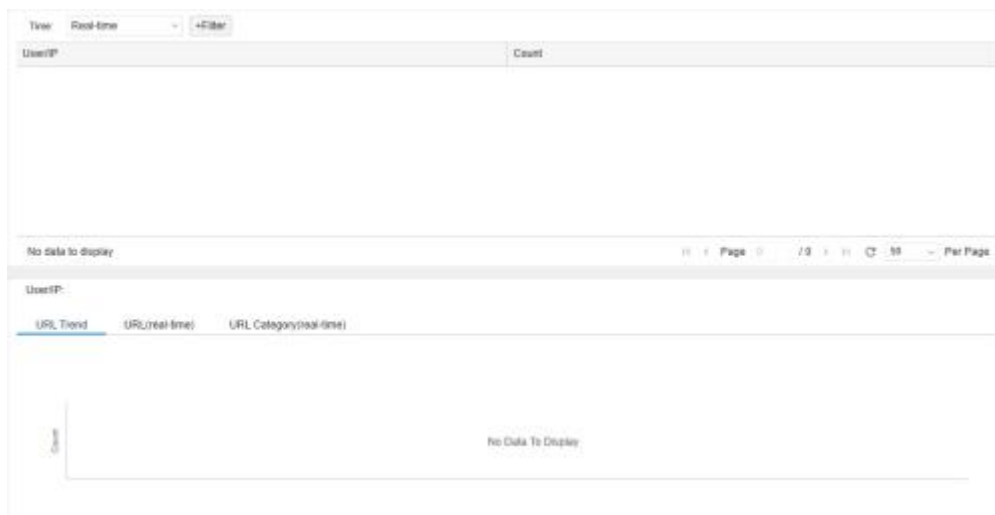

Click **Monitor> URL Hit>Summary**.

- Select a different [Statistical_Period](#) to view the statistical information in that period of time.
- Hover your mouse over a bar, to view the hit count of user/IP, URL or URL Category .
- Click at top-right corner of every table and enter the corresponding details.

- Click  to switch between the bar chart and the pie chart.

User/IP

Click **Monitor**> **URL Hit**>**User/IP**.

- The user/IPs and detailed hit count are displayed in the list below.
- Click a user/IP in the list to display the corresponding URL hit statistics in the curve chart below.
 - **Statistics:** Displays the hit statistics of the selected User/IP, including the real-time statistics and statistics for the latest 1 hour, 24 hours, 30 days.
 - **URL(real-time):** Displays the URLs' real-time hit count of selected User/IP. Click URL link, you can view the corresponding URLs detailed statistics page. Click **Detail** link, you can view the URL hit trend of the selected User/IP in the **URL Filter Details** dialog.
 - **URL category(real-time):** Displays the URL categories' real-time hit count of selected user/IP. Click URL category link, you can view the corresponding URL categories' detailed statistics page. Click **Detail** link, you can view the URL category hit trend of the selected user/IP in the pop-up dialog.
- Click  at top-right corner and then click the **Filter** button at top-left corner. Select **User/IP** and you can search the user/IP hit count information by entering the keyword of the username or IP.

URL

Click **Monitor** > **URL Hit** > **URL**.

- The URL, URL category and detailed hit count are displayed in the list below.

- Click a URL in the list to view its detailed statistics.
- **Statistics:** Displays the hit statistics of the selected URL, including the real-time statistics and statistics for the latest 1 hour, 24 hours 30 days .
- **User/IP(real-time):** Displays the User/IP's real-time hit count of selected URL. Click the User/IP link and you can view the corresponding user/IPs detailed statistics page. Click the **Detail** link and you can view the URL hit trend of the selected user/IP in the **URL Filter Details** dialog box.
- Click  **Filter** at the top-right corner and then click the **Filter** button at the top-left corner. Select **URL** and you can search the URL hit count information by entering the keyword of the URL.
- Click  to refresh the real-time data in the list.

URL Category

Click **Monitor**> **URL Hit** > **URL Category**.

- The URL category, count, traffic are displayed in the list.
- Click a URL category in the list to view its detailed statistics displayed in the **Statistics**, **URL(real-time)**, **User/IP(real-time)** tabs.
 - **Statistics:** Displays the trend of the URL category visits, including the real-time trend and the trend in the last 60 minutes, 24 hours , 30 days.
 - **URL(real-time):** Displays the visit information of the URLs, contained in the URL category, that are being visited.
 - **User/IP(real-time):** Displays the visit information of the users or IPs that are visiting the URL category.
- Click  to refresh the real-time data in the list.

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click the time button on the top right corner of each tab to set the time cycle.

- **Real-time:** Displays the current statistical information.
- **Last 60 Minutes:** Displays the statistical information within the latest 1 hour.
- **Last 24 Hours:** Displays the statistical information within the latest 1 day.

- Last 30 Days: Displays the statistical information within the latest 1 month.

Link Status Monitor

Link status monitoring can calculate the sampling traffic information of the specific interface in the link, including latency, packet loss rate, and jitter, to monitor and display the overall status of the link.

Link state monitor page displays the traffic statistics of the interfaces that have been bound within a specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month) . System also supports for link detection to calculate the traffic information of the specific destination IP address in the link, including latency, and jitter.

Link User Experience

The link user experience page displays the traffic statistics of the interfaces that have been bound within a specified period (Realtime, latest 1 hour, latest 1 day, latest 1 month) .

Click **Monitor > Link Status Monitor**. For more information about configuration of binding interfaces, refer to [Link Configuration](#).

- Select a different [Statistical_Period](#) to view the statistical information in that periods of time.
- Select the binding interface **Binding Interface** drop-down list, Click the **Binding Interface** drop-down menu and select the interface name to view the link status monitoring statistics for this interface. You can select multiple interfaces.
- Click  button and select **Application** in the drop-down menu. You can select the TOP 10 or Application / Application group name to view the link status monitoring statistics according to the specified application.

Notes:

- "Time" and "Binding Interface" are required in the filter condition.
- If the application switch of the specified interface is not enabled in the link configuration, the **Application** filter condition cannot be added.

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click **Last 60 Minutes** on the top right corner of each tab to set the time cycle.

- Real-time: Displays the current statistical information.
- Last 60 Minutes: Displays the statistical information within the latest 1 hour.

- Last 24 Hours: Displays the statistical information within the latest 1 day.
- Last 30 Days: Displays the statistical information within the latest 1 month.

Link Detection

The link detection page displays real-time traffic statistics of specified detection destination IP to link or link to detection destination IP, include latency, and jitter.

To configure the link detection, take the following steps:

1. Click **Monitor > Link Status Monitor > Link Detection**.

Link Detection (Real-time)

Link:

Detection Destination:

2. Select the interface name to view the link status monitoring statistics for this interface, you can select up to 8 interfaces. Click **New** to add interfaces, you can add up to 16 interfaces. For more information about configuration of binding interfaces, refer to [Link Configuration](#).
3. Select the IP address to view the link status monitoring statistics for this destination address, you can select up to 8 addresses. Click **New** to add destination address, you can add up to 32 addresses. For more information about configuration of destination addresses, refer to [Detection Destination](#).
4. Click **Start Detection**, and view the statistics of the real-time link detection at the bottom of the page. Select **Detection Destination IP->Link** or **Link->Detection Destination IP** tab to view the trend chart of latency and jitter. Click Trend Chart and Table to switch between the trend chart and table.
5. Click **End Detection** to end the real-time link detection.

Link Configuration

In the link configuration page, you can configure the binding interface to monitor the link state and can enable the application switch and link user experience.

To configure the link, take the following steps:

1. Click **Monitor > Link Status Monitor > Link Configuration**.
2. Click **New**.

In the Link Configuration dialog box, configure these values

Option	Description
Binding Interface	Select the interface in the drop down menu.
Application	Select Application check box. After enabling, you can see details of the specific application in this interface.
Monitor	Select Monitor check box. After enabling, you can see traffic statistics in this interface.

3. Click **OK**.

Detection Destination

In the detection destination page, you can configure the destination IP address to monitor the link state.

To configure the detection destination, take the following steps:

1. Click **Monitor > Link Status Monitor > Detection Destination**
2. Click **New**.

In the Detection Destination Configuration dialog box, configure these values

Option	Description
IP Type	Selects the IP address type, include IPv4 or IPv6.
Detection Destination IP	Specifies the IP address of the detection destination.
Protocol	Specifies the protocol of the detection destination, include TCP or ICMP.
Port	Specifies the port number of the detection destination.
Interval	Specifies the interval time of the detection packet. The value range is 1 to 5 seconds, the default value is 1.
Description	Types the description for the detection destination

3. Click **OK**.

Application Block

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

If system is configured with "**Security Policy**" the application block can gather statistics on the applications and user/IPs.

If IPv6 is enabled, system will support to monitor both IPv4 and IPv6 address.

Summary

The summary displays the application block's statistics on the top 10 applications and top 10 user/IPs. Click **Monitor>Application Block> Summary**.

- Select a different [Statistical_Period](#) to view the statistical information in that period of time.
- Hover your mouse over a bar to view the block count on the applications and user/IPs.
- Click  at the top-right corner of every table and enter the corresponding details page.
- Click  to switch between the bar chart and the pie chart.

Application

Click **Monitor>Application Block> Application**.

- The applications and detailed block count are displayed in the list below.
- To view the corresponding information of application block on the applications and user/IPs, select the application entry in the list.
 - **Statistics:** Displays the block count statistics of the selected application, including the real-time statistics and statistics for the latest 1 hour, 24 hours and 30 days.
 - **User/IP:** Displays the user/IPs that are blocked from the selected application. Click a user/IP in the list to display the corresponding block count statistics in the curve chart below. Click  to jump to the corresponding user / IPs page.
- Click , and then click  to select the condition in the drop-down list. You can search the application block information by entering the keyword of the application name.
- Click  to refresh the real-time data in the list.

User/IP

Click **Monitor>Application Block> User/IP**.

- The user/IP and detailed block count are displayed in the list below.
- Click a user/IP in the list to display the corresponding block count statistics in the curve chart below. Click  to jump to the corresponding user / IPs page.

- Click **Filter**, and then click **+ Filter** to select the condition in the drop-down list. You can search the users/IPs information.

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click (**Real-time**) on the top right corner of each tab to set the time cycle.

- **Realtime:** Displays the statistical information within the realtime.
- **Last Hour:** Displays the statistical information within the latest 1 hour.
- **Last Day:** Displays the statistical information within the latest 1 day.
- **Last Month:** Displays the statistical information within the latest 1 month.

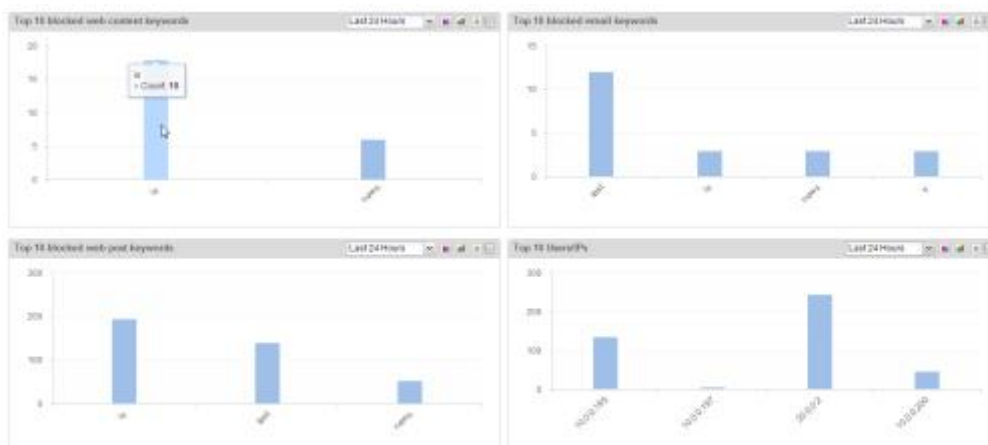

Keyword Block

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

If system is configured with **"Web Content"**, **"Email Filter"** on, or **"Web Posting"**, the predefined stat-set of the Keyword Block can gather statistics on the Web keyword, Web keywords, email keywords, posting keywords and users/IPs.

Summary

The summary displays the predefined stat-set of the Keyword Block that can gather statistics on the top 10 hit Web keywords, the top 10 hit email keywords, the top 10 posting keywords, and the top 10 users/IPs. Click **Monitor > Keyword Block > Summary**.

- Select a different [Statistical_Period](#) to view the statistical information in that period of time.
- Hover your mouse over a bar to view the block count on the keywords .
- Click at the top-right corner of every table and enter the corresponding details page.
- Click to switch between the bar chart and the pie chart.

Web Content

Click **Monitor>Keyword Block> Web Content**.

- The Web content and detailed block count are displayed in the list below.
- To view the corresponding information of keyword block on the Web content, select the keyword entry in the list.
 - **Statistics:** Displays the statistics of the selected keyword, including the real-time statistics and statistics for the latest 1 hour, 24 hours and 30 days.
 - **User/IP:** Displays the user/IPs that are blocked by the selected keyword. Click a user/IP in the list to display the corresponding block count statistics in the curve chart below. Click to jump to the corresponding user / IPs page.
- Click , and then click to select the condition in the drop-down list. You can search the keyword block information by entering the keyword .
- Click to refresh the real-time data in the list.

Email Content

Click **Monitor>Keyword Block> Email Content**.

For a page description, see [Web_Content](#).

Web Posting

Click **Monitor>Keyword Block>Web Posting**.

For a page description, see [Web_Content](#).

User/IP

Click **Monitor>Keyword Block>User/IP**.

- The user/IP and detailed block count are displayed in the list below.
- Click a user/IP in the list to display the corresponding statistics , Web content, Email Content, Web Posting in the curve chart below. Click to jump to the corresponding detail page.
- Click **Filter** , and then click **+ Filter** to select the condition in the drop-down list. You can search the users/IPs information .

Statistical Period

System supports the predefined time cycle and the custom time cycle. Click () on the top right corner of each tab to set the time cycle.

- Real-time: Displays the current statistical information.
- Last Hour: Displays the statistical information within the latest 1 hour.
- Last Day: Displays the statistical information within the latest 1 day.
- Last Month: Displays the statistical information within the latest 1 month.

Authentication User

If system is configured with "Web Authentication", "Single Sign-On", "SSL VPN", "L2TP VPN" the authentication user can gather statistics on the authenticated users.

Click **Monitor**>**Authenticated User**.

- Click  **Filter**, and click  **+ Filter** to select the condition in the drop-down list to filter the users.
- Click **Kick Out** under the Operation column to kick the user out.
- Click  to refresh the real-time data in the list.

Monitor Configuration

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

You can enable or disable some monitor items as needed. The monitor items for Auth user are enabled automatically.

To enable/disable a monitor item, take the following steps:

1. Click **Monitor > Monitor Configuration**.

2. Select or clear the monitor item(s) you want to enable or disable.
3. Click **OK**.

Notes: After a monitor item is enabled or disabled in the root VSYS, the item of all VSYSs will be enabled or disabled(except that the non-root VSYS does not support this monitor item). You can not enable or disable monitor item in non-root VSYSs.

User-defined Monitor

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

A user-defined stat-set provides a more flexible approach to view the statistics. You can view the statistics as needed. The statistical data may vary in the data types you have selected.

If IPv6 is enabled, system will support to monitor both IPv4 and IPv6 address.

The IP type-based statistical information table.

Direction	Condition	Data type					
		Traffic	Session	Ramp-up rate	URL hit count	Keyword block count	Application block count
No direction	Initiator	Statistics on the traffic of the initiator's IP	Statistics on the session number of the initiator's IP	Statistics on the new sessions of the initiator's IP

You can configure a filtering condition for the stat-set to gather statistics on the specified condition, such as statistics on the session number of the specified security zone, or the traffic of the specified IP.

The filtering conditions supported table.

Type	Description
filter zone	Data is filtered by security zone.
filter zone zone-name ingress	Data is filtered by ingress security zone.
filter zone zone-name egress	Data is filtered by egress security zone.
filter interface	Data is filtered by interface.
filter interface if-name ingress	Data is filtered by ingress interface.
filter interface if-name egress	Data is filtered by egress interface.
filter application	Data is filtered by application.
filter ip	Data is filtered by address entry.
filter ip add-entry source	Data is filtered by source address (address entry).
filter ip add-entry destination	Data is filtered by destination address (address entry).
filter ip A.B.C.D/M	Data is filtered by IP.

Type	Description
filter ip A.B.C.D/M source	Data is filtered by source IP.
filter ip A.B.C.D/M destination	Data is filtered by destination IP.
filter user	Data is filtered by user.
filter user-group	Data is filtered by user group.
filter severity	Data is filtered by signature severity.

Click **Monitor>User-defined Monitor**.

- Click **New**. For more information, see [Creating a User-defined Stat-set](#)
- Click the user-defined stat-set name link. For more information, see [Viewing User-defined Stat-set Statistics](#).

Creating a User-defined Stat-set

To create a user-defined stat-set, take the following steps:

1. Click **Monitor>User Defined Monitor**.
2. Click **New**.

In the User-defined Monitor Configuration dialog box, modify according to your needs.

Option	Description
Name	Type the name for the stat-set into the Name box.
Data Type	Select an appropriate data type from the Data type list.
Group by	Select an appropriate grouping method from the Group by list.
Root vsys only	If you only want to perform the data statistics for the root VSYS, select the Root vsys only checkbox. This checkbox will take effect when the data type is Traffic, Session, Ramp-up rate, or URL hit. If the data grouping method is configured to VSYS, this checkbox will be unavailable.
Options	To configure a filtering condition, click Option. In the Advanced dialog box, select a filter condition from the Filter drop-down list. For more details about this option, see The filtering conditions supported table .

3. Click **OK** to save your settings . The configured stat-set will be displayed .

Notes: You need to pay attention to the following when configure a stat-set.

- The URL hit statistics are only available to users who have a URL license.
- If the Data type is Traffic, Session, Ramp-up rate, Virus attack count, Intrusion count or URL hit count, then the Filter should not be Attack log.
- If the Data type is URL hit count, then the Filter should not be Service.
- System will hide unavailable options automatically.

Viewing User-defined Monitor Statistics

Click the user-defined stat-set name link, and then select the stat-set you want to view.

- Displays the top 10 statistical result from multiple aspects in forms of bar chart.
- View specified historic statistics by selecting a period from the statistic period drop-down list.
- Click **All Data** to view all the statistical result from multiple aspects in forms of list, trend. Click **TOP 10** returns bar chart.

Reporting

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

The reporting feature gathers and analyzes data for the following report categories, providing all-around and multi-dimensional statistics to you.

Report Categories	Description
-------------------	-------------

Report Categories	Description
Threat Report	Helps users quickly understand the overall risk situation of the servers and users.
Traffic Report	Analysis and display of the user, application, interface, zone's traffic and concurrency.
URL Content Report	Detailed description of the URL hit, including the hit times, trends, categories.

You can configure report task in "[User-defined Task](#)" and "[Predefined Task](#)", and view generated report files in "[Report File](#)".

Report File

Go to **Monitor > Reports > Report File** and the report file page shows all of the generated report files. The report file pages may vary slightly on different platforms, which are shown below.

- Sort report files by different conditions: Select **Group by Time**, **Group by Task** or **Group by Status** from the drop-down list, and then select a time, task or status from the selective table, and the related report files will be shown in the report file table.
- Click **Delete** to delete the selected report files.
- Click **Export** to download the selected report files.
- Click **Mark as Read** to modify the status of the selected report files.
- Click  **Filter**, and click  to select the condition in the drop-down list. In the text box, enter the keyword to search for the report files.
- In the File Type column, click the icon of the report file to preview the report file. Not all platforms support this function. The content of the security report varies slightly on different platforms.
- Hover your mouse over the Send Object column, and the system will prompt the Email addresses or FTP information about sending.

Notes: If your browser has enabled "Blocking pop-up windows", you will not see the generated file. Make sure to set your browser "Always allow pop-up windows", or you can go to your blocked window history to find the report file.

User-defined Task

A user-defined task is a customized report task which can be tailored to meet your requirements.

Creating a User-defined Task

To create a user-defined task, take the following steps:

1. Select **Monitor > Reports > User-defined Task**.
2. Click **New**.

In the Report Task Configuration dialog box, configure these values.

Option	Description
Basic	
Name	Specifies the name of the report task.
Description	Specifies the description of the report task.
Report Items	
Report Items	<p>Specifies the content for the report file.</p> <p>To add report items to the report task, take the following steps:</p> <ol style="list-style-type: none"> 1. Expand the categories from the left list. 2. Select the category item you want, and click Add to add it to the right column.
Schedule	
<p>The schedule specifies the running time of the report task. The report task can be run periodically or run immediately.</p> <p>Periodic: Generates report files as planned.</p> <ul style="list-style-type: none"> • Schedule: Specifies the statistical period. • At: Specifies the running time. <p>Generate Now: Generates report files immediately.</p> <ul style="list-style-type: none"> • Type: Generates report file based on the data in the specified statistical period. 	

Option	Description
Output	
File Format	The output format of the report file is a PDF.
Recipient	Sends report file via email. To add recipients, enter the email addresses in to the recipient text box (use ";" to separate multiple email addresses).
Send via FTP	<p>Check the Send via FTP check box to send the report file to a specified FTP server.</p> <ul style="list-style-type: none"> • Server Name/IP: Specifies the FTP server name or the IP address. • Virtual Router: Specifies the virtual router of the FTP server. • Username: Specifies the username used to log on to the FTP server. • Password: Enter the password of the FTP username. • Anonymous: Check the check box to log on to the FTP server anonymously. • Path: Specifies the location where the report file will be saved.

3. Click **OK** to complete task configuration.

Enabling/Disabling the User-defined Task

To enable or disable the user-defined task, take the following steps:

1. Select **Monitor > Reports > User-defined Task**.
2. Select the task you want, and click the **Enable** or **Disable** button on the top.
By default, the user-defined task is enabled.

Viewing Report Files

To view the generated report files, select **Monitor > Reports > Report File**.

Predefined Task

The predefined tasks are the system report task template. Each report task is named according to the name of the report item, the configured date and time.

The predefined tasks include the following types:

- Threat Report
- Traffic Report
- URL Content Report

Generating Report Tasks

1. Select **Monitor > Reports > Predefined Task**.
2. In the **Action** column, click the icon.

In the Report Task Configuration dialog box, configure these values.

Option	Description
Basic	
Name	Specifies the name of the report task.
Description	Specifies the description of the report task. You can modify according to your requirements.
Schedule	
The schedule specifies the running time of report task. The report task can be run periodically or run immediately.	
Periodic: Generates report files as planned.	
<ul style="list-style-type: none"> • Schedule: Specifies the statistical period. • At: Specifies the running time. 	
Generate Now: Generates report file immediately.	
<ul style="list-style-type: none"> • Type: Generates report files based on the data in the specified statistical period. 	
Output	
File Format	The report file is outputted in PDF format.

Option	Description
Recipient	Sends report file via email. To add recipients, enter the email addresses in to the recipient text box (use ";" to separate multiple email addresses).
Send via FTP	<p>Check the Send via FTP check box to send the report file to a specified FTP server.</p> <ul style="list-style-type: none"> • Server Name/IP: Specifies the FTP server name or the IP address. • Virtual Router: Specifies the virtual router of the FTP server. • Username: Specifies the username used to log on to the FTP server. • Password: Enter the password of the FTP username. • Anonymous: Check the check box to log on to the FTP server anonymously. • Path: Specifies the location where the report file will be saved.

3. Click **OK** to complete task configuration.

Viewing Report Files

To view the generated report files, select **Monitor > Reports > Report File**.

Logging

Logging is a feature that records various kinds of system logs, including device log, threat log, session log, NAT log, Content filter log, File filter log, Network Behavior Record log, share access logs, and URL logs.

- **Device log**
 - **Event** - includes 8 severity levels: debugging, information, notification, warning, error, critical, alert, emergency.
 - **Network** - logs about network services, like PPPoE and DDNS.

- Configuration - logs about configuration on command line interface, e.g. interface IP address setting.
- Share Access Logs - logs about share access rule.
- Threat - logs related to behaviors threatening the protected system, e.g. attack defense and application security.
- Session - Session logs, e.g. session protocols, source and destination IP addresses and ports.
- NAT - NAT logs, including NAT type, source and destination IP addresses and ports.
- File Filter - logs related with file filter function.
- Content filter logs – logs related with content filter function, e.g. Web content filter, Web posting, Email filter and HTTP/FTP control.
- Network behavior record logs – Logs related with network behavior record function, e.g. IM behavior ,etc.
- URL - logs about network surfing, e.g. Internet visiting time, web pages visiting history, an URL filtering logs.
- PBR - logs about policy-based route.

The system logs the running status of the device, thus providing information for analysis and evidence.

Log Severity

Event logs are categorized into eight severity levels.

Severity	Level	Description	Log Definition
Emergencies	0	Identifies illegitimate system events.	LOG_EMERG
Alerts	1	Identifies problems which need immediate attention such as device is being attacked.	LOG_ALERT
Critical	2	Identifies urgent problems, such as hardware failure.	LOG_CRIT
Errors	3	Generates messages for system errors.	LOG_ERR
Warnings	4	Generates messages for warning.	LOG_WARNING

Severity	Level	Description	Log Definition
Notifications	5	Generates messages for notice and special attention.	LOG_NOTICE
Informational	6	Generates informational messages.	LOG_INFO
Debugging	7	Generates all debugging messages, including daily operation messages.	LOG_DEBUG

Destination of Exported Logs

Log messages can be sent to the following destinations:

- Console - The default output destination. You can close this destination via CLI.
- Remote - Includes Telnet and SSH.
- Buffer - Memory buffer.
- File - By default, the logs are sent to the specified USB destination in form of a file.
- Syslog Server - Sends logs to UNIX or Windows Syslog Server.
- Email - Sends logs to a specified email account.
- Local database - Sends logs to the local database of the device.

Log Format

To facilitate the access and analysis of the system logs, FSOS logs follow a fixed pattern of information layout, i.e. **date/time, severity level@module: descriptions**. See the example below:

2000-02-05 01:51:21, WARNING@LOGIN: Admin user "admin" logged in through console from localhost.

Event Logs

This feature may vary slightly on different platforms. Please see the actual page of the feature that your device delivers.

To view event logs, select **Monitor > Log > Event Log**.

In this page, you can perform the following actions:

- Configure: Click to jump to the configuration page.
- Clear: Click to clear the selected logs.

- **Export:** Click to export the displayed logs as a TXT or CSV file.
- **Filter:** Click Filter to add conditions to show logs that march your filter.

Network Logs

This feature may vary slightly on different platforms. Please see the actual page of the feature that your device delivers.

To view network logs, select **Monitor > Log > Network Log**.

In this page, you can perform the following actions:

- **Configure:** Click to jump to the configuration page.
- **Clear:** Click to clear the selected logs.
- **Export:** Click to export the displayed logs as a TXT or CSV file.
- **Filter:** Click  **Filter**, and then click  to add conditions to show logs that march your filter.

Configuration Logs

This feature may vary slightly on different platforms. Please see the actual page of the feature that your device delivers.

To view configuration logs, select **Monitor > Log > Configuration Log**.

In this page, you can perform the following actions:

- **Configuration:** Click to jump to the configuration page.
- **Clear:** Click to clear the selected logs.
- **Export:** Click to export the displayed logs as a TXT or CSV file.
- **Filter:** Click  **Filter**, and then click  to add conditions to show logs that march your filter.

Share Access Logs

To view share access logs, select **Monitor > Log > Share Access Log**.

In this page, you can perform the following actions:

- **Configuration:** Click to jump to the Log Management page.

- Clear: Click to clear the selected logs.
- Export: Click to export the displayed logs as a TXT file.
- Add to My Log: Click to add the current filtered results to MyLog list.
- Filter: Click  **Filter**, and then click  to add conditions to show logs that match your filter.

Threat Logs

This feature may vary slightly on different platforms. Please see the actual page of the feature that your device delivers.

Threat logs can be generated under the conditions that:

- Threat logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".
- You have enabled one or more of the following features: "[Anti Virus](#)", "[Intrusion Prevention System](#)", "[Attack-Defense](#)" or "[Perimeter Traffic Filtering](#)".

To view threat logs, select **Monitor > Log > Threat Log**.

In this page, you can perform the following actions:

- Configure: Click to jump to the configuration page.
- Clear: Click to clear the selected logs.
- Export: Click to export the displayed logs as a TXT or CSV file.
- Filter: Click  **Filter**, and then click  to add conditions to show logs that match your filter. You can enter the IPv4 or IPv6 address if the filter condition is selected as source or destination IP.
- View the details of selected log in the Log Details tab. In the Log Details tab, you can click "View Pcap" "Download" "[Add Whitelist](#)" "[Disable Signatures](#)" to quickly link to the relevant page.

Session Logs

Session logs can be generated under the conditions that:

- Session logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".
- You have enabled one or more of the following features: "[Web Content](#)", "[Web Posting](#)", "[Email Filter](#)" and "[Data Security](#)" functions.

To view session logs, select **Monitor > Log > Session log**.

Time	Source IP	Destination IP	Destination port	Protocol	Action	Sent Traffic(Bytes)	Received Traffic	Close Reason
2015-12-15 14:30:00	10.0.1.100	110.75.8.0	80	TCP	Session End	752	221	TCP FIN

2015-12-15 14:30:00	10.0.1.100	140.205.190.213	80	TCP	Session End	645	489	TCP FIN

Notes:

- For ICMP session logs, the system will only record the ICMP type value and its code value. As ICMP 3, 4, 5, 11 and 12 are generated by other communications, not a complete ICMP session, system will not record such kind of packets.
- For TCP and UDP session logs, system will check the packet length first. If the packet length is 20 bytes (i.e., with IP header, but no loads), it will be defined as a malformed packet and be dropped; if a packet is over 20 bytes, but it has errors, system will drop it either. So, such abnormal TCP and UDP packets will not be recorded.

PBR Logs

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

PBR logs can be generated under the conditions that:

- PBR logging in the Logging feature is enabled. Refer to ["Log Configuration"](#).
- You have enabled logging function in PBR rules. Refer to ["Creating a Policy-based Route Rule"](#).

To view PBR logs, select **Monitor > Log > PBR Log**.

Time	PBR name	Source IP	AAA user	Source Port	Destination IP	Destination Port	Protocol	Application	Next hop	Egress interface	Status Reason	Decision Reason
------	----------	-----------	----------	-------------	----------------	------------------	----------	-------------	----------	------------------	---------------	-----------------

NAT Logs

NAT logs are generated under the conditions that:

- NAT logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".
- NAT logging of the NAT rule configuration is enabled. Refer to "[Configuring SNAT](#)" and "[Configuring SNAT](#)" "[Configuring DNAT](#)".

To view NAT logs, select **Monitor > Log > NAT Log**.

- Filter: Click Filter to add conditions to show logs that march your filter
- Configure: Click to jump to the configuration page
- Clear: Click to delete all the displayed logs.
- Export: Click to export the displayed logs as a TXT or CSV file.

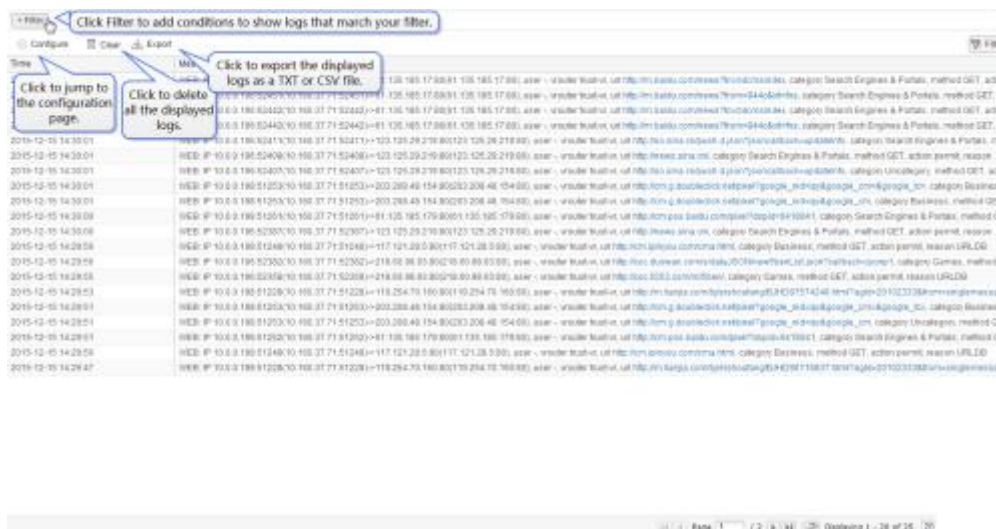

URL Logs

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

URL logs can be generated under the conditions that:

- URL logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".
- You have enabled logging function in URL rules. Refer to "[URL Filtering](#)".

To view URL logs, select **Monitor > Log > URL Log**.

File Filter Logs

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

File Filter logs can be generated under the conditions that:

- File Filter logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".
- You have enabled the function of "[File Filter](#)".

To view File Filter logs, select **Monitor > Log > File Filter**.

- Filter: Click Filter to add conditions to show logs that march your filter
- Configure: Click to jump to the configuration page
- Clear: Click to delete all the displayed logs.
- Export: Click to export the displayed logs as a TXT or CSV file.

Content Filter Logs

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

Content Filter logs can be generated under the conditions that:

- Content Filter logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".
- You have enabled one or more of the following features: "[Web Content](#)", "[Web Posting](#)", "[Email Filter](#)" and "[HTTP/FTP Control](#)" function.

To view Content Filter logs, select **Monitor > Log > Content Filter**.

- Filter: Click Filter to add conditions to show logs that march your filter
- Configure: Click to jump to the configuration page
- Clear: Click to delete all the displayed logs.
- Export: Click to export the displayed logs as a TXT or CSV file.

Network Behavior Record Logs

This feature may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

Network Behavior Record logs can be generated under the conditions that:

- Network Behavior Record logging in the Logging feature is enabled. Refer to "[Log Configuration](#)".

- You have enabled the function of "[Network Behavior Record](#)".

To view Network Behavior Record logs, select **Monitor > Log > Network Behavior Record**.

- **Filter:** Click Filter to add conditions to show logs that match your filter
- **Configure:** Click to jump to the configuration page
- **Clear:** Click to delete all the displayed logs.
- **Export:** Click to export the displayed logs as a TXT or CSV file.

Managing Logs

You can configure system to enable the logging function, including enabling various logs.

Configuring Logs

To configure parameters of various log types, take the following steps:

1. Select **Monitor > Log > Log Management**.
2. Click on the tab of the log type you want, and you will enter the corresponding log settings.
3. Click **OK**.

Option Descriptions of Various Log Types

This section describes the options when you set the properties of each log types.

Event Log

Option	Description
Enable	Select the check box to enable the event logging function.
Console	Select the check box to send a syslog to the Console. <ul style="list-style-type: none"> • Lowest Severity - Specifies the lowest severity level. Logs below the severity level selected here will not be exported.
Terminal	Select the check box to send a syslog to the terminal. <ul style="list-style-type: none"> • Lowest Severity - Specifies the lowest severity level. Logs below the severity level selected

Option	Description
	here will not be exported.
Cache	<p>Select the check box to send a syslog to the cache.</p> <ul style="list-style-type: none"> • Lowest Severity - Specifies the lowest severity level. Logs below the severity level selected here will not be exported. • Max Buffer Size - The maximum size of the cached logs. The default value may vary for different hardware platforms.
File	<p>Select the check box to send a syslog to a file.</p> <ul style="list-style-type: none"> • Max File Size - Specifies the maximum size of the syslog file. The value range is 4096 to 1048576 bytes. The default value is 1048576 bytes. • Save logs to USB - Select the check box and select a USB drive (USB0 or USB1) from the drop-down list. Type a name for the syslog file into the File Name box.
Log Server	<p>Select the check box to export event logs to the syslog server.</p> <ul style="list-style-type: none"> • View Log Server - Click to see all existing syslog servers or to add new server. • Lowest Severity - Specifies the lowest severity level. Logs below the severity level selected here will not be exported.
Email Address	<p>Select the check box to send event logs to the email.</p> <ul style="list-style-type: none"> • View Email Address: Click to see all existing email addresses or add a new address. • Lowest Severity - Specifies the lowest severity level. Logs below the severity level selected here will not be exported.

Network Log

Option	Description
Enable	Select the check box to enable the network logging function.
Cache	<p>Select the check box to export network logs to the cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached network logs. The value range is 4096 to 524288 bytes. The default value may vary for different hardware platforms.
File	<p>Select the check box to send a syslog to a file.</p> <ul style="list-style-type: none"> Max File Size - Specifies the maximum size of the syslog file. The value range is 4096 to 1048576 bytes. The default value is 1048576 bytes. Save logs to USB - Select the check box and select a USB drive (USB0 or USB1) from the drop-down list. Type a name for the syslog file into the File Name box.
Log Server	<p>Select the check box to export network logs to the syslog server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server.

Configuration Log

Option	Description
Enable	Select the check box to enable the configuration logging function.
Cache	<p>Select the check box to export configuration logs to the cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached configuration logs. The value range is 4096 to 524288 bytes. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export network logs to the syslog server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add new server.

Option	Description
Log Speed Limit	<p>Select the check box to define the maximum efficiency of generating logs.</p> <ul style="list-style-type: none"> Maximum Speed - Specified the speed (messages per second).

Session Log

Option	Description
Enable	<p>Select the check box to enable the session logging function.</p> <ul style="list-style-type: none"> Record User Name: Select to show the user's name in the session log messages. Record Host Name: Select to show the host's name in the session log messages.
Cache	<p>Select the check box to export session logs to cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached session logs. The value range is 4096 to 2097152 bytes. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export session logs to the syslog server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

PBR Log

Option	Description
Enable	Select the check box to enable a PBR logging function.

Option	Description
	<ul style="list-style-type: none"> Record User Name: Select to show the user's name in the PBR log messages. Record Host Name: Select to show the host's name in the PBR log messages.
Cache	<p>Select the check box to export PBR logs to the cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached PBR logs. The value range is 4096 to 2097152 bytes. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export PBR logs to the syslog server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of plain text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

NAT Log

Option	Description
Enable	<p>Select the check box to enable the NAT logging function.</p> <ul style="list-style-type: none"> Record Host Name: Select to show the host's name in the NAT log messages.
Cache	<p>Select the check box to export NAT logs to cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached NAT logs. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export NAT logs to log servers.</p>

Option	Description
	<ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

URL Log

Option	Description
Enable	<p>Select the check box to enable the URL logging function.</p> <ul style="list-style-type: none"> Record Host Name: Select to show the host's name in the URL log messages.
Cache	<p>Select the check box to export URL logs to the cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached URL logs. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export URL logs to a log server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

File Filter Log

Option	Description
Enable	Select this check box to enable the File Filter logging function.

Option	Description
Cache	<p>Select the check box to export File Filter logs to cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached File Filter logs. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export File Filter logs to log server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

Content Filtering Log

Option	Description
Enable	Select this check box to enable the Content Filter logging function.
Cache	<p>Select the check box to export Content Filter logs to cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached Content Filter logs. The default value may vary for different hardware platforms.
Log Server	<p>Select the check box to export Content Filter logs to log server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

Network Behavior Record Log

Option	Description
Enable	Select this check box to enable the Network Behavior Record logging function.
Cache	<p>Select the check box to export Network Behavior Record logs to cache.</p> <ul style="list-style-type: none"> Max Buffer Size - The maximum size of the cached Network Behavior Record logs. The default value may vary from different hardware platforms.
Log Server	<p>Select the check box to export Network Behavior Record logs to log server.</p> <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server. Syslog Distribution Methods - The distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.

Threat Log

Option	Description
Enable	Select this check box to enable the threat logging function.
Cache	<p>Select the check box to export threat logs to the cache.</p> <ul style="list-style-type: none"> Max buffer size - The maximum size of the cached threat logs. The default value may vary from different hardware platforms. Lowest Severity - Specifies the lowest severity level. Logs below the severity level selected here will not be exported.
File	<p>Select to export threat logs as a file to USB.</p> <ul style="list-style-type: none"> Lowest Severity - Specifies the lowest severity

Option	Description
	<p>level. Logs below the severity level selected here will not be exported.</p> <ul style="list-style-type: none"> • Max File Size - Exported log file maximum size. • Save logs to USB - Select a USB device and enter a name as the log file name.
Terminal	Select to send logs to terminals.
Log Server	<p>Select the check box to export threat logs to log server.</p> <ul style="list-style-type: none"> • View Log Server - Click to see all existing syslog servers or to add a new server. • Syslog Distribution Methods - the distributed logs can be in the format of binary or text. If you select the check box, you will send log messages to different log servers, which will relieve the pressure of a single log server. The algorithm can be Round Robin or Src IP Hash.
Email address	<p>Select the check box to export logs to the specified email address.</p> <ul style="list-style-type: none"> • Viewing Email Address: Click to see or add email address.
Database	<p>Select the checkbox to save logs in the local device. Only several platforms support this parameters.</p> <ul style="list-style-type: none"> • Disk Space - Enter a number as the percentage of a storage the logs will take. For example, if you enter 30, the threat logs will take at most 30% of the total disk size. • Disk Space Limit - If Auto Overwrite is selected, the logs which exceed the disk space will overwrite the old logs automatically. If Stop Storing is selected, system will stop storing new logs when the logs exceed the disk space.

Share Access Log

Option	Description
Enable	Select this check box to enable the Share Access logging function.
Console	Select to export Share Access logs to the console.
Cache	Select the check box to export Share Access logs to the cache. <ul style="list-style-type: none"> Max buffer size - The maximum size of the cached Share Access logs.
Log Server	Select the check box to export Share Access logs to log server. <ul style="list-style-type: none"> View Log Server - Click to see all existing syslog servers or to add a new server.

Log Configuration

You can create log server, set up log email address, and add UNIX servers.

Creating a Log Server

To create a log server, take the following steps:

1. Select **Monitor > Log > Log Configuration**.
2. Click **Log Server Configuration** tab.
3. Click **New**.

In the Log Server Configuration dialog box, configure these values.

Option	Description
Hostname	Enter the name or IP of the log server.
Binding	Specifies the source IP address to receive logs. <ul style="list-style-type: none"> Virtual Router: Select Virtual Router and then select a virtual router from the drop-down list. If a virtual router is selected, the device will determine the source IP address by searching the reachable routes in the virtual router. Source Interface: Select Source Interface and then select a source interface from the drop-down list. The

Option	Description
	device will use the IP address of the interface as the source IP to send logs to the syslog server. If management IP address is configured on the interface, the management IP address will be preferred.
Protocol	Specifies the protocol type of the syslog server. If "Secure-TCP" is selected, you can select Do not validate the server certificate option, and system can transfer logs normally and do not need any certifications.
Port	Specifies the port number of the syslog server.
Log Type	Specifies the log types the syslog server will receive.

4. Click **OK** to save the settings.

Notes: You can add at most 3 log servers.

Configuring Log Encoding

The default encoding format for the log information that is output to the log server is utf-8, and the user can start GBK encoding as needed. After the GBK encoding format is opened, the log encoding format that is output to the log server will be GBK encoding. To enable the GBK encoding :

1. Select **Monitor > Log > Log Configuration**.
2. Click **Log Server Configuration** tab.
3. Click the **Log Encoding Configuration** button in the upper right corner to open the Log Encoding Config dialog box.
4. Select the check box to enable the GBK encoding.
5. .Click **OK** to save the settings.

Adding Email Address to Receive Logs

An email in the log management setting is an email address for receiving log messages.

To add an email address, take the following steps:

1. Select **Monitor > Log > Log Configuration**.

2. Click **Web Mail Configuration** tab.

3. Enter an email address and click **Add**.
4. If you want to delete an existing email, click **Delete**.

Notes: You can add at most 3 email addresses.

Specifying a Unix Server

To specify a Unix server to receive logs, take the following steps:

1. Select **Monitor > Log > Log Configuration**.
2. Click the **Facility Configuration** tab.

3. Select the device you want and the logs will be exported to that Unix server.
4. Click **OK**.

Chapter 13 Diagnostic Tool

This feature may not be available on all platforms. Please check your system's actual page if your device delivers this feature.

System supports the following diagnostic methods:

- Test Tools: DNS Query, Ping and Traceroute can be used when troubleshooting the network.

Test Tools

DNS Query, Ping and Traceroute can be used when troubleshooting the network.

DNS Query

To check the DNS working status of the device, take the following steps:

1. Select **System** > **Diagnostic Tool** > **Test Tools**.
2. Type a domain name into the **DNS Query** box.
3. Click **Test**, and the testing result will be displayed in the list below.

Ping

To check the network connecting status, take the following steps:

1. Select **System** > **Diagnostic Tool** > **Test Tools**.
2. Type an IP address into the **Ping** box.
3. Click **Test**, and the testing result will be displayed in the list below.
4. The testing result contains two parts:
 - The Ping packet response. If there is no response from the target after timeout, it will print Destination Host Not Response, etc. Otherwise, the response contains sequence of packet, TTL and the response time.
 - Overall statistics, including number of packet sent, number of packet received, percentage of no response, the minimum, average and maximum response time.

Traceroute

Traceroute is used to test and record gateways the packet has traversed from the originating host to the destination. It is mainly used to check whether the network connection is reachable, and analyze the broken point of the network. The common Traceroute function is performed as follows: first, send a packet with TTL 1, so the first hop sends back an ICMP error message to indicate that this packet can not be sent (because of the TTL timeout); then this packet is re-sent, with TTL 2, TTL timeout is sent back again; repeat this process till the packet reaches the destination. In this way, each ICMP TTL timeout source address is recorded. As the result, the path from the originating host to the destination is identified.

To test and record gateways the packet has traversed by Traceroute, take the following steps:

1. Select **System** > **Diagnostic Tool** > **Test Tools**.
2. Type an IP address into the **Traceroute** box.
3. Click **Test**, and the testing result will be displayed in the list below.

Chapter 14 High Availability

HA, the abbreviation for High Availability, provides a fail-over solution for communications lines or device failure to ensure the smooth communication and effectively improve the reliability of the network. To implement the HA function, you need to configure the two devices as HA clusters, using the identical hardware platform and firmware version, both enabling Virtual Router and AV functions, with anti-virus license installed. When one device is not available or can not handle the request from the client properly, the request will be promptly directed to the other device that works normally, thus ensuring uninterrupted network communication and greatly improving the reliability of communications.

System supports three HA modes: Active-Passive (A/P), Active-Active (A/A), and Peer.

- **Active-Passive (A/P) mode:** In the HA cluster, configure two devices to form an HA group, with one device acting as a primary device and the other acting as its backup device. The primary device is active, forwarding packets, and meanwhile synchronizes all of its network and configuration information and current session information to the backup device. When the primary device fails, the backup device will be promoted to primary and takes over its work to forward packets. This A/P mode is redundant, and features a simple network structure for you to maintain and manage.
- **Active-Active (A/A) mode:** When the security device is in NAT mode, routing mode or a combination of both, you can configure two FS devices in the HA cluster as active, so that the two devices are running their own tasks simultaneously, and monitoring the operation status of each other. When one device fails, the other will take over the work of the failure device and also run its own tasks simultaneously to ensure uninterrupted work. This mode is known as the Active-Active mode. The A/A mode has the advantage of high-performance, as well as load-balancing.
- **Peer mode:** the Peer mode is a special HA Active-Active mode. In the Peer mode, two devices are both active, perform their own tasks simultaneously, and monitor the operation status of each other. When one device fails, the other will take over the work of the failure device and also run its own tasks simultaneously. In the Peer mode, only the device at the active status can send/receive packets. The device at the disabled status can make two devices have the same configuration information but its interfaces do not send/receive any packets. The Peer mode is more flexible and is suitable for the deployment in the asymmetric routing environment.

HA Active-Active (A/A) and Peer mode may not be available on all platforms. Please check your system's actual page to see if your device delivers this feature.

Basic Concepts

HA Cluster

For the external network devices, an HA cluster is a single device which handles network traffic and provides security services. The HA cluster is identified by its cluster ID. After specifying an HA cluster ID for the device, the device will be in the HA state to implement HA function.

HA Group

System will select the primary and backup device of the same HA group ID in an HA cluster according to the HCMP protocol and the HA configuration. The primary device is in the active state and processes network traffic. When the primary device fails, the backup device will take over its work.

When assigning a cluster ID to the device, the HA group with ID 0 will be automatically created. In Active-Passive (A/P) mode, the device only has HA group 0. In Active-Active (A/A) mode, the latest FS version supports two HA groups, i.e., Group 0 and Group 1.

HA Node

To distinguish the HA devices in an HA group, you can use the value of HA Node to mark the devices. FSOS support the values of 0 and 1.

In the HA Peer mode, the system can decide which device is the master according to the HA Node value. In the HA group 0, the device whose HA Node value is 0 will be active and the device whose HA Node value is 1 is at the disabled status. In the HA group 1, this does not make sense because both times is HA Node value of 0

Virtual Forward Interface and MAC

In the HA environment, each HA group has an interface to forward traffic, which is known as the Virtual Forward Interface. The primary device of each HA group manages a virtual MAC (VMAC) address which is corresponding with its interface, and the traffic is forwarded on the interface. Different HA groups in an HA cluster cannot forward data among each other. VMAC address is defined by HA base MAC, HA cluster ID, HA group ID and the physical interface index.

HA Selection

In an HA cluster, if the group ID of the HA devices is the same, the one with higher priority will be selected as the primary device.

HA Synchronization

To ensure the backup device can take over the work of the primary device when it fails, the primary device will synchronize its information with the backup device. There are three types of information that

can be synchronized: configuration information, files and RDO (Runtime Dynamic Object). The specific content of RDO includes:

- Session information (The following types of session information will not be synchronized: the session to the device itself, tunnel session, deny session, ICMP session, and the tentative session)
- IPsec VPN information
- SCVPN information
- DNS cache mappings
- ARP table
- PKI information
- DHCP information
- MAC table
- WebAuth information

System supports two methods to synchronize: real-time synchronization and batch synchronization. When the primary device has just been selected successfully, the batch synchronization will be used to synchronize all information of the primary device to the backup device. When the configurations change, the real-time synchronization will be used to synchronize the changed information to the backup device. Except for the HA related configurations and local configurations (for example, the host name), all the other configurations will be synchronized.

Configuring HA

To configure the HA function, take the following steps:

1. Configure an HA Virtual Forward Interface. For more information on configuring the interface, see "[Configuring an Interface](#)".
2. Configure an HA link interface which is used for the device synchronization and HA packets transmission.
3. Configure an HA cluster. Specify the ID of HA cluster to enable the HA function.
4. Configure an HA group. Specify the priority for devices and HA messages parameters.

You need to configure the HA data link interface when configuring the HA function, and make sure the HA group interface 0 and interface 1 can be configured as an HA control link interface, but not an HA data link interface.

To configure HA, take the following steps:

1. Go to **System > HA**.

Option	Description
Control link interface 1	Specifies the name of the HA control link interface. The control link interface is used to synchronize all data between two devices.
Control link interface 2	Specifies the name of HA control link interface (Backup device).
Data link interface	Specifies the name of the HA data link interface. The data link interface is used to synchronize the data packet information. After specifying this data link, the session information will be synchronized over this data link. You can configure the physical interface or aggregate interface as the interface of the data link and you can specify at most 1 HA data link interface.
IP address	Specifies the IP address and netmask of the HA link interface.
HA cluster ID	Specifies an ID for HA cluster. When the length of prefix is set to 7 hexadecimal, the ID ranges from 1~128. When the length of prefix is set to 8 or by default, the ID ranges from 1~8. None indicates to disable the HA function.
Node ID	After enabling the HA function, specify the Node ID (HA Node) for the device. The IDs for two devices must be different. The range is 0 to 1. If you do not specify this value, the devices will obtain the Node ID by automatic negotiation.
Peer-mode	Selects the Enable checkbox to enable the HA Peer mode and specifies the role of this device in the HA cluster. The range is 0 to 1. By default, the group 0 in the device whose HA Node ID is 0 will be active and the group 0 in the device whose HA Node ID is will be in the disabled status.
Symmetric-routing	Select Symmetric-routing to make the device work in the

Option	Description
	symmetrical routing environment.
HA Synchronize Configuration	In some exceptional circumstances, the master and backup configurations may not be synchronized. In such a case you need to manually synchronize the configuration information of the master and backup device. Click HA Synchronize Configuration to synchronize the configuration information of the master and backup device.
HA Synchronize Session	By default the system will synchronize sessions between HA devices automatically. Session synchronization will generate some traffic, and will possibly impact device performance when the device is overloaded. You can enable automatic HA session synchronization according to the device workload to assure stability. Click HA Synchronize Session to enable automatic HA session synchronization.
New	After specifying the HA cluster ID, the system will create the HA group 0 automatically. Click New to create the HA group 1.
Delete	Click Delete to remove HA group 1 if needed.
Priority	Specifies the priority for the device. The device with higher priority (smaller number) will be selected as the primary device.
Preempt	Configure the preempt mode. When the preempt mode is enabled, once the backup device finds that its own priority is higher than the primary device, it will upgrade itself to become the primary device and the original primary device will become the backup device. The value of 0 indicates to disable the preempt mode. When the preempt mode is disabled, even if the device's priority is higher than the primary device, it will not take over the primary device unless the primary device fails.
Hello interval	Specifies the Hello interval value. The Hello interval refers to the interval for the HA device to send heartbeats (Hello packets) to other devices in the HA group. The Hello interval in the same HA group must be identical.

Option	Description
Hello threshold	Specifies the threshold value of the Hello message. If the device does not receive the specified number of Hello messages from the other device, it will suppose the other device's heartbeat stops.
Gratuitous ARP packet number	Specifies the number of gratuitous ARP packets. When the backup device is selected as the primary device, it will send an ARP request packet to the network to inform the relevant network devices to update its ARP table.
Track object	Specifies the track object you have configured. The track object is used to monitor the working status of the device. Once finding the device stop working normally, system will take the corresponding action.
Description	Type the descriptions of HA group into the box.

2. Click **OK**.

Chapter 15 System Management

The device's maintenance and management include:

- ["System Information"](#)
- ["Device Management"](#)
- ["Configuration File Management"](#)
- ["SNMP"](#)
- ["Upgrading System"](#)
- ["License"](#)
- ["Mail Server"](#)
- ["Test Tools"](#)
- ["VSYS \(Virtual System\)"](#)

System Information

Users can view the general information of the system in the System Information page, including Serial Number, Hostname, Platform, System Time, System Uptime, Firmware, Signature Database and so on.

Viewing System Information

To view system information, select **System > System Information**.

Option	Description
Serial Number	Show the serial number of device.
Hostname	Show the name of device.
Platform	Show the platform model of device.
System Time	Show the system date and time of device.
System Uptime	Show the system uptime of device.
HA State	Show the HA status of device. <ul style="list-style-type: none"> • Standalone: Non-HA mode that represents HA is disabled. • Init: Initial state. • Hello: Negotiation state that represents the

Option	Description
	<p>device is consulting the relationship between the master and backup.</p> <ul style="list-style-type: none"> • Master: Master state that represents the current device is the master. • Backup: Backup state that represents the current device is the backup. • Failed: Fault state that represents the device has failed.
Firmware	Show the current firmware version of the device.
Boot File	Show the current boot file version of the device.
AntiVirus Signature	Show the current version of the antivirus signature database and the date of the last update.
IPS Signature	Show the current version of the IPS signature database and the date of the last update.
URL Category Signature	Show the current version of the URL signature database and the date of the last update.
Application Identification Signature	Show the current version of the application signature database and the date of the last update.

Notes: The signature is all license controlled, so you need to make sure that your system has installed that license. Refer to "[License](#)".

Device Management

Introduces how to configure the Administrator, Trust Host, MGT Interface, System Time, NTP Key and system options.

Administrators

Device administrators of different roles have different privileges. The system supports pre-defined administrator roles and customized administrator roles. By default, the system supports the following administrators, which cannot be deleted or edited:

- **admin:** Permission for reading, executing and writing. This role has the authority over all features. You can view the current or historical configuration information.
- **admin-read-only:** Permission for reading and executing. You can view the current or historical configuration information.
- **operator:** Permission for reading, executing and writing. You have the authority over all features except modify the Administrator's configuration, view the current or historical configuration information , but no permission to check the log information.
- **auditor:** You can only operate on the log information, including view, export and clear.

The following table shows the permissions to different types of administrators.

Operation	Administrator	Administrator(read-only)	Auditor	Operator
Configure (including saving configuration)	✓	✗	✗	✓
Configure administrator	✓	✗	✗	✗
Restore factory default	✓	✗	✗	✗
Delete configuration file	✓	✗	✗	✓
Roll back configuration	✓	✗	✗	✓
Reboot	✓	✗	✗	✗
View configuration information	✓	✓	✗	✓
View log information	✓	✓	✓	✗
Modify current admin password	✓	✓	✗	✓
ping/traceroute	✓	✓	✗	✓

Notes:

- The device ships with a default administrator named admin. You can modify the setting of admin. However, this account cannot be deleted.
- Other administrator roles (except default administrator) cannot configure the admin settings, except modifying its own password.
- The system auditor can manage one or more logs, but only the system administrator can manage the log types.

VSYS Administrator

Administrators in different VSYSs are independent from each other. Administrators in the root VSYS are known as root administrators and administrators in the non-root VSYS are known as non-root administrators. The system supports four types of administrator, including Administrator, Administrator(read-only), Operator, and Auditor.

When creating VSYS administrators, you must follow the rules listed below:

- Backslash (\) cannot be used in administrator names.
- The non-root administrators are created by root administrators or root operators after logging into the non-root VSYS.
- After logging into the root VSYS, the root administrators can switch to the non-root VSYS and configure it.
- Non-root administrators can enter the corresponding non-root VSYS after a successful login, but the non-root administrators cannot switch to the root VSYS.
- Each administrator name should be unique in the VSYS it belongs to, while administrator names can be the same in different VSYSs. In such a case, when logging in, you must specify the VSYS the administrator belongs to in form of vsys_name\admin_name. If no VSYS is specified, you will enter the root VSYS.

The following table shows the permissions to different types of VSYS administrators.

Operation	Root VSYS Administrator	Root VSYS Administrator(read-only)	Root VSYS Auditor	Root VSYS Operator	Non-root VSYS Administrator	Non-root VSYS Administrator(read-only)	Non-root VSYS Operator	Non-root VSYS Auditor
Configure (including	✓	✗	✗	✓	✓	✗	✓	✗

Operation	Root VSYS Administrator	Root VSYS Administrator(read-only)	Root VSYS Auditor	Root VSYS Operator	Non-root VSYS Administrator	Non-root VSYS Administrator(read-only)	Non-root VSYS Operator	Non-root VSYS Auditor
saving configuration)								
Configure administrator	✓	χ	χ	χ	✓	χ	χ	χ
Restore factory default	✓	χ	χ	χ	χ	χ	χ	χ
Delete configuration file	✓	χ	χ	✓	✓	χ	✓	χ
Roll back configuration	✓	χ	χ	✓	✓	χ	✓	χ

View log information	✓	✓	✓	χ	✓	✓	χ	✓
Modify current admin password	✓	✓	✓	✓	✓	✓	✓	✓
ping/trace route	✓	✓	χ	✓	✓	✓	✓	χ

Creating an Administrator Account

To create an administrator account, take the following steps:

1. Select **System > Device Management > Administrators**.
2. Click **New**.
3. In the Configuration dialog box, configure the following.

Configure the following options.

Option	Description
Name	Type a name for the system administrator account.
Role	<p>From the Role drop-down list, select a role for the administrator account. Different roles have different privileges.</p> <ul style="list-style-type: none"> • Administrator: Permission for reading, executing and writing. This role has the authority over all features. • Operator: This role has the authority over all features except modifying the Administrator's configurations, and has no permission to check the log information • Auditor: You can only operate on the log information, including the view, export and clear. • Administrator-read-only: Permission for reading and executing. You can view the current or historical configuration information.
Password	Type a login password for the admin into the Password box. The password should meet the requirements of Password Strategy.
Confirm Password	Re-type the password into the Confirm Password box.
Login Type	Select the access method(s) for the admin, including Console, Telnet, SSH, HTTP and HTTPS. If you need all access methods, select Select All .
Description	Enter descriptions for the administrator account.

4. Click **OK**.

Admin Roles

Device administrators of different roles have different privileges. The system supports pre-defined administrator roles and customized administrator roles. The pre-defined administrator role cannot be deleted or edited. You can customize administrator roles according to your requirements:

To create a new administrator role, take the following steps:

1. Select **System > Device Management > Admin Roles**.
2. Click **New**.
3. In the Configuration dialog box, configure the following:

Option	Description
Role	Enter the role name.
CLI	Specify the administrator role's privileges of CLI.
WebUI	Click module name to set the administrator role's privilege.  represents the administrator role does not have privilege of the specified module, and cannot read and edit the configurations of the specified module.  represents the administrator role has the read privilege of the specified module, and cannot edit the configurations.  represents the administrator role can read and edit the configurations of the specified module.
Description	Specify the description for this administrator role.

4. Click **OK** to save the settings.

Trusted Host

The device only allows the trusted host to manage the system to enhance the security. Administrator can specify an IP range, and hosts in the specified IP range are trusted hosts. Only trusted hosts could access the management interface to manage the device.

Notes: If the system cannot be managed remotely, check the trusted host configuration.

Creating a Trusted Host

To create a trust host, take the following steps:

1. Select **System > Device Management > Trusted Host**.

2. Click **New**.
3. In the Trusted Host Configuration dialog box, configure these values.

Configure the following options.

Option	Description
Type	<p>Specifies the type of host. You can select IP/Netmask or IP Range.</p> <ul style="list-style-type: none"> • IP/Netmask: Type the IP address and netmask into the IP box respectively. • IP Range: Type the start IP and end IP into the IP box respectively.
Login Type	Select the access methods for the trust host, including Telnet, SSH, HTTP and HTTPS.

4. Click **OK**.

Management Interface

The device supports the following access methods: Console, Telnet, SSH and WebUI. You can configure the timeout value, port number, PKI trust domain of HTTPS, and PKI trust domain of certificate authentication. When accessing the device through Telnet, SSH, HTTP or HTTPS, if login fails three times in one minute, the IP address that attempts the login will be blocked for 2 minutes during which the IP address cannot connect to the device.

To configure the access methods:

1. Select **System > Device Management > Management Interface**.
2. In the Management Interface tab, configure these values.

Configure the following options.

Option	Description
Console	<p>Configure the Console access method parameters.</p> <ul style="list-style-type: none"> • Timeout: Type the Console timeout value into the Timeout box. The value range is 0 to 60. The default value is 10. The value of 0 indicates never timeout. If there is no activity until the timeout, system will drop the console connection.

Option	Description
Telnet	Configure the Telnet access method parameters. <ul style="list-style-type: none"> • Timeout: Specifies the Telnet timeout value. The value range is 1 to 60. The default value is 10. • Port: Specifies the Telnet port number. The value range is 1 to 65535. The default value is 23.
SSH	Configure the SSH access method parameters. <ul style="list-style-type: none"> • Timeout: Specifies the SSH timeout value. The value range is 1 to 60. The default value is 10. • Port: Specifies the SSH port number. The value range is 1 to 65535. The default value is 22.
Web	Configure the WebUI access method parameters. <ul style="list-style-type: none"> • Multiple Login with Same Account: Select the check box and users are allowed to log in to devices with the same account simultaneously. By default, the function is disabled. In the default situation, when a same account is used to log in again, the previous login account will be kicked out. • Timeout: Specifies the WebUI timeout value. The value range is 1 to 1440. The default value is 10. • HTTP Port: Specifies the HTTP port number. The value range is 1 to 65535. The default value is 80. • HTTPS Port: Specifies the HTTPS port number. The value range is 1 to 65535. The default value is 443. • HTTPS Trust Domain: Select the trust domain existing in the system from the drop-down list. When HTTPS starts, HTTPS server will use the certificate with the specified trusted domain. By default, the trust domain trust_domain_default will be used. • Certificate Authentication: With this checkbox selected, system will start the certificat authentication. The certificate includes the digital certificate of users and secondary CA certificate signed by the root

Option	Description
	<p>CA.Certificate authentication is one of two-factor authentication. The two-factor authentication does not only need the user's name and password authentication, but also needs other authentication methods, like a certificate or fingerprint.</p> <ul style="list-style-type: none"> • Certificate Trust Domain: After enabling the certificate authentication and logging into the device over HTTPS, HTTPS server will use the certificate with the specified trusted domain. Make sure that root CA certificate is imported into it. • CN Check: After the CN check is enabled, the name of the root CA certificate is checked and verified when the user logs in. Only the certificate and the user can be consistent, and the login succeeds.

3. Click **OK**.

Notes: When changing HTTP port, HTTPS port or HTTPS Trust Domain, the web server will restart. You may need to log in again if you are using the Web interface.

System Time

You can configure the current system time manually, or synchronize the system time with the NTP server time via NTP protocol.

Configuring the System Time Manually

To configure the system time manually, take the following steps:

1. Select **System > Device Management > System Time**.
2. Under System Time Configuration in the System Time tab, configure the following.

Option	Description
Sync with Local PC	<p>Specifies the method of synchronize with local PC. You can select Sync Time or Sync Zone&Time.</p> <ul style="list-style-type: none"> • Sync Time: Synchronize the system time with local PC. • Sync Zone&Time: Synchronize the system

Option	Description
	zone&time with local PC.
Specified the system time.	Configure parameter of system time. <ul style="list-style-type: none"> • Time Zone: Select the time zone from the drop-down list. • Date: Specifies the date. • Time: Specifies the time.

3. Click **OK**.

Configuring NTP

The system time may affect the establishment time of VPN tunnel and the schedule, so the accuracy of the system time is very important. To ensure the system is able to maintain an accurate time, the device allows you to synchronize the system time with a NTP server on the network via NTP protocol.

To configure NTP:

1. Select **System > Device Management > System Time**.
2. Under NTP Configuration in the System Time tab, configure the following.

Option	Description
Enable	Select the Enable check box to enable the NTP function. By default, the NTP function is disabled.
Authentication	Select the Authentication check box to enable the NTP Authentication function.
Server	Specifies the NTP server that device need to synchronize with. You can specify at most 3 servers. <ul style="list-style-type: none"> • IP: Type IP address of the server . • Key: Select a key from the Key drop-down list. If you enable the NTP Authentication function, you must specify a key. • Virtual Router: Select the Virtual Router of interface for NTP communication from the drop-down list. • Source interface: Select an interface for

Option	Description
	<p>sending and receiving NTP packets.</p> <ul style="list-style-type: none"> Specify as a preferred server: Click Specify as a preferred server to set the server as the first preferred server. The system will synchronize with the first preferred server.
Sync Interval	Type the interval value. The device will synchronize the system time with the NTP server at the interval you specified to ensure the system time is accurate.
Time Offset	Type the time value. If the time difference between the system time and the NTP server's time is within the max adjustment value you specified, the synchronization will succeed, otherwise it will fail.

- Click **OK**.

NTP Key

After enabling NTP Authentication function, you need to configure MD5 key ID and keys. The device will only synchronize with the authorized servers.

Creating a NTP Key

To create an NTP key:

- Select **System > Device Management > NTP Key**.
- Click **NEW**.
- In the NTP Key Configuration dialog box, configure these values.

Configure the following options.

Option	Description
Key ID	Type the ID number into the Key ID box. The value range is 1 to 65535.
Password	Type a MD5 key into the Password box. The value range is 1 to 31.
Confirm Password	Re-type the same MD5 key you have entered into the Confirm box.

- Click **OK**.

Option

Specifies system options, including system language, administrator authentication server, host name, password strategy, reboot and exporting the system debugging information.

To change system option, take the following steps:

1. Select **System > Device Management > Option**
2. Configure the following.

Option	Description
System Maintenance	<p>Configure the system language and administrator authentication server.</p> <ul style="list-style-type: none"> • System Language: You can select Chinese or English according to your own requirements. • Administrator Authentication Server: Select a server to authenticate the administrator from the drop-down list.
Host Configuration	<p>In some situation, more than one devices are installed within a network. To distinguish among these devices, different names should be assigned to different devices. The default host name is assigned according to the model.</p> <ul style="list-style-type: none"> • Hostname: Type a host name you want to change into the Hostname box. • Domain: Type a domain name you want to specify into the Domain box.
Password Strategy	<p>Configure password complexity for admin user.</p> <ul style="list-style-type: none"> • Minimum Password Length: Specifies the minimum length of password. The value range is 4 to 16 characters. The default value is 4. • Password Complexity: Unlimited means no restriction on the selection of password characters. You can select Set Password Complexity to enable password complexity checking and configure password complexity. <ul style="list-style-type: none"> • Capital letters length: The default

Option	Description
	<p>value is 2 and the range is 0 to 16.</p> <ul style="list-style-type: none"> • Small letters length: The default value is 2 and the range is 0 to 16. • Number letters length: The default value is 2 and the range is 0 to 16. • Special letters Length: The default value is 2 and the range is 0 to 16. • Validity Period: The unit is day.The range is 0 to 365.The default value is 0, which indicates that there is no restriction on validity period of the password.

3. Click **OK**.

Rebooting the System

Some operations like license installation or image upgrading will require the system to reboot before it can take effect.

To reboot a system, take the following steps:

1. Go to **System > Device Management > Option** .
2. Click **Reboot**, and select **Yes** in the prompt.
3. The system will reboot. You need to wait a while before it can start again.

System Debug

System debug is supported for you to check and analyze the problems.

Failure Feedback

To enable the failure feedback function, take the following steps:

1. Select **System > Device Management> Option**.
2. In the System Tools dialog box, select the **Enable** check box for Failure feedback, and then system will automatically send the technical support file to the manufacturer.

System Debug Information

System debugging helps you to diagnose and identify system errors by the exported file.

To export the system debugging information, take the following steps:

1. Select **System > Device Management > Option**.
2. Click **Export**, system will pack the file in /etc/local/core and prompt to save tech-support file. After selecting the saved location and click **OK**, you can export the file successfully.

Configuration File Management

System configuration information is stored in the configuration file, and it is stored and displayed in the format of command line. The information that is used to initialize the FS device in the configuration file is known as the initial configuration information. If the initial configuration information is not found, the FS device will use the default parameters for the initialization. The information being taking effect is known as the current configuration information.

System initial configuration information includes current initial configuration information (used when the system starts) and backup initial configuration information. System records the latest ten saved configuration information, and the most recently saved configuration information for the system will be recorded as the current initial configuration information. The current configuration information is marked as Startup; the previous nine configuration information is marked with number from 0 to 8, in the order of save time.

You can not only export or delete the saved configuration files, but also export the current system configurations.

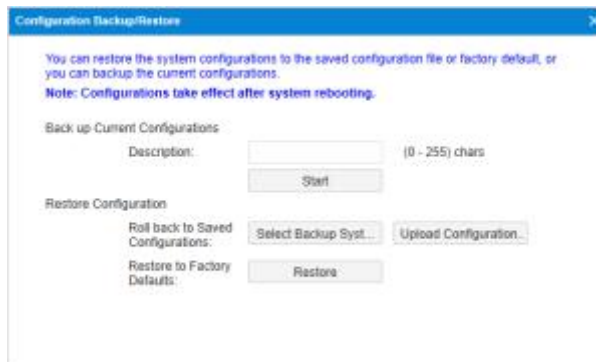

Managing Configuration File

This feature may vary slightly on different platforms. If there is a conflict between this guide and the actual page, the latter shall prevail.

To manage the system configuration files, take the following steps:

1. Select **System > Configuration File Management > Configuration File List**.
2. In the Configuration File List page, configure the following.
 - **Export**: Select the configuration file you want to export, and click **Export**.
 - **Delete**: Select the configuration file you want to delete, and click **Delete**.

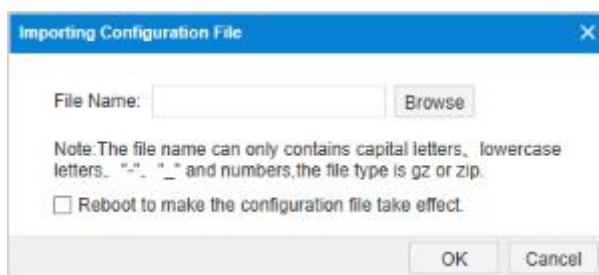

- **Backup Restore:** You can restore the system configurations to the saved configuration file or factory default, or you can backup the current configurations.

Option	Description
Back up Current Configurations	Type descriptions for the configuration file into Description box. Click Start to backup.
Restore Configuration	Roll back to Saved Configurations: <ul style="list-style-type: none"> • Select Backup System Configuration File: Click this button, then select Backup Configuration File from the list. Click OK. • Upload Configuration File: Click this button. In the Importing Configuration File dialog box, click Browse and choose a local configuration file you need in your PC. If you need to make the configuration file take effect, select the check box. Click OK. Restore to Factory Defaults: <ul style="list-style-type: none"> • Click Restore, in the Restore to Factory Defaults dialog box, click OK.

Notes: Device will be restored to factory defaults. Meanwhile, all the system configurations will be cleared, including backup system configuration files.

- **Export All Vsys Configuration:** Click **Export All Vsys Configuration** to export the current configuration file of VSYS.
- **Import All Vsys Configuration:** Click **Import All Vsys Configuration** to import the saved configuration file of VSYS.

Option	Description
File Name	Click Browse to select the configuration file needed to be imported. The file type can be GZ and ZIP.
Reboot to make the configuration file take effect	After importing the configuration file, you need to reboot the device to make the configuration file take effect. Select the Reboot to make the configuration file take effect checkbox and click OK to reboot the device immediately.

Viewing the Current Configuration

To view the current configuration file:

1. Select **System > Configuration File Management > Current Configurations**.
2. Click **Export** to export the current configuration file.

SNMP

The device is designed with a SNMP Agent, which can receive the operation request from the Network Management System and give the corresponding information of the network and the device.

The device supports SNMPv1 protocol, SNMPv2 protocol and SNMPv3 protocol. SNMPv1 protocol and SNMPv2 protocol use community-based authentication to limit the Network Management System to get device information. SNMPv3 protocol introduces an user-based security module for information security and a view-based access control module for access control.

The device supports all relevant Management Information Base II (MIB II) groups defined in RFC-1213 and the Interfaces Group MIB (IF-MIB) using SMIV2 defined in RFC-2233. Besides, the system offers a private MIB, which contains the system information, IPSec VPN information and statistics information of the device. You can use the private MIB by loading it into an SNMP MIB browser on the management host.

SNMP Agent

The device is designed with a SNMP Agent, which provides network management and monitors the running status of the network and devices by viewing statistics and receiving notification of important system events.

To configure an SNMP Agent, take the following steps:

1. Select **System > SNMP > SNMP Agent**.
2. In the SNMP Agent page, configure these values.

Option	Description
SNMP Agent	Select the Enable check box for Service to enable the SNMP Agent function.
ObjectID	The Object ID displays the SNMP object ID of the system. The object ID is specific to an individual system and cannot be modified.
System Contact	Type the SNMP system contact information of the device into the System Contact box. System contact is a management variable of the group system in MIB II and it contains the ID and contact of relevant administrator of the managed device. By configuring this parameter, you can save the important information to the device for the possible use in case of emergency.
Location	Type the location of the device into the Location box.
Host Port	Type the port number of the managed device into the Host Port box.
Virtual Router	Select the VRouter from the Virtual Router drop-down list.
Local EngineID	Type the SNMP engine ID into the Local EngineID box.

3. Click **Apply**.

Notes: SNMP Engine ID identifies an engine uniquely. SNMP Engine is an important component of the SNMP entity (Network Management System or managed network device) which implements the functions like the reception/sending and verification of SNMP messages, PDU abstraction, encapsulation, and communications with SNMP applications.

SNMP Host

To create an SNMP host, take the following steps:

1. Select **System > SNMP > SNMP Host**.
2. Click **New**.
3. In the SNMP Agent dialog box, configure these values.

Option	Description
Type	<p>Select the SNMP host type from the Type drop-down list. You can select IP Address, IP Range or IP/Netmask.</p> <ul style="list-style-type: none"> • IP Address: Type the IP address for SNMP host into Hostname box. • IP Range: Type the start IP and end IP into the Hostname box respectively. • IP/Netmask: Type the start IP address and Netmask for SNMP host into the Hostname box respectively.
SNMP Version	Select the SNMP version from the SNMP Version drop-down list.
Community	Type the community for the SNMP host into the Community box. Community is a password sent in clear text between the manager and the agent. This option is only effective if the SNMP version is V1 or V2C.
Permission	<p>Select the read and write permission for the community from the Permission drop-down list. This option is only effective if the SNMP version is V1 or V2C.</p> <ul style="list-style-type: none"> • RO: Stand for read-only, the read-only community is only allowed to read the MIB information. • RW: Stand for read-write, the read-write community is allowed to read and modify the MIB information.

4. Click **OK**.

Trap Host

To create a Trap host, take the following steps:

1. Select **System > SNMP > Trap Host**.
2. Click **New**.
3. In the Trap Host Configuration dialog box, configure these values.

Option	Description
Host	Type the domain name or IP address of the Trap host into the Host box.
Trap Host Port	Type the port number for the Trap host into the Trap Host Port box.
SNMP Agent	Select the SNMP version from the SNMP Agent drop-down list. <ul style="list-style-type: none"> • V1 or V2C: Type the community for the Trap host into the Community box. • V3: Select the V3 user from the V3 User drop-down list. Type the Engine ID for the trap host into the Engine ID box.

4. Click **OK**.

V3 User Group

SNMPv3 protocol introduces a user-based security module. You need to create an SNMP V3 user group for the SNMP host if the SNMP version is V3.

To create a V3 user group:

1. Select **System > SNMP > V3 User Group**.
2. Click **New**.
3. In the V3 Group Configuration dialog box, enter values.

Option	Description
Name	Type the SNMP V3 user group name into the Name box.
Security Model	The Security model option displays the security model for the SNMP V3 user group.
Security Level	Select the security level for the user group from the Security

Option	Description
	<p>Level drop-down list.</p> <p>Security level determines the security mechanism used in processing an SNMP packet. Security levels for V3 user groups include No Authentication (no authentication and encryption), Authentication (authentication algorithm based on MD5 or SHA) and Authentication and Encryption (authentication algorithm based on MD5 or SHA and message encryption based on AES and DES).</p>
Read View	Select the read-only MIB view name for the user group from the Read View drop-down list. If this parameter is not specified, all MIB views will be none.
Write View	Select the write MIB view name for the user group from the Write View drop-down list. If this parameter is not specified, all MIB views will be none.

4. Click **OK**.

V3 User

If the selected SNMP version is V3, you need to create an SNMP V3 user group for the SNMP host and then add users to the user group.

To create a user for an existing V3 user group, take the following steps:

1. Select **System > SNMP > V3 User**.
2. Click **New**.
3. In the V3 User Configuration dialog box, configure these values.

Option	Description
Name	Type the SNMP V3 user name into the Name box.
V3 User Group	Select an existing user group for the user from the Group drop-down list.
Security Model	The Security model option displays the security model for the SNMP V3 user.
Remote IP	Type the IP address of the remote management host into the Remote IP box.
Authentication	Select the authentication protocol from the Authentication drop-down list. By default, this parameter is None, i.e., no

Option	Description
	authentication.
Authentication Password	Type the authentication password into the Authentication password box.
Confirm Password	Re-type the authentication password into the Confirm Password box to confirm.
Encryption	Select the encryption protocol from the Encryption drop-down list.
Encryption Password	Type the encryption password into the Encryption Password box.
Confirm Password	Re-type the encryption password into the Confirm Password box to confirm.

4. Click **OK**.

SNMP Server

You can configure the SNMP server to get the ARP information through the SNMP protocol.

Creating an SNMP Server

To create an SNMP server, take the following steps:

1. Select **System > SNMP server**.
2. Click **New**.

In the SNMP Server Configuration dialog box, configure these values

Option	Description
Server IP	Type the SNMP server IP address into the Server IP box.
Port	Type the port number for the SNMP server into the Port box. The value range is 1 to 65535, the default value is 161.
Community	Type the community for the SNMP server into the Community box. This option is only effective if the SNMP version is V1 or V2C.
Virtual Router	Select the VRouter from the drop-down list.

Option	Description
Source Interface	Select the source interface from the drop-down list for receiving ARP information on the SNMP server.
Interval Time	Type the the interval into the Interval Time box for receiving ARP information on the SNMP server. The value range is 5 to 1800 seconds, the default value is 60 seconds.

3. Click **OK**.

Upgrading System

The firmware upgrade wizard helps you:

- Upgrade system to a new version or roll back system to a previous version.
- Update the Signature Database.

Upgrading Firmware

To upgrade firmware, take the following steps:

1. Select **System > Upgrade Management > Upgrade Firmware**.
2. In the Upgrade Firmware tab box, configure the following.

Upgrade Firmware	
Backup Configuration File	Make sure you have backed up the configuration file before upgrading. Click Backup Configuration File to backup the current firmware file and the system will automatically redirect the Configuration File Management page after the backup.
Current Version	The current firmware version.
Upload Firmware	Click Browse to select a firmware file from your local disk.
Backup Image	The backup firmware version.
Reboot	Select the Reboot now to make the new firmware take effect check box and click Apply to reboot system and make the firmware take effect. If you click Apply without selecting the check box, the firmware will take effect after the next startup.
Choose a Firmware for the next startup	
Select the	Select the firmware that will take effect for the next startup.

Upgrade Firmware	
firmware that will take effect for the next startup.	
Reboot	Select the Reboot now to make the new firmware take effect check box and click Apply to reboot system and make the firmware take effect. If you click Apply without selecting the check box, the firmware will take effect after the next startup.

Updating Signature Database

To update signature database, take the following steps:

1. Select **System > Upgrade Management > Signature Database Update**.
2. In the Signature Database Update tab box, configure the following.

Option	Description
Current Version	Show the current version number.
Remote Update	<p>Application signature database, URL signature database, Share Access Signature Database Update, Antivirus signature database, IPS signature database .</p> <ul style="list-style-type: none"> • Update Now: Click Update to update the signature database right now. • Auto Update: Select Enable Auto Update and specify the auto update time. Click Save to save your changes. • Configure Update Server: By default the system updates the signature database everyday automatically. You can change the update configuration as needed. FS devices provide two default update servers: https://Update1.fw1.fs.com and https://Update2.fw2.fs.com. You can customize the servers according to your need. In the pop-up Auto Update Settings dialog box, specify the server IP or domain name and Virtual Router.

Option	Description
	<ul style="list-style-type: none"> Configure Proxy Server: When the device accesses the Internet through a HTTP proxy server, you need to specify the IP address and the port number of the HTTP proxy server. With the HTTP proxy server specified, various signature database can update normally. Click Configure Proxy Server, then enter the IP addresses and ports of the main proxy server and the backup proxy server.
Local Update	Click Browse and select the signature file in your local PC, and then click Upload .

License

Licenses are used to authorize the users' features, authorize the users' services, or extend the performance. If you do not buy and install the corresponding license, the features, services, and performance which is based on the license will not be used or cannot be achieved.

License classes and rules.

Platform License	Description	Valid Time
Platform Trial	Platform license is the basis of the other licenses operation. If the platform license is invalid, the other licenses are not effective. The device have been pre-installed platform trial license for 15 days in the factory.	You cannot modify the existing configuration when License expires. The system will restore to factory defaults when the device reboot.
Platform Base	You can install the platform base license after the device formal sale. The license provide basic firewall and VPN function.	System cannot upgrade the OS version when the license expires, but the system could still work normally.
Function License	Description	Valid Time
VSYS	Authorizing the available number of VSYS.	Permanent

SSL VPN	Authorizing the maximum number of SSL VPN access. Through installing multiple SSL VPN licenses, you can add the maximum number of SSL VPN access.	Permanent
QoS	Enable iQoS function.	System cannot upgrade the iQoS function and cannot provide the maintenance service when License expired.
Service License	Description	Valid Time
AntiVirus	Providing antivirus function and antivirus signature database update.	System cannot update the antiviru signature database when the license expires, but the antivirus function could still be used normally.
URL	Providing URL database and URL signature database update.	System cannot provide the search URL database online function when the license expires, but the user-defined URL and URL filtering function can be used normally.
IPS	Providing IPS function and IPS signature database update.	System cannot update the IPS signature database when the license expires, but the IPS function could still be used normally.
APP signature	APP signature license is issued with platform license, you do not need to apply alone. The valid time of license is same as platform license.	>System cannot update the APP signature database when the license expires, but the included functions and rules could still be used

normally.

Viewing License List

Select **System > License** to enter the License List page. All licenses the system supports will be displayed in this page, including the authorized licenses and unauthorized licenses.

If there is license that is about to expire (the remaining valid period is within 30 days) or has expired:

- When you log into the device, the **License Expiration Information** dialog box will pop up, which prompts for licenses that are about to expire or have expired. Check the **Don't remind me again** checkbox so that the dialog box will never prompt again when you login. Click the **Update Now** button to jump to the License List page.
- The notification icon with the number of notifications is displayed in the upper-right corner. Hover your mouse over the icon, and click **Details** after the License Expiration Information, the **License Expiration Information** dialog will pop up.

Applying for a License

Before you apply for a license, you have to generate a license request first.

1. Under License Request, input user information. All fields are required.
2. Click **Generate**, and then appears a bunch of code.
3. Send the code to your sales contact. The sales person will issue the license and send the code back to you.

Installing a License

After obtaining the license, you must install it to the device.

To install a license, take the following steps:

1. Select **System > License** .
2. Under License installation in the License page, configure options below.

Option	Description
Upload	Select Upload License File . Click Browse to select the license file,

Option	Description
License File	using the 'TXT' format, and then click OK to upload it.
Manual Input	Select Manual Input . Type the license string into the box.

3. Click **OK**.
4. Go to **System > Device Management**, and click the **Option** tab.
5. Click **Reboot**, and select **Yes** in the prompt.
6. System will reboot. When it starts again, installed license(s) will take effect.

Mail Server

By configuring the SMTP server in the Mail Server page, the system can send the log messages to the specified email address.

Creating a Mail Server

To create a mail server, take the following steps:

1. Select **System > Mail Server**.
2. In the SMTP Server Configuration page, configure these values.

Option	Description
Name	Type a name for the SMTP server into the box.
Server	Type Domain name or IP address for the SMTP server into the box.
Virtual Router	From the Virtual Router drop-down list, select the Virtual Router for the SMTP server.
Verification	Select the Enable check box for SMTP verification to enable it if needed. Type the username and its password into the corresponding boxes.
Email	Type the email address that sends log messages.

3. Click **Apply**.

VSYS (Virtual System)

This feature may vary slightly on different platforms. If there is a conflict between this guide and the actual page, the latter shall prevail.

VSYS (Virtual System) is logically divides the physical firewall into several virtual firewalls. Each virtual firewall can work independently as a physical device with its own system resources, and it provides most firewall features. A VSYS is separated from other VSYS, and by default, they cannot directly communicate with each other.

VSYS has the following characteristics:

- Each VSYS has its own administrator;
- Each VSYS has an its own virtual router, zone, address book and service book;
- Each VSYS can have its own physical or logical interfaces;
- Each VSYS has its own security policies.

Notes: The maximum VSYS number is determined by the platform capacity and license. You can expand VSYS maximum number by purchasing addition licenses.

VSYS Objects

This section describes VSYS objects, including root VSYS, non-root VSYS, administrator, VRouter, VSwitch, zone, and interface.

Root VSYS and Non-root VSYS

System contains only one root VSYS which cannot be deleted. You can create or delete non-root VSYSs after installing a VSYS license and rebooting the device. When creating or deleting non-root VSYSs, you must follow the rules listed below:

- When creating or deleting non-root VSYSs through CLI, you must be under the root VSYS configuration mode.
- Only the root VSYS administrators and root VSYS operators can create or delete non-root VSYS. For more information about administrator permissions, see "[Device Management](#)".
- When creating a non-root VSYS, the following corresponding objects will be created simultaneously:
 - A non-root VSYS administrator named admin. The password is vsys_name-admin.
 - A VRouter named vsys_name-vr.
 - A L3 zone named vsys_name-trust.

For example, when creating the non-root VSYS named vsys1, the following objects will be created:

- The RXW administrator named admin with the password vsys1-admin.
- The default VRouter named vsys1-vr.
- The L3 zone named vsys1-trust and it is bound to vsys1-vr automatically.
- When deleting a non-root VSYS, all the objects and logs in the VSYS will be deleted simultaneously.
- The root VSYS contains a default VSwitch named VSwitch1, but there is no default VSwitch in a newly created non-root VSYS. Therefore, before creating l2 zones in a non-root VSYS, a VSwitch must be created. The first VSwitch created in a non-root VSYS will be considered as the default VSwitch, and the l2 zone created in the non-root VSYS will be bound to the default VSwitch automatically.

VRouter, VSwitch, Zone and Interface

VRouter, VSwitch, zone, and interface in VSYS have two properties which are shared and dedicated. Objects with dedicated property are dedicated objects, while doing specific operations to the object with the shared property will make it a shared object. The dedicated object and shared object have the following characters:

- **Dedicated object:** A dedicated object belongs to a certain VSYS, and cannot be referenced by other VSYSs. Both root VSYS and non-root VSYS can contain dedicated objects.
- **Shared object:** A shared object can be shared by multiple VSYSs. A shared object can only belong to the root VSYS and can only be configured in the root VSYS. A non-root VSYS can reference the shared object, but cannot configure them. The name of the shared object must be unique in the whole system.

The figure below shows the reference relationship among dedicated and shared VRouter, VSwitch, zone, and interface.

As shown in the figure above, there are three VSYSs in FSOS: Root VSYS, VSYS-A, and VSYS B.

Root VSYS contains shared objects (including Shared VRouter, Shared VSwitch, Shared L3-zone, Shared L2-zone, Shared IF1, and Shared IF2) and dedicated objects.

VSYS-A and VSYS-B only contain dedicated objects. The dedicated objects VSYS-A and VSYS-B can reference the shared objects in Root VSYS. For example, A-zone2 in VSYS-A is bound to the shared

object Shared VRouter in Root VSYS, and B-IF3 in VSYS-B is bound to the shared object Shared L2-zone in Root VSYS.

Shared VRouter

A shared VRouter contains the shared and dedicated L3 zones of the root VSYS. Bind a L3 zone to a shared VRouter and configure this L3 zone to have the shared property. Then this zone becomes a shared zone.

Shared VSwitch

A shared VSwitch contains the shared and dedicated L2 zones of the root VSYS. Bind a L2 zone to a shared VSwitch and configure this L2 zone to have the shared property. Then this zone becomes a shared zone.

Shared Zone

The shared zones consist of L2 shared zones and L3 shared zones. After binding the L2 zone with the shared property to a shared VSwitch, it becomes a shared L2 zone; after binding the L3 zone with shared property to a shared VRouter, it becomes a shared L3 zone. A shared zone can contain interfaces in both root VSYS and non-root VSYS. All function zones cannot be shared.

Shared Interface

After binding an interface in the root VSYS to a shared zone, it becomes a shared interface automatically.

Interface Configuration

Only RXW administrator in the root VSYS can create or delete interfaces. Configurations to an interface and its sub-interfaces must be performed in the same VSYS.

Notes: Only administrator has the authority to delete or create interfaces. If you are about to delete an interface and its subinterfaces, you have to do it under the same VSYS.

Creating Non-root VSYS

To create a new non-root VSYS, take the following steps:

1. Select **System > VSYS > VSYS**.
2. Click **New** to add a non-root VSYS.
3. In the prompt, configure these values.

Option	Description
Name	Enter a name for the non-root VSYS.

Option	Description
Interface Binding	<p>Select a physical or a logical interface. In VSYS, a physical interface can have its sub-interfaces, but logical interfaces cannot.</p> <ul style="list-style-type: none"> • Physically Import: Select the interface you want, and click Physically Import to add it to the right pane. • Logically Allocate: Select the interface you want, and click Logically Allocate to add it to the right pane. • Release: Select the added interface(s), and click Release to delete it.
Quota	Select an existing quota.

4. Click **OK** to save configuration. The new VSYS will be seen in the VSYS list.

Configuring Dedicated and Shared Objects for Non-root VSYS

VRouter, VSwitch, zone, and interface in VSYS have two properties which are shared and dedicated. Objects with dedicated property are dedicated objects, while doing specific operations to the object with the shared property will make it a shared object. The dedicated object and shared object have the following characters:

- **Dedicated object:** A dedicated object belongs to a certain VSYS, and cannot be referenced by other VSYSs. Both root VSYS and non-root VSYS can contain dedicated objects.
- **Shared object:** A shared object can be shared by multiple VSYSs. A shared object can only belong to the root VSYS and can only be configured in the root VSYS. A non-root VSYS can reference the shared object, but cannot configure them. The name of the shared object must be unique in the whole system.

To configure VSYS shared object, take the following steps:

1. Select **System > VSYS > VSYS**.
2. Click **Share Resource**.
3. In the prompt, configure these values for VSwitch, VRouter and Zone.

Option	Description
VSwitch	In the VSwitich tab, select a Vswitch and click Share to set it as a shared object; to make a VSwitch as a dedicated object, click Do Not Share .

Option	Description
Virtual Router	In the Virtual Router tab, select a Vswitch and click Share to set it as a shared object; to make a Virtual Router as a dedicated object, click Do Not Share .
Zone	In the Zone tab, select a Zone and click Share to set it as a shared object; to make a Zone as a dedicated object, click Do Not Share .

4. Click **Close** to exit.

Configuring VSYS Quota

VSYSs work independently in functions but share system resources including concurrent sessions, zone number, policy rule number, SNAT rule number, DNAT rule number, session limit rules number, memory buffer, URL resources , IPS resources and SCVPN users' number. You can specify the reserved quota and maximum quota for each type of system resource in a VSYS by creating a VSYS profile. Reserved quota refers to the resource number reserved for the VSYS; maximum quota refers to the maximum resource number available to the VSYS. The root administrator have the permission to create VSYS quota. The total for each resource of all VSYSs cannot exceed the system capacity.

To define a quota for VSYS, take the following steps:

1. Select **System > VSYS > Quota**.
2. Click **New** .
3. In the prompt, configure these values.

Option	Description
Basic Configuration	
Name	Enter a name for the new quota.
CPU	Specify values for parameters of CPU. <ul style="list-style-type: none"> • Limit: Specifies the maximum performance limit for processing 1 Mbps packets. • Reserve: A dedicated reserved value for CPU in this VSYS. The value range is 0 to 20000. • Alarm Threshold: Specifies a percentage value for alarms. When the CPU usage reaches this value, the system will generate alarm logs.

Option	Description
Basic Configuration	
System Resources	
System Resources	<p data-bbox="515 371 1244 450">Specify the maximum quota and reserved quota of system resources.</p> <ul style="list-style-type: none"> <li data-bbox="595 488 1284 566">• Sessions: Specifies the maximum and reserved number for sessions in the VSYS. <li data-bbox="595 604 1256 683">• Zone: Specifies the maximum and reserved number for zones in the VSYS. <li data-bbox="595 721 1323 799">• Policy rules: Specifies the maximum and reserved number for policy rules in the VSYS. <li data-bbox="595 837 1246 916">• Policy Groups: Specifies the maximum and reserved number for policy groups in the VSYS. <li data-bbox="595 954 1224 1032">• SNAT rules: Specifies the maximum and reserved number for SNAT rules in the VSYS. <li data-bbox="595 1070 1233 1149">• DNAT rules: Specifies the maximum and reserved number for SNAT rules in the VSYS. <li data-bbox="595 1187 1283 1312">• Stat-set (session): Specifies the maximum and reserved number for sessions of a static set in the VSYS. <li data-bbox="595 1350 1272 1476">• Stat-set (others): Specifies the maximum and reserved number for other items than sessions of a static set in the VSYS. <li data-bbox="595 1514 1259 1592">• IPSec: Specifies the maximum and reserved number for IPSec tunnels in the VSYS. <li data-bbox="595 1630 1238 1709">• SCVPN users: Specifies the maximum and reserved number for SCVPN users. <li data-bbox="595 1747 1311 1825">• Session Limit Rules: Specifies the maximum and reserved number for session limit rules in the VSYS. <li data-bbox="595 1863 1321 1942">• Keyword Categories: Specifies the maximum and reserved number for keyword categories in the VSYS. <li data-bbox="595 1980 1294 2018">• URL Regex Keywords: Specifies the maximum

Option	Description
Basic Configuration	
	<p>and reserved number for regular expression keywords in a URL category in the VSYS.</p> <ul style="list-style-type: none"> • Keyword: Specifies the maximum and reserved number for simple keywords in a URL category in the VSYS. • IQoS: Select the Enable check box to enable the QoS function and specifies the maximum and reserved number for root-pipe in the VSYS.
Protection	
URL Resources	<p>Specify the maximum quota and reserved quota of URL resources.</p> <ul style="list-style-type: none"> • URL: Select the Enable check box to enable the URL filter function. • URL Profiles: Specifies the maximum and reserved number for URL filter profiles in a VSYS. • URL Categories: Specifies the maximum and reserved number for user-defined URL categories in a VSYS. • URL: Specifies the maximum and reserved number for URLs in a VSYS.
IPS Resources	<p>Specify the maximum quota and reserved quota of IPS resources.</p> <ul style="list-style-type: none"> • IPS: Select the Enable check box to enable the IPS function. • IPS Profiles: Specifies the maximum and reserved number for IPS profiles in a VSYS. You can create one IPS Profile at most in non-root VSYS, i.e., the range of maximum quota varies from 0 to 1. The default value of maximum quota and reserved quota is 0, which means only predefined IPS Profiles can be used in non-root VSYS.

Option	Description
Basic Configuration	
Log Configuration	
Log Configuration	<p>Specify the maximum quota and reserved quota of memory buffer for each type of log in a VSYS. The reserved quota should not exceed the maximum quota. If the logs' capacity in a VSYS exceeds its maximum quota, the new logs will override the earliest logs in the buffer.</p> <ul style="list-style-type: none"> • Config Logs: Specify the maximum and reserved value of buffer for configuration logs in a VSYS. • Event Logs: Specify the maximum and reserved value of buffer for event logs in a VSYS. • Network Logs: Specify the maximum and reserved value of buffer for network logs in a VSYS. • Threat Logs: Specify the maximum and reserved value of buffer for threat logs in a VSYS. • Session Logs: Specify the maximum and reserved value of buffer for session logs in a VSYS. • NAT Logs: Specify the maximum and reserved value of buffer for NAT logs in a VSYS. • Web Surfing: Specify the maximum and reserved value of buffer for websurf logs in a VSYS. • PBR: Surfing: Specify the maximum and reserved value of buffer for PBR logs in a VSYS.

4. Click **OK** to save settings. The new VSYS quota will be shown in the list.

Notes:

- Up to 128 VSYS quotas are supported.
- The default VSYS profile of the root VSYS named root-vsyz-profile and the default VSYS profile of non-root VSYS named default-vsyz-profile cannot be edited or deleted.

- Before deleting a VSYS profile, you must delete all the VSYSs referencing the VSYS profile.
- The maximum quota varies from one platform to another. The reserved quota cannot exceed maximum quota.

Entering the VSYS

After typing the management IP in a browser, you should type the username and password in the login page. For example, the management IP of root VSYS is 10.90.89.1, after typing the username (admin) and password (admin), you can enter the root VSYS. After creating the non-root VSYS (vsys1), you should type the name management IP 10.90.89.1, type the non-root administrator username (vsys1\admin) and password (vsys1-admin), and then you can enter the non-root VSYS directly. For the detailed information of administrator configuration, see "[Device Management](#)".

Besides, the root VSYS administrator can enter the non-root VSYS from root VSYS. The administrator in the root VSYS can configure the functions of the non-root VSYS after entering it. To enter a non-root VSYS, take the following steps:

1. Select **System > VSYS > VSYS** to enter the VSYS page.
2. In the VSYS list, click the name of non-root VSYS, and enter the non-root VSYS.
3. Return to the root VSYS, click  in the right top corner of the page, and click **Return root Vsys** in the pop-up dialog box.

Note: If you enter the non-root VSYS directly, you cannot back to the root VSYS.
