<b>Usage Guide</b>	<p>This command takes effect only on an ABR, and is used to summarize multiple routes in an area into a route and advertise this route to other areas. Combination of the routing information occurs only on the boundary of an area. Routers inside the area can learn specific routing information, whereas routers in other areas can learn only one summarized route. In addition, you can set <b>advertise</b> or <b>not-advertise</b> to determine whether to advertise the summarized route to shield and filter routes. By default, the summarized route is advertised. You can use the <b>cost</b> parameter to set the metric of the summarized route.</p> <p>You can configure route summarization commands for multiple areas. This simplifies routes in the entire OSPF routing domain, and improves the network forwarding performance, especially for a large-sized network.</p> <p>When multiple route summarization commands are configured and have the inclusive relationship with each other, the area range to be summarized is determined based on the maximum match principle.</p>

### ▾ Configuring External Route Summarization

<b>Command</b>	<b>summary-prefix ipv6-prefix/prefix-length [not-advertise   tag number ]</b>
----------------	---

<b>Parameter Description</b>	<p><i>ipv6-prefix/prefix-length</i>: Indicates the range of IP addresses to be summarized.</p> <p><b>not-advertise</b>: Indicates that the summarized route is not advertised. If this parameter is not specified, the summarized route is advertised.</p> <p><b>tag number</b>: Specifies the tag value of the route that is redistributed into the OSPFv3 routing domain. The value ranges from 0 to 4,294,967,295.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>When routes are redistributed from other routing processes and injected to the OSPFv3 routing process, each route is advertised to the OSPFv3 routers using an external LSA. If the injected routes are a continuous address space, the ABR can advertise only one summarized route to significantly reduce the size of the routing table.</p> <p><b>area range</b> summarizes the routes between OSPFv3 areas, whereas <b>summary-prefix</b> summarizes external routes of the OSPFv3 routing domain.</p> <p>When configured on the NSSA ABR translator, <b>summary-prefix</b> summarizes redistributed routes and routes obtained based on the LSAs that are converted from Type 7 to Type 5. When configured on the ASBR (not an NSSA ABR translator), <b>summary-prefix</b> summarizes only redistributed routes.</p>

**Configuration Example**

<p><b>Configuration Steps</b> Figure 5-13</p>		
	<b>Remarks</b>	<p>The interface IPv6 addresses are as follows:</p> <p>B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64</p> <p>C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64</p> <p>D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Summarize routes of area 2 on Router B.</li> </ul>	
<b>B</b>	<pre> B#configure terminal B(config)#ipv6 router ospf 1 B(config-router)#area 2 range 2001:16::/64                     </pre>	
<b>Verification</b>	<p>On Router A, check the routing table and verify that the entry 2001:16::/64 is generated and other routes do not exist.</p>	

A	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static          R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          IA - Inter area  O IA 2001:16::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>
---	--

### Common Errors

- Inter-area route summarization cannot be implemented because the **area range** command is configured on a non-ABR device.

### 5.4.6 Configuring Route Filtering

#### Configuration Effect

- Routes that do not meet filtering conditions cannot be loaded to the routing table, or advertised to neighbors. Network users cannot access specified destination network.

#### Notes

- The OSPF basic functions must be configured.
- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area filter-list** or **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

#### Configuration Steps

##### ▾ Configuring Inter-Area Route Filtering

- (Optional) This configuration is recommended if users need to be restricted from accessing the network in a certain OSPF area.
- Unless otherwise required, perform this configuration on an ABR in the area where filtered routes are located.

##### ▾ Configuring Redistributed Route Filtering

- (Optional) Perform this configuration if external routes introduced by the ASBR need to be filtered.
- Unless otherwise required, perform this configuration on an ASBR to which filtered routes are introduced.

##### ▾ Configuring Learned Route Filtering

- (Optional) Perform this configuration if users need to be restricted from accessing a specified destination network.
- Unless otherwise required, perform this configuration on a router that requires route filtering.

#### Verification

- Run the **show ipv6 route** command to verify that the router is not loaded with routes that have been filtered out.
- Run the **ping** command to verify that the specified destination network cannot be accessed.

#### Related Commands

##### ▾ Configuring a Passive Interface

<b>Command</b>	<b>passive-interface</b> { <b>default</b>   <i>interface-type</i> <i>interface-number</i> }
<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates the interface that should be configured as a passive interface.
<b>Description</b>	<b>default</b> : Indicates that all interfaces will be configured as passive interfaces.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When an interface is configured as a passive interface, it no longer sends or receives Hello packets. This command takes effect only on an OSPFv3-enabled interface, and not on a virtual link.

##### ▾ Configuring Redistributed Route Filtering

<b>Command</b>	<b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>out</b> [ <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> ]
<b>Parameter</b>	<i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering. <b>bgp</b>   <b>connected</b>   <b>isis</b> [ <i>area-tag</i> ]   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>static</b> : Indicates the source of routes to be filtered.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<b>distribute-list out</b> is similar to <b>redistribute route-map</b> , and is used to filter routes that are redistributed from other protocols to OSPFv3. The <b>distribute-list out</b> command itself does not redistribute routes, and is generally used together with the <b>redistribute</b> command. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes coming from a certain source, the prefix list cannot be configured to filter the same routes.

##### ▾ Configuring Learned Route Filtering

<b>Command</b>	<b>distribute-list</b> { <i>name</i>   <b>prefix-list</b> <i>prefix-list-name</i> } <b>in</b> [ <i>interface-type</i> <i>interface-number</i> ]
<b>Parameter</b>	<i>name</i> : Uses the ACL for filtering.
<b>Description</b>	<b>prefix</b> <i>prefix-list-name</i> : Uses the prefix list for filtering. <i>interface-type interface-number</i> : Specifies the interface for which LSA routes are filtered.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Filter routes that are computed based on received LSAs. Only routes meeting the filtering conditions can be forwarded. The command does not affect the LSDB or the routing tables of neighbors. The ACL and the prefix list filtering rules are mutually exclusive in the configuration. That is, if the ACL is used for filtering routes on a specified interface, the prefix list cannot be configured to filter routes on the same interface. Filtering routes by using the <b>distribute-list in</b> command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and

advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated. In this case, you can run the **area range** (containing the **not-advertise** parameter) command on the ABR to prevent generation of black-hole routes.

**Configuration Example**

<p><b>Scenario</b> Figure 5-14</p>	<p><b>Remarks</b> The interface IPv6 addresses are as follows:                  B: GE0/2 2001:16:2::1/64 GE0/3 2001:16:3::1/64                  C: GE0/2 2001:16:2::2/64 GE0/1 2001:16:4::2/64                  D: GE0/3 2001:16:3::2/64 GE0/1 2001:16:5::1/64</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure route filtering.</li> </ul>
<p><b>A</b></p>	<pre>A#configure terminal A(config)#ipv6 access-list test A (config-ipv6-acl)#permit ipv6 2001:16:5::/64 any A(config)#ipv6 router ospf 1 A(config-router)#distribute-list test in GigabitEthernet0/1</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table. Verify that only the entry 2001:16:5::/64 is loaded.</li> </ul>
<p><b>A</b></p>	<pre>A#show ipv6 route ospf</pre> <p>IPv6 routing table name - Default - 0 entries</p> <p>Codes: C - Connected, L - Local, S - Static</p> <p>R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route</p> <p>N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2</p> <p>E1 - OSPF external type 1, E2 - OSPF external type 2</p> <p>SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2</p> <p>IA - Inter area</p> <pre>O IA 2001:16:5::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>

## Common Errors

- Filtering routes by using the **distribute-list in** command affects forwarding of local routes, but does not affect route computation based on LSAs. Therefore, if route filtering is configured on the ABR, Type 3 LSAs will still be generated and advertised to other areas because routes can still be computed based on LSAs. As a result, black-hole routes are generated.

### 5.4.7 Modifying the Route Cost and AD

#### Configuration Effect

- Change the OSPF routes so that the traffic passes through specified nodes or bypasses specified nodes.
- Change the sequence that a router selects routes so as to change the priorities of OSPF routes.

#### Notes

- The OSPF basic functions must be configured.
- If you run the **ipv6 ospf cost** command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

#### Configuration Steps

##### ▾ Configuring the Reference Bandwidth

- Optional.
- A router is connected with lines with different bandwidths. This configuration is recommended if you wish to preferentially select the line with a larger bandwidth.

##### ▾ Configuring the Cost of an Interface

- Optional.
- A router is connected with multiple lines. This configuration is recommended if you wish to manually specify a preferential line.

##### ▾ Configuring the Default Metric for Redistribution

- Optional.
- This configuration is mandatory if the cost of external routes of the OSPF domain should be specified when external routes are introduced to an ASBR.

##### ▾ Configuring the Maximum Metric

- Optional.
- A router may be unstable during the restart process or a period of time after the router is restarted, and users do not want to forward data through this router. In this case, this configuration is recommended.

##### ▾ Configuring the AD

- Optional.
- Perform this configuration if you wish to change the priorities of OSPF routes on a router that runs multiple unicast routing protocols.

#### Verification

- Run the **show ipv6 ospf interface** command to verify that the costs of interfaces are correct.
- Run the **show ipv6 route** command to verify that the costs of external routes introduced by the ASBR are correct.
- Restart the router. Within a specified period of time, data is not forwarded through the restarted router.

#### Related Commands

##### ▾ Configuring the Reference Bandwidth

<b>Command</b>	<b>auto-cost reference-bandwidth</b> <i>ref-bw</i>
<b>Parameter Description</b>	<i>ref-bw</i> : Indicates the reference bandwidth. The unit is Mbps. The value ranges from 1 to 4,294,967.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	You can run the <b>ipv6 ospf cost</b> command in interface configuration mode to specify the cost of the interface. The priority of this cost is higher than that of the metric computed based on the reference bandwidth.

##### ▾ Configuring the Cost of an Interface

<b>Command</b>	<b>ipv6 ospf cost</b> <i>cost</i> [ <i>instance instance-id</i> ]
<b>Parameter Description</b>	<i>cost</i> : Indicates the cost of an OSPF interface. The value ranges from 0 to 65,535. <i>instance instance-id</i> : Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, the cost of an OSPFv3 interface is equal to 100 Mbps/Bandwidth, where Bandwidth is the bandwidth of the interface and configured by the <b>bandwidth</b> command in interface configuration mode. The costs of OSPF interfaces on several typical lines are as follows: <ul style="list-style-type: none"> <li>● 64 Kbps serial line: The cost is 1562.</li> <li>● E1 line: The cost is 48.</li> <li>● 10M Ethernet: The cost is 10.</li> <li>● 100M Ethernet: The cost is 1.</li> </ul> If you run the <b>ipv6 ospf cost</b> command to configure the cost of an interface, the configured cost will automatically overwrite the cost that is computed based on the auto cost.

##### ▾ Configuring the Cost of the Default Route in a Stub/NSSA Area

<b>Command</b>	<b>area area-id default-cost</b> <i>cost</i>
<b>Parameter Description</b>	<i>area-id</i> : Indicates the ID of the stub/nssa area. <i>cost</i> : Indicates the cost of the default summarized route injected to the stub/nssa area. The value ranges from 0 to 16,777,215.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	This command takes effect only on an ABR in a stub/nssa area.

##### ▾ Configuring the Default Metric for Redistribution

<b>Command</b>	<b>default-metric</b> <i>metric</i>
<b>Parameter Description</b>	<i>metric</i> : Indicates the default metric of the OSPF redistributed route. The value ranges from 1 to 16,777,214.

<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The <b>default-metric</b> command must be used together with the <b>redistribute</b> command to modify the initial metrics of all redistributed routes. The <b>default-metric</b> command does not take effect on external routes that are injected to the OSPF routing domain by the <b>default-information originate</b> command. The default metric of a redistributed direct route is always 20.

▾ **Configuring the AD**

<b>Command</b>	<b>distance</b> { <i>distance</i>   <b>ospf</b> { [ <b>intra-area</b> <i>distance</i> ] [ <b>inter-area</b> <i>distance</i> ] [ <b>external</b> <i>distance</i> ]} }
<b>Parameter Description</b>	<i>distance</i> : Indicates the AD of a route. The value ranges from 1 to 255. <b>intra-area</b> <i>distance</i> : Indicates the AD of an intra-area route. The value ranges from 1 to 255. <b>inter-area</b> <i>distance</i> : Indicates the AD of an inter-area route. The value ranges from 1 to 255. <b>external</b> <i>distance</i> : Indicates the AD of an external route. The value ranges from 1 to 255.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	Use this command to specify different ADs for different types of OSPF routes. The AD allows different routing protocols to compare route priorities. A smaller AD indicates a higher route priority. The priorities of routes generated by different OSPFv3 processes must be compared based on ADs. If the AD of a route entry is set to 255, the route entry is not trustworthy and does not participate in packet forwarding.

**Configuration Example**

<b>Scenario</b> Figure 5-15	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the cost of each interface.</li> </ul>
<b>A</b>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ipv6 ospf cost 10 A(config)#interface GigabitEthernet0/2 A(config-if-GigabitEthernet 0/2)#ipv6 ospf cost 20</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A, check the routing table. The next hop of the optimum path to 2001:16:1::/64 is Router B.</li> </ul>

A	<pre>A#show ipv6 route ospf  IPv6 routing table name - Default - 0 entries  Codes: C - Connected, L - Local, S - Static          R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          IA - Inter area  O E2 2001:16:1::/64 [110/2] via FE80::2D0:F8FF:FE22:4547, GigabitEthernet 0/1</pre>
---	--

### Common Errors

- If the cost of an interface is set to 0 in the **ipv6 ospf cost** command, a route computation error may occur. For example, a routing loop is obtained.

### 5.4.8 Enabling Authentication

#### Configuration Effect

- All routers connected to the OSPF network must be authenticated to ensure stability of OSPF and protect OSPF against intrusions.

#### Notes

- The OSPF basic functions must be configured.
- If authentication is configured for an area, the configuration takes effect on all interfaces that belong to this area.
- If authentication is configured for both an interface and the area to which the interface belongs, the configuration for the interface takes effect preferentially.

#### Configuration Steps

##### ▾ Configuring Authentication

- Optional.
- Perform this configuration if a router accesses a network that requires authentication.

##### ▾ Configuring Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

##### ▾ Configuring Virtual Link Authentication

- Optional.

- Perform this configuration if a router accesses a network that requires authentication.

### ↘ Configuring Virtual Link Encryption

- Optional.
- Perform this configuration if a router accesses a network that requires encryption.

#### Verification

- If routers are configured with different authentication keys, run the **show ipv6 ospf neighbor** command to verify that there is no OSPF neighbor.
- If routers are configured with the same authentication key, run the **show ipv6 ospf neighbor** command to verify that there are OSPF neighbors.

#### Related Commands

### ↘ Configuring Area-based Authentication

<b>Command</b>	<b>area</b> <i>area-id</i> <b>authentication ipsec spi</b> <i>spi</i> <b>[md5[string-key] sha1] [0   7 ] key</b>
<b>Parameter</b>	<i>area-id</i> : Indicates the area ID. The value can be an integer or an IPv4 prefix.
<b>Description</b>	<p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>string-key</b>: Indicates that MD5 authentication key supports special characters.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p> <p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p><i>key</i>: Indicates the authentication key.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The FSOS supports three authentication types:</p> <ul style="list-style-type: none"> <li>● No authentication</li> <li>● MD5 authentication</li> <li>● SHA1 authentication</li> </ul> <p>Configuration of area-based authentication for OSPFv3 takes effect on all interfaces (except virtual links) in the area, but the interface-based authentication configuration takes precedence over the area-based configuration.</p>

### ↘ Configuring Area-based Encryption and Authentication

<b>Command</b>	<b>area</b> <i>area-id</i> <b>encryption ipsec spi</b> <i>spi</i> <b> esp [ null [ des   3des ] [ 0   7 ] des-key][md5 sha1] [0 7] key</b>
<b>Parameter</b>	<i>area-id</i> : Indicates the area ID. The value can be an integer or an IPv4 prefix.
<b>Description</b>	<p><i>spi</i>: Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>null</b>: Indicates that no encryption mode is used.</p> <p><b>des</b>: Indicates that the Data Encryption Standard (DES) mode is used.</p> <p><b>3des</b>: Indicates that the Triple DES (3DES) mode is used.</p> <p><i>des-key</i>: Indicates the encryption key.</p> <p><b>md5</b>: Enables MD5 authentication.</p> <p><b>sha1</b>: Enables SHA1 authentication.</p> <p><b>0</b>: Indicates that the key is displayed in plain text.</p>

	<p><b>7:</b> Indicates that the key is displayed in cipher text.</p> <p><b>key:</b> Indicates the authentication key.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The FSOS supports two encryption modes and two authentication modes.</p> <p>The two encryption modes are as follows:</p> <ul style="list-style-type: none"> <li>● DES</li> <li>● 3DES</li> </ul> <p>The two authentication modes are as follows:</p> <ul style="list-style-type: none"> <li>● MD5</li> <li>● SHA1</li> </ul> <p>Configuration of area-based encryption and authentication for OSPFv3 takes effect on all interfaces (except virtual links) in the area, but the interface-based encryption and authentication configuration takes precedence over the area-based configuration.</p>

### ↘ Configuring Interface-based Authentication

<b>Command</b>	<b>ipv6 ospfauthentication</b> [ null   ipsec spi spi [md5[string-key]]sha1] [0 7]key][instance instance-id]
<b>Parameter Description</b>	<p><b>area-id:</b> Indicates the area ID. The value can be an integer or an IPv4 prefix.</p> <p><b>spi:</b> Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>md5:</b> Enables MD5 authentication.</p> <p><b>string-key:</b> Indicates that MD5 authentication key supports special characters.</p> <p><b>sha1:</b> Enables SHA1 authentication.</p> <p><b>0:</b> Indicates that the key is displayed in plain text.</p> <p><b>7:</b> Indicates that the key is displayed in cipher text.</p> <p><b>key:</b> Indicates the authentication key.</p> <p><b>instance instance-id:</b> Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The FSOS supports three authentication types:</p> <ul style="list-style-type: none"> <li>● No authentication</li> <li>● MD5 authentication</li> <li>● SHA1 authentication</li> </ul> <p>OSPFv3 authentication parameters configured on interconnected interfaces must be consistent.</p>

### ↘ Configuring Interface-based Encryption and Authentication

<b>Command</b>	<b>ipv6 ospfencryption ipsec spi spi esp</b> [ null [des   3des][0 7]des-key][md5 sha1][0 7]key][instance instance-id]
<b>Parameter Description</b>	<p><b>spi:</b> Indicates the SPI. The value ranges from 256 to 4,294,967,295.</p> <p><b>null:</b> Indicates that no encryption mode is used.</p> <p><b>des:</b> Indicates that the DES mode is used.</p> <p><b>3des:</b> Indicates that the 3DES mode is used.</p> <p><b>des-key:</b> Indicates the encryption key.</p> <p><b>md5:</b> Enables MD5 authentication.</p> <p><b>sha1:</b> Enables SHA1 authentication.</p> <p><b>0:</b> Indicates that the key is displayed in plain text.</p>

	<p><b>7</b>: Indicates that the key is displayed in cipher text.</p> <p>key: Indicates the authentication key.</p> <p><b>instance <i>instance-id</i></b>: Indicates the ID of a specified OSPFv3 process of the interface. The value ranges from 0 to 255.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The FSOS supports two encryption modes and two authentication modes.</p> <p>The two encryption modes are as follows:</p> <ul style="list-style-type: none"> <li>● DES</li> <li>● 3DES</li> </ul> <p>The two authentication modes are as follows:</p> <ul style="list-style-type: none"> <li>● MD5</li> <li>● SHA1</li> </ul> <p>OSPFv3 encryption and authentication parameters configured on the local interface must be consistent with those configured on the interconnected interfaces.</p>

**Configuration Example**

<b>Scenario</b> Figure 5-16	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure MD5 authentication for interfaces of all routers.</li> </ul>
<b>A</b>	<pre>A#configure terminal A(config)#interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)#ipv6 ospf authentication ipsec spi 256 md5 01234567890123456789012345678912</pre>
<b>B</b>	<pre>B# configure terminal B(config)#interface GigabitEthernet 0/3 B(config-if-GigabitEthernet0/3)#ipv6 ospf authentication ipsec spi 256 md5 01234567890123456789012345678912</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the OSPF neighbor status is correct.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

B	B# show ipv6 ospf neighbor					
	OSPFv3 Process (1), 1 Neighbors, 1 is Full:					
	Neighbor ID	Pri	State	Dead Time	Instance ID	Interface
	1.1.1.1	1	Full/BDR	00:00:38	0	GigabitEthernet 0/1

### Common Errors

- The configured authentication modes are inconsistent.
- The configured authentication keys are inconsistent.

### 5.4.9 Modifying the Maximum Number of Concurrent Neighbors

#### Configuration Effect

- Control the maximum number of concurrent neighbors on the OSPF process to ease the pressure on the device.

#### Notes

- The OSPF basic functions must be configured.

#### Configuration Steps

##### ▾ Configuring the Maximum Number of Concurrent Neighbors on the OSPF Process

- (Optional) This configuration is recommended if you wish to set up the OSPF adjacency more quickly when a router is connected with a lot of other routers.
- Perform this configuration on a core router.

#### Verification

- Run the **show ipv6 ospf neighbor** command to display the number of neighbors that are concurrently interacting with the OSPF process.

#### Related Commands

##### ▾ Configuring the Maximum Number of Concurrent Neighbors on the Current Process

<b>Command</b>	<b>max-concurrent-ddnumber</b>
<b>Parameter Description</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value ranges from 1 to 65,535.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which each OSPF process can concurrently initiate or accept interaction.

##### ▾ Configuring the Maximum Number of Concurrent Neighbors on All Processes

<b>Command</b>	<b>ipv6 router ospf max-concurrent-ddnumber</b>
<b>Parameter</b>	<i>number</i> : Specifies the maximum number of neighbors that are concurrently interacting with the OSPF process. The value

<b>Description</b>	ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the performance of a router is affected because the router exchanges data with multiple neighbors, you can configure this command to restrict the maximum of neighbors with which all OSPF processes can concurrently initiate or accept interaction.

**Configuration Example**

<p><b>Scenario</b> Figure 5-17</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers.(Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On the Router Core, set the maximum number of concurrent neighbors to 4.</li> </ul>
<p><b>Core</b></p>	<pre>Core# configure terminal Core(config)# ipv6 router ospf max-concurrent-dd 4</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On the Router Core, check the neighbor status and verify that at most eight neighbors concurrently interact with the OSPF process.</li> </ul>

**Common Errors**

N/A

**5.4.10 Type-9 LSA Carrying IPv6 Prefix**

**Configuration Effect**

- Type-9 LSA generated by the router carries IPv6 prefix not address.

**Notes**

- The OSPF basic functions must be configured.

**Configuration Steps**

📌 **Configure Type-9 LSA Carrying IPv6 Prefix**

- (Optional) It is recommended to run this command to connect with quagga or other vendors' products.

- Perform this configuration on all routers.

### Verification

- Check whether type-9 LSA carrying IPv6 prefix.

### Related Commands

#### ▾ Configuring Type-9 LSA Carrying IPv6 Prefix

<b>Command</b>	<b>ipv6 router ospf compatible lsa type-9</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, type-9 LSA carries IPv6 address. If the device is connected with quagga, an error will occur because the type-9 LSA generated by quagga carries IPv6 prefix. If quagga exists in the topology, this command should be configured.

### Configuration Example

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Run this command on all routers. (This function is disabled by default.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ipv6 router ospf compatible lsa type-9</pre>
<b>B</b>	<pre>B# configure terminal B(config)# ipv6 router ospf compatible lsa type-9</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the OSPF neighbor and the prefix of type-9 LSA on router A.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State           Dead Time   Instance ID  Interface 2.2.2.2        1   Full/DR         00:00:38   0           GigabitEthernet 0/1</pre>

### Common Errors

#### 5.4.11 Disabling MTU Verification

### Configuration Effect

- The unicast routing service can be provided even if the MTUs of interfaces on neighbor routers are different.

## Notes

- The OSPF basic functions must be configured.

## Configuration Steps

### ▾ Disabling MTU Verification

- (Optional) MTU verification is disabled by default. You are advised to retain the default configuration.
- Perform this configuration on two routers with different interface MTUs.

## Verification

- The adjacency can be set up between routers with different MTUs.

## Related Commands

### ▾ Disabling MTU Verification

<b>Command</b>	<b>ipv6 ospf mtu-ignore</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	On receiving the database description packet, OSPF checks whether the MTU of the interface on the neighbor is the same as the MTU of its own interface. If the interface MTU specified in the received database description packet is greater than the MTU of the local interface, the adjacency cannot be set up. To resolve this problem, you can disable MTU verification.

## Configuration Example

<b>Scenario</b> Figure 5-18	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure different MTUs for interfaces on two routers.</li> <li>● Disable MTU verification on all routers. (By default, the function of disabling MTU verification is enabled.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 mtu 1400 A(config-if-GigabitEthernet 0/1)#ipv6 ospf mtu-ignore</pre>

<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 mtu 1600 B(config-if-GigabitEthernet 0/1)# ipv6 ospf mtu-ignore</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A, verify that the OSPF neighbor information is correct.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri   State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

**Common Errors**

N/A

**5.4.12 Enabling Two-Way Maintenance**

**Configuration Effect**

- Non-Hello packets can also be used to maintain the adjacency.

**Notes**

- The OSPF basic functions must be configured.

**Configuration Steps**

▾ **Enabling Two-Way Maintenance**

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on all routers.

**Verification**

- Non-Hello packets can also be used to maintain the adjacency.

**Related Commands**

▾ **Enabling Two-Way Maintenance**

<b>Command</b>	<b>two-way-maintain</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	On a large network, a lot of packets may be sent or received, occupying too much CPU and memory. As a result, some packets are delayed or discarded. If the processing time of Hello packets exceeds the dead interval, the adjacency will be destroyed due to timeout. If the two-way maintenance function is enabled, in addition to the Hello packets, the DD, LSU, LSR, and LSAck packets can also be used to maintain the bidirectional communication between neighbors when a large

	number of packets exist on the network. This prevents termination of the adjacency caused by delayed or discarded Hello packets.
--	--

**Configuration Example**

<b>Scenario</b> Figure 5-19	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, enable the two-way maintenance function. (This function is enabled by default.)</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ipv6 routerospf 1 A(config-router)#two-way-maintain</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● When the adjacency is being set up, Router A checks the neighbor dead interval and updates the dead interval without waiting for Router B to send a Hello packet.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospfneighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full:  Neighbor ID    Pri  State           Dead Time   Instance ID  Interface 2.2.2.2        1    Full/DR         00:00:38   0            GigabitEthernet 0/1</pre>

**Common Errors**

N/A

**5.4.13 Correlating OSPF with BFD**

**Configuration Effect**

- Once a link is faulty, OSPF can quickly detect the failure of the route. This configuration helps shorten the traffic interruption time.

**Notes**

- The OSPF basic functions must be configured.
- The BFD parameters must be configured for the interface in advance.
- If BFD is configured for both a process and an interface, the interface-based configuration takes effect preferentially.

**Configuration Steps**

**▾ Correlating OSPF with BFD**

- (Optional) Perform this configuration if you wish to accelerate OSPF network convergence.
- Perform this configuration on routers at both ends of the link.

**Verification**

- Run the **show bfd neighbor** command to verify that the BFD neighbors are normal.

**Related Commands**

▾ **Correlating an OSPF Interface with BFD**

<b>Command</b>	<b>ipv6 ospf bfd [ disable ]</b>
<b>Parameter Description</b>	<b>disable:</b> Disables BFD for link detection on a specified OSPF-enabled interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The interface-based configuration takes precedence over the <b>bfd all-interfaces</b> command used in process configuration mode. Based on the actual environment, you can run the <b>ipv6 ospf bfd</b> command to enable BFD on a specified interface for link detection, or run the <b>bfd all-interfaces</b> command in OSPF process configuration mode to enable BFD on all interface of the OSPF process, or run the <b>ipv6 ospf bfd disable</b> command to disable BFD on a specified interface.

▾ **Correlating an OSPF Process with BFD**

<b>Command</b>	<b>bfd all-interfaces</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF process configuration mode
<b>Usage Guide</b>	OSPF dynamically discovers neighbors through the Hello packets. After OSPF enables the BFD function, a BFD session will be set up to achieve the full adjacency, and use the BFD mechanism to detect the neighbor status. Once a neighbor failure is detected through BFD, OSPF performs network convergence immediately. You can also run the <b>ipv6 ospf bfd [disable]</b> command in interface configuration mode to enable or disable the BFD function on a specified interface, and this configuration takes precedence over the <b>bfd all-interfaces</b> command used in OSPF process configuration mode.

**Configuration Example**

<b>Scenario</b> Figure 5-20	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the BFD parameters for interfaces of all routers.</li> <li>● Correlate OSPF with BFD on all routers.</li> </ul>

<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)#bfd interval 200 min_rx 200 multiplier 5 A(config)# ipv6 router ospf 1 A(config-router)#bfd all-interfaces</pre>
<b>B</b>	<pre>B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 2/1)#bfd interval 200 min_rx 200 multiplier 5 B(config)# ipv6 router ospf 1 B(config-router)#bfd all-interfaces</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On Router A and Router B, verify that the BFD state is Up.</li> <li>● Disconnect Router B from the switch. On Router A, verify that a neighbor is found disconnected during BFD, and the corresponding OSPF route is deleted.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf neighbor OSPFv3Process(1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State   BFD State  Dead Time  Instance ID  Interface 2.2.2.2        1    Full/BDR Up          00:00:35   0            GigabitEthernet 0/1</pre>
<b>B</b>	<pre>B# show ipv6 ospf neighbor OSPFv3Process(1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State   BFD State  Dead Time  Instance ID  Interface 1.1.1.1        1    Full/DR  Up          00:00:35   0            GigabitEthernet 0/1</pre>

### Common Errors

N/A

### 5.4.14 Enabling GR

#### Configuration Effect

- When a distributed route switches services from the active board to the standby board, traffic forwarding continues and is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and is not interrupted.

#### Notes

- The OSPF basic functions must be configured.
- The neighbor router must support the GR helper function.
- The grace period cannot be shorter than the neighbor dead time of the neighbor router.

#### Configuration Steps

### ▾ Configuring the OSPF GR Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on routers where hot standby switchover is triggered or the OSPF process is restarted.

### ▾ Configuring the OSPF GR Helper Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration.
- Perform this configuration on a router if hot standby switchover is triggered or the OSPF process is restarted on a neighbor of this router.

#### Verification

- When a distributed router switches services from the active board to the standby board, data forwarding continues and the traffic is not interrupted.
- When the OSPF process is being restarted, data forwarding continues and the traffic is not interrupted.

#### Related Commands

### ▾ Configuring the OSPF GR Function

<b>Command</b>	<b>graceful-restart [ grace-period <i>grace-period</i>   inconsistent-lsa-checking ]</b>
<b>Parameter Description</b>	<b>grace-period</b> <i>grace-period</i> : Indicates the grace period, which is the maximum time from occurrence of an OSPF failure to completion of the OSPF GR. The value of the grace period varies from 1s to 1800s. The default value is 120s. <b>inconsistent-lsa-checking</b> : Enables topological change detection. If any topological change is detected, OSPF exits the GR process to complete convergence. After GR is enabled, topological change detection is enabled by default.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The GR function is configured based on the OSPF process. You can configure different parameters for different OSPF processes based on the actual conditions. This command is used to configure the GR restarter capability of a device. The grace period is the maximum time of the entire GR process, during which link status is rebuilt so that the original state of the OSPF process is restored. After the grace period expires, OSPF exits the GR state and performs common OSPF operations.</p> <p>Run the <b>graceful-restart</b> command to set the grace period to 120s. The <b>graceful-restart grace-period</b> command allows you to modify the grace period explicitly.</p> <p>The precondition for successful execution of GR and uninterrupted forwarding is that the topology remains stable. If the topology changes, OSPF quickly converges without waiting for further execution of GR, thus avoiding long-time forwarding black-hole.</p> <ul style="list-style-type: none"> <li>● Disabling topology detection: If OSPF cannot converge in time when the topology changes during the hot standby process, forwarding black-hole may appear in a long time.</li> <li>● Enabling topology detection: Forwarding may be interrupted when topology detection is enabled, but the interruption time is far shorter than that when topology detection is disabled.</li> </ul> <p>In most cases, it is recommended that topology detection be enabled. In special scenarios, topology detection can be disabled if the topology changes after the hot standby process, but it can be ensured that the forwarding black-hole will not appear in a long time. This can minimize the forwarding interruption time during the hot standby process.</p> <p>If the Fast Hello function is enabled, the GR function cannot be enabled.</p>

### ▾ Configuring the OSPF GR Helper Function

<b>Command</b>	<b>graceful-restart helper { disable  strict-lsa-checking   internal-lsa-checking}</b>
<b>Parameter Description</b>	<p><b>disable:</b> Prohibits a device from acting as a GR helper for another device.</p> <p><b>strict-lsa-checking:</b> Indicates that changes in Type 1 to Type 5 and Type 7 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p> <p><b>internal-lsa-checking:</b> Indicates that changes in Type 1 to Type 3 LSAs will be checked during the period that the device acts as a GR helper to determine whether the network changes. If the network changes, the device will stop acting as the GR helper.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>This command is used to configure the GR helper capability of a router. When a neighbor router implements GR, it sends a Grace-LSA to notify all neighbor routers. If the GR helper function is enabled on the local router, the local router becomes the GR helper on receiving the Grace-LSA, and helps the neighbor to complete GR. The <b>disable</b> option indicates that GR helper is not provided for any device that implements GR.</p> <p>After a device becomes the GR helper, the network changes are not detected by default. If any change takes place on the network, the network topology converges after GR is completed. If you wish that network changes can be quickly detected during the GR process, you can configure <b>strict-lsa-checking</b> to check Type 1 to 5 and Type 7 LSAs that indicate the network information or <b>internal-lsa-checking</b> to check Type 1 to 3 LSAs that indicate internal routes of the AS domain. When the network scale is laFSe, it is recommended that you disable the LSA checking options (<b>strict-lsa-checking</b> and <b>internal-lsa-checking</b>) because regional network changes may trigger termination of GR and consequently reduce the convergence of the entire network.</p>

**Configuration Example**

<b>Scenario</b> <b>Figure 5-21</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● On Router A, Router C, and Router D, enable the GR helper function. (This function is enabled by default.)</li> <li>● On Router B, enable the GR function.</li> </ul>
<b>B</b>	<pre> B# configure terminal B(config)# ipv6 router ospf1 B(config-router)# graceful-restart                     </pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Trigger a hot standby switchover on Router B, and verify that the routing tables of destination Network 1 and Network 2 remain unchanged on Router A during the switchover.</li> <li>● Trigger a hot standby switchover on Router B, ping destination Network 1 from Router A, and verify that traffic forwarding is not interrupted during the switchover.</li> </ul>
---------------------	---

### Common Errors

- Traffic forwarding is interrupted during the GR process because the configured grace period is shorter than the neighbor dead time of the neighbor router.

### 5.4.15 Enabling NSR

#### Configuration Effect

- During an active/standby switchover of devices in distributed or Virtual Switch Unit (VSU) mode, data forwarding continues and is not interrupted.

#### Notes

- The OSPF basic functions must be configured.

#### Configuration Steps

##### ▾ Enabling the OSPF NSR Function

- (Optional) This function is disabled by default. Enable it when required.

#### Verification

- During a hot-backup switchover of devices in distributed or VSU mode, data forwarding continues and is not interrupted.

#### Related Commands

##### ▾ Enabling NSR

<b>Command</b>	<code>nsr</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	OSPF routing configuration mode
<b>Usage Guide</b>	<p>This command is used to enable the NSR function. For the same OSPF process, either NSR or GR is enabled because they are mutually exclusive. Nevertheless, when NSR is enabled, the GR helper capability is supported.</p> <p>The switchover of devices in distributed or VSU mode takes a period of time. If the OSPF neighbor keepalive duration is shorter than the switchover duration, the OSPF neighbor relationship with the neighbor device is removed, and services are interrupted during the switchover. Therefore, it is recommended that the OSPF neighbor keepalive duration be no less than the default value when the NSR function is enabled. It is recommended that Fast Hello be disabled because when it is enabled, the OSPF neighbor keepalive duration is less than 1 second.</p>

### Configuration Example

-  The following configuration is performed based on OSPF basic functions. For details about OSPF basic functions, see section 5.4.1 “Configuring OSPF Basic Functions”.

<b>Scenario</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure interface IPv6 addresses for all routers.</li> <li>● Configure OSPF basic functions for all routers.</li> <li>● Enable the NSR function for router B.</li> </ul>
<b>B</b>	<pre>B# configure terminal B(config)#ipv6routerospf 1 B(config-router)# nsr</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● A hot-backup switchover is performed for router B. During the switchover, routing tables for target networks 1 and 2 on router A remain unchanged.</li> <li>● A hot-backup switchover is performed for router B. During the switchover, router A can continuously ping target network 1.</li> </ul>

### Common Errors

- The neighbor keepalive duration is short. When Fast Hello is enabled, the OSPF neighbor relationship times out during a switchover, causing forwarding interruption.

### 5.4.16 Configuring Network Management Functions

#### Configuration Effect

- Use the network management software to manage OSPF parameters and monitor the OSPF running status.

#### Notes

- The OSPF basic functions must be configured.
- You must enable the MIB function of the SNMP server before enabling the OSPF MIB function.
- You must enable the trap function of the SNMP server before enabling the OSPF trap function.
- You must enable the logging function of the device before outputting the OSPF logs.

## Configuration Steps

### ✚ Binding the MIB with the OSPF Process

- (Optional) This configuration is required if you want to use the network management software to manage parameters of a specified OSPF process.
- Perform this configuration on all routers.

### ✚ Enabling the Trap Function

- (Optional) This configuration is required if you want to use the network management software to monitor the OSPF running status.
- Perform this configuration on all routers.

### ✚ Configuring the Logging Function

- (Optional) This function is enabled by default. You are advised to retain the default configuration. If you want to reduce the log output, disable this function.
- Perform this configuration on all routers.

## Verification

- Use the network management software to manage the OSPF parameters.
- Use the network management software to monitor the OSPF running status.

## Related Commands

### ✚ Binding the MIB with the OSPF Process

<b>Command</b>	<b>enable mib-binding</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	The OSPFv2 MIB does not have the OSPFv3 process information. Therefore, you can perform operations only on a single OSPFv2 process through SNMP. By default, the OSPFv3 MIB is bound with the OSPFv3 process with the smallest process ID, and all user operations take effect on this process.  If you wish to perform operations on a specified OSPFv3 process through SNMP, run this command to bind the MIB with the process.

### ✚ Enabling the Trap Function

<b>Command</b>	<b>enable traps[error [IfConfigError  IfRxBadPacket   VirtIfConfigError   VirtIfRxBadPacket]   state-change[IfStateChange  NbrStateChange  NssaTranslatorStatusChange  VirtIfStateChange  VirtNbrStateChange   RestartStatusChange   NbrRestartHelperStatusChange   VirtNbrRestartHelperStatusChange]]</b>
<b>Parameter Description</b>	<b>IfConfigError:</b> Indicates that an interface parameter configuration error occurs. <b>IfRxBadPacket:</b> Indicates that the interface receives a bad packet. <b>VirtIfConfigError:</b> Indicates that a virtual interface parameter configuration error occurs.

	<p><b>VirtIfRxBadPacket:</b> Indicates that the virtual interface receives a bad packet.</p> <p><b>IfStateChange:</b> Indicates that interface state changes.</p> <p><b>NbrStateChange:</b> Indicates that the neighbor state changes.</p> <p><b>NssaTranslatorStatusChange:</b> Indicates that the NSSA state changes.</p> <p><b>VirtIfStateChange:</b> Indicates that the virtual interface state changes.</p> <p><b>VirtNbrStateChange:</b> Indicates that the virtual neighbor state changes.</p> <p><b>RestartStatusChange:</b> Indicates that the GR state of the local device changes.</p> <p><b>NbrRestartHelperStatusChange:</b> Indicates that the state of the neighbor GR process changes.</p> <p><b>VirtNbrRestartHelperStatusChange:</b> Indicates that the GR state of the virtual neighbor changes.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>The function configured by this command is restricted by the <b>snmp-server enable traps ospf</b> and then <b>enable traps</b> command before the corresponding OSPF traps can be correctly sent out.</p> <p>This command is not restricted by the MIB bound with the process. The trap function can be enabled concurrently for different processes.</p>

↘ **Configuring the Logging Function**

<b>Command</b>	<b>log-adj-changes[ detail]</b>
<b>Parameter Description</b>	<b>detail:</b> Records all status change information.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

<b>Scenario</b> Figure 5-22	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Bind the MIB with the OSPF process on Router A.</li> <li>● Enable the trap function on Router A.</li> </ul>

<b>A</b>	<pre>A# configure terminal A(config)#snmp-server host 192.168.2.2 traps version 2c public A(config)#snmp-server community public rw A(config)#snmp-server enable traps A(config)# A(config)# ipv6 routerospf 10 A(config-router)# enable mib-binding A(config-router)# enable traps</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Use the MIB tool to read and set the OSPF parameters and display the OSPF running status.</li> </ul>

### Common Errors

N/A

### 5.4.17 Modifying Protocol Control Parameters

#### Configuration Effect

- Modify protocol control parameters to change the protocol running status.

#### Notes

- The OSPF basic functions must be configured.
- The neighbor dead time cannot be shorter than the Hello interval.

#### Configuration Steps

##### ▾ Configuring the Hello Interval

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on routers at both end of a link.

##### ▾ Configuring the Dead Interval

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if you wish to accelerate OSPF convergence when a link fails.
- Perform this configuration on routers at both end of a link.

##### ▾ Configuring the LSU Retransmission Interval

- (Optional) You are advised to adjust this configuration if a lot of routes exist in the user environment and network congestion is serious.

##### ▾ Configuring the LSA Generation Time

- (Optional) You are advised to retain the default configuration.

##### ▾ Configuring the LSA Group Refresh Time

- (Optional) You are advised to retain the default configuration. This configuration can be adjusted if a lot of routes exist in the user environment.
- Perform this configuration on an ASBR or ABR.

#### ↘ Configuring LSA Repeated Receiving Delay

- (Optional) You are advised to retain the default configuration.

#### ↘ Configuring the SPF Computation Delay

- (Optional) This configuration can be adjusted if network flapping frequently occurs.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on all routers.

#### ↘ Configuring the Inter-Area Route Computation Delay

- (Optional) You are advised to retain the default configuration.
- Perform this configuration on all routers.

#### Verification

- Run the **show ipv6 ospf** and **show ipv6 ospf neighbor** commands to display the protocol running parameters and status.

#### Related Commands

#### ↘ Configuring the Hello Interval

<b>Command</b>	<b>ipv6ospf hello-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the interval at which OSPF sends the Hello packet. The unit is second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The Hello interval is contained in the Hello packet. A shorter Hello interval indicates that OSPF can detect topological changes more quickly, but the network traffic increases. The Hello interval must be the same on all routers in the same network segment. If you want to manually modify the neighbor dead interval, ensure that the neighbor dead interval is longer than the Hello interval.

#### ↘ Configuring the Dead Interval

<b>Command</b>	<b>ipv6ospf dead-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the time that the neighbor is declared lost. The unit is second. The value ranges from 2 to 65535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The OSPF dead interval is contained in the Hello packet. If OSPF does not receive a Hello packet from a neighbor within the dead interval, it declares that the neighbor is invalid and deletes this neighbor record from the neighbor list. By default, the dead interval is four times the Hello interval. If the Hello interval is modified, the dead interval is modified automatically.

	<p>When using this command to manually modify the dead interval, pay attention to the following issues:</p> <ol style="list-style-type: none"> <li>1. The dead interval cannot be shorter than the Hello interval.</li> <li>2. The dead interval must be the same on all routers in the same network segment.</li> </ol>
--	--

### ↘ Configuring the LSU Transmission Delay

<b>Command</b>	<b>ipv6ospf transmit-delayseconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU transmission delay on the OSPF interface. The unit is second. The value ranges from 0 to 65,535.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Before an LSU packet is transmitted, the Age fields in all LSAs in this packet will increase based on the amount specified by the <b>ip ospf transmit-delay</b> command. Considering the transmission delay and line propagation delay on the interface, you need to set the LSU transmission delay to a greater value for a low-speed line or interface. The LSU transmission delay of a virtual link is defined by the <b>transmit-delay</b> parameter in the <b>area virtual-link</b> command.</p> <p>If the value of the Age field of an LSA reaches 3600, the packet will be retransmitted or a retransmission will be requested. If the LSA is not updated in time, the expired LSA will be deleted from the LSDB.</p>

### ↘ Configuring the LSU Retransmission Interval

<b>Command</b>	<b>ipv6ospf retransmit-intervalseconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSU retransmission interval. The unit is second. The value ranges from 0 to 65,535. This interval must be longer than the round-trip transmission delay of data packets between two neighbors.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After a router finishes sending an LSU packet, this packet is still kept in the transmit buffer queue. If an acknowledgment from the neighbor is not received within the time defined by the <b>ip ospf retransmit-interval</b> command, the router retransmits the LSU packet.</p> <p>The retransmission delay can be set to a greater value on a serial line or virtual link to prevent unnecessary retransmission. The LSU retransmission delay of a virtual link is defined by the <b>retransmit-interval</b> parameter in the <b>area virtual-link</b> command.</p>

### ↘ Configuring the LSA Generation Time

<b>Command</b>	<b>timers throttle lsa all delay-time hold-time max-wait-time</b>
<b>Parameter Description</b>	<p><i>delay-time</i>: Indicates the minimum delay for LSA generation. The first LSA in the database is always generated instantly. The value ranges from 0 to 600,000. The unit is ms.</p> <p><i>hold-time</i>: Indicates the minimum interval between the first LSA update and the second LSA update. The value ranges from 1 to 600,000. The unit is ms.</p> <p><i>max-wait-time</i>: Indicates the maximum interval between two LSA updates when the LSA is updated continuously. This interval is also used to determine whether the LSA is updated continuously. The value ranges from 1 to 600,000. The unit is ms.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If a high convergence requirement is raised when a link changes, you can set <b>delay-time</b> to a smaller value. You can also appropriately increase values of the preceding parameters to reduce the CPU usage.</p> <p>When configuring this command, the value of <b>hold-time</b> cannot be smaller than the value of <b>delay-time</b>, and the value</p>

of **max-wait-time** cannot be smaller than the value of **hold-time**.

#### ↘ Configuring the LSA Group Refresh Time

<b>Command</b>	<b>timers pacinglsa-group seconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the LSA group pacing interval. The value ranges from 10 to 1,800. The unit is second.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>Every LSA has a time to live (LSA age). When the LSA age reaches 1800s, a refreshment is needed to prevent LSAs from being cleared because their ages reaching the maximum. If LSA update and aging computation are performed for every LSA, the device will consume a lot of CPU resources. In order to use CPU resources effectively, you can refresh LSAs by group on the device. The interval of group refreshment is called group pacing interval. The group refreshment operation is to organize the LSAs generated within a group pacing interval into a group and refresh the group as a whole.</p> <p>If the total number of LSAs does not change, a larger group pacing interval indicates that more LSAs need to be processed after timeout. To maintain the CPU stability, the number of LSAs processes upon each timeout cannot be too large. If the number of LSAs is large, you are advised to reduce the group pacing interval. For example, if there are 1000 LSAs in the database, you can reduce the pacing interval; if there are 40 to 100 LSAs, you can set the pacing interval to 10-20 minutes.</p>

#### ↘ Configuring the LSA Group Refresh Interval

<b>Command</b>	<b>timers pacing lsa-transmit transmit-time transmit-count</b>
<b>Parameter Description</b>	<p><i>transmit-time</i>: Indicates the LSA group transmission interval. The value ranges from 10 to 600,000. The unit is ms.</p> <p><i>transmit-count</i>: Indicates the number of LS-UPD packets in a group. The value ranges from 1 to 200.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If the number of LSAs is large and the device load is heavy in an environment, properly configuring <b>transmit-time</b> and <b>transmit-count</b> can limit the number of LS-UPD packets flooded on a network.</p> <p>If the CPU usage is not high and the network bandwidth load is not heavy, reducing the value of <b>transmit-time</b> and increasing the value of <b>transmit-count</b> can accelerate the environment convergence.</p>

#### ↘ Configuring LSA Repeated Receiving Delay

<b>Command</b>	<b>timers lsa arrival arrival-time</b>
<b>Parameter Description</b>	<i>arrival-time</i> : Indicates the delay after which the same LSA is received. The value ranges from 0 to 600,000. The unit is ms.
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	No processing is performed if the same LSA is received within the specified time.

#### ↘ Configuring the SPF Computation Delay

<b>Command</b>	<b>timers throttle spf spf-delay spf-holdtime spf-max-waittime</b>
<b>Parameter Description</b>	<p><i>spf-delay</i>: Indicates the SPF computation delay. The unit is ms. The value ranges from 1 to 600,000. When detecting a topological change, the OSPF routing process triggers the SPF computation at least after <b>spf-delay</b> elapses.</p> <p><i>spf-holdtime</i>: Indicates the minimum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p>

	<p><i>spf-max-waittime</i>: Indicates the maximum interval between two SPF computations. The unit is ms. The value ranges from 1 to 600,000.</p> <p><i>number</i>: Indicates the metric of the summarized route.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p><b>spf-delay</b> indicates the minimum time between the occurrence of the topological change and the start of SPF computation. <b>spf-holdtime</b> indicates the minimum interval between the first SPF computation and the second SPF computation. After that, the interval between two SPF computations must be at least twice of the previous interval. When the interval reaches <b>spf-max-waittime</b>, the interval cannot increase again. If the interval between two SPF computations already exceeds the required minimum value, the interval is computed by starting from <b>spf-holdtime</b>. You can set <b>spf-delay</b> and <b>spf-holdtime</b> to smaller values to accelerate topology convergence, and set <b>spf-max-waittime</b> to a larger value to reduce SPF computation. Flexible settings can be used based on stability of the network topology.</p> <p>Compared with the <b>timers spf</b> command, this command supports more flexible settings to accelerate the convergence speed of SPF computation and further reduce the system resources consumed by SPF computation when the topology continuously changes. Therefore, you are advised to use the <b>timers throttle spf</b> command for configuration.</p> <ol style="list-style-type: none"> <li>1. The value of <b>spf-holdtime</b> cannot be smaller than the value of <b>spf-delay</b>; otherwise, <b>spf-holdtime</b> will be automatically set to the value of <b>spf-delay</b>.</li> <li>2. The value of <b>spf-max-waittime</b> cannot be smaller than the value of <b>spf-holdtime</b>; otherwise, <b>spf-max-waittime</b> will be automatically set to the value of <b>spf-holdtime</b>.</li> <li>3. The configurations of <b>timers throttle spf</b> and <b>timers spf</b> are mutually overwritten.</li> <li>4. When both <b>timers throttle spf</b> and <b>timers spf</b> are not configured, the default values of <b>timers throttle spf</b> prevail.</li> </ol>

📌 **Configuring the Computation Delays of Inter-Area Routes and External Routes**

<b>Command</b>	<b>timers throttle route</b> {inter-area <i>ia-delay</i>  asease- <i>delay</i> }
<b>Parameter Description</b>	<p><i>inter-areaia-delay</i>: Indicates the inter-area route computation delay. The unit is ms. The value ranges from 0 to 600,000.</p> <p><i>asease-delay</i>: Indicates the external route computation delay. The unit is ms. The value ranges from 0 to 600,000.</p>
<b>Command Mode</b>	OSPF routing process configuration mode
<b>Usage Guide</b>	<p>If a strict requirement is raised for the network convergence time, use the default value.</p> <p>If a lot of inter-area or external routes exist on the network and the network is not stable, adjust the delays and optimize route computation to reduce the load on the device.</p>

**Configuration Example**

📌 **Configuring the Hello Interval and Dead Interval**

<p><b>Scenario</b> Figure 5-23</p>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable IPv6 on interfaces of all routers. (Omitted)</li> <li>● Configure the OSPF basic functions on all routers. (Omitted)</li> <li>● Configure the Hello interval and dead interval on all routers.</li> </ul>

<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ipv6 ospf hello-interval 15 A(config-if-GigabitEthernet 0/1)# ipv6 ospf dead-interval 50</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the interface parameters on Router A and Router B. Verify that the Hello interval is 10s and the dead interval is 50s.</li> <li>● On Router A and Router B, verify that the OSPF neighbor information is correct.</li> </ul>
<b>A</b>	<pre>A# show ipv6 ospf interface GigabitEthernet0/1 is up, line protocol is up Interface ID 2 IPv6 Prefixes   fe80::2d0:f8ff:fe22:3346/64 (Link-Local Address) OSPFv3 Process (1), Area 0.0.0.0, Instance ID 0   Router ID 1.1.1.1, Network Type BROADCAST, Cost: 1   Transmit Delay is 1 sec, State DR, Priority 1   Timer interval configured, Hello 15, Dead 50, Wait 40, Retransmit 10   Hello due in 00:00:06   Neighbor Count is 1, Adjacent neighbor count is 1   Hello received 40 sent 40, DD received 17 sent 9   LS-Req received 1 sent 3, LS-Upd received 6 sent 5   LS-Ack received 3 sent 4, Discarded 1  A# show ipv6 ospf neighbor OSPFv3 Process (1), 1 Neighbors, 1 is Full: Neighbor ID    Pri  State           DeadTime   InstanceID  Interface 2.2.2.21     Full/BDR      00:00:30   0          GigabitEthernet 0/1</pre>

<b>B</b>	<pre> B# show ipv6 ospf interface  GigabitEthernet0/1 is up, line protocol is up    Interface ID 2    IPv6 Prefixes      fe80::2d0:f8ff:fe22:3446/64 (Link-Local Address)    OSPFv3 Process (1), Area 0.0.0.0, Instance ID 0      Router ID 2.2.2.2, Network Type BROADCAST, Cost: 1      Transmit Delay is 1 sec, State BDR, Priority 1      Timer interval configured, Hello 15, Dead 50, Wait 40, Retransmit 10      Hello due in 00:00:06      Neighbor Count is 1, Adjacent neighbor count is 1      Hello received 40 sent 40, DD received 17 sent 9      LS-Req received 1 sent 3, LS-Upd received 6 sent 5      LS-Ack received 3 sent 4, Discarded 1  B# show ipv6 ospf neighbor  OSPFv3 Process (1), 1 Neighbors, 1 is Full:  NeighborID    Pri  State           DeadTime  InstanceID  Interface 1.1.1.11     Full/DR      00:00:38    0          GigabitEthernet0/1 </pre>
----------	---

### Common Errors

- The configured neighbor dead time is shorter than the Hello interval.

## 5.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears and resets an OSPF process.	<b>clear ipv6 ospf</b> [ <i>process-id</i> ] <b>process</b>

### Displaying

Description	Command
Displays the OSPF process configurations.	<b>show ipv6 ospf</b> [ <i>process-id</i> ]
Displays information about the OSPF LSDB.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>database</b> [ <i>lsa-type</i> [ <b>adv-router</b> <i>router-id</i> ] ]
Displays OSPF-enabled interfaces.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>interface</b> [ <i>interface-type interface-number</i>   <b>brief</b> ]
Displays the OSPF neighbor list.	<b>show ipv6 ospf</b> [ <i>process-id</i> ] <b>neighbor</b> [ <i>interface-type interface-number</i> [ <b>detail</b> ] ] <i>neighbor-id</i>

Description	Command
	<b> detail]</b>
Displays the OSPF routing table.	<b>show ipv6 ospf [ process-id ] route[ count ]</b>
Displays the summarized route of OSPF redistributed routes.	<b>show ipv6 ospf [process-id] summary-prefix</b>
Displays the OSPF network topology information.	<b>show ipv6 ospf [process-id] topology [area area-id]</b>
Displays OSPF virtual links.	<b>show ipv6 ospf [ process-id ] virtual-links</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs OSPF events.	<b>debug ipv6 ospf events [abr asbr os router] vlink]</b>
Debugs OSPF interfaces.	<b>debug ipv6 ospf ifsm [events status timers]</b>
Debugs OSPF neighbors.	<b>debug ipv6 ospf nsm [events   status   timers]</b>
Debugs the OSPF NSM.	<b>debug ipv6 ospf nsm [interface   redistribute   route]</b>
Debugs OSPF LSAs.	<b>debug ipv6 ospf lsa [flooding   generate   install   maxage   refresh]</b>
Debugs OSPF packets.	<b>debug ipv6 ospf packet [dd detail hello ls-ack ls-request ls-update rcv send]</b>
Debugs OSPF routes.	<b>debug ipv6 ospf route [ase   ia   install   spf   time]</b>

## 6 Configuring IS-IS

### 6.1 Overview

Intermediate System to Intermediate System (IS-IS) is an extensible, robust, and easy-to-use Interior Gateway Protocol (IGP) for route selection and applicable to an IP-ISO CLNS dual environment network (ISO CLNS is short for International Organization for Standardization Connectionless Network Service).

IS-IS has the common characteristics of a link state protocol. It sends Hello packets to discover and maintain neighbor relationships, and sends Link State Protocol Data Units (LSPs) to neighbors to advertise its link state. IS-IS supports Level-1 routing and Level-2 routing. All devices at the same Level maintain the same Link State Database (LSDB), which stores the LSPs generated by the devices to notify each other of the Level's network topology. Each device uses the Dijkstra Shortest Path First (SPF) algorithm to perform best-route calculation, path selection, and fast convergence.

#### Protocols and Standards

- RFC1142: OSI IS-IS Intra-domain Routing Protocol
- RFC1195: Use of OSI IS-IS for routing in TCP/IP and dual environments
- RFC3786: Extending the Number of Intermediate System to Intermediate System (IS-IS) Link State PDU (LSP) Fragments Beyond the 256 Limit
- RFC3373: Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies
- RFC3358: Optional Checksums in Intermediate System to Intermediate System (ISIS)
- RFC3784: Intermediate System to Intermediate System (IS-IS) Extensions for Traffic Engineering (TE)

- RFC2763: Dynamic Hostname Exchange Mechanism for IS-IS
- RFC6119(draft-ietf-isis-ipv6-te-00): IPv6 Traffic Engineering in IS-IS
- RFC 2966: Domain-wide Prefix Distribution with Two-Level IS-IS

## 6.2 Applications

Application	Description
Planar Topology	A planar topology is applicable to a small-scale network. At the initial stage of large-scale network construction, core devices are deployed to form an area based on a planar topology.
Hierarchical Topology	A hierarchical topology is applicable to a large-scale network with frequent link flapping.

### 6.2.1 Planar Topology

#### Scenario

A planar topology is formed by devices in the same area. See Figure 6-1.

Figure 6-1 Planar Topology

#### Deployment

- To facilitate future extension and reduce device burden, configure the devices in a planar topology as Level-2 devices.

### 6.2.2 Hierarchical Topology

#### Scenario

A hierarchical topology divides the network into the core layer, convergence layer, and access layer. See Figure 6-2.

- Route summarization at the convergence layer is facilitated by address planning.
- When primary and secondary routes exist, devices at the convergence layer leak Level-2 routes to Level-1 areas.

Figure 6-2 Hierarchical Topology

<b>Remarks</b>	Devices at the core layer must be connected consecutively.
----------------	--

### Deployment

- Design the network topology starting from the core layer.
- Configure devices at the core layer as Level-2 devices.
- Configure devices at the convergence layer as Level-1/Level-2 devices.
- Configure devices at the access layer as Level-1 devices.

## 6.3 Features

### Basic Concepts

#### ↘ End System (ES)

An ES is a non-router device, for example, a host.

#### ↘ Intermediate System (IS)

An IS is a router, which is the basic unit used to transmit routing information and generate routes in IS-IS.

#### ↘ End System to Intermediate System Routing Exchange Protocol (ES-IS)

ES-IS is the protocol used for communication between ESs and ISs in Open System Interconnection (OSI) to dynamically discover Level-2 neighbor relationships.

#### ↘ Domain

A set of ISs in the same routing domain (RD) use the same routing protocol to exchange routing information.

#### ↘ Area

An RD can be divided into multiple areas.

#### ↘ Complete Serial Number PDU (CSNP)

CSNPs are sent by a Designated Intermediate System (DIS) every 10s to synchronize link states in a broadcast network.

#### ↘ Partial Sequence Number PDU (PSNP)

PSNPs are sent by a point-to-point (P2P) link to confirm LSPs, or request LSPs in a broadcast network.

#### ↘ **Connectionless Network Protocol (CLNP)**

CLNP is an OSI protocol used to transmit data and error messages at the network layer. It is similar to the IP protocol.

#### ↘ **Connectionless Network Service (CLNS)**

The CLNS is a type of unreliable connection and requires no circuit setup before data transmission.

#### ↘ **Designated Intermediate System (DIS)**

Similar to a DIS router (DR) in Open Shortest Path First (OSPF), a DIS propagates LSPs to other machines in a Local Area Network (LAN). Neighbor relationships are established not only between DISs and other machines but also between those machines. This characteristic is not possessed by OSPF.

#### ↘ **Hello Packet**

Hello packets are used to establish and maintain neighbor relationships.

#### ↘ **LSP**

LSPs describe link states, similar to link-state advertisement (LSA) in OSPF, but the former do not depend on TCP/IP information. LSPs are classified into Level-1 LSPs and Level-2 LSPs, depending on different route types.

#### ↘ **Network Selector (NSEL)**

An NSEL (sometimes referred to as SEL) specifies the target network-layer protocol service. It is similar to the TCP/UDP port for the Upper Layer Service in the IP protocol. In IS-IS, SEL is typically set to 00 to indicate a device.

#### ↘ **Network Service Access Point (NSAP)**

An NSAP is the CLNS complete address, including the OSI address and high-layer processes. It consists of an area ID, a system ID, and SEL. When SEL is set to 00, the NSAP is a Network Entity Title (NET), similar to an IP address plus a protocol number.

#### ↘ **Sub-Network Point of Attachment (SNPA)**

An SNPA provides physical connections and network-layer services. It is similar to a MAC address used in the IP protocol, a Data Link Connection Identifier (DLCI) used by frame relay (FR), or High-Level Data Link Control (HDLC) in a wide area network (WAN).

#### ↘ **Level-1 Route**

A Level-1 route is an intra-area route that only receives relevant information within the area. To reach other areas, you need to store in Level-1 a default route destined for the closest Level-2.

#### ↘ **Level-2 Route**

A Level-2 route is an inter-area backbone route. Level-1 and Level-2 cannot be connected directly.

#### ↘ **Level-1/Level-2 Route**

A Level-1/Level-2 route is a border route connecting a Level-1 route and a Level-2 route. It maintains two databases for the Level-1 and Level-2 routes respectively. It is similar to an area border router (ABR) in OSPF.

#### ↘ **Pseudonode**

A pseudonode identifies a broadcast subnet (LAN) and allows a broadcast medium to work as a virtual device, which has a route as its interface. The route-pseudonode relationship is managed by a DIS.

### ↘ Network Entity Title (NET)

A NET is part of an OSI address and describes the area ID and system ID, but it does not define the NSEL, which is contained in the NSAP of the specified system.

### ↘ Circuit

Circuit is an interface-related term used in IS-IS. Whereas NSAP and NET indicate whole devices, a circuit indicates an interface. The circuit ID of a P2P interface is one byte long. For example, the circuit ID of HDLC is 0x00. In a broadcast network (for example, a LAN), the circuit ID is seven bytes long, including the system ID, for example, 1921.6800.0001.01.

 For details about terms related to IS-IS, see ISO 10589 and RFC 1195.

## Overview

Feature	Description
IS-IS Network Hierarchy	An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).
IS-IS Address Coding Mode	An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier.
IS-IS Packet Types	There are three types of IS-IS packets: LSP, IS-IS Hello packet (IIH PDU), and serial number packet (SNP) classified into CSNP and PSNP.
DIS Election	A DIS simulates multiple access links as a pseudonode and generates LSPs for the pseudonode. The pseudonode sets up a relationship with each device in the local network and forbids direct communication between the devices.
IS-IS Supported TLV Types	IS-IS supports 21 types of Type-Length-Value (TLV).
LSP Fragment Extension	IS-IS floods LSPs to advertise link states. The size of an LSP is limited by the Maximum Transmission Unit (MTU) size of the link. When the content to be advertised exceeds one LSP, IS-IS will create LSP fragments to carry new link state information.
IS-IS VRF	VPN Routing and Forwarding (VRF) is mainly used for local routing and packet separation. It avoids route conflict caused by use of the same prefix by multiple VPNs.
IS-IS MTR	Multi-Topology Routing (MTR) is mainly used to calculate IPv4 and IPv6 unicast routes in IS-IS based on different topologies.

### 6.3.1 IS-IS Network Hierarchy

An IS-IS network is divided into Level-1 and Level-2. The nodes on which devices exchange information in the same area form one Level (Level-1).

#### Working Principle

All devices in an area know the area's network topology and exchange data within the area. A Level-1/Level-2 device is a border device that belongs to different areas and provides inter-area connections. Areas are connected by Level-2 devices. The border devices in various areas form a Level-2 backbone network for inter-area data exchange.

Level-1 devices are only interested in the local area's topology, including all nodes in the local area and the next-hop devices destined for the nodes. Level-1 devices access other areas through Level-2 devices and forward packets from a target network outside of the local area to the closest Level-2 device.

Figure 6- 3 IS-IS Network Topology

#### Related Configuration

##### ▾ Setting the Circuit Type of an IS-IS Interface

By default, **circuit-type** is set to Level-1/Level-2.

Run the **isis circuit-type** command to change the Level of an interface.

If **circuit-type** is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level.

##### ▾ Specifying the IS-IS Level

By default, **is-type** is set to Level-1/Level-2 if no IS-IS instance runs at Level-2 (including Level-1/Level-2). **is-type** is set to Level-1 if there are IS-IS instances running at Level-2 (including Level-1/Level-2).

Run the **is-type** command to specify the Level at which IS-IS will run.

Changing the **is-type** value will enable or disable the routes of a certain Level. A device can have only one instance running at Level-2 (including Level-1/Level-2).

#### 6.3.2 IS-IS Address Coding Mode

An IS-IS address is called a NET, which consists of an area ID, a system ID, and an NSAP identifier, ranging from eight to 20 bytes.

#### Working Principle

Figure 6- 4 NET Address Format

- The area ID identifies the RD length in an area and is fixed relative to the RD. It ranges from one to 13 bytes.
- The system ID is unique in an autonomous system (AS).
- The NSAP is a network selector and sometimes called SEL. In IS-IS, SEL is typically set to 00 to indicate a device.

#### Related Configuration

##### ✎ Configuring a NET Address in IS-IS

By default, no NET address is configured in IS-IS.

Run the **net** command to configure a NET address in IS-IS.

The command configures an area ID and a system ID in IS-IS. Different NET addresses must have the same system ID.

### 6.3.3 IS-IS Packet Types

There are three types of IS-IS packets:

- LSP
- IIH PDU
- SNP (classified into CSNP and PSNP)

#### Working Principle

There are three types of IS-IS packets:

- LSP

LSPs are used to transmit link state records within an area and are classified into Level-1 LSPs and Level-2 LSPs. LSPs are only flooded to the corresponding Level.

- IIH PDU

IIH PDUs are used to maintain neighbor relationships. They carry multicast MAC addresses used to determine whether other systems run IS-IS.

- SNP (classified into CSNP and PSNP)

CSNPs are used for LSDB synchronization. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established.

PSNPs are also used for LSDB synchronization.

## Related Configuration

### ✎ Configuring the LSP Interval on an IS-IS Interface

By default, the LSP interval is 33 ms. If no Level is specified, the interval takes effect for Level-1 and Level-2 LSPs.

Run the **isis lsp-interval** command to configure the LSP interval on an IS-IS interface, in the unit of seconds.

The command changes the LSP interval.

### ✎ Configuring the Maximum Number of LSP PDUs Sent by IS-IS Interface at a Time

The default value is 5. If no particular level is designated, the default level is set to **level-1-2**, that is, the configuration of the maximum number takes effect at Level-1 and Level-2 concurrently.

Run the **isis lsp-flood** command to set the number of LSP PDUs sent by the IS-IS interface at a time.

You can use this command to change the maximum number of LSP PDUs sent by the interface at a time.

### ✎ Configuring the Interval for Receiving Duplicate LSP Packets

By default, this command is not configured and the function of setting the interval for receiving LSP packets is not supported. If no particular level is designated, the default level is set to **level-1-2**, that is, the interval configuration takes effect at Level-1 and Level-2 concurrently.

Run the **min-lsp-arrival** command to set the interval for receiving duplicate LSP packets.

During network flapping, LSP packets are frequently duplicated and the LSP packet sequence number constantly increases. If the device processes the duplicate LSP packets, more system resources are consumed. Therefore, setting the interval for receiving duplicate LSP packets can relieve device load.

### ✎ Configuring the Hello Packet Interval on an IS-IS Interface

By default, the Hello packet interval is 10s for Level-1 and Level-2.

Run the **isis hello-interval** command to configure the Hello packet interval on an IS-IS interface, in the unit of seconds.

The command changes the Hello packet interval. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.

### ✎ Configuring the Minimum PSNP Interval

By default, the minimum PSNP interval is not configured, and the default interval 2s takes effect for Level-1 and Level-2 PSNPs.

Run the **isis psnp-interval** command to configure the minimum PSNP interval, in the unit of seconds.

PSNPs are mainly used to request LSPs that are absent locally or respond to received LSPs (in a P2P network). The PSNP interval should be minimized. If many LSPs exist and the device performance is low, you can increase the PSNP interval and LSP retransmission interval to reduce the device burden.

### ✎ Configuring the CSNP Broadcast Interval on an IS-IS Interface

By default, CSNPs are sent at 10s intervals in a broadcast network. No CSNPs are sent in a P2P network. When you configure a new CSNP interval without Level-1 or Level-2 specified, the interval takes effect for Level-1 and Level-2 CSNPs.

Run the **isis csnp-interval** command to specify the CSNP broadcast interval on an IS-IS interface, in the unit of seconds.

The command changes the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs.

No CSNPs are sent if the CSNP interval is set to 0.

### 6.3.4 DIS Election

A DIS is a designated device in a broadcast network and works like a DR in OSPF.

A pseudonode is generated by a DIS and sets up a relationship with each device in the local network.

#### Working Principle

A DIS simulates multiple access links as a pseudonode and generates LSPs for the pseudonode. The pseudonode sets up a relationship with each device in the local network and forbids direct communication between the devices. A broadcast subnet and a non-broadcast multiple access (NBMA) network are considered as pseudonodes externally. Non-DIS devices report their link states to the DIS in the same network, and the DIS maintains the link states reported by all ISs in the network. Like DR election in OSPF, a DIS is elected to reduce unnecessary neighbor relationships and route information exchanges.

DIS election in IS-IS is preemptive. The election result can be manually controlled through interface priority configuration. The device with a higher interface priority is more likely to be elected as the DIS.

#### Related Configuration

##### ✚ Configuring the Priority for DIS Election in a LAN

By default, Priority 64 takes effect for Level-1 and Level-2.

Run the **isis priority** command to configure the priority for DIS election in a LAN.

The command changes the priority carried in Hello packets in a LAN. The device with a lower priority is less likely to be elected as the DIS.

The command is invalid on a P2P network interface. The **no isis priority** command, with or without parameters, restores the priority to its default value. To change the configured priority, run the **isis priority** command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.

### 6.3.5 IS-IS Supported TLV Types

IS-IS supports 26 types of TLV.

#### Working Principle

The following table lists the IS-IS supported TLV types:

TLV Code	Description
Code = 1	Area ID
Code = 2	Priority of an IS neighbor
Code = 3	ES neighbor
Code = 6	MAC address of an IS neighbor
Code = 8	Filling field
Code = 9	LSP entity
Code = 10	Verification field
Code = 14	Size of the source LSP buffer
Code = 22	Extended IS reachability
Code = 128	IP internal reachability information
Code = 129	Supported protocol
Code = 130	IP external reachability information

TLV Code	Description
Code = 131	Inter-domain routing protocol information
Code = 132	IP interface address
Code = 133	Verification information
Code = 135	Extended IP reachability TLV
Code = 137	Dynamic host name
Code = 211	Graceful Restart (GR)
Code = 222	Multi-Topology (MT) IS reachability
Code = 229	MT TLV
Code = 211	GR
Code=232	IPv6 interface
Code = 235	IPv4 MT IP reachability TLV
Code =236	IPv6 IP reachability TLV
Code = 237	IPv6 MT IP reachability TLV
Code = 240	P2P three-way handshake TLV

## Related Configuration

### 📄 Configuring the Neighbor Detection Protocol Carried in Hello Packets

By default, neighbor detection is enabled.

Run the **adjacency-check** command to configure the neighbor detection protocol carried in Hello packets.

### 6.3.6 LSP Fragment Extension

IS-IS floods LSPs to advertise link states. The size of an LSP is limited by the MTU size of the link. When the content to be advertised exceeds one LSP, IS-IS will create LSP fragments to carry new link state information. According to ISO standards, an LSP fragment is identified by a one-byte LSP number. An IS-IS device can generate up to 256 LSP fragments.

#### Working Principle

The 256 LSP fragments are insufficient in any of the following situations:

26. New applications (such as traffic engineering [TE]) extend new TLV or Sub-TLV.
27. The network is expanded continuously.
28. Routes with reduced granularity are advertised, or other routes are redistributed to IS-IS.

After LSP fragments are used up, new routing information and neighbor information will be discarded, causing network exceptions such as routing black holes or loops. LSP fragments must be extended to carry more link state information, thus ensuring normal network operation.

You can configure an additional system ID and enable fragment extension to allow IS-IS to advertise more link state information in extended LSP fragments. Each virtual system can be considered as a virtual device that establishes a neighbor relationship (with the path value being 0) with the originating system. Extended LSPs are published by the neighbor of the originating system, that is, the virtual system.

The following terms are related to fragment extension:

### 📄 Normal System ID

The system ID defined by ISO is used to establish neighbor relationships and learn routes. It is further defined as the normal system ID in order to be distinguished from the additional system ID introduced to fragment extension.

#### ↘ Additional System ID

The additional system ID is configured by an administrator to generate extended LSPs. The additional system ID shares the usage rules of the normal system ID (for example, the additional system ID must be unique in the entire area), except that the additional system ID is not carried in Hello packets for neighbor relationship establishment.

#### ↘ Originating System

An originating system is an IS-IS-enabled device and maps a virtual system identified by the additional system ID.

#### ↘ Virtual System (VirtualIS)

A virtual system is identified by the additional system ID and used to generate extended LSPs. The virtual system concept is proposed by RFC for distinguishing from the originating system concept. Each virtual system can generate up to 256 LSP fragments. The administrator can configure multiple additional system IDs (virtual systems) to generate more LSP fragments.

#### ↘ Original LSP

An original LSP is the LSP whose system ID contained in the LSP ID is a normal system ID. Original LSPs are generated by an originating system.

#### ↘ Extended LSP

An extended LSP is the LSP whose system ID contained in the LSP ID is an additional system ID. Extended LSPs are generated by a virtual system.

### Related Configuration

#### ↘ Enabling Fragment Extension

By default, fragment extension is disabled. If you do not specify a Level when enabling fragment extension, it will take effect for Level-1 and Level-2 LSPs.

Run the **isp-fragments-extend** command to enable fragment extension.

There are up to 256 LSP fragments. When the fragments are used up, subsequent link state information, including neighbor information and IP route information, will be discarded, causing a network exception. To solve this problem, enable fragment extension at the specified Level and configure an additional system ID by using the **virtual-system** command.

### 6.3.7 IS-IS VRF

VRF is mainly used for local routing and packet separation. It avoids route conflict caused by use of the same prefix by multiple VPNs. IPv4 VPN and IPv6 VPN combine Multiprotocol Label Switching (MPLS) advantages in terms of Quality of Service (QoS) and security assurance, and are the primary solutions for interconnecting the geographically different office branches of an enterprise or industry user.

#### Working Principle

Figure 6- 5 Separation of Different VPNs by VRF Tables Configured on Provider Edge (PE) Devices

In Figure 6-5, the following configuration requirements exist: Configure the two sites (CE1 and CE3) in VPN1 to access each other and the two sites (CE2 and CE4) in VPN2 to access each other, and forbid access between the sites in VPN1 and those in VPN2, because VPN1 and VPN2 belong to different customers or departments and may have identical IP addresses.

The customer edge (CE) devices connect the customer network to the PEs to exchange VPN routing information with the PEs, that is, advertise local routes to the PEs and learn remote routes from the PEs.

Each PE learns routes from directly connected CEs and exchanges the learned VPN routes with the other PE through the Border Gateway Protocol (BGP). The PEs provide access to the VPN service.

The Provider (P) device in the Service Provider (SP) network is not directly connected to the CEs. The P device only needs the MPLS forwarding capability and does not maintain VPN information.

The IS-IS protocol running between the PEs and CEs requires the VRF capability to separate routing information between VPN1 and VPN2. That is, IS-IS only learns routes through VRF.

## Related Configuration

### ▾ Binding an IS-IS Instance with a VRF Table

By default, an IS-IS instance is not bound with any VRF table.

Run the **VRF** command to bind an IS-IS instance with a VRF table.

Note the following constraints or conventions for the binding operation:

- The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip** (or **ipv6**) **router isis** [ tag ] interface configuration and the redistribution configuration in routing process mode will be deleted.

### 6.3.8 IS-IS MTR

IS-IS MTR is an extended feature used to separate IPv4 unicast route calculation and IPv6 unicast route calculation based on topologies. It complies with the specification of IS-IS MT extension defined in RFC 5120. New TLV types are introduced to IIH PDUs and LSPs to transmit IPv6 unicast topology information. One physical network can be divided into an IPv4 unicast logical topology and an IPv6 unicast logical topology. The two topologies perform SPF calculation separately and maintain independent IPv4 and IPv6 unicast routing tables respectively. In this way, IPv4 unicast service traffic and IPv6 unicast service traffic are forwarded by different paths. The

IS-IS MTR technique helps users deploy IPv6 unicast networks without the constraint on consistency between IPv4 and IPv6 unicast topology information.

IS-IS MTR is derived from IS-IS MT, which is used to separate IPv4 and IPv6 unicast topologies, unicast and multicast topologies, and topologies using different protocol stacks (such as IPv4 and Pv6). IS-IS MTR separates IPv4 and IPv6 unicast topologies based on IS-IS MT.

**Working Principle**

Figure 6-6 shows a typical networking application. The following implementation requirements exist: Deploy an IPv6 unicast topology in incremental mode, and upgrade some devices to support IPv4 and IPv6 dual protocol stacks while keeping other IPv4-enabled devices unchanged.

Figure 6- 6 Physical Topology for IPv4-IPv6 Hybrid Deployment

In Figure 6-6, each link is marked by a number indicating its metric. RB only supports the IPv4 protocol stack, whereas other devices support IPv4 and IPv6 dual protocol stacks.

The networking constraint on consistency between IPv4 and IPv6 unicast topologies must be canceled to retain the use of RB; otherwise, RB cannot establish a neighbor relationship with RA or RD, which will cause new problems.

Figure 6- 7 IPv4-IPv6 Hybrid Topology

In Figure 6-7, without IS-IS MTR support, the SPF calculations performed by RA, RB, RC, and RD only take into account the single hybrid topology. The calculated shortest path is RA -> RB -> RD, with the overhead being 20. RB will discard IPv6 packets because it does not support IPv6.

Figure 6- 8 Separation of IPv4 and IPv6 Topologies

In Figure 6-8, the IS-IS MTR technique is used to separate IPv4 and IPv6 unicast topologies. RA, RB, RC, and RD establish neighbor relationships based on the IPv4 unicast topology and IPv6 unicast topology respectively. The left part shows the IPv4 topology formed by IPv4-enabled routers. The calculated IPv4 shortest path is RA -> RB -> RC, which realizes IPv4 packet forwarding. The right part shows the IPv6 topology formed by IPv6-enabled routers. The calculated IPv6 shortest path is RA -> RC -> RD, which realizes IPv6 packet forwarding.

IS-IS MTR must be deployed to avoid routing blackholes when some devices support only one protocol. IS-IS MTR is not required when all devices support IPv4 and IPv6 dual protocol stacks.

- Deployment of a new network: IS-IS MTR is not required when devices only support the IPv4 protocol stack. For devices that only support the IPv6 protocol stack or devices that support IPv4 and IPv6 dual protocol stacks, enable the MT mode of IS-IS MTR. You are advised not to enable Multi-Topology Transition (MTT); otherwise, loops may occur.
- Reconstruction of an existing network with devices supporting only one protocol stack: Enable the MTT mode of IS-IS MTR on devices that support IPv4 and IPv6 dual protocol stacks in sequence (starting from the device closest to a device supporting only one protocol stack in the network topology). After the MTT mode is enabled on all new devices, switch the MTT mode to the MT mode on these devices in sequence (starting from the device farthest from a device supporting only one protocol stack in the network topology).

## Related Configuration

### ▾ Enabling MTR for IS-IS Instances

By default, IS-IS instances are not enabled with MTR.

Run the **multi-topology** command to configure IS-IS to support IPv6 unicast topologies. After that, IPv4 and IPv6 unicast routes in IS-IS will be calculated based on different topologies.

Note the following constraints or conventions when you use the **multi-topology** command:

29. Set **metric-style** to **Wide** or **Transition** before you run the command.

30. The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

### 6.3.9 IS-IS Neighbor

The following conditions must be met for two routing devices to establish a neighbor relationship when IS-IS MTR is not configured:

- The interface addresses on both routing devices are in the same network segment.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices support the same protocol.

The following conditions must be met for routing devices to establish a neighbor relationship when IS-IS MTR is configured:

- The interface addresses on both routing devices are in the same network segments.
- The interface Levels on both routing devices match.
- The routing devices are authenticated by each other.
- The routing devices have at least one consistent MT ID when P2P links are configured.
- There are no constraints on the MT IDs that the routing devices support when LAN links are configured.

## 6.4 Configuration

Configuration	Description and Command	
Enabling IS-IS	 (Mandatory) It is used to enable IS-IS on specified interfaces. You need to create an IS-IS routing process in advance.	
	<b>router isis</b> [ tag ]	Starts an IS-IS routing process. <i>tag</i> indicates the process name.
	<b>net</b> areaAddress.SystemId.00	Configures a NET address in IS-IS.
	<b>ip router isis</b> [ tag ]	Enables IS-IS on an interface. <i>tag</i> indicates the name of the IS-IS routing process.
Configuring IS-IS Hello Packets	 (Optional) It is used to configure the IS-IS Hello packet holdtime.	
	<b>isis hello-interval</b> { interval   minimal } [ level-1   level-2 ]	Configures the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.
	<b>isis hello-multiplier</b> multiplier-number [ level-1   level-2 ]	Configures the Hello packet holdtime multiplier on an IS-IS interface. The value range is 2 to 100. The default value is 3.
Configuring IS-IS LSPs	 (Optional) It is used to perform time-related LSP configuration, determine whether to ignore LSP checksum errors, and enable/disable LSP fragment extension.	
	<b>isis lsp-interval</b> interval [ level-1   level-2 ]	Configures the minimum LSP interval on an interface. The value range is 1 to 4,294,967,295, in the unit of milliseconds.
	<b>isis lsp-flood</b> lsp-number [ level-1   level-2 ]	Indicates the maximum number of LSP packets

Configuration	Description and Command	
		sent by the IS-IS interface at a time. The value range is <b>1</b> to <b>1000</b> . The default value is <b>5</b> .
	<b>isis retransmit-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the LSP retransmission interval by P2P links on an interface. The value range is 0 to 65,535, in the unit of seconds.
	<b>lsp-gen-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i> [ <i>initial-interval</i> <i>hold-interval</i> ]	Configures LSP generation cycle. <i>maximum-interval</i> : Indicates the maximum interval for generating two consecutive LSP packets. The value range is <b>1</b> to <b>65535</b> (in seconds). The default value is <b>5</b> . <i>initial-interval</i> : Indicates the waiting time for generating an LSP packet for the first time. The value range is <b>0</b> to <b>60000</b> (in milliseconds). The default value is <b>50</b> . <i>hold-interval</i> : Indicates the minimum interval for generating an LSP packet for the second time. The value range is <b>10</b> to <b>60000</b> (in milliseconds). The default value is <b>200</b> .
	<b>ignore-lsp-errors</b>	Configures to ignore LSP checksum errors.
	<b>lsp-fragments-extend</b> [ <b>level-1</b>   <b>level-2</b> ] [ <b>compatible</b> <b>rfc3786</b> ]	Enables fragment extension.
	<b>virtual-system</b> <i>system-id</i>	Configures an additional system ID.
Configuring IS-IS SNPs	 (Optional) It is used to configure the CSNP broadcast interval.	
	<b>isis csnp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]	Configures the CSNP interval on an interface. The value range is 0 to 65,535, in the unit of seconds. The default value is 10s. No CSNPs are sent if the CSNP interval is set to 0.
Configuring the IS-IS Level Type	 (Optional) It is used to configure the system type or interface circuit type in IS-IS.	
	<b>is-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> }	Configures the system type.
	<b>isis circuit-type</b> { <b>level-1</b>   <b>level-1-2</b>   <b>level-2-only</b> } [ <b>external</b> ] }	Configures the interface circuit type.
Configuring IS-IS Authentication	 (Optional) It is used to configure interface authentication, area authentication, and RD authentication.	
	<b>isis password</b> [ <b>0</b>   <b>7</b> ] <i>password</i> [ <b>send-only</b> ] [ <b>level-1</b>   <b>level-2</b> ]	Configures the password for plaintext authentication of Hello packets on an interface. When <b>send-only</b> is included, the authentication password is only used to authenticate sent Hello packets. Received Hello packets are not authenticated. If no Level is specified, the configured authentication and password take effect for all

Configuration	Description and Command	
		<p>Levels.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. Both commands are used to configure IS-IS interface authentication, but the <b>isis password</b> command has a lower priority. Before you run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration.</p>
	<p><b>isis authentication mode</b> { <i>text</i>   <i>md5</i> } [ <i>level-1</i>   <i>level-2</i> ]</p>	<p>Specifies authentication as plaintext or MD5. If no Level is specified, the authentication mode takes effect for all Levels.</p> <p>If you use this command after the <b>isis password password</b> [ <i>level-1</i>   <i>level-2</i> ] command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS interface authentication, but the <b>isis authentication mode</b> command has a higher priority.</p>
	<p><b>isis authentication key-chain</b> <i>name-of-chain</i> [ <i>level-1</i>   <i>level-2</i> ]</p>	<p>Configures the password for interface authentication.</p> <p>If no Level is specified, the configured keychain takes effect for all Levels.</p> <p>This command must be used with the <b>isis authentication mode</b> command to configure IS-IS interface authentication.</p>
	<p><b>isis authentication send-only</b> [ <i>level-1</i>   <i>level-2</i> ]</p>	<p>(Optional) Specifies that interface authentication is performed only on sent packets. Received packets are not authenticated.</p> <p>If no Level is specified, the send-only authentication mode takes effect for all Levels. This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire network, run the <b>isis authentication mode</b> { <i>text</i>   <i>md5</i> } [ <i>level-1</i>   <i>level-2</i> ] and <b>isis authentication key-chain</b> <i>name-of-chain</i> [ <i>level-1</i>   <i>level-2</i> ] commands on each device. After that, run the <b>no isis authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p>

Configuration	Description and Command	
	<b>area-password [ 0   7 ] password [ send-only ]</b>	<p>Configures the password for area (Level-1) plaintext authentication.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent packets. Received packets are not authenticated. This command does not take effect if the <b>authentication mode</b> command is executed. Both commands are used to configure IS-IS area authentication, but the <b>area-password</b> command has a lower priority. Before you run the <b>area-password</b> command, delete the <b>authentication mode</b> command configuration.</p>
	<b>authentication mode { text   md5 } level-1</b>	<p>Specifies the IS-IS area authentication mode. If you use this command after the <b>area-password password</b> command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS area authentication, but the <b>authentication mode</b> command has a higher priority.</p>
	<b>authentication key-chain name-of-chain level-1</b>	<p>Configures the key chain for IS-IS area authentication.</p> <p>This command must be used with the <b>authentication mode</b> command to configure IS-IS area authentication.</p>
	<b>authentication send-only level-1</b>	<p>(Optional) Specifies that IS-IS area authentication is performed only on sent packets. Received packets are not authenticated.</p> <p>This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire area, run the <b>authentication mode { text   md5 } level-1</b> and <b>authentication key-chain name-of-chain level-1</b> commands on each device. After that, run the <b>no authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p>
	<b>domain-password [ 0   7 ] password [ send-only ]</b>	<p>Configures the password for RD (Level-2) plaintext authentication.</p> <p>When <b>send-only</b> is included, the authentication password is only used to authenticate sent</p>

Configuration	Description and Command	
		<p>packets. Received packets are not authenticated. This command does not take effect if the <b>authentication mode</b> command is executed. Both commands are used to configure IS-IS RD authentication, but the <b>domain-password</b> command has a lower priority. Before you run the <b>domain-password</b> command, delete the <b>authentication mode</b> command configuration.</p>
	<p><b>authentication mode { text   md5 } level-2</b></p>	<p>Specifies the IS-IS RD authentication mode. If you use this command after the <b>domain-password password</b> command is executed, the previous command configuration will be overwritten. Both commands are used to configure IS-IS RD authentication, but the <b>authentication mode</b> command has a higher priority.</p>
	<p><b>authentication key-chain name-of-chain level-2</b></p>	<p>Configures the password for IS-IS RD authentication. This command must be used with the <b>authentication mode</b> command to configure IS-IS RD authentication.</p>
	<p><b>authentication send-only level-2</b></p>	<p>(Optional) Specifies that IS-IS RD authentication is performed only on sent packets. Received packets are not authenticated. This command is used to avoid network flapping caused by a temporary authentication failure when IS-IS authentication is configured. Before you deploy IS-IS authentication in the entire RD, run the <b>authentication mode { text   md5 } level-2</b> and <b>authentication key-chain name-of-chain level-2</b> commands on each device. After that, run the <b>no authentication send-only</b> command to restore the authentication of received packets. This realizes smooth authentication deployment and avoids network flapping.</p>
<p>Configuring IS-IS GR</p>	<p> (Optional) It is used to enable IS-IS GR.</p>	
	<p><b>graceful-restart</b></p>	<p>Enables the GR Restart capability on the device that works as a Restarter. By default, the GR Restart capability is enabled.</p>
	<p><b>graceful-restart grace-period seconds</b></p>	<p>(Optional) Configures the IS-IS GR time on the device that works as a Restarter. The default value is 300s.</p>

Configuration	Description and Command	
	<b>no graceful-restart helper disable</b>	Enables the IS-IS GR Help capability on the device that works as a Helper. By default, the GR Help capability is enabled.
Configuring IS-IS NSR	 (Optional) It is used to enable IS-IS NSR.	
	<b>nsr</b>	Enables the IS-IS NSR. By default, it is disabled.
Configuring BFD Support for IS-IS	 (Optional) It is used to enable BFD support for IS-IS.	
	<b>bfd all-interfaces [anti-congestion]</b>	Enables BFD support for IS-IS on all interfaces.
	<b>isis bfd [ disable   anti-congestion ]</b>	Enables or disables BFD support for IS-IS on the current interface.
Setting the IS-IS Overload Bit	 (Optional) It is used to set the overload bit in LSPs.	
	<b>set-overload-bit [ on-startup { seconds   wait-for-bgp [ bgpseconds ] } ] [ suppress { [ interlevel ] [ external ] } ] [ level-1   level-2 ]</b>	Sets the overload bit.
Configuring IS-IS VRF	 (Optional) It is used to bind an IS-IS instance with a VRF table.	
	<b>vrf vrf-name</b>	Binds an IS-IS instance with a VRF table.
Configuring IS-IS MTR	 (Optional) It is used to calculate IPv4 and IPv6 unicast routes in IS-IS based on different topologies.	
	<b>multi-topology [ transition ]</b>	Configures IS-IS to support IPv6 unicast topologies.
Configuring Simple Network Management Protocol (SNMP) for IS-IS	 (Optional) It is used to allow the SNMP software to perform Management Information Base (MIB) operations on IS-IS instances.	
	<b>enable mib-binding</b>	Performs MIB operations on the instance bound with Tag 1.
	<b>configure terminal</b>	Enters global configuration mode.
	<b>snmp-server enable traps isis</b>	Enables IS-IS trap globally.
	<b>snmp-server host { host-addr   ipv6 ipv6-addr } [ vrf vrfname ] [ traps ] [ version { 1   2c   3 { auth   noauth   priv } } ] community-string [ udp-port port-num ]</b>	Configures an SNMP host in global configuration mode to receive IS-IS trap messages.
	<b>router isis</b>	Enters IS-IS routing process configuration mode.
	<b>enable traps all</b>	Allows the sending of all IS-IS trap messages to the host with the IP address 10.1.1.1.
Configuring IS-IS Two-way Maintenance	 Optional.	
	<b>two-way-maintain</b>	Enables IS-IS two-way maintenance.
Configuring Other IS-IS Parameters	 Optional.	
	<b>maximum-paths maximum</b>	Configures the maximum number of IS-IS IPv4/IPv6 equal-cost paths.
	<b>max-metric on-neighbor-up seconds</b>	Configures the maximum metric for the connected routes after the first neighbor is up.

Configuration	Description and Command	
	<b>isp-length</b> <i>receive size</i>	Configures the maximum length allowed for received LSPs.
	<b>isp-length originate</b> <i>size [ level-1   level-2 ]</i>	Configures the maximum length allowed for sent LSPs.
	<b>passive-interface</b> [ <b>default</b> ] { <i>interface-type interface-number</i> }	Configures a passive interface.
	<b>bandwidth-reference</b> <i>value</i>	Configures the bandwidth reference for IS-IS to automatically calculate the link metric.
	<b>interfaces-protocol-compatible</b>	Configures the TLV field of the IS-IS protocol to be padded based on protocols supported by an interface.
	<b>is-name</b> <i>name</i>	Configures the instance name.
	<b>isis metric</b> <i>metric [ level-1   level-2 ]</i>	Configures the interface metric, which is valid only when <b>metric-style</b> is set to <b>Narrow</b> .
	<b>isis wide-metric</b> <i>metric [ level-1   level-2 ]</i>	Configures the interface wide-metric value, which is valid only when <b>metric-style</b> is set to <b>Wide</b> .
	<b>isis passive</b>	Configures the passive interface.
	<b>isis priority</b> <i>value [ level-1   level-2 ]</i>	Configures the priority for DIS election on an interface.
	<b>isis suppress on-neighbor-up</b> <i>seconds</i>	Suppresses the routing calculation after the IS-IS neighbor is up.
	<b>default-information originate</b> [ <b>route-map map-name</b> ]	Generates a Level-2 default route, which will be advertised through LSPs. When the command includes the <b>route-map</b> option, a default route is generated only if the criteria in route-map are met.
	<b>summary-address</b> <i>ip-address net-mask [ level-1   level-2   level-1-2 ] [ metric number ]</i>	Configures an IPv4 summary route.
	<b>summary-prefix</b> <i>ipv6-prefix/prefix-length [ level-1   level-2   level-1-2 ]</i>	Configures an IPv6 summary route.
	<b>ignore-isp-errors</b>	Configures to ignore LSP checksum errors.
	<b>log-adjacency-changes</b>	Activates logging of IS-IS neighbor relationship changes.
	<b>redistribute</b>	Configures route redistribution.

#### 6.4.1 Enabling IS-IS

##### Configuration Effect

- Before you run IS-IS, create an IS-IS routing process in global configuration mode. You can set the **tag** parameter after the **router isis** command to name the process. You can add different tags to configure different IS-IS routing processes. The setting of the **tag** parameter is optional.

- A system ID uniquely identifies an IS in a routing AS; therefore, the system ID must be unique across the AS. In IS-IS, each area may contain one or multiple area IDs. Normally, you only need to configure one area ID. You can configure multiple area IDs to realize area division. If an IS is configured with multiple area IDs, the system IDs must be the same.
- After an interface is added to the specified IS-IS routing process, the interface will establish a neighbor relationship.

### Notes

- The Level-1 IS devices in an area must be configured with the same area ID.
- The core routing table does not distinguish the routing entries generated by different IS-IS routing processes.
- The IP addresses of interfaces connected between neighbors must be in the same network segment.
- If the two IP addresses are in different network segments, a neighbor relationship cannot be established.
- If you need to add an interface to the specified IS-IS routing process, set the **tag** parameter after the **ip router isis** command to indicate the process name.
- If you run the **no ip routing** command in global configuration mode, IS-IS will disable IPv4 routing on all interfaces. That is, the **no ip router isis [ tag ]** command is automatically executed on all interfaces. Other IS-IS settings remain unchanged.
- By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (All IS Systems, All L1 IS Systems, and All L2 IS Systems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short intervals, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global configuration mode to increase the limit.

### Configuration Steps

#### ▾ Starting an IS-IS Routing Process

- Mandatory.
- Perform this configuration in global configuration mode on each device, unless otherwise specified.

#### ▾ Configuring a NET Address in IS-IS

- Mandatory.
- Perform this configuration in IS-IS routing process configuration mode on each device, unless otherwise specified.

#### ▾ Enabling IS-IS on an Interfaces

- Mandatory.
- Perform this configuration in interface configuration mode on each device, unless otherwise specified.

### Verification

- Check whether devices send Hello packets.
- Check whether devices establish neighbor relationships.
- Check whether devices exchange LSPs.

### Related Commands

#### ▾ Starting an IS-IS Routing Process

<b>Command</b>	<b>router isis [ tag ]</b>
<b>Parameter Description</b>	<i>tag</i> : Indicates the name of an IS-IS instance.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Use this command to initialize an IS-IS instance and enter IS-IS routing process configuration mode.</p> <p>An IS-IS instance will start running after a NET address is configured.</p> <p>If you set the <b>tag</b> parameter when you start an IS-IS routing process, you need to add the <b>tag</b> parameter when closing the IS-IS routing process.</p> <p>By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short intervals, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global configuration mode to increase the limit.</p>

### ↘ Configuring a NET Address in IS-IS

<b>Command</b>	<b>net net-address</b>
<b>Parameter Description</b>	<i>net-address</i> : The NET address is in the format of XX.XXXX.YYYY.YYYY.YYYY.00.XX.XXXX indicates the area ID, and YYYY.YYYY.YYYY indicates the system ID.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Use this command to configure an area ID and a system ID in IS-IS.</p> <p>Different NET addresses must have the same system ID.</p>

### ↘ Enabling IS-IS on an Interface

<b>Command</b>	<b>ip router isis [ tag ]</b>
<b>Parameter Description</b>	<i>tag</i> : Indicates the name of an IS-IS instance.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to enable an interface to participate in IS-IS IPv4 routing. Use the <b>no</b> form of this command to disable the IS-IS routing process on the interface.</p> <p>If you run the <b>no ip routing</b> command in global configuration mode, IS-IS will disable IPv4 routing on all interfaces. That is, the <b>no ip router isis [ tag ]</b> command is automatically executed on all interfaces. Other IS-IS settings remain unchanged.</p>

### Configuration Example

#### ↘ Establishing a Neighbor Relationship on an IS-IS P2P Link

<b>Scenario</b>	Router A and Router B are connected in P2P mode.
-----------------	--

<b>Figure 6- 9</b> <b>P2P Link</b> <b>Topology</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Wide Area Network (WAN) interfaces.</li> </ul>
<b>A</b>	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config)# interface Serial 1/0 A(config-if)# ip address 192.168.1.1 255.255.255.252 A(config-if)# ip router isis</pre>
<b>B</b>	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00 B(config)# interface Serial 1/0 B(config-if)# ip address 192.168.1.2 255.255.255.252 B(config-if)# ip router isis</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Enable sending of Hello packets from the interface 192.168.1.1 on Router A to the interface 192.168.1.2 on Router B.</li> <li>● Establish an IS-IS neighbor relationship between Router A and Router B, with the neighbor state being Up.</li> <li>● Check the LSPs on Router A and Router B. The system IDs 0000.0000.0001 and 0000.0000.0002 should exist.</li> </ul>

C	C# show isis neighbors

▾ Performing Simple IS-ISv6 Configuration

<b>Scenario</b>	Router A and Router B are connected through the Ethernet.
<b>Figure 6- 11 IS-ISv6 Broadcast Link Topology</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> </ul>
<b>A</b>	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config)# interface GigabitEthernet 0/0 A(config-if)# ipv6 address 1000 ::1/112 A(config-if)# ipv6 router isis</pre>
<b>B</b>	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00 B(config)# interface GigabitEthernet 0/0 B(config-if)# ipv6 address 1000 ::2/112 B(config-if)# ipv6 router isis</pre>
<b>Verification</b>	<p>Enable sending of Hello packets from the interface 1000::1 on Router A to the interface 1000::2 on Router B.</p> <p>Establish an IS-IS neighbor relationship between Router A and Router B, with the neighbor state being Up.</p> <p>Check the LSPs on Router A and Router B. The system IDs 0000.0000.0001 and 0000.0000.0002 should exist.</p>
<b>A</b>	<pre>A# show isis neighbors A# show isis database detail</pre>
<b>B</b>	<pre>B# show isis neighbors</pre>

**Common Errors**

- The IP addresses of the interfaces connected between neighbors are not in the same network segment.

- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level-1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

#### 6.4.2 Configuring IS-IS Hello Packets

##### Configuration Effect

- Configure the Hello packet interval on an interface. The value range is 1 to 65,535, in the unit of seconds.
- Configure the Hello packet holdtime multiplier on an IS-IS interface.

##### Notes

- You can change the Hello packet holdtime by using the **isis hello-multiplier** command or **isis hello-interval** command or both.
- By default, CPU protection is enabled on devices. For packets mapped to the destination group addresses (AllISSystems, AllL1ISSystems, and AllL2ISSystems) in IS-IS, there is a default limit (for example, 400 pps) on the number of packets sent to the CPU. If a device has many neighbor relationships or sends Hello packets at short interval, the IS-IS packets that the device receives may exceed the default limit, causing frequent flapping of neighbor relationships. To solve the problem, you can use the CPU protection command in global mode to increase the limit.

##### Configuration Steps

###### ▾ Configuring the Hello Packet Interval on an Interface

- Perform this configuration based on requirements.
- Run the **isis hello-interval** command in interface configuration mode on the desired device, unless otherwise specified.

###### ▾ Configuring the Hello Packet Holdtime Multiplier on an Interface

- Perform this configuration based on requirements.
- Run the **isis hello-multiplier** command in interface configuration mode on the desired device, unless otherwise specified.

##### Verification

- Enable Router A to send Hello packets to Router B and Router C, and capture packets to check the packet interval.
- Make Router B or Router C down. After the holdtime has elapsed, check whether the corresponding neighbor relationship on Router A is invalid.

##### Related Commands

###### ▾ Configuring the Hello Packet Interval on an Interface

Command	<code>isis hello-interval { interval   minimal } [ level-1   level-2 ]</code>
---------	---

<b>Parameter Description</b>	<p><i>interval</i>: Indicates the Hello packet interval. The value range is 1 to 65,535, in the unit of seconds. The default value is 10.</p> <p><b>minimal</b>: Indicates the minimum value of the holdtime, which is 1.</p> <p><b>level-1</b>: Applies the setting to Level-1 Hello packets.</p> <p><b>level-2</b>: Applies the setting to Level-2 Hello packets.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to change the Hello packet interval. The default interval is 10s. A DIS sends Hello packets at a frequency three times that by non-DIS devices in a broadcast network. If an IS is elected as the DIS on the interface, by default, the interface sends a Hello packet every 3.3s.</p> <p>If the keyword <b>minimal</b> is used, the Hello packet holdtime is set to 1. The Hello packet interval will be calculated based on the holdtime multiplier. If the holdtime multiplier is set to 4 and the <b>isis hello-interval minimal</b> command is executed, the Hello packet interval is equal to 1s divided by 4. The default Hello packet holdtime multiplier on an IS-IS interface is 3. The holdtime is equal to the holdtime multiplier multiplied by the packet interval. If the keyword <b>minimal</b> is used, the holdtime is set to 1. The packet interval is equal to 1 divided by the holdtime multiplier. If the holdtime multiplier is set to 4 and the <b>isis hello-interval minimal</b> command is executed, the packet interval is equal to 1 divided by 4s, which is 250 ms.</p>

### ▾ Configuring Hello Packet Holdtime Multiplier on an Interface

<b>Command</b>	<b>isis hello-multiplier</b> <i>multiplier-number</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>multiplier-number</i> : Indicates the Hello packet holdtime multiplier. The value range is 2 to 100. The default value is 3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The Hello packet holdtime is equal to the Hello packet interval multiplied by the holdtime multiplier.

### Configuration Example

#### ▾ Configuring the Hello Packet Interval and Holdtime on an IS-IS Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the Hello packet interval on an IS-IS interface.</li> <li>● Configure the Hello packet holdtime multiplier on an IS-IS interface.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# isis hello-interval 5 A(config-if)#isis hello-multiplier 5</pre>
<b>Verification</b>	<p>Enable Router A to send Hello packets to Router B and Router C, and capture packets to check the packet interval. Make Router B or Router C down. After the holdtime has elapsed, check whether the corresponding neighbor relationship on Router A is invalid.</p>
	<pre>A# show isisneighbor</pre>

### 6.4.3 Configuring IS-IS LSPs

#### Configuration Effect

- **isis lsp-interval:** Configures the LSP interval on an IS-IS interface.
- **isis lsp-flood:** Sets the number of LSP PDUs sent by the IS-IS interface at a time.
- **lsp-gen-interval:** Configures the minimum LSP generational interval. The LSP generational interval is the interval between the new-version LSP generation time and the old-version LSP generation time.
- **isis retransmit-interval:** After a device at one end of a P2P link sends an LSP packet, if the device receives no response within a period of time, it determines that the LSP packet is lost or dropped due to an error. The device will resend the LSP packet.
- **lsp-gen-interval:** Indicates the exponential backoff algorithm of LSP packet generation. Any update to related information forming the LSP packet leads to LSP packet generation. During network flapping, LSP packets are frequently generated, which increases system resource consumption. An appropriate value can be set by running the **lsp-gen-interval** command. In this way, LSP packets are generated and advertised in time when the network is stable. When the network becomes unstable, less LSP packets are generated as the flapping continues, reducing the device consumption.
- **lsp-refresh-interval:** All current LSPs are periodically retransmitted to enable each network node to maintain the latest LSPs. The retransmission period is called the LSP refresh interval, which aims to update and synchronize LSPs in the entire area.
- **max-lsp-lifetime:** An LSP contains a field to indicate its lifetime. When a device generates an LSP, the field is set to the maximum lifetime of the LSP. After the LSP is received by the peer device, its lifetime will decrease with time. The peer device will replace the old LSP with the newly received one. If the device receives no new LSP until the existing LSP's lifetime decreases to 0, the existing LSP is still maintained in the LSDB for another 60s. If the device still receives no new LSP during this period, the existing LSP will be deleted from the LSDB. This mechanism updates and synchronizes LSPs in the entire area.
- **min-lsp-arrival:** During network flapping, LSP packets are frequently duplicated and the LSP packet sequence number constantly increases. As a result, the device keeps receiving duplicate LSP packets with different sequence numbers. If the device processes the duplicate LSP packets, more system resources are consumed. An appropriate value can be set by running the **min-lsp-arrival** command. In this way, LSPs are received and processed in time when the network is stable. When the network becomes unstable, less duplicate LSP packets are received and processed as the flapping continues, reducing the device consumption.
- **ignore-lsp-errors:** After receiving an LSP, the local IS-IS neighbor calculates its checksum and compares it with the checksum contained in the LSP. By default, if the two checksums are inconsistent, the LSP will be discarded. If you run the **ignore-lsp-errors** command to configure to ignore checksum errors, the LSP will be processed normally despite checksum inconsistency.
- **lsp-fragments-extend:** Enables LSP fragment extension, which is used to generate an extended LSP when the 256 fragments of the original LSP are used up.

#### Notes

- The LSP refresh interval must be smaller than the maximum LSP lifetime.
- The maximum LSP lifetime must be greater than the LSP refresh interval.
- The value of **initial-interval** cannot be greater than that of **maximum-interval**. Otherwise, the value of **initial-interval** will be used as the value of **maximum-interval**.
- The value of **hold-interval** cannot be greater than that of **maximum-interval**. Otherwise, the value of **hold-interval** will be used as the value of **maximum-interval**.

- The value of **initial-interval** cannot be greater than that of **hold-interval**. Otherwise, the value of **initial-interval** will be used as the value of **hold-interval**.

### Configuration Steps

#### ↘ **Configuring the Minimum LSP Interval**

- Perform this configuration based on requirements.
- Run the **isis lsp-interval** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring the Maximum Number of LSP Packets Sent at a Time**

- Perform this configuration based on requirements.
- Run the **isis lsp-flood** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring the LSP Retransmission Interval**

- Perform this configuration based on requirements.
- Run the **isis retransmit-interval** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring LSP Packet Generation Cycle**

- Perform this configuration based on requirements.
- Run the **lsp-gen-interval** command in interface configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring the LSP Refresh Interval**

- Perform this configuration based on requirements.
- Run the **lsp-refresh-interval** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring the LSP Lifetime**

- Perform this configuration based on requirements.
- Run the **max-lsp-lifetime** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring the Interval for Receiving Duplicate LSP Packets**

- Perform this configuration based on requirements.
- Run the **min-lsp-arrival** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring to Ignore LSP Checksum Errors**

- Perform this configuration based on requirements.
- Run the **ignore-lsp-errors** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ **Configuring LSP Fragment Extension**

- Perform this configuration based on requirements.

- Run the **lsp-fragments-extend** and **virtual-system** commands in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Update LSPs continuously and capture LSPs to check the minimum LSP interval.
- Disable neighboring routes and capture LSPs to check the LSP retransmission interval.
- Capture LSPs to check the refresh interval.
- Check the LSP lifetime.
- Send an LSP with an incorrect checksum and check whether the LSP is discarded.
- Reduce the **lsp-length-originate** command value, add routing information, and capture LSPs to check whether more than 256 LSP fragments are generated.

### Related Commands

#### ▾ Configuring the Minimum LSP Interval

<b>Command</b>	<b>isis lsp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>milliseconds</i> : Indicates the LSP interval. The value range is 1 to 4,294,967,295, in the unit of milliseconds. <b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Maximum Number of LSP Packets Sent at a Time

<b>Command</b>	<b>isis lsp-flood</b> <i>lsp-number</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>lsp-number</i> : Indicates the maximum number of LSP packets sent by the IS-IS interface at a time. The value range is <b>1</b> to <b>1000</b> . The default value is <b>5</b> . <b>level-1</b> : Applies the configuration only to Level-1. <b>level-2</b> : Applies the configuration only to Level-2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring LSP Packet Generation Cycle

<b>Command</b>	<b>lsp-gen-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i> [ <i>initial-interval</i> <i>hold-interval</i> ]
<b>Parameter Description</b>	<b>level-1</b> : Applies the configuration only to Level-1. <b>level-2</b> : Applies the configuration only to Level-2. <i>maximum-interval</i> : Indicates the maximum interval for generating two consecutive LSP packets. The value range is <b>1</b> to <b>65535</b> (in seconds). The default value is <b>5</b> . <i>initial-interval</i> : Indicates the waiting time for generating an LSP packet for the first time. The value range is <b>0</b> to <b>60000</b> (in milliseconds). The default value is <b>50</b> . <i>hold-interval</i> : Indicates the minimum interval for generating an LSP packet for the second time. The value range is <b>10</b> to <b>60000</b> (in milliseconds). The default value is <b>200</b> .

<b>Configuration Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>The LSP packet generation interval refers to the interval for generating two different LSP packets. A smaller generation interval indicates faster network convergence, which, however, will be accompanied by frequent flooding on the network.</p> <p>The waiting time for generating an LSP packet for the first time is the initial interval. If the network becomes unstable, the LSP packet regeneration interval is changed to be less than the maximum interval, and the interval for generating an LSP packet for the second time becomes the hold interval. A corresponding penalty will be added to this interval: The next interval for regenerating a LSP packet doubles the previous interval for generating the same LSP packet, until the regeneration interval reaches the maximum interval. Subsequent LSP packets will be generated at the maximum interval. When the network becomes stable, the LSP packet regeneration interval becomes greater than the maximum interval, and the waiting time for LSP packet generation is restored to the initial interval.</p> <p>Link changes have high requirements for convergence. The initial interval can be set to a small value. The preceding parameters can also be adjusted to larger values to reduce CPU consumption.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>hold-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>hold-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>hold-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>hold-interval</b>.</p>

#### ▾ Configuring the LSP Retransmission Interval

<b>Command</b>	<b>isis retransmit-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><b>seconds</b>: Indicates the LSP retransmission interval. The value range is 0 to 65,535, in the unit of seconds.</p> <p><b>level-1</b>: Applies the setting only to Level-1 LSPs.</p> <p><b>level-2</b>: Applies the setting only to Level-2 LSPs.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure the LSP retransmission interval. In a P2P network, after a device sends an LSP, if the device receives no PSNP response within the time specified by this command, it will resend the LSP. If the retransmission interval is set to 0, the LSP will not be resent,

#### ▾ Configuring the LSP Refresh Interval

<b>Command</b>	<b>lsp-refresh-interval</b> <i>interval</i>
<b>Parameter Description</b>	<i>interval</i> : Indicates the LSP refresh interval. The value range is 1 to 65,535, in the unit of seconds. The default value is 900.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>After an LSP has remained stable for a period specified by this command, it will be refreshed and updated before being published.</p> <p>The LSP refresh interval must be smaller than the maximum LSP lifetime.</p>

#### ▾ Configuring the LSP Lifetime

<b>Command</b>	<b>max-lsp-lifetime</b> <i>value</i>
----------------	--------------------------------------

<b>Parameter Description</b>	<i>value</i> : Indicates the maximum time that LSPs keep alive. The value range is 1 to 65,535, in the unit of seconds. The default value is 1,200.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	The maximum LSP lifetime must be greater than LSP refresh interval.

### ↘ Configuring the Interval for Receiving Duplicate LSP Packets

<b>Command</b>	<b>min-lsp-arrival [ level-1   level-2 ] maximum-interval initial-interval hold-interval</b>
<b>Parameter Description</b>	<p><b>level-1</b>: Applies the configuration only to Level-1.</p> <p><b>level-2</b>: Applies the configuration only to Level-2.</p> <p><i>maximum-interval</i>: Indicates the maximum interval for receiving two duplicate LSP packets. The value range is <b>1 to 120</b> (in seconds).</p> <p><i>initial-interval</i>: Indicates the interval for receiving a duplicate LSP packet for the first time. The value range is <b>0 to 60000</b> (in milliseconds).</p> <p><i>hold-interval</i>: Indicates the minimum interval for receiving a duplicate LSP packet for the second time. The value range is <b>10 to 60000</b> (in milliseconds).</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>The interval for receiving a duplicate LSP packet for the first time is the initial interval. When the interval for receiving duplicate LSP packets is less than the maximum interval, the interval for receiving a duplicate LSP packet for the second time becomes the hold interval. In addition, a corresponding penalty is added to this interval: The next interval for receiving a duplicate LSP packet doubles the previous interval for receiving the same LSP packet, until this interval reaches the maximum interval. When the network becomes stable, the interval for receiving a duplicate LSP packet becomes greater than the maximum interval, and the interval for receiving a duplicate LSP packet is restored to the initial interval.</p> <p>Link changes have high requirements for convergence. The initial interval can be set to a small value. The preceding parameters can also be adjusted to larger values to reduce CPU consumption.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>hold-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>hold-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>hold-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>hold-interval</b>.</p>

### ↘ Configuring to Ignore LSP Checksum Errors

<b>Command</b>	<b>ignore-lsp-errors</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	After receiving an LSP, the local IS-IS neighbor calculates its checksum and compares it with the checksum contained in the LSP. By default, if the two checksums are inconsistent, the LSP will be discarded. If you run the <b>ignore-lsp-errors</b> command to configure to ignore checksum errors, the LSP will be processed normally despite checksum inconsistency.

### ↘ Configuring LSP Fragment Extension

<b>Command</b>	<b>lsp-fragments-extend</b> [ level-1   level-2 ] [compatible rfc3786]
<b>Parameter Description</b>	<b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs. <b>compatible</b> : Indicates compatibility with the RFC version of extended LSPs. <b>rfc3786</b> : Extends the LSP old version.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to enable LSP fragment extension.

### ↘ Configuring an Additional System ID

<b>Command</b>	<b>virtual-system</b> <i>system-id</i>
<b>Parameter Description</b>	<i>system-id</i> : Indicates an additional system ID (6-byte).
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to configure the additional system ID of an IS-IS routing process, which is used by the extended LSP that is generated after the 256 fragments of the original LSP are used up. To enable fragment extension, run the <b>lsp-fragments-extend</b> command.

### Configuration Example

#### ↘ Configuring the Minimum LSP Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the minimum LSP interval.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis lsp-interval 100 level-2</pre>
<b>Verification</b>	Run the <b>clear isis *</b> command to update LSPs continuously and capture LSPs to check the minimum LSP interval.

#### ↘ Configuring the Maximum Number of LSP Packets Sent at a Time

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the maximum number of LSP packets sent at a time.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis lsp-flood 10 level-2</pre>
<b>Verification</b>	Run <b>show isis interface</b> command to check the maximum number of LSP packets sent at a time.

#### ↘ Configuring the LSP Retransmission Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors in P2P mode. (Omitted)</li> <li>● Configure the LSP retransmission interval.</li> </ul>
----------------------------	--

	A(config)# interface serial 0/1 A(config-if)# isis retransmit-interval 10 level-2
<b>Verification</b>	Disable neighboring routes and capture LSPs to check the LSP retransmission interval.

#### ▾ Configuring LSP Packet Generation Cycle

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP packet generation cycle.</li> </ul>
	A(config)# router isis A(config-router)# lsp-gen-interval 5 50 100
<b>Verification</b>	Generate LSP packet frequently to see whether the exponential backoff algorithm is used.

#### ▾ Configuring the LSP Refresh Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP refresh interval.</li> </ul>
	A(config)# router isis A(config-router)# lsp-refresh-interval 600
<b>Verification</b>	Capture LSPs to check the refresh interval.

#### ▾ Configuring the LSP Lifetime

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the LSP lifetime.</li> </ul>
	A(config)# router isis A(config-router)# max-lsp-lifetime 1500
<b>Verification</b>	Check the LSP lifetime ( <b>LSP Holdtime</b> field).
	A# show isis database

#### ▾ Configuring the Interval for Receiving Duplicate LSP Packets

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the interval for receiving duplicate LSP packets.</li> </ul>
	A(config)# router isis A(config-router)# min-lsp-arrival 10 100 200
<b>Verification</b>	Check <b>LSP Seq Num</b> field, that is, the receiving LSP status.
	A# show isis database

### ▾ Configuring to Ignore LSP Checksum Errors

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure to ignore LSP checksum errors.</li> </ul>
	<pre>A(config)# router isis A(config-router)# ignore-lsp-errors</pre>
<b>Verification</b>	Send an LSP with an incorrect checksum and check whether the LSP is discarded.

### ▾ Configuring LSP Fragment Extension

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure LSP fragment extension.</li> <li>● Configure the additional system ID of the IS-IS routing process.</li> </ul>
	<pre>A(config)# router isis A(config-router)# lsp-fragments-extend A(config-router)# virtual-system 0000.0000.0034</pre>
<b>Verification</b>	Reduce the <b>lsp-length originate</b> command value, add routing information, and capture LSPs to check whether more than 256 LSP fragments are generated.

## 6.4.4 Configuring IS-IS SNPs

### Configuration Effect

- CSNPs are periodically broadcast by the DIS in a broadcast network for LSDB synchronization. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to **mesh-groups** can be configured to periodically send CSNPs.
- When you need to set **mesh-group** on an IS-IS interface, run the **isis csnp-interval** command to configure the non-0 CSNP interval to ensure complete LSP synchronization between neighbors in the network. After that, CSNPs will be periodically sent to synchronize LSPs.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **isis csnp-interval interval[level-1 | level-2]** command in interface configuration mode on the desired device, unless otherwise specified.

### Verification

Capture CSNPs in the broadcast network to check the CSNP interval.

### Related Commands

### ▾ Configuring Source Registration Filter

<b>Command</b>	<b>isis csnp-interval</b> <i>interval</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>interval</i> : Indicates the CSNP interval. The value range is 0 to 65,535, in the unit of seconds. <b>level-1</b> : Applies the setting only to Level-1 CSNPs. <b>level-2</b> : Applies the setting only to Level-2 CSNPs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to change the CSNP interval. By default, a DIS sends a CSNP every 10s in a broadcast network. In a P2P network, a CSNP is sent only after a neighbor relationship is established. An interface set to <b>mesh-groups</b> can be configured to periodically send CSNPs. No CSNPs are sent if the CSNP interval is set to 0.

### Configuration Example

#### 📌 Configuring the CSNP Broadcast Interval

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the CSNP broadcast interval.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis csnp-interval 20</pre>
<b>Verification</b>	Capture packets to check the CSNP interval.

### 6.4.5 Configuring the IS-IS Level Type

#### Configuration Effect

- IS-IS supports a two-Level system to realize routing management and extensible route selection in a large network. Each Level is only concerned about maintaining the topology of the corresponding area.
- You can run the **is-type** command in IS-IS routing process configuration mode to configure an IS-IS Level, or run the **isis circuit-type** command in interface configuration mode to configure the IS-IS Level of an interface. The default Levels specified by the **is-type** and **isis circuit-type** commands are Level-1/Level-2. If you run both commands, the interface only sends the PDUs of the same Level specified by the two commands.

#### Notes

- If Level-1 or Level-2-only is configured using the **circuit-type** command, IS-IS will only send PDUs of the corresponding Level.
- If an interface is set to **external**, the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level.
- A device can have only one instance running at Level-2 (including Level-1/Level-2).

#### Configuration Steps

##### 📌 Configuring the System Type

- Perform this configuration based on requirements.
- Run the **is-type** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring the Interface Circuit Type

- Perform this configuration based on requirements.
- Run the **isis circuit-type** command in interface configuration mode on the desired device, unless otherwise specified.

#### Verification

- Check whether only the instances of the Level specified by the **is-type** command are processed, and neighbors of the corresponding Level are created.
- Check whether the interface only sends the PDUs of the same Level specified by the **is-type** and **circuit-type** commands.

#### Related Commands

### ▾ Configuring the System Type

<b>Command</b>	<b>is-type { level-1   level-1-2   level-2-only }</b>
<b>Parameter</b>	<b>level-1</b> : Indicates that IS-IS only runs at Level-1.
<b>Description</b>	<b>level-1-2</b> : Indicates that IS-IS runs at Level-1 and Level-2. <b>level-2-only</b> : Indicates that IS-IS only runs at Level-2.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Changing the <b>is-type</b> value will enable or disable the routes of the corresponding level.

### ▾ Configuring the Interface Circuit Type

<b>Command</b>	<b>isis circuit-type { level-1   level-1-2   level-2-only [ external ] }</b>
<b>Parameter</b>	<b>level-1</b> : Establishes a Level-1 neighbor relationship.
<b>Description</b>	<b>level-2-only</b> : Establishes a Level-2 neighbor relationship. <b>level-1-2</b> : Establishes a Level-1/Level-2 neighbor relationship. <b>external</b> : Uses the interface as an external domain interface.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the circuit type is set to Level-1 or Level-2-only, IS-IS will only send PDUs of the corresponding Level. If the system type is set to Level-1 or Level-2-only, IS-IS only processes the instances of the corresponding Level, and the interface only sends the PDUs of the same Level specified by the <b>is-type</b> and <b>circuit-type</b> commands. If the interface is set to <b>external</b> , the interface will work as an external domain interface and IS-IS will not send PDUs of the corresponding Level.

#### Configuration Example

### ▾ Configuring IS-IS Levels

<b>Configuration Requirements</b>	Router A is connected to Router B and Router C by P2P serial links. Router B and Router C are connected by the Ethernet, and Router D and Router E are also connected by the Ethernet. On Router A, configure IS-IS area route summarization. Note that area route summarization can be configured only on border devices.
<b>Figure 6- 12 IS-IS Level Configuration</b>	

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the IS-IS Level structure.</li> </ul>
<p><b>A</b></p>	<p>Configure IS-IS.</p> <pre>A(config)# router isis A(config-router)# net 50.0001.0000.0000.0001.00 A(config-router)# is-type level-2-only</pre>

#### 6.4.6 Configuring IS-IS Authentication

##### Configuration Effect

- Interface authentication is intended for establishing and maintaining neighbor relationships. A neighbor relationship cannot be established between two IS-IS devices with different interface authentication passwords. This prevents unauthorized or unauthenticated IS-IS devices from joining an IS-IS network that requires authentication. Interface authentication passwords are encapsulated in Hello packets before being sent.
- Area authentication and RD authentication in IS-IS are performed to verify LSPs, CSNPs, and PSNPs to prevent unauthorized or unauthenticated routing information from being injected into the LSDB. Authentication passwords are encapsulated in LSPs, CSNPs, and PSNPs before being sent.

##### Notes

- An interface authentication password is encapsulated in a Hello packet before being sent by an interface. When an interface receives a Hello packet, it checks the password in the packet against the existing one.
- Area authentication passwords are encapsulated in Level-1 LSPs, CSNPs, and PSNPs. When an interface receives an LSP, CSNP, or PSNP, it checks the password in the packet against the existing one.
- RD authentication passwords are encapsulated in Level-2 LSPs, CSNPs, and PSNPs. When an interface receives an LSP, CSNP, or PSNP, it checks the password in the packet against the existing one.

##### Configuration Steps

###### ▾ Configuring Interface Authentication

- Perform this configuration based on requirements.
- Configure **isis password** in interface configuration mode on the desired device, unless otherwise specified.

###### ▾ Configuring Area Authentication

- Perform this configuration based on requirements.
- Run the **area-password** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ⌵ Configuring RDAuthentication

- Perform this configuration based on requirements.
- Run the **domain-password** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### Verification

- IS-IS plaintext authentication provides only limited security because the password transferred through a packet is visible.
- IS-IS MD5 authentication provides higher security because the password transferred through a packet is encrypted using the MD5 algorithm.

#### Related Commands

#### ⌵ Configuring the Password for Plaintext Authentication of Hello Packets on an Interface

<b>Command</b>	<b>isis password [ 0   7 ] password [ send-only ] [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<p><b>0:</b> Indicates that the key is displayed in plaintext.</p> <p><b>7:</b> Indicates that the key is displayed in ciphertext.</p> <p><b>password-string:</b> Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only:</b> Indicates that the plaintext authentication password is only used to authenticate sent packets. Received packets are not authenticated.</p> <p><b>level-1:</b> Applies the setting to the Level-1 circuit type.</p> <p><b>level-2:</b> Applies the setting to the Level-2 circuit type.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to configure the password for Hello packet authentication on an interface. Use the <b>no</b> form of this command to clear the password.</p> <p>If no Level is specified, by default, the password takes effect for Level-1 and Level-2 circuit types.</p> <p>This command does not take effect if the <b>isis authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>If you include the <b>send-only</b> parameter when deleting the <b>isis authentication mode</b> command configuration, only the parameter setting is canceled.</p>

#### ⌵ Specifying Interface Authentication as Plaintext or MD5

<b>Command</b>	<b>isis authentication mode { md5   text } [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<p><b>md5:</b> Uses MD5 authentication.</p> <p><b>text:</b> Uses plaintext authentication.</p> <p><b>level-1:</b> Applies the setting to the Level-1 circuit type.</p> <p><b>level-2:</b> Applies the setting to the Level-2 circuit type.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to specify the authentication mode before you can make the key chain configured using the <b>isis</b>

	<p><b>authentication key-chain</b> command take effect.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2 circuit types.</p> <p>If you use the <b>isis authentication mode</b> command after the <b>isis password</b> command is executed to configure plaintext authentication, the previous command configuration will be overwritten.</p> <p>The <b>isis password</b> command does not take effect if the <b>isis authentication mode</b> command is executed. To run the <b>isis password</b> command, delete the <b>isis authentication mode</b> command configuration first.</p>
--	--

### ↘ Configuring the Password for Interface Authentication

<b>Command</b>	<b>isis authentication key-chain</b> <i>name-of-chain</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><i>name-of-chain</i>: Indicates the name of a key chain. The maximum length is 255.</p> <p><b>level-1</b>: Indicates that the authentication key chain takes effect for Level-1.</p> <p><b>level-2</b>: Indicates that the authentication key chain takes effect for Level-2.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Authentication is not performed if no key chain is configured using the <b>key chain</b> command. In addition to the <b>key chain</b> command, you also need to run the <b>isis authentication mode</b> command to make IS-IS key chain authentication take effect.</p> <p>The key chain is applicable to plaintext authentication and MD5 authentication. Which authentication mode to use can be determined using the <b>isis authentication mode</b> command.</p> <p>For plaintext authentication, the key-string in the key chain cannot exceed 80 characters; otherwise, the key chain will be invalid.</p> <p>Only one key chain can be used at a time. After you configure a new key chain, it will replace the original one.</p> <p>If no Level is specified, the key chain takes effect for Level-1 and Level-2.</p> <p>The key chain is applicable to Hello packets. IS-IS will send or receive passwords that belong to the key chain.</p> <p>A key chain may contain multiple passwords. A password with a smaller SN is preferentially used for sending a packet.</p> <p>When the packet arrives at the peer device, the device will receive the packet if the packet-carried password is consistent with a password in the key chain.</p> <p>The authentication commands (for example, <b>authentication key-chain</b>) executed in IS-IS routing process configuration mode are intended for LSPs and SNPs. They do not take effect for IS-IS interfaces.</p>

### ↘ (Optional) Applying Interface Authentication Only to Sent Packets (Received Packets Are Not Authenticated)

<b>Command</b>	<b>isis authentication send-only</b> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><b>level-1</b>: Sets <b>send-only</b> for Level-1 on an interface.</p> <p><b>level-2</b>: Sets <b>send-only</b> for Level-2 on an interface.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to enable IS-IS to set an authentication password in the Hello packet sent by an interface. However, IS-IS does not authenticate the Hello packet received by the interface. You can use this command before you deploy IS-IS interface authentication on all devices in the network or before you change the authentication password or authentication mode. After you run the <b>isis authentication send-only</b> command, the devices will not authenticate received Hello packets to avoid network flapping when IS-IS interface authentication is deployed. After authentication is deployed in the entire network, run the <b>no isis authentication send-only</b> command to cancel the <b>send-only</b> setting.</p> <p>The <b>isis authentication send-only</b> command is applicable to plaintext authentication and MD5 authentication. You can run the <b>isis authentication mode</b> command to specify the authentication mode for an IS-IS interface.</p>

	If no Level is specified, the authentication mode will take effect for Level-1 and Level-2 on the interface.
--	--

### ▾ Configuring the Password for Area (Level-1) Plaintext Authentication

<b>Command</b>	<b>area-password</b> [ 0   7 ] <i>password</i> [ <b>send-only</b> ]
<b>Parameter Description</b>	<p><b>0</b>: Indicates that the key is displayed in plaintext.</p> <p><b>7</b>: Indicates that the key is displayed in ciphertext.</p> <p><b>password-string</b>: Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only</b>: Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticated.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-1 areas and include authentication information in these packets before they are sent. All IS-IS devices in an area must be configured with the same password.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>To delete the password, run the <b>no area-password</b> command. If you run the <b>no area-password send-only</b> command, only the <b>send-only</b> setting is canceled. If you run the <b>area-password psw send-only</b> and <b>no area-password send-only</b> commands in sequence, the configuration is changed to <b>area-password psw</b>.</p>

### ▾ Configuring the Password for RD (Level-2) Plaintext Authentication

<b>Command</b>	<b>domain-password</b> [ 0   7 ] <i>password</i> [ <b>send-only</b> ]
<b>Parameter Description</b>	<p><b>0</b>: Indicates that the key is displayed in plaintext.</p> <p><b>7</b>: Indicates that the key is displayed in ciphertext.</p> <p><b>password-string</b>: Indicates the password string for plaintext authentication. The string can contain up to 126 characters.</p> <p><b>send-only</b>: Indicates that the plaintext authentication password is only used to authenticate sent Hello packets in Level-1 areas. Received Hello packets are not authenticated.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Run this command to enable authentication of received LSPs, CSNPs, and PSNPs in Level-2 domains and include authentication information in these packets before they are sent. All IS-IS devices in a Level-2 domain must be configured with the same password.</p> <p>This command does not take effect if the <b>authentication mode</b> command is executed. You need to first delete the previous command configuration.</p> <p>To delete the password, run the <b>no domain-password</b> command. If you run the <b>no domain-password send-only</b> command, only the <b>send-only</b> setting is canceled. If you run the <b>domain-password psw send-only</b> and <b>no domain-password send-only</b> commands in sequence, the configuration is changed to <b>domain-password psw</b>.</p>

### ▾ Specifying the IS-IS RD Authentication Mode

<b>Command</b>	<b>authentication mode</b> { <b>md5</b>   <b>text</b> } [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><b>md5</b>: Uses MD5 authentication.</p> <p><b>text</b>: Uses plaintext authentication.</p> <p><b>level-1</b>: Indicates that the authentication mode takes effect for Level-1.</p> <p><b>level-2</b>: Indicates that the authentication mode takes effect for Level-2.</p>

<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Use this command to specify the authentication mode before you can make the key chain configured using the <b>authentication key-chain</b> command take effect.</p> <p>If no Level is specified, the authentication mode will take effect for Level-1 and Level-2.</p> <p>If you use the <b>authentication mode</b> command after the <b>area-password</b> or <b>domain-password</b> command is executed to configure plaintext authentication, the previous command configuration will be overwritten.</p> <p>The <b>area-password</b> or <b>domain-password</b> command does not take effect if the <b>authentication mode</b> command is executed. To run the <b>area-password</b> or <b>domain-password</b> command, delete the <b>authentication mode</b> command configuration first.</p>

### 📌 Specifying the Key Chain for IS-IS Authentication

<b>Command</b>	<b>authentication key-chain</b> <i>name-of-chain</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><i>name-of-chain</i>: Indicates the name of a key chain. The maximum length is 255.</p> <p><b>level-1</b>: Indicates that the authentication key chain takes effect for Level-1.</p> <p><b>level-2</b>: Indicates that the authentication key chain takes effect for Level-2.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Authentication is not performed if no key chain is configured using the <b>key chain</b> command. In addition to the <b>key chain</b> command, you also need to run the <b>authentication mode</b> command to make IS-IS key chain authentication take effect.</p> <p>The key chain is applicable to plaintext authentication and MD5 authentication. Which authentication mode to use can be determined using the <b>authentication mode</b> command.</p> <p>For plaintext authentication, the key-string in the key chain cannot exceed 80 characters; otherwise, the key chain will be invalid.</p> <p>Only one key chain can be used at a time. After you configure a new key chain, it will replace the original one.</p> <p>If no Level is specified, the key chain takes effect for Level-1 and Level-2.</p> <p>The key chain is applicable to LSPs, CSNPs, and PSNPs. IS-IS will send or receive passwords that belong to the key chain. A key chain may contain multiple passwords. A password with a SN is preferentially used for sending a packet. When the packet arrives at the peer device, the device will receive the packet if the packet-carried password is consistent with a password in the key chain.</p>

### 📌 Applying IS-IS Authentication Only to Sent Packets

<b>Command</b>	<b>authentication send-only</b> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><b>level-1</b>: Applies the <b>send-only</b> setting to Level-1.</p> <p><b>level-2</b>: Applies the <b>send-only</b> setting to Level-2.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Use this command to enable IS-IS to set an authentication password in the Hello packet to be sent. However, IS-IS does not authenticate received Hello packets. You can use this command before you deploy IS-IS authentication on all devices in the network or before you change the authentication password or authentication mode. After you run the <b>authentication send-only</b> command, the devices will not authenticate received packets to avoid network flapping when authentication passwords are deployed. After authentication is deployed in the entire network, run the <b>no isis authentication send-only</b> command to cancel the <b>send-only</b> setting.</p> <p>The <b>authentication send-only</b> command is applicable to plaintext authentication and MD5 authentication. You can run</p>

the **authentication mode** command to specify the authentication mode.  
 If no Level is specified, the authentication mode will take effect for Level-1 and Level-2.

**Configuration Example**

➤ **Configuring IS-IS Authentication**

<p><b>Configuration Requirements</b></p>	<p>Router A, Router B, and Router C are connected through the Ethernet and run IS-IS. Router A is a Level-1 device, Router B is a Level-1/Level-2 device, and Router C is a Level-2 device. The following configuration requirements exist: Apply plaintext authentication to the Hello packets between Router A and Router B, as well as Level-1 LSPs and SNPs. Apply MD5 authentication to the Hello packets between Router B and Router C, as well as Level-2 LSPs and SNPs.</p>
<p><b>Figure 6-13 IS-IS Authentication Topology</b></p>

#### Common Errors

- Different authentication passwords are configured between neighbors.
- Different authentication modes are configured between neighbors.

#### 6.4.7 Configuring IS-IS GR

##### Configuration Effect

- IS-IS GR helps improve system reliability. On devices that separate the control plane from the forwarding plane, GR ensures that data forwarding is not interrupted during routing protocol restart.

##### 📌 IS-IS GR Working Mechanism

For GR to be successful, the following two conditions must be met: (1) The network topology is stable; (2) The device can ensure uninterrupted forwarding when it restarts IS-IS.

Two roles exist during the GR process: Restarter and Helper. Accordingly, IS-IS GR is divided into the IS-IS GR Restart capability and IS-IS GR Help capability. A device with the GR Restart capability can send a GR request and execute GR. A device with the GR Help capability can receive a GR request and help its neighbor with GR implementation. The GR process starts when the Restarter sends a GR request. After receiving the GR request, the neighboring device enters Help mode to help the Restarter reestablish its LSDB while maintaining the neighbor relationship with the Restarter. The main GR working mechanism is as follows:

When an IS-IS device needs to perform GR, it instructs its neighbor to maintain their neighbor relationship so that other devices in the network cannot sense the change in the topological relationship and the neighbor will not recalculate the route and update its forwarding table. The IS-IS device synchronizes and restores the LSDB to its pre-GR state with the help of the neighbor to ensure that the route and forwarding table remain unchanged before and after GR implementation and data forwarding is not interrupted.

The Restarter performs the following operations during the GR process:

1. The GR Restarter notifies the GR Helpers that it will be restarted.

Figure 6- 14 Restart Notification by the GR Restarter

Switch A is a GR Restarter, and Switch B and Switch C are the GR Helpers for Switch A. Switch A sends a GR request instructing all its neighbors not to delete the neighbor relationships with Switch A when it is restarted. After receiving the GR request, the neighbors send GR responses to the GR Restarter, and will maintain their neighbor relationships with the GR Restarter during the GR time (specified by **GR grace-period**) notified by the GR Restarter.

2. The GR Restarter is restarted.

Figure 6- 15 Restart Performed by the GR Restarter

When the GR Restarter is restarted, its IS-IS interface goes from Down to Up. Because the GR Helpers know that the GR Restarter is in IS-IS restart state, they maintain their neighbor relationships with the GR Restarter during the GR time and retain the routes from the GR Restarter.

31. The GR Restarter synchronizes topology and routing information from the GR Helpers.

Figure 6- 16 LSDB Synchronization

After IS-IS restart, the GR Restarter synchronizes topology or routing information from the GR Helpers and recalculates its routing table. During this process, any change in the routing table is not updated to the forwarding table.

32. GR is completed when the GR Restarter finishes LSDB synchronization. Then all devices enter IS-IS interaction state.

Figure 6- 17 GR Completion

After the GR Restarter synchronizes all required data, all devices enter IS-IS interaction state. The GR Restarter's routing table is updated to the forwarding table and invalid entries are cleared. Because the GR Restarter is completely restored to the pre-restart state under stable network conditions, its routing table and forwarding table remain unchanged before and after GR.

#### Notes

- IS-IS GR is implemented based on RFC5306: Restart Signaling for IS-IS.

All products support the IS-IS GR Helper capability.

#### Configuration Steps

##### ▾ Enabling the IS-IS GR Restart Capability

- Perform this configuration based on requirements.

- Run the **graceful-restart** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Configuring the Maximum GR Time

- Perform this configuration based on requirements.
- Run the **graceful-restart grace-period** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### ↘ Enabling the IS-IS GR Help Capability

- Perform this configuration based on requirements.
- Run the **graceful-restart helper** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

#### Verification

- Check whether the routing table and forwarding table remain unchanged before and after GR.

#### Related Commands

##### ↘ Enabling the IS-IS GR Restart Capability

<b>Command</b>	<b>graceful-restart</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to enable the IS-IS GR Restart capability. As long as the network conditions remain unchanged, IS-IS can be restarted and restored to the pre-restart state without impact on data forwarding.

##### ↘ Configuring the Maximum GR Time

<b>Command</b>	<b>graceful-restart grace-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the GR time. The value range is 1s to 65,535s. The default value is 300s.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	N/A

##### ↘ Enabling the IS-IS GR Help Capability

<b>Command</b>	<b>graceful-restart helper disable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use the <b>graceful-restart helper disable</b> command to disable the IS-IS GR Help capability. The command enables IS-IS to ignore the GR request sent by the device to be restarted.

#### Configuration Example

## 6.4.8 Configuring IS-ISNSR

### Configuration Effect

- IS-IS nonstop routing (IS-IS NSR) helps improve system reliability. During the active/standby switchover of devices in distributed mode, user data traffic keeps being forwarded without interruption.

### Working Mechanism of IS-IS NSR

NSR backs up relevant IS-IS information from the master Supervisor Engine to the slave Supervisor Engine of the distributed device so that the device can automatically recover the link state and regenerate a route upon active/standby switchovers, without requiring help from neighbor devices during the recovery.

### Notes

For the same IS-IS process, either NSP or GR is enabled, because they are exclusive.

The switchover of distributed devices takes a period of time. If the IS-IS neighbor keepalive duration is less than the switchover duration, IS-IS neighbor relationship with the neighbor device is removed, and the services are interrupted during the switchover.

Therefore, it is recommended to set the IS-IS neighbor keepalive duration not less than the default value. When Fast Hello is enabled, the IS-IS neighbor keepalive duration is less than 1 second and the IS-IS neighbor relationship times out during the switchover, causing NSR failures. Therefore, it is recommended to disable Fast Hello when NSR is enabled.

### Configuration Steps

#### Configuring IS-ISNSR

- Optional. IS-IS NSR is disabled by default. Perform this configuration as required.
- Configure NSR in IS-IS routing process configuration mode on the required devices unless otherwise specified.

### Verification

- Verify that user data traffic keeps being forwarded without interruption during the hot-backup switchover of devices in distributed mode.

### Related Commands

#### Enabling NSR

<b>Command</b>	nsr
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Configuration Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>NSR backs up relevant IS-IS information from the master Supervisor Engine to the slave Supervisor Engine of the distributed device so that the device can automatically recover the link state and regenerate a route upon active/standby switchovers, without requiring help from neighbor devices during the recovery. Information such as the neighbor relationship and link status needs to be backed up.</p> <p>For the same IS-IS process, either NSP or GR is enabled, because they are exclusive.</p>
	<p>The switchover of distributed devices and VSU devices takes a period of time. If the IS-IS neighbor keepalive duration is less than the switchover duration, IS-IS neighbor relationship with the neighbor device is removed, and the services are interrupted during the switchover. Therefore, it is recommended to set the IS-IS neighbor keepalive duration not less than the default value. When Fast Hello is enabled, the IS-IS neighbor keepalive duration is less than 1 second and the</p>

IS-IS neighbor relationship times out during the switchover, causing NSR failures. Therefore, it is recommended to disable Fast Hello when NSR is enabled.

By default, if the DIS is a FS device, the neighbor relationship between the neighbor device and the FS device is maintained for 10 seconds at most (the DIS interface sends one HELLO packet every 3.3 seconds). However, the active/standby switchover of FS devices takes at least 7 seconds. If the switchover takes place when the interface is to send HELLO packets, the period for the neighbor device to receive HELLO packets again may be greater than 10 seconds, leading to neighbor down. To avoid neighbor down, when NSR is enabled, increase the time for maintaining the neighbor relationship with the neighbor device that is to send HELLO packets by 10 seconds.

**Configuration Example**

**Configuring IS-IS NSR**

<p><b>Configuration Requirements</b></p>	<p>Two high-end FS-S8600 devices are required and both support IS-IS NSR and are equipped with master and slave SuperEngines to implement redundancy backup on control plane. -

### 6.4.9 Configuring BFD Support for IS-IS

#### Configuration Effect

- IS-IS dynamically discovers neighbors through Hello packets. After IS-IS enables the BFD function, a BFD session will be set up with the neighbor in Up state. The BFD mechanism is used to detect the neighbor state. Once a neighbor failure is detected through BFD, IS-IS performs network convergence immediately. The convergence time can be reduced from 30s to less than 1s. By default, IS-IS Hello packets are sent at an interval of 10s in a P2P network, and the time required to detect a neighbor failure is three times the packet interval, that is 30s.

#### Notes

- You must set BFD session parameters before you enable BFD support for IS-IS.
- When you run the **bfd up-dampening** command on an interface with BFD support for IS-IS, you need to run the **bfd all-interfaces** command with the *[anti-congestion]* option selected.
- When you run the **bfd all-interfaces** command with the *[anti-congestion]* option selected, run the **bfd up-dampening** command on the interface.
- IP routing may cause a neighbor's interface for BFD session setup to be inconsistent with the interface for outgoing BFD packets. If this happens, the BFD session cannot be set up.
- If a neighbor's interface for BFD session setup is inconsistent with the interface for outgoing BFD packets, the BFD session cannot be setup.

#### Configuration Steps

##### ▾ Enabling BFD Support for IS-IS on All Interfaces

- Perform this configuration based on requirements.
- Run the **bfd all-interfaces** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

##### ▾ Enabling BFD Support for IS-IS on the Current Interface

- Perform this configuration based on requirements.
- Run the **isis bfd** command in interface configuration mode on the desired device, unless otherwise specified.

#### Verification

- Build a topology with two parallel lines. Typically, IS-IS selects one line as the master line and the other as the backup line. Enable BFD on the master line.
- Make the master line fail. Check whether IS-IS performs route convergence based on the BFD monitoring state and starts the backup line.

#### Related Commands

##### ▾ Enabling BFD Support for IS-IS on the Current Interface

<b>Command</b>	<b>bfd all-interfaces</b> <i>[anti-congestion]</i>
<b>Parameter</b>	<i>anti-congestion</i> : Indicates the IS-IS BFD anti-congestion option.
<b>Description</b>	

<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>You can enable or disable BFD on an IS-IS interface by using any of the following two methods:</p> <p>Method 1: Run the <b>bfd all-interfaces</b> command in IS-IS routing process configuration mode to enable BFD on all IS-IS interfaces, and then run the <b>no bfd all-interfaces</b> command to disable BFD on all IS-IS interfaces.</p> <p>Method 2: Run the <b>isis bfd [disable]</b> command in interface configuration mode to enable BFD on the specified IS-IS interface, and then run the <b>isis bfd disable</b> command to disable BFD on the interface.</p>

### ▾ Enabling BFD Support for IS-IS on the Current Interface

<b>Command</b>	<b>isis bfd [ disable   anti-congestion ]</b>
<b>Parameter Description</b>	<p><i>disable</i>: Disables BFD support for IS-IS on the current interface.</p> <p><i>anti-congestion</i>: Indicates the IS-IS BFD anti-congestion option.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>You can enable or disable BFD on an IS-IS interface by using any of the following two methods:</p> <p>Method 1: Run the <b>[no]bfd all-interfaces [anti-congestion]</b> command in IS-IS routing process configuration mode to enable or disable BFD on all IS-IS interfaces.</p> <p>Method 2: Run the <b>isis bfd [disable] anti-congestion</b> command in interface configuration mode to enable or disable BFD on the specified interface.</p> <p>Normally, BFD sends detection packets at millisecond intervals to detect the link state. When a link exception (such as a disconnected link) occurs, BFD can quickly detect it and instruct IS-IS to delete the neighbor relationship and the neighbor reachability information in LSPs. Then IS-IS recalculates and generates a new route to bypass the abnormal link, thus realizing fast convergence. With the introduction of new techniques such as the Multi-Service Transport Platform (MSTP), link congestion tends to occur during peak hours of data communication. BFD quickly detects the link exception and instructs IS-IS to delete the neighbor relationship and the neighbor reachability information in LSPs. Link switch is performed to bypass the congested link. A Hello packet for IS-IS neighbor detection is sent every 10s and its expiration time is 30s. The Hello packet can still be received normally when BFD detects an exception, and therefore an IS-IS neighbor relationship is reestablished quickly, causing the route to be restored to the congested link. Then BFD detects the abnormal link and link switch is performed again. This process is repeated, which makes the route be switched between the congested link and other links, causing repetitive flapping.</p> <p>The <b>anti-congestion</b> option is used to avoid routing flapping in case of link congestion. After the option is configured, the IS-IS neighbor state is still kept alive when link congestion occurs, but the neighbor reachability information in LSPs is deleted. The route is switched to a normal link. When the congested link is restored, the neighbor reachability information in LSPs is recovered and the route is switched back, which avoids route flapping.</p> <p>When you run the <b>bfd all-interfaces [anti-congestion]</b> command, run the <b>bfd up-dampening</b> command on the interface. The two commands must be used together. If you run only one command, the route flap dampening feature may not take effect or other network exceptions may occur.</p>

### Configuration Example

	<pre>A#showbfdneighborsdetail</pre>

### Common Errors

- BFD support for IS-IS is not enabled on neighbors.

#### 6.4.10 Setting the IS-IS Overload Bit

##### Configuration Effect

The overload bit is used in the following three situations:

- Device overload

The local IS-IS node has overload issues, such as insufficient memory or full CPU load; as a result, its routing table has incomplete routes or does not have resource forwarding data. You can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device.

To set the overload bit, run the **set-overload-bit** command without the **on-startup** keyword. The overload bit can be configured or canceled manually. When the local IS-IS node is restored, manually cancel the command configuration; otherwise, the node is always in overload state.

- Instantaneous black hole

In the scenario described by RFC3277, the IS-IS convergence speed is faster than the BGP speed; as a result, after an IS-IS node is restarted, a route may be instantaneously unreachable, which is called an instantaneous black hole. You can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device until the specified time has elapsed.

To set the overload bit, run the **set-overload-bit** command with the **on-startup** keyword. The overload bit can be configured or canceled automatically by the IS-IS node based on the configuration. If the **on-startup** keyword is selected, the IS-IS node automatically enters instantaneous black hole state after restart. When a neighbor relationship is established, the IS-IS node sends an LSP with the overload bit to notify the neighbor that the local node enters instantaneous black hole (or overload) state and instruct the neighbor not to use the local node as a forwarding device. After the specified time has elapsed, the IS-IS node immediately sends an LSP with the overload bit canceled to notify the neighbor that the local node has exited instantaneous black hole (or overload) state and can work as a forwarding device.

- Disabling real data forwarding on the local IS-IS node

If you only need to connect the local IS-IS node to a production network for testing or to meet other functional requirements, but does not require the node to forward real data in the network, you can set the overload bit in an LSP to instruct the neighbor not to use the local node as a forwarding device.

To set the overload bit, run the **set-overload-bit** command without the **on-startup** keyword. The overload bit can be configured or canceled manually. You can set the **suppress** keyword based on requirements to limit the routing information carried in an LSP in case of overload. For example, internal and external routes can be suppressed, and only the local direct route is advertised.

### Notes

- At the same Level, the configuration with the **on-startup** keyword is mutually exclusive with the configuration without the **on-startup** keyword.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **set-overload-bit** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Capture packets and check that the neighbor does not forward LSPs from the local node.

	<pre>A# show isis neighbors</pre>

### ↘ Disabling Real Data Forwarding on the Local IS-IS Node

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Connect the local IS-IS node as a test device to a production network. The node is not required to forward real data in the network to avoid impact on production.</li> </ul>
	<pre>A(config)# router isis A(config-router)#set-overload-bit suppress interlevel external</pre>
<b>Verification</b>	<p>Capture packets to check LSPs. Verify that the LSPs carry the overload bit and only advertise local direct routes.</p>
	<pre>A# show isis neighbors</pre>

#### 6.4.11 Configuring IS-IS VRF

##### Configuration Effect

- Each VRF table can be seen as a virtual device or a dedicated PE device.
- The virtual device contains the following elements: an independent routing table, as well as an independent address space; a set of interfaces that belong to the VRF table; a set of routing protocols applicable only to the VRF table.
- Each device can maintain one or more VRF tables and a public-network routing table (also called a global routing table). Multiple VRF instances are separated from each other.

##### Notes

- Note the following constraints or conventions when you bind IS-IS instances and VRF tables:

- The IS-IS instances bound with the same VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.
- One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.
- When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the **ip router isis [tag]** interface configuration and the redistribution configuration in routing process configuration mode will be deleted.

### Configuration Steps

- Perform this configuration based on requirements.
- Run the **vrf** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### Verification

- Check whether the local device establishes neighbor relationships with other devices specified in the VRF table.

### Related Commands

#### ↘ Configuring IS-ISVRF

<b>Command</b>	<b>vrf vrf-name</b>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of an existing VRF table.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Before you bind an IS-IS instance to a VRF table, ensure that the VRF table has been configured. If you need to establish an IS-ISv6 neighbor relationship, enable IPv6 and ensure that the table to be bound is a multiprotocol VRF table.</p> <p>Note the following constraints or conventions when you bind IS-IS instances and VRF tables:</p> <ul style="list-style-type: none"> <li>● The IS-IS instances bound with the same non-default VRF table must be configured with different system IDs. The IS-IS instances bound with different VRF tables can be configured with the same system ID.</li> <li>● One IS-IS instance can be bound with only one VRF table, but one VRF table can be bound to multiple IS-IS instances.</li> <li>● When the VRF table bound to an IS-IS instance is changed, all IS-IS interfaces associated with the instance will be deleted. That is, the <b>ip (or ipv6) router isis [ tag ]</b> interface configuration and the redistribution configuration in routing process configuration mode will be deleted.</li> </ul>

### Configuration Example

#### ↘ Configuring IS-ISVRF

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Bind an IS-IS instance to a VRF table.</li> <li>● Add interfaces to the VRF table and IS-IS instance. (Omitted)</li> </ul>
----------------------------	---

	<pre>A(config)#vrf definition vrf_1 A(config-vrf)#address-family ipv4 A(config-vrf-af)#exit-address-family A(config)# router isis A(config-router)# vrf vrf_1</pre>
<b>Verification</b>	Check whether the local device establishes neighbor relationships with other devices specified in the VRF table.
	<pre>A# show isis neighbors</pre>

### Common Errors

- Interfaces are not added to the VRF table.
- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level-1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

### 6.4.12 Configuring IS-IS MTR

#### Configuration Effect

- If the **multi-topology** command is not executed, IPv4 and IPv6 share one IS-IS physical topology, also called the default topology. If the **multi-topology** command is executed without the **transition** parameter, routing devices run in MT mode. IS-ISv4 runs in the default topology, and IS-ISv6 runs in the IPv6 unicast topology. If the **multi-topology** command is executed with the **transition** parameter, routing devices run in MTT mode. IS-ISv6 runs in the default topology and IPv6 unicast topology. The three configurations are mutually exclusive. The routing devices in MTT mode can transfer the MT TLV or the default topology TLV. The MTT mode is applicable to incremental deployment to ensure smooth network migration. The MTT mode can cause route leaking between the default topology and IPv6 unicast topology. If the MTT mode is configured improperly, network failures such as routing black holes and loops may occur.

#### Notes

Note the following constraints or conventions when you configure the IS-IS MTR feature:

- Set **metric-style** to **Wide** or **Transition** before you run the **multi-topology** command.
- The MTR feature will be disabled if **metric-style** is set to **Narrow** or only one Level is configured to support the Wide or Transition mode.

#### Configuration Steps

- Perform this configuration based on requirements.
- Configure the MTR feature in IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

#### Verification

- Check whether the local device establishes neighbor relationships with other devices.

#### Related Commands

##### ▾ Configuring IS-IS MTR

<b>Command</b>	<b>multi-topology</b> [ <i>transition</i> ]
<b>Parameter Description</b>	<i>transition</i> : Configures the MTT mode, which supports smooth migration from an IPv4-IPv6 hybrid topology to separate IPv4 and IPv6 topologies.
<b>Command Mode</b>	IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>If the <b>multi-topology</b> command is not executed, IPv4 and IPv6 share one IS-IS physical topology, also called the default topology. If the <b>multi-topology</b> command is executed without the <b>transition</b> parameter, routing devices run in MT mode. IS-ISv4 runs in the default topology, and IS-ISv6 runs in the IPv6 unicast topology. If the <b>multi-topology</b> command is executed with the <b>transition</b> parameter, routing devices run in MTT mode. IS-ISv6 runs in the default topology and IPv6 unicast topology. The three configurations are mutually exclusive. The routing devices in MTT mode can transfer the MT TLV or the default topology TLV. The MTT mode is applicable to incremental deployment to ensure smooth network migration. The MTT mode can cause route leaking between the default topology and IPv6 unicast topology. If the MTT mode is configured improperly, network failures such as routing black holes and loops may occur.</p> <p>Set <b>metric-style</b> to <b>Wide</b> or <b>Transition</b> before you run the command. The MTR feature will be disabled if <b>metric-style</b> is set to <b>Narrow</b> or only one Level is configured to support the Wide or Transition mode.</p>

#### Configuration Example

##### ▾ Configuring IS-IS MTR

<b>Configuration Requirements</b>	<p>The typical application scenario of MTR is to retain devices that only support IPv4 services in a network where IPv6 service extension will be performed.</p> <p>In Figure 1-20, Router 2 only supports the IPv4 protocol stack but does not support the MTR feature; therefore, it can only run IPv4 services. The network capacity needs to be scaled to support IPv6 services in order to meet service extension requirements. (Router 1, Router 3, and Router 4 that support the MTR feature will be added.) The device (Router 2) that supports only one protocol stack must be replaced to maintain the stability of the network running IPv4 and IPv6 dual protocol stacks; otherwise, IPv6 routing black holes may occur.</p> <p>If you need to retain Router 2, you can configure the MTR feature on Router 1, Router 3, and Router 4. The MTR feature enables Router 2 to continue to run IPv4 services without interference on the IPv4 and IPv6 services on Router 1, Router 3, and Router 4. The MTR feature improves networking flexibility, indirectly prolongs the service life of old devices, and meets service extension requirements while maximizing the values of old devices.</p> <p>The configuration requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Retain Router 2, which only supports IPv4 services.</li> <li>● Add devices that support IPv4 and IPv6 dual topologies, and separate IPv4 route calculation and IPv6 route</li> </ul>
-----------------------------------	---

calculation based on different topologies.

**Topology**

**Router 1**

Configure IS-IS and Ethernet interfaces.

Configure IS-IS:

```
FS(config)# router isis
```

```
FS(config-router)# net 49.0001.0000.0000.0001.00
```

```
FS(config-router)# is-type level-1
```

```
FS(config-router)# metric-style wide
```

```
FS(config-router)# address-family ipv6
```

```
FS(config-router-af)# multi-topology
```

Configure Ethernet interfaces:

```
FS(config)# interface gigabitEthernet 0/1
```

```
FS(config-if-GigabitEthernet 0/1)# ipv6 enable
```

```
FS(config-if-GigabitEthernet 0/1)# ipv6 address 1002::1/112
```

```
FS(config-if-GigabitEthernet 0/1)# ipv6 router isis
```

```
FS(config-if-GigabitEthernet 0/1)# ip address 192.168.1.1 255.255.255.0
```

```
FS(config-if-GigabitEthernet 0/1)# ip router isis
```

```
FS(config-if-GigabitEthernet 0/1)# interface gigabitEthernet 0/2
```

```
FS(config-if-GigabitEthernet 0/2)# ipv6 enable
```

```
FS(config-if-GigabitEthernet 0/2)# ipv6 address 1003::1/112
```

```
FS(config-if-GigabitEthernet 0/2)# ipv6 router isis
```

```
FS(config-if-GigabitEthernet 0/2)# ip address 192.168.2.1 255.255.255.0
```

```

### Common Errors

- **metric-style** is not set to **Wide** or **Transition**.
- The protocol types used by two neighbors do not match; therefore, a neighbor relationship cannot be established.
- The IP addresses of the interfaces connected between neighbors are not in the same network segment.
- The **ip router isis** command is not executed on interfaces.
- No NET address is configured, or different NET addresses exist at Level 1.
- **max-area-addresses** is configured differently on both sides.
- **metric-style** is configured differently on both sides.
- The interface Levels on both sides are different. One side is Level-1, whereas the other side is Level-2.
- One side is configured with the P2P mode, whereas the other side is configured with the broadcast mode.
- One side is enabled with authentication, whereas the other side is not.

#### 6.4.13 Configuring SNMP for IS-IS

##### Configuration Effect

- By default, the SNMP software can perform the MIB operation on the first IS-IS instance. To perform the MIB operation on other instances, you need to manually specify these instances.

##### Notes

- By default, the SNMP software can perform the MIB operation on the first displayed IS-IS instance.

##### Configuration Steps

###### ↘ Binding the Instances on Which the IS-IS MIB Operation Will Be Performed

- Perform this configuration based on requirements.
- Run the **enable mib-binding** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

###### ↘ Enabling IS-IS Trap Globally

- Perform this configuration based on requirements.
- Run the **snmp-server enable traps isis** command in global configuration mode on the desired device, unless otherwise specified.

###### ↘ Configuring an SNMP Host Globally

- Perform this configuration based on requirements.
- Run the **snmp-server host** command in global configuration mode on the desired device, unless otherwise specified.

###### ↘ Allowing the Sending of all IS-IS Trap Messages to the SNMP Host

- Perform this configuration based on requirements.
- Run the **enable traps all** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- Use the MIB tool to read and write IS-IS settings.

## Related Commands

### ▾ Binding the Instances on Which the IS-IS MIB Operation Will Be Performed

<b>Command</b>	<b>enable mib-binding</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	The latest standards stipulate that the MIB operation can be performed on a single instance. By default, the MIB operation is performed on the first displayed IS-IS instance. Because multiple IS-IS instances can be configured, the administrator can use this command to specify the instances on which the MIB operation will be performed.

### ▾ Enabling IS-IS Trap Globally

<b>Command</b>	<b>snmp-server enable traps [ isis ]</b>
<b>Parameter Description</b>	<i>isis</i> : Enables IS-IS event trap.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command must be used with the <b>snmp-server host</b> command in global configuration mode so that trap messages can be sent.

### ▾ Configuring an SNMP Host Globally

<b>Command</b>	<b>snmp-server host { host-addr   ipv6 ipv6-addr } [ vrf vrfname ] [ traps ] [ version { 1   2c   3 { auth   noauth   priv } } ] community-string [ udp-port port-num ] [ notification-type ]</b>
<b>Parameter Description</b>	<p><i>host-addr</i>: Indicates the address of the SNMP host.</p> <p><i>ipv6-addr</i>: Indicates the IPv6 address of the SNMP host.</p> <p><i>vrfname</i>: Indicates the name of a VRF table.</p> <p><b>version</b>: Indicates the SNMP version, which can be set to <b>V1</b>, <b>V2C</b>, or <b>V3</b></p> <p><b>auth   noauth   priv</b>: Indicates the security level of V3 users.</p> <p><i>community-string</i>: Indicates the community string or user name (V3 version).</p> <p><i>port-num</i>: Indicates the port number of the SNMP host.</p> <p><i>notification-type</i>: Indicates the type of trap messages that are actively sent, for example, snmp.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used with the <b>snmp-server enable traps</b> command to actively send trap messages to a Network Management System (NMS). You can configure different SNMP hosts to receive trap messages. A host supports different trap types, ports, and VRF tables. For the same host (with the same port configuration and VRF configuration), the last configuration is combined with the previous configurations. That is, to send different trap messages to the same host, configure a type of trap messages each time. These configurations are finally combined.

▾ **Allowing the Sending of Trap Messages**

<b>Command</b>	<b>enable traps { all   traps set }</b>
<b>Parameter</b>	<b>all:</b> Indicates all trap messages.
<b>Description</b>	<b>traps set:</b> Indicates a trap message type in any set.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	IS-IS packets are classified into 18 types of trap messages, which are grouped into several sets, with each set containing several trap message types. To enable the sending of IS-IS trap messages, run the <b>snmp-server enable traps isis</b> command in global configuration mode and specify the recipient host and the type of trap messages that can be sent.

**Configuration Example**

▾ **Configuring IS-IS SNMP**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Bind the instances on which the IS-IS MIB operation will be performed.</li> <li>● Complete trap message-related settings.</li> </ul>
	<pre>A(config)# router isis A(config-router)# enable mib-binding A# configure terminal A(config)#snmp-server enable traps isis A(config)#snmp-server host 10.1.1.1 traps version 2c public A(config)#router isis A(config-router)# enable traps all</pre>
<b>Verification</b>	Run the MIB tool to read and write IS-IS settings.
	<pre>A# show running-config</pre>

**6.4.14 Configuring IS-IS Two-way Maintenance**

**Configuration Effect**

- Enable IS-IS two-way maintenance.

**Notes**

- The IS-IS basic functions must be configured.
- The neighbor relationship is successfully established.

**Configuration Steps**

▾ **Configuring IS-IS Two-way Maintenance**

- Configure the two-way maintenance function as required.

- Run the **two-way-maintain** command in IS-IS routing process configuration mode on the required devices unless otherwise specified.

**Verification**

- Run the **show isis neighbor** command to check the neighbor update time.
- Run the **show isis protocol** command to check whether the two-way maintenance function is enabled.

**Related Commands**

▾ **Configuring IS-IS Two-way Maintenance**

<b>Command</b>	<b>two-way-maintain</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	In a large-scale network, a large number of packets are sent and received, which occupies lots of CPU and memory resources, causing some IS-IS packets to be delayed or discarded. If the time required for processing HELLO packets exceeds the neighbor relationship maintenance time, the corresponding neighbor relationship times out and is removed. When the two-way maintenance function is enabled, if a large number of packets exist on the network, the LSP packets, CSNP packets, and PSNP packets from a neighbor in addition to HELLO packets can also be used to maintain the two-way relationship with the neighbor, preventing neighbor failure caused by delay or discard of HELLO packets.

**Configuration Example**

- i** The following example is implemented based on IS-IS basic functions. For details about the IS-IS basic functions, see preceding description

▾ **Configuring IS-IS Two-way Maintenance**

<b>Scenario</b>	<p style="text-align: center;">Area 49.0001</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the ISIS basic functions on all devices.</li> <li>● The neighbor relationship is successfully established.</li> </ul>
<b>Verification</b>	<p>Verify that an ISIS interface neighbor is established on device A.</p> <p>Check the status of an ISIS instance on device A.</p>

**Common Errors**

**6.4.15 Configuring Other IS-IS Parameters**

**Configuration Effect**

- **maximum-paths**: Configures the maximum number of IS-IS equal-cost paths to be installed to a routing table.
- **max-metric on-neighbor-up** : Configures the maximum metric for the connected routes after the first neighbor is up.
- **isp-length receive**: Configures the maximum length allowed for received LSPs.
- **isp-length originate**: Configures the maximum length allowed for sent LSPs.
- **passive-interface**: Prevents passive interfaces from receiving and sending IS-IS packets. That is, IS-IS neighbor relationships will not be established on passive interfaces. The IP addresses of passive interfaces are flooded through other interfaces.
- **bandwidth-reference**: Configures the bandwidth reference for IS-IS to automatically calculate the link metric. If a metric is configured, the metric prevails. If no metric is configured, the metric is automatically calculated based on the configured bandwidth reference.
- **interface-protocol-compatible**: Configures the TLV field of the IS-IS protocol to be padded based on protocols supported by an interface.
- **is-name**: Replaces the system ID of an instance with the configured name.
- **isis metric**: Stores the metric, which is used in SPF calculation, in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation.
- **isis passive**: Prevents the interface from sending or receiving IS-IS packets, but the corresponding IP address will be flooded through other interfaces.
- **isis priority**: In a broadcast network, IS-IS needs to elect a DIS among all devices. The DIS will generate a pseudonode and related LSPs. The device with the highest priority is elected as the DIS. You can configure different priorities for different levels.
- **isis suppress on-neighbor-up** : Suppresses the routing calculation after the IS-IS neighbor is up.
- **default-information originate**: Generates a Level-2 default route, which will be advertised through LSPs.
- **spf-interval**: Configures the exponential backoff algorithm of SPF.
- **summary-address** and **summary-prefix**: Creates a summary route to represent a group of routes in a routing table. A summary route can include multiple routes of the specified level. The interface metric of the summary route follows the smallest interface metric among all routes.
- **log-adjacency-changes**: Enables neighbor relationship event output to log IS-IS neighbor relationship changes.
- **redistribute**: Redistributes other routes to IS-IS; redistributes Level-1 routes to Level-2; redistributes Level-2 routes to Level-1.

## Configuration Steps

### ▾ Configuring the Maximum Number of Equal-Cost Paths

- Perform this configuration based on requirements.
- Run the **maximum-paths** command in IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring the Maximum Metric for the Connected Routes after the First Neighbor Is Up

- Perform this configuration based on requirements.
- Run the **max-metric on-neighbor-up** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

### ▾ Configuring the Maximum Length Allowed for Received LSPs

- Perform this configuration based on requirements.
- Run the **isp-length receive** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring the Maximum Length Allowed for Sent LSPs**
  - Perform this configuration based on requirements.
  - Run the **isp-length originate** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring a Passive Interface**
  - Perform this configuration based on requirements.
  - Run the **passive-interface** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring the IS-IS Interface Bandwidth Reference**
  - Perform this configuration based on requirements.
  - Run the **bandwidth-reference** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring the TLV Field of the IS-IS Protocol to Be Padded Based on Protocols Supported by an Interface**
  - Perform this configuration based on requirements.
  - Run the **interfaces-protocol-compatible** command in IS-IS routing process configuration mode on the desired devices, unless otherwise specified.
- ▼ **Configuring the IS-IS Instance Alias**
  - Perform this configuration based on requirements.
  - Run the **is-name** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring the IS-IS Interface Metric**
  - Perform this configuration based on requirements.
  - Run the **isis metric** command in interface configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring an Interface as a Passive Interface**
  - Perform this configuration based on requirements.
  - Run the **isis passive** command in interface configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring the Priority of the DIS**
  - Perform this configuration based on requirements.
  - Run the **isis priority** command in interface configuration mode on the desired device, unless otherwise specified.
- ▼ **Suppressing the Routing Calculation after the IS-IS Neighbor Is Up**
  - Perform this configuration based on requirements.
  - Run the **isis suppress on-neighbor-up** command in interface configuration mode on the desired device, unless otherwise specified.
- ▼ **Generating a Default Route**

- Perform this configuration based on requirements.
- Run the **default-information originate** command in IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring the SPF Calculation Cycle**
  - Perform this configuration based on requirements.
  - Run the **spf-interval** command in interface configuration mode on the desired device, unless otherwise specified.
- ▼ **Configure a Summary Route**
  - Perform this configuration based on requirements.
  - Run the **summary-address** and **summary-prefix** commands in IS-IS routing process configuration mode or IS-IS address-family ipv6 configuration mode on the desired device, unless otherwise specified.
- ▼ **Enabling Neighbor Relationship Event Output**
  - Perform this configuration based on requirements.
  - Run the **log-adjacency-changes** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.
- ▼ **Configuring Route Redistribution**
  - Perform this configuration based on requirements.
  - Run the **redistribute** command in IS-IS routing process configuration mode on the desired device, unless otherwise specified.

## Verification

- **maximum-paths**: Check whether the maximum number of equal-cost paths displayed by routing entries is the same as the configuration.
- **max-metric on-neighbor-up** : Check the database details of IS-IS.
- **lsp-length receive**: Capture packets to check the length of LSPs.
- **lsp-length originate**: Capture packets to check the length of LSPs.
- **passive-interface**: Capture packets to check whether the interface receives and sends IS-IS packets.
- **bandwidth-reference**: Check the metric of the routing table.
- **interfaces-protocol-compatible**: Check the neighbor relationship establishment status.
- **is-name**: Check the database details of IS-IS
- **isis metric**: Check the database details of IS-IS.
- **isis priority**: Check whether the device with the changed priority setting is elected as the DIS.
- **isis suppress on-neighbor-up**: Check the database details of IS-IS.
- **default-information originate**: Check whether a default route is generated.
- **spf-interval**: Check whether the SPF calculation cycle works.
- **summary-address** and **summary-prefix**: Capture packets to check whether the summary route instead of detailed routes is advertised through LSPs.
- **log-adjacency-changes**: Change the neighbor state and verify that the change is recorded when debugging is disabled.

- **redistribute**: Check IS-IS routing entries.

## Related Commands

### ▾ Configuring the Maximum Number of Equal-Cost Paths

<b>Command</b>	<b>maximum-paths</b> <i>maximum</i>
<b>Parameter Description</b>	<i>maximum</i> : Indicates the maximum number of IS-IS equal-cost routes to be installed to a routing table. The value range is 1 to 32.
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	This command is used by IS-IS to control the number of IS-IS equal-cost paths to be installed to a routing table. The routing table also has a command used to control the number of equal-cost paths. The number of effective equal-cost paths is determined by either of the two command values, whichever is smaller.

### ▾ Configuring the Maximum Metric for the Connected Routes after the First Neighbor Is Up

<b>Command</b>	<b>max-metric on-neighbor-up</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the delay time, the value range is 5 to 1800..
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	When the ISIS Overlay scene is applied on the Underlay network, Overlay tunnel may rely on Underlay routing. After ISIS neighbor is up, the Underlay routing is reachable but the Overlay tunnel may not be created, which may lead to traffic interruption. Therefore, this command is run to prevent traffic interruption. According to the metric type, the maximum metric for Narrow is 63 and for Wide is 16777214.

### ▾ Configuring the Maximum Length Allowed for Received LSPs

<b>Command</b>	<b>lsp-length receive</b> <i>size</i>
<b>Parameter Description</b>	<i>size</i> : Indicates the maximum length allowed for received LSPs. According to RFC, the value range is 1,492 to 16,000, in the unit of bytes.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to control the maximum length allowed for LSPs received by the local device. Intermediate nodes with sufficient memory are required to receive LSPs whose maximum length is equal to the interface MTU in order to avoid a route convergence failure. From this perspective, the command is meaningless. The maximum length allowed for received LSPs cannot be smaller than that allowed for sent LSPs; otherwise, the former will be automatically adjusted to be equal to the latter.

### ▾ Configuring the Maximum Length Allowed for Sent LSPs

<b>Command</b>	<b>lsp-length originate</b> <i>size</i> [ <b>level-1</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<i>size</i> : Indicates the maximum length allowed for sent LSPs. The value range is 512 to 16,000, in the unit of bytes. <b>level-1</b> : Applies the setting only to Level-1 LSPs. <b>level-2</b> : Applies the setting only to Level-2 LSPs.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	In principle, the maximum length of LSPs and SNPs cannot be greater than the interface MTU; otherwise, the packets will

	be discarded when being sent.
--	-------------------------------

### ▾ Configuring a Passive Interface

<b>Command</b>	<b>passive-interface [ default ] { interface-type interface-number }</b>
<b>Parameter Description</b>	<b>default:</b> Configures all IS-IS interfaces that are not enabled as passive interfaces. <i>interface-type:</i> Indicates the interface type. <i>interface-number:</i> Indicates the interface number.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	This command prevents the specified interface from receiving and sending IS-IS packets, but the IP address of the interface will be flooded by other interfaces.  If the <b>default</b> option is selected and there are more than 255 IS-IS interfaces not enabled, only the first 255 interfaces will be configured as passive interfaces. The remaining interfaces are non-passive interfaces.

### ▾ Configuring the Bandwidth Reference

<b>Command</b>	<b>bandwidth-reference value</b>
<b>Parameter Description</b>	<i>value:</i> Indicates the bandwidth value. The value ranges from <b>1</b> to <b>4294967</b> , in the unit of Mbps. The default value is <b>100</b> .
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to calculate the interface metric in an instance according to the bandwidth reference configured in the instance. If a metric is configured, the metric prevails.

### Configuring the TLV Field of the IS-IS Protocol to Be Padded Based on Protocols Supported by an Interface

<b>Command</b>	<b>interfaces-protocol-compatible</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	When devices supporting IS-IS for IPv4 or IS-IS for IPv6 and those supporting both IS-IS for IPv4 and IS-IS for IPv6 on a network are configured to establish a neighbor relationship, the calculated routes may be unreachable, resulting in routing black holes. To prevent routing black holes, the TLV (#129) field of FS IS-IS protocol is padded based on protocols supported by an instance, that is, IS-IS instances that establish a neighbor relationship need to support the same protocol.  The TLV (#129) field of the IS-IS protocol supported by devices of some vendors is padded based on protocols supported by an interface. In single topology mode, a FS device connects to a device of another vendor, a loopback interface is configured on both devices, both IS-IS for IPv4 and IS-IS for IPv6 are enabled, and only a single protocol stack (IS-IS for IPv4 or IS-IS for IPv6) is configured on the interface for interconnecting the two devices. The device of the other vendor sends TLV#129 (supporting only a single protocol stack) based on interfaces whereas FS device sends TLV#129 (supporting dual protocol stacks) based on instances. As a result, the displayed neighbor status on the device of the other vendor is "Init" but FS device cannot establish a neighbor relationship with the device of the other vendor.  For this, the <b>interfaces-protocol-compatible</b> command can be configured to enable FS devices to establish a neighbor relationship with devices of other vendors.

### ▾ Configuring an IS Name

<b>Command</b>	<b>isis-name name</b>
<b>Parameter Description</b>	<i>name</i> : Indicates the name for replacing the system ID. The name contains a maximum of 64 characters.
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	Use this command to replace the system ID of an instance with the configured name. All system IDs displayed in the command output of <b>show isis database</b> and <b>show isis neighbors</b> are replaced with the configured name.

#### ↘ Configuring the IS-IS Interface Metric

<b>Command</b>	<b>isis metric <i>metric</i> [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<i>metric</i> : Indicates the metric value. The value range is 1 to 63. The default value is 10. <b>level-1</b> : Applies the setting to Level-1 circuits. <b>level-2</b> : Applies the setting to Level-2 circuits.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The metric, which is used in SPF calculation, is stored in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation. The metric belongs to the narrow type and is valid only when <b>metric-style</b> is set to <b>Narrow</b> .

#### ↘ Configuring the Wide Metric of an Interface

<b>Command</b>	<b>isis wide-metric <i>metric</i> [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<i>metric</i> : Indicates the metric value. The value range is 1 to 16,777,214. The default value is 10. <b>level-1</b> : Applies the setting to Level-1 circuits. <b>level-2</b> : Applies the setting to Level-2 circuits.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The metric, which is used in SPF calculation, is stored in the IP reachability information TLV. The greater the metric, the greater the routing consumption of the interface and the longer the path obtained by SPF calculation. The metric is valid only when <b>metric-style</b> is set to <b>Wide</b> .

#### ↘ Configuring the Interface as an Passive Interface

<b>Command</b>	<b>isis passive</b>
<b>Parameter Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The command prevents the interface from receiving or sending IS-IS packets, but the IP address is flooded through other interfaces. The command is valid only for the generated IS-IS interface.

#### ↘ Configuring the Priority of the DIS

<b>Command</b>	<b>isis priority <i>value</i> [ level-1   level-2 ]</b>
<b>Parameter Description</b>	<i>value</i> : Indicates the priority. The value range is 0 to 127. The default value is 64. <b>level-1</b> : Applies the setting to Level-1 circuits. <b>level-2</b> : Applies the setting to Level-2 circuits.

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Use this command to change the priority carried in Hello packets in a LAN.</p> <p>The device with a lower priority is less likely to be elected as the DIS.</p> <p>The command is invalid on a P2P network interface.</p> <p>The <b>no isis priority</b> command, with or without parameters, restores the priority to its default value. To change the configured priority, run the <b>isis priority</b> command with the priority specified to overwrite the existing configuration, or you can first restore the priority to its default value and then configure a new priority.</p>

#### ▾ Suppressing the Routing Calculation after the IS-IS Neighbor Is Up

<b>Command</b>	<b>isis suppress on-neighbor-up</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the delay time, the value range is 1 to 60.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the interface neighbor is up, this command prevents the neighbor reachability from being added to LSP so as to delay the routing calculation. When the timer expires, the neighbor reachability is added to LSP to start the routing calculation. This function prevents the routing calculation from using the old LSP, which may lead to routing flapping.

#### ▾ Generating a Default Route

<b>Command</b>	<b>default-information originate</b> [ <b>route-map</b> <i>map-name</i> ]
<b>Parameter Description</b>	<b>route-map</b> <i>map-name</i> : Associates with a route map.
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	Because Level-2 domains do not generate any default route, use this command to allow a default route to enter a Level-2 domain.

#### ▾ Configuring SPF Calculation Cycle

<b>Command</b>	<b>spf-interval</b> [ <b>level-1</b>   <b>level-2</b> ] <i>maximum-interval</i> [ <i>initial-interval</i> <i>hold-interval</i> ]
<b>Parameter Description</b>	<p><b>level-1</b>: Applies the configuration only to Level-1.</p> <p><b>level-2</b>: Applies the configuration only to Level-2.</p> <p><i>maximum-interval</i>: Indicates the maximum interval for performing two consecutive SPF calculations. The value range is 1 to 120 (in seconds). The default value is 10.</p> <p><i>initial-interval</i>: Indicates the waiting time for performing the SPF calculation for the first time. The value range is 0 to 60000 (in milliseconds). The default value is 50.</p> <p><i>hold-interval</i>: Indicates the minimum interval for performing the SPF calculation for the second time. The value range is 10 to 60000 (in milliseconds). The default value is 200.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	<p>Increasing the maximum interval for performing SPF calculations can avoid frequent SPF calculations and waste of CPU resources. However, a larger minimum interval also leads to slower responses to route changes.</p> <p>The waiting time for performing the SPF calculation for the first time is the initial interval. If the network becomes unstable, the SPF calculation interval is less than the maximum interval, and the interval for performing the SPF calculation for the second time becomes the hold interval. A corresponding penalty is added to this interval: The next interval for the SPF calculation doubles the previous interval for the same SPF calculation, until the SPF calculation</p>

	<p>interval reaches the maximum interval. Subsequent SPF calculations are performed at the maximum interval. When the network becomes stable, the interval for performing the SPF calculation becomes greater than the maximum interval, and the waiting time for performing the SPF calculation is restored to the initial interval.</p> <p>Link changes have high requirements for convergence. The initial interval can be set to a small value. The preceding parameters can also be adjusted to larger values to reduce CPU consumption.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>hold-interval</b> cannot be greater than that of <b>maximum-interval</b>. Otherwise, the value of <b>hold-interval</b> will be used as the value of <b>maximum-interval</b>.</p> <p>The value of <b>initial-interval</b> cannot be greater than that of <b>hold-interval</b>. Otherwise, the value of <b>initial-interval</b> will be used as the value of <b>hold-interval</b>.</p>
--	---

### ⌵ Configuring an IPv4 Summary Route

<b>Command</b>	<b>summary-address</b> <i>ip-address net-mask</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ] [ <i>metric number</i> ]
<b>Parameter Description</b>	<p><i>ip-address</i>: Indicates the IP address of the summary route.</p> <p><i>net-mask</i>: Indicates the subnet mask of the summary route.</p> <p><b>level-1</b>: Applies the setting only to Level-1.</p> <p><b>level-2</b>: Applies the setting only to Level-2. By default, the setting takes effect for Level-2.</p> <p><b>level-1-2</b>: Applies the setting to Level-1 and Level-2.</p> <p><i>number</i>: Indicates the metric of the summary route.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	If the configured summary route contains routing information about a reachable address or network segment, the summary route, instead of detailed routes, is advertised externally.

### ⌵ Configuring an IPv6 Summary Route

<b>Command</b>	<b>summary-prefix</b> <i>ipv6-prefix/prefix-length</i> [ <b>level-1</b>   <b>level-2</b>   <b>level-1-2</b> ]
<b>Parameter Description</b>	<p><i>ipv6-prefix/prefix-length</i>: Indicates the network address of the summary route and its IPv6 prefix length. The address format is X:X:X:X::X/&lt;0-128&gt;.</p> <p><b>level-1</b>: Applies the setting only to Level-1.</p> <p><b>level-2</b>: Applies the setting only to Level-2. By default, the setting takes effect for Level-2.</p> <p><b>level-1-2</b>: Applies the setting to Level-1 and Level-2.</p>
<b>Command Mode</b>	IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	If the configured summary route contains routing information about a reachable address or network segment, the summary route, instead of detailed routes, is advertised externally.

### ⌵ Enabling Neighbor Relationship Event Output

<b>Command</b>	<b>log-adjacency-changes</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	IS-IS routing process configuration mode
<b>Usage Guide</b>	You can also use the <b>debug</b> command to record IS neighbor state changes, but the command consumes many system

resources.

### ↘ Redistributing Other Routes to IS-IS

<b>Command</b>	<b>redistribute</b> { <b>bgp</b>   <b>ospf</b> <i>process-id</i> [ <b>match</b> { <b>internal</b> [ <b>external</b> [ 1   2 ] ] [ <b>nssa-external</b> [ 1   2 ] ]   <b>external</b> [ 1   2 ] [ <b>internal</b> ] [ <b>nssa-external</b> [ 1   2 ] ]   <b>nssa-external</b> [ 1   2 ] [ <b>internal</b> ] [ <b>external</b> [ 1   2 ] ] } }   <b>rip</b>   <b>connected</b>   <b>static</b> } [ <b>metric</b> <i>metric-value</i> ] [ <b>metric-type</b> <i>type-value</i> ] [ <b>route-map</b> <i>map-tag</i> ] [ <b>level-1</b>   <b>level-1-2</b>   <b>level-2</b> ]
<b>Parameter Description</b>	<p><b>process-id</b>: Indicates the OSPF process ID. The range is 1 to 65,535.</p> <p><b>match</b> { <b>internal</b>   <b>external</b> [ 1   2 ]   <b>nssa-external</b> [ 1   2 ] }: When OSPF routes are redistributed, the routes are filtered by subtype. If the <b>match</b> option is not selected, routes of all OSPF types will be received. If <b>match external</b> is not followed by the number 1 or 2, OSPF routes specified by <b>external 1</b> and <b>external 2</b> will be redistributed. If <b>match nssa-external</b> is not followed by the number 1 or 2, OSPF routes specified by <b>nssa-external 1</b> and <b>nssa-external 2</b> will be redistributed.</p> <p><b>metric</b> <i>metric-value</i>: Indicates the metric of redistributed routes. The value range is 0 to 4,261,412,864. The metric of external routes is used when the <b>metric</b> option is not specified.</p> <p><b>metric-type</b> { <b>internal</b>   <b>external</b> }: Indicates the metric type of redistributed routes. <b>internal</b>: Indicates that the metric belongs to the internal type. <b>external</b>: Indicates that the metric belongs to the external type. If <b>metric-type</b> is not specified, the metric belongs to the internal type.</p> <p><b>route-map</b> <i>map-tag</i>: Indicates the route map used for external route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>map-tag</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>level-1</b>   <b>level-1-2</b>   <b>level-2</b>: Indicates the Level of redistributed routes received by IS-IS. If no Level is specified, routes are redistributed to Level-2. <b>level-1</b>: Redistributes routes to Level-1. <b>level-1-2</b>: Redistributes routes to Level-1 and Level-2. <b>level-2</b>: Redistributes routes to Level-2.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>The <b>no redistribute</b> { <b>bgp</b>   <b>ospf</b> <i>process-id</i>   <b>rip</b>   <b>connected</b>   <b>static</b> } command is used to cancel the redistribution of routes mapped to the specified protocol. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution. For example, <b>no redistribute bgp</b> cancels BGP route redistribution, whereas <b>no redistribute bgp route-map aa</b> cancels the route map named <b>aa</b> used for BGP route redistribution.</p> <p>When external routes are redistributed in IPv4 mode, the routing information is stored in LSPs' IP External Reachability Information TLV.</p> <p>When external routes are redistributed in IPv6 mode, the routing information is stored in LSPs' IPv6 Reachable TLV.</p> <p>In the old versions of some vendors, if <b>metric-type</b> is set to <b>external</b>, the metric of redistributed routes is added by 64 during route calculation and used to determine routing. This practice does not comply with the related protocol. In the actual application, external routes may be preferred over internal routes. If this happens during interworking with old versions of some vendors, you can modify the related setting (such as <b>metric</b> or <b>metric-type</b>) of each device to ensure that internal routes are preferred over external routes.</p>

### ↘ Redistributing the Level-1 Reachable Routing Information of the Specified IS-IS Instance to Level-2 of the Current Instance

<b>Command</b>	<b>redistribute isis</b> [ <i>tag</i> ] <b>level-1 into level-2</b> [ <b>route-map</b> <i>route-map-name</i>   <b>distribute-list</b> <i>access-list-name</i> ]
<b>Parameter Description</b>	<p><b>tag</b>: Indicates the name of the IS-IS instance whose routing information will be redistributed.</p> <p><b>route-map</b> <i>route-map-name</i>: Indicates the route map used for route redistribution. It is used to filter redistributed routes</p>

	<p>or configure the attributes of redistributed routes. The value of <i>route-map-name</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>distribute-list access-list-name</b>: Filters redistributed routes by using <b>distribute-list</b>. <i>access-list-name</i> indicates the associated prefix list, which can be a standard prefix list, an extended prefix list, or a name prefix list. It is in the format of {&lt;1-99&gt;   &lt;100-199&gt;   &lt;1300-1999&gt;   &lt;2000-2699&gt;   <i>acl-name</i>}. When the IS-IS address-family ipv6 configuration mode is applied, only the name prefix list can be used, in the format of <i>acl-name</i>.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>You can use the <b>route-map</b> or <b>distribute-list</b> parameter to filter the specified instance's Level-1 routes to be redistributed. Only the routes that meet specific criteria can be redistributed to Level-2 of the current instance. The <b>route-map</b> and <b>distribute-list</b> parameters cannot be used at the same time.</p> <p>The <b>no redistribute isis [tag] level-2 into level-1</b> command is used to cancel the redistribution of the specified instance's routes. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution.</p> <p>For example, <b>no redistribute isis tag1 level-1 into level-2</b> cancels the redistribution of the routes of the IS-IS instance name <b>tag1</b>. <b>no redistribute isis tag1 level-1 into level-2 route-map aa</b> cancels the use of the route map named <b>aa</b> to filter redistributed routes.</p>

#### ↘ Redistributing the Level-2 Reachable Routing Information of the Specified IS-IS Instance to Level-1 of the Current Instance

<b>Command</b>	<b>redistribute isis [tag] level-2 into level-1 [ route-map route-map-name   distribute-list access-list-name   (prefix ip-address net-mask   ipv6-prefix ipv6-address/length) ]</b>
<b>Parameter Description</b>	<p><i>tag</i>: Indicates the name of the IS-IS instance whose routing information will be redistributed.</p> <p><b>route-map route-map-name</b>: Indicates the route map used for route redistribution. It is used to filter redistributed routes or configure the attributes of redistributed routes. The value of <i>route-map-name</i> cannot exceed 32 characters. By default, <b>route-map</b> is not configured.</p> <p><b>Distribute-list access-list-name</b>: Filters redistributed routes by using <b>distribute-list</b>. <i>access-list-name</i> indicates the associated prefix list, which can be a standard prefix list, an extended prefix list, or a name prefix list. It is in the format of {&lt;1-99&gt;   &lt;100-199&gt;   &lt;1300-1999&gt;   &lt;2000-2699&gt;   <i>acl-name</i>}. When the IS-IS address-family ipv6 configuration mode is applied, only the name prefix list can be used, in the format of <i>acl-name</i>.</p> <p><b>prefix ip-address net-mask</b>: Determines the routes to be redistributed by address and prefix length.</p> <p><b>ipv6-prefix ipv6-address/length</b>: Determines the IPv6 routes to be redistributed by address and prefix length.</p>
<b>Command Mode</b>	IS-IS routing process configuration mode and IS-IS address-family ipv6 configuration mode
<b>Usage Guide</b>	<p>You can use the <b>route-map</b>, <b>distribute-list</b>, or <b>prefix</b> parameter to filter the specified instance's Level-2 routes to be redistributed. Only the routes that meet specific criteria can be redistributed to Level-1 of the current instance.</p> <p>The <b>no redistribute isis [tag] level-2 into level-1</b> command is used to cancel the redistribution of the specified instance's routes. If <b>no redistribute</b> is followed by other parameters, the command will restore the default parameter settings, rather than cancel route redistribution.</p> <p>For example:</p> <p><b>no redistribute isis tag1 level-2 into level-1</b> cancels the redistribution of the routes of the IS-IS instance name <b>tag1</b>. <b>no redistribute isis tag1 level-2 into level-1 route-map aa</b> cancels the use of the route map named <b>aa</b> to filter redistributed routes.</p>

#### Configuration Example

### ▾ Configuring the Maximum Number of Equal-Cost Paths

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the maximum number of equal-cost paths.</li> </ul>
	<pre>A(config)# router isis A(config-router)# maximum-paths 5</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the maximum number of equal-cost paths displayed by routing entries is the same as the configuration.</li> </ul>
	<pre>A#show ip route isis</pre>

### ▾ Configuring the Maximum Metric for the Connected Routes after the First Neighbor Is Up

<b>Configuration</b>	<p>Configure IS-IS neighbors. (Omitted)</p> <p>Configure the maximum metric after the first neighbor is up.</p>
	<pre>A(config)# router isis A(config-router)# max-metric on-neighbor-up 10</pre>
<b>Verification</b>	<p>Checks the database details of IS-IS.</p>
	<pre>A# show isis database detail</pre>

### ▾ Configuring the Maximum Length Allowed for Received LSPs

<b>Configuration</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the maximum length allowed for received LSPs.</li> </ul>
	<pre>A(config)# router isis A(config-router)# lsp-length receive 512</pre>
<b>Verification</b>	<p>Capture packets to check the length of received LSPs.</p>

### ▾ Configuring the Maximum Length Allowed for Sent LSPs

<b>Configurations</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the maximum length allowed for sent LSPs.</li> </ul>
	<pre>A# configure terminal A(config)# router isis 1 A(config-router)# lsp-length originate 512 level-2</pre>
<b>Verification</b>	<p>Capture packets to check the length of sent LSPs.</p>

### ▾ Configuring a Passive Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure a passive interface.</li> </ul>
	<pre>A# configure terminal A(config)# router isis 1 A(config-router)# passive-interface GigabitEthernet 0/0</pre>
<b>Verification</b>	Capture packets to check whether the interface receives and sends IS-IS packets.

### ▾ Configuring the Metric of an IS-IS Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure metric of the IS-IS interface.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)#isis metric 1</pre>
<b>Verification</b>	Check the database details of IS-IS.
	<pre>A# show isis database detail</pre>

### ▾ Configuring the Interface as an Passive Interface

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure a passive interface.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis passive</pre>
<b>Verification</b>	Capture packets to check whether the interface receives and sends IS-IS packets.

### ▾ Configuring the Priority of the DIS

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure the priority of the DIS.</li> </ul>
	<pre>A(config)# interface GigabitEthernet 0/1 A(config-if)# isis priority 127 level-1</pre>
<b>Verification</b>	Check whether the device with the changed priority setting is elected as the DIS.
	<pre>A# show isis database detail</pre>

### ▾ Suppressing the Routing Calculation after the IS-IS Neighbor Is Up

<b>Configuration Steps</b>	Configure IS-IS neighbors. (Omitted) Suppress the routing calculation after the is-is neighbor is up.
	A(config)# interface GigabitEthernet 0/1 A(config-if)# isis suppress on-neighbor-up 10
<b>Verification</b>	Run the command <b>show ip route</b>

↘ **Generating a Default Route**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Generate a default route.</li> </ul>
	A(config)# router isis A(config-router)# default-information originate
<b>Verification</b>	Capture packets to check whether the sent LSP contains a default route.

↘ **Configuring SPF Calculation Cycle**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configuring SPF calculation cycle.</li> </ul>
	A(config)# router isis A(config-router)# spf-interval 5 100 200
<b>Verification</b>	Check whether the SPF calculation cycle works.

↘ **Configuring an IS-IS Summary Route**

<b>Configuration Requirements</b>	Router A and Router B are connected through the Ethernet and run IS-IS. Configure Router A to advertise only the 172.16.0.0/22 route instead of the 172.16.1.0/24 and 172.16.2.0/24 routes.
-----------------------------------	---

**Figure 6-20**  
IS-IS Route Summary Topology

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>
----------------------------	--

<b>A</b>	Configure IS-IS.
	<pre>A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# summary-address 172.16.0.0/16 level-1-2</pre>
	Configure Ethernet interfaces.
	<pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ip address 192.168.20.1 255.255.255.0 A(config-if)# ip router isis A(config)# interface GigabitEthernet 1/0 A(config-if)# ip address 172.16.1.1 255.255.255.0 A(config-if)# ip router isis A(config)# interface GigabitEthernet 1/1 A(config-if)# ip address 172.16.2.1 255.255.255.0 A(config-if)# ip router isis</pre>
<b>B</b>	Configure IS-IS.
	<pre>B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00</pre>
	Configure an Ethernet interface.
	<pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ip address 192.168.20.2 255.255.255.0 B(config-if)# ip router isis</pre>
<b>Verification</b>	Run the <b>show ip route</b> command on Router B to check whether only one summary route exists.
<b>B</b>	<pre>B(config)# show ip route iL1    172.16.0.0/16 [115/20] via 192.168.20.1, FastEthernet0/0</pre>

### ↘ Configuring an IS-ISv6 Summary Route

	Router A and Router B are connected through the Ethernet and run IS-ISv6. Configure Router A to advertise only the 2000::/96 route instead of the 2000::1111:0/112 and 2000::2222::0/112 routes.
--	--

<p><b>Figure 6- 21</b> <b>IS-ISv6 Route</b> <b>Summary</b> <b>Topology</b></p>	
<p><b>Configuration</b> <b>Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IS-IS.</li> <li>● Configure Ethernet interfaces.</li> <li>● Configure the password for IS-IS authentication.</li> </ul>
<p><b>A</b></p>	<p>Configure IS-IS.</p>
	<pre>A(config)# ipv6 unicast-routing A(config)# router isis A(config-router)# net 49.0001.0000.0000.0001.00 A(config-router)# address-family ipv6 unicast A (config-router-af)# summary-prefix 2000::/96 level-1-2 A (config-router-af)# exit-address-family</pre>
	<p>Configure Ethernet interfaces.</p> <pre>A(config)# interface GigabitEthernet 0/0 A(config-if)# ipv6 address 5000::1/64 A(config-if)# ipv6 router isis A(config)# interface GigabitEthernet 1/0 A(config-if)# ipv6 address 2000::1111:0001/112 A(config-if)# ipv6 router isis A(config)# interface GigabitEthernet 1/1 A(config-if)# ipv6 address 2000::2222:0001/112 A(config-if)# ipv6 router isis</pre>
<p><b>B</b></p>	<p>Configure IS-IS.</p>
	<pre>B(config)# ipv6 unicast-routing B(config)# router isis B(config-router)# net 49.0001.0000.0000.0002.00</pre>
	<p>Configure an Ethernet interface.</p>
	<pre>B(config)# interface GigabitEthernet 0/0 B(config-if)# ipv6 address 5000::2/64</pre>

	B(config-if)# ipv6 router isis
<b>Verification</b>	Run the <b>show ipv6 route</b> command on Router B to check whether only one summary route exists.
<b>B</b>	B(config)# show ipv6 route  I1 2000::/96 [115/20] via FE80::C800:1BFF:FEF8:1C, FastEthernet1/0

### ▾ Enabling Neighbor Relationship Event Output

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Enable neighbor relationship event output.</li> </ul>
	A(config-router)# log-adjacency-changes
<b>Verification</b>	Change the neighbor state and verify that the change is recorded when debugging is disabled.

### ▾ Configuring Route Redistribution

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IS-IS neighbors. (Omitted)</li> <li>● Configure OSPF routes. (Omitted)</li> <li>● Configure route redistribution</li> </ul>
	A(config)# router isis  A(config-router)# redistribute ospf 1 metric 10 level-1
<b>Verification</b>	Check whether routing entries with redistributed routes exist.
	A#showiprouteisis

## 6.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears all IS-IS neighbor relationship tables.	<b>clear clns neighbors</b>
Clears all IS-IS data structures.	<b>clear isis *</b>
Clears all IS-IS counters.	<b>clear isis [ tag ] counter</b>

### Displaying

Description	Command
Displays all IS neighbors and inter-device	<b>show clns [ tag ] is-neighbors [ interface-type interface-number ] [ detail ]</b>

neighbor relationships.	
Displays all IS neighbors and provides device information and information about the neighbor relationship with ESs.	<b>show clns [ tag ] neighbors [ interface-type interface-number ] [ detail ]</b>
Displays all IS-IS counters.	<b>show isis [ tag ] counter</b>
Displays the LSDB information.	<b>show isis [ tag ] database [ FLAGS ] [ LEVEL ] [ LSPID ]</b>
Displays the state information related to IS-IS GR.	<b>show isis [ tag ] graceful-restart</b>
Displays the relationship between the device name and system ID.	<b>show isis [ tag ] hostname</b>
Displays the details of an IS-IS interface.	<b>show isis [ tag ] interface [ interface-type interface-number ] [ counter ]</b>
Displays the mesh group configuration of all interfaces.	<b>show isis [ tag ] mesh-groups</b>
Displays IS-IS neighbor information.	<b>show isis [ tag ] neighbors [ detail ]</b>
Displays IS-IS NSR information.	<b>show isis [ tag ] nsr</b>
Displays the neighbor information of virtual systems in IS-IS.	<b>show isis [ tag ] virtual-neighbors</b>
Displays IS-IS information.	<b>show isis [ tag ] protocol</b>
Displays the topology of IS-IS device connection.	<b>show isis [ tag ] topology [ frr { self-originate   WORD   all } ] [ I1   I2   level-1   level-2 ]</b>
Displays information of an IS-IS IPv6 unicast topology.	<b>show isis [ tag ] ipv6 topology [ I1   I2   level-1   level-2 ]</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables IS-IS debugging.	<b>debug isis { all   auth   events   frr   gr   ifsm   lsp   mtr   nfsp   nsm   nsr   pdu   spf   warn }</b>

## 7 Configuring BGP

### 7.1 Overview

The Border Gateway Protocol (BGP) is an Exterior Gateway Protocol (EGP) used for communication between routers in different autonomous systems (ASs). BGP is used to exchange network accessibility information between different ASs and eliminate routing loops by using its own mechanism.

BGP uses TCP as the transmission protocol. The reliable transmission mechanism of TCP is used to ensure the transmission reliability of BGP.

Routers running BGP are called BGP speakers. BGP speakers between which a BGP session is established are called BGP peers.

Two modes can be used to establish peers between BGP speakers: Internal BGP (IBGP) and External BGP (EBGP).

- IBGP refers to a BGP connection established within an AS and completes transition of routing information within the AS.
- EBGP refers to a BGP connection established between different ASs and completes exchange of routing information between different ASs.

Rules for BGP to select an optimum route:

33. Invalid routing table entries are not involved in optimum route selection.
-  Invalid entries include entries of inaccessible next hops and flapping entries.
34. Otherwise, select a route with a lae value of **LOCAL\_PREF**.
35. Otherwise, select a route generated by a BGP speaker.
-  Routes generated by a BGP speaker include routes generated by the **network**, **redistribute** and **aggregate** commands.
36. Otherwise, select a route with the shortest AS length.
37. Otherwise, select a route with a smaller value of **ORIGIN**.
38. Otherwise, select a route with the smallest value of **MED**.
39. Otherwise, EBGP routes have higher priorities than IBGP routes and routes in the AS alliance, and the IBGP routes have the same priorities as the routes in the AS alliance.
40. Otherwise, select a route with the smallest IGP metric value to the next hop.
41. Otherwise, select an EBGP route that is received first.
42. Otherwise, select a route advertised by a BGP speaker with a smaller router ID.
43. Otherwise, select a route with a smaller cluster length.
44. Otherwise, select a route with a smaller neighbor address.
-  The preceding shows the route selection process under the default configurations. By using CLI commands, you can change the route selection process. For example, you can run the **bgp bestpath as-path ignore** command to make step 4 of the route selection process lose effect or run the **bgp bestpath compare-routerid** command to make step 9 lose effect.

### Protocols and Standards

- RFC4271: A Border Gateway Protocol 4 (BGP-4)
- RFC4273: Definitions of Managed Objects for BGP-4
- RFC4360: Proposed Standard: BGP Extended Communities Attribute
- RFC4364: Proposed Standard: BGP/MPLS IP Virtual Private Networks (VPNs)
- RFC4486: Proposed Standard: Subcodes for BGP Cease Notification Message
- RFC4724: Proposed Standard: Graceful Restart Mechanism for BGP
- RFC4760: Draft Standard: Multiprotocol Extensions for BGP-4
- RFC5492: Draft Standard: Capabilities Advertisement with BGP-4
- RFC7313: Enhanced Route Refresh Capability for BGP-4
- RFC7432: Proposed Standard: BGP MPLS-based Ethernet VPN

## 7.2 Applications

Application	Description
Inter-AS Route Advertisement	Implement inter-AS route advertisement by using BGP.
Intra-AS Route Reflection	Set up a route reflection topology within an AS to reduce BGP connections.

### 7.2.1 Inter-AS Route Advertisement

#### Scenario

BGP implements route advertisement and maintenance across different ASs.

As shown in Figure 7-1, BGP transfers the route of AS 65536 to AS 65538 through AS 65537.

Figure 7-1

<b>Remarks</b>	<p>R1 is a device at the network edge of AS 65536.</p> <p>R2 and R3 are devices at the network edge of AS 65537.</p> <p>R4 is a device at the network edge of AS 65538.</p>
----------------	---

#### Deployment

- Establish the EBGP neighborhood between R1 and R2 to implement inter-AS route advertisement.
- Establish the IBGP neighborhood between R2 and R3 to implement intra-AS route advertisement.
- The Internet runs OSPF to ensure network accessibility between R2 and R3.
- Establish the EBGP neighborhood between R3 and R4 to implement inter-AS route advertisement.

### 7.2.2 Intra-AS Route Reflection

#### Scenario

According to the BGP route advertisement principles, routes learned by an IBGP neighbor will not be advertised to the next IBGP neighbor by default. Therefore within an AS, a device running BGP must implement full-mesh. When there are many BGP devices within the AS, implementing full-mesh may cause large difficulties for network deployment. In this case, route reflection can be used to solve this problem.

As shown in Figure 7-2, route reflection is deployed to implement BGP full-mesh among R1 to R4 and RR.

Figure 7-2

<b>Remarks</b>	RR is a route reflector. R1 to R4 are route reflection clients.
----------------	--

### Deployment

- Establish IBGP neighborships between R1 to R4 and RR respectively.
- Configure R1 to R4 as the route reflection clients of RR.

## 7.3 Features

### Basic Concept

#### ▾ BGP Speaker and AS Number

A router enabled with BGP is called a BGP speaker.

After a route is enabled with BGP, a local AS number must be specified for the router. An AS number is a globally unique number allocated by IANA, ranging from 1 to 4294967295.

#### ▾ BGP Neighbor and Peer

Before a route is advertised between BGP speakers, a neighborhood must be established in advance. You need to manually configure BGP neighbors on both BGP speakers. That is, configure the peer as a neighbor on the two BGP speakers respectively. Therefore, BGP neighbors are also called BGP peers.

#### ▾ Neighbor Type and Route Type

BGP neighborships are classified into the following types:

- IBGP neighborhood: The neighborhood between BGP speakers within an AS is called IBGP neighborhood. Routes learned from IBGP neighbors are called IBGP routes.
- EBGP neighborhood: The neighborhood between BGP speakers in different ASs is called EBGP neighborhood. Routes learned from EBGP neighbors are called EBGP routes.

#### ▾ BGP route attribute

When a BGP speaker advertises routes to its neighbors, the BGP speaker also advertises the attributes carried by the routes. Common BGP attributes are as follows:

- ORIGIN: Specifies the origin of a BGP route and can be set to **IGP**, **EGP**, or **INCOMPLETE**.
- AS-PATH: Lists the ASs passed by a route in a reverse order. The last AS is placed at the beginning of the list.
- NEXT-HOP: Specifies the IP address of the next hop to be reached by a BGP route.
- MULTI-EXIT-DISC: Distinguishes multiple output/input interfaces for reaching the same neighbor AS. A smaller value means a higher priority.
- LOCAL-PREF: Distinguishes the priorities of IBGP routes in an AS. A larger value means a higher priority.

### Overview

Feature	Description
Creating a BGP Neighbor	Create a BGP neighbor.
Configuring a BGP Route	Set up a BGP route reflection topology to simplify network deployment for BGP neighbor full-mesh.

Feature	Description
Reflector	
Configuring a BGP Alliance	Configure a BGP alliance to simplify network deployment for BGP neighbor full-mesh.
Re-distributing Local AS Network Information to BGP	Re-distribute routing information to BGP and advertise local routes through BGP.
Controlling Route Exchange Between BGP Peers	Configure the route exchange policy for a BGP peer and control routes to be received by and to be advertised to this peer.
Obtaining Accessible Networks of Other ASs from BGP	Re-distribute routing information in BGP into a core routing table or IGP.
Configuring Synchronization Between BGP and IGP	Configure BGP to check whether BGP routes are synchronized with IGP routes.
Configuring BGP Soft Reset	After a routing policy changes, use soft reset to apply a new policy.
Configuring the Route Attributes of BGP	Configure the route selection algorithms and routing policy control of BGP.
Configuring BGP Route Aggregation	Reduce routes by means of route aggregation.
Configuring BGP Route Dampening	Reduce the impacts of route flapping on a network topology.
Configuring the Management Distance of BGP	Change the priorities of BGP routes.
Configuring Multi-path Load Balancing of BGP	Configure multi-path load balancing for BGP to enhance the network reliability and increase the network bandwidth.
Configuring BGP FRR	Configure fast rerouting for BGP to enhance the network reliability.
Configuring BGP Timers	Modify the internal timer time of BGP.
Configuring BGP Route Update Mechanisms	Disable/Enable regular scanning for BGP routes and configure the route scanning interval.
Configuring the Next-Hop Triggering Update Function of BGP	Configure the next hop triggering update function of BGP.
Configuring BGP LOCAL AS	Configure the LOCAL AS for a BGP neighbor.
Configuring BGP Capacity Protection	Avoid non-predictable running status caused by consumption of device capacity.
Configuring BGP GR	Configure the BGP GR function to enhance the network reliability.
Configuring 4-Byte AS Numbers of BGP	Configure the display mode of a 4-byte AS number.
Configuring a Regular Expression	Use a regular expression to filter routing information.
Configuring BGP Session Retention	Configure BGP to ensure that after an address family with incorrect routing attributes is detected for a neighbor, other address family routes advertised by the neighbor will not be affected.

Feature	Description
Configuring BGP Delayed Advertisement upon System Restart	Configure BGP to delay route advertisement to a neighbor within a period after the system is restarted.
Configuring BGP Tracking	Configure BGP tracking function.
Configuring BGP NSR	Enable the NSR function for BGP neighbor.
Configuring BGP Routes to Be Recursive Only to Host Routes	Enable IBGP or EBG routes to be recursive only to host routes.
Configuring Outbound Loop Detection for a BGP Neighbor	Enable outbound loop detection for a BGP neighbor.
Shutting Down BGP Connection Gracefully	Shut down BGP connection gracefully. Make sure that the service traffic is not interrupted or is interrupted for a very short period of time.
<u>Configuring Enhanced VPN Route Import</u>	Configure the enhanced VPN route import function.
<u>Configuring Enhanced Route-Refresh</u>	Indicate the BGP route update group, which is used to improve the handling performance for route advertisement to neighbors.
<u>Configuring BGP EVPN</u>	Configure the BGP EVPN function.
Other Related Configurations	Configure extended BGP functions.

### 7.3.1 Creating a BGP Neighbor

A BGP neighbor is manually configured by a user. Two connection modes are supported: IBGP and EBG. You can identify the connection mode between BGP speakers based on the AS where the BGP peer resides and the AS where the BGP speaker resides.

-  Generally, BGP speakers between which an EBG connection is established are directly connected whereas BGP speakers between which an IBGP connection is established can be at any location within an AS.

#### Working Principle

A BGP speaker can initiate a TCP connection request to a BGP peer specified by a user. After the TCP connection is successfully created, the peers will exchange BGP packets to negotiate about connection parameters. The BGP neighborhood is successfully established after the negotiation succeeds.

#### ↘ Creating a TCP Connection

A BGP speaker initiates a TCP connection request to a neighbor. The destination IP address is the peer IP address specified by the user and the port number is fixed to 179.

The BGP speaker also listens on the port number 179 of the local TCP connection to receive connection requests from its peer.

#### ↘ Negotiating about Protocol Parameters

After the TCP connection is successfully created, the BGP speakers exchange OPEN packets to negotiate about BGP connection parameters. The parameters for negotiation include:

- **Version:** Indicates the BGP version number. At present, only version 4 is supported.

- Neighbor AS number: Determines whether the AS number of the neighbor is consistent with the local AS number. If not, the connection request will be denied.
- Hold Time: Negotiates about the timeout duration for the BGP connection. The default value is 180 seconds.
- Neighbor capability: Negotiates about various extended capabilities supported by the neighbor, including the address family, dynamic route update, and GR functions.

### ✚ Maintaining Neighborhood

The Keepalive message is periodically sent between BGP speakers. If a new Keepalive packet is not received from the BGP neighbor after the Hold Time expires, the BGP speaker considers that the neighbor is not accessible, disconnects the TCP connection from the neighbor, and attempts to reconnect to it. The interval for a BGP speaker to send the Keepalive message is one third of the Hold Time determined through negotiation and is 60 seconds by default.

### Related Configuration

#### ✚ Creating a BGP Neighbor

By default, a BGP speaker does not specify any neighbor. You can manually configure a BGP neighbor.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify the AS number of the neighbor.

#### ✚ Setting the Neighbor TTL

By default, The TTL field in a TCP packet sent by an IBGP neighbor is set to the maximum value (255). It is set to 1 by an EBGP neighbor.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **ebgp-multihop** [*tll*] command to set the TTL field of a TCP packet sent by a BGP neighbor.

A larger value of TTL means a longer distance between BGP neighbors. When TTL is 1, the BGP neighbor devices must be directly connected.

#### ✚ Setting the Source Address of TCP

By default, BGP automatically selects the source IP address of a TCP connection based on the IP address of the neighbor. Generally, the IP address of a local packet output interface is used.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **update-source** { *interface-type interface-number* | *address* } command to adjust the source IP address of the neighbor's TCP connection.

#### ✚ Disabling Private PIC Process

By default, BGP neighbors support private PIC process.

Run **neighbor** { *neighbor-address* | *peer-group-name* } **pic-disable** command to disable the private PIC process to a BGP neighbor.

#### ✚ Setting MD5 Encryption

By default, a BGP connection is not encrypted through MD5.

You can run the **neighbor** { *peer-address* | *peer-group-name* } **password** [ *0* | *7* ] *string* command to set encryption for a BGP neighbor's TCP connection.

#### ✚ Activating the Address Family Capability of a Neighbor

By default, a neighbor created in the BGP configuration mode activates only the IPv4 Unicast address family capability.

You can run the **address-family** command to enter a corresponding address family mode, and then run the **neighbor {neighbor-address|peer-group-name} activate {ipv4|ipv6}** command to activate the address family capability for the BGP neighbor.

### 7.3.2 Configuring a BGP Route Reflector

According to the principle of BGP route advertisement, full mesh must be established for all BGP speakers within an AS (neighborships need to be established between each two BGP speakers). Too many BGP speakers within an AS will increase the resource overhead of the BGP speakers, increase the network administrator's workload and complexity of configuration and decrease the network expansion capability.

Using a route reflector is a method for reducing IBGP peer connections within an AS.

 The methods for reducing the IBGP peer connections within an AS include using a route reflector and using an AS alliance.

#### Working Principle

Configure a BGP speaker as a route reflector which classifies IBGP peers in an AS into two types: clients and non-clients.

The rules for implementing a route reflector within an AS are as follows:

- Configure a route reflector and specify clients for the route reflector. The route reflector and its clients form a cluster. The route reflector will connect to its clients.
- The clients of a route reflector in a cluster cannot connect to other BGP speakers out of the cluster.
- Within an AS, full mesh is established among IBGP peers of non-clients. The IBGP peers of non-clients include the following situations: Multiple route reflectors in a cluster; a route reflector in a cluster and BGP speakers (generally not supporting the route reflector function) not involved in the route reflector function out of the cluster; a route reflector in a cluster and route reflectors in other clusters.

The rules for processing a route received by a route reflector are as follows:

- A route update message received by an EBGP speaker will be sent to all clients and non-clients.
- A route update message received by a client will be sent to other clients and all non-clients.
- A route update message received by an IBGP speaker will be sent to all the other clients.
-  Generally, only one route reflector is configured in a cluster. In this case, the Router ID of the route reflector can be used to identify this cluster. To increase the redundancy, you can set multiple route reflectors in a cluster. In this case, you must configure the cluster ID so that a route reflector can identify the route update messages from other route reflectors in the cluster.
-  If multiple route reflectors are configured for a cluster, you must configure a cluster ID for the cluster.
-  Generally, it is unnecessary to create connections between the clients of a route reflector in a cluster because the route reflector will reflect the routes between the clients. However, if full mesh has been established among all clients, you can cancel the client route reflection function of the route reflector.

#### Related Configuration

##### 🔽 Configuring a BGP Route Reflector and Reflected Clients

By default, BGP is not configured with route reflection.

You can run the **neighbor {peer-address} route-reflector-client** command to configure a device as a route reflector and its neighbor devices as reflected clients.

#### ✚ Configuring BGP Client-Client Reflection

By default, BGP client-client route reflection is enabled, which means that routes received from a reflected client can be advertised to other clients.

You can run the **bgp client-to-client reflection** command to enable or disable (using the **no** form of this command) client-client reflection.

#### ✚ Configuring a BGP Reflection Cluster ID

By default, a BGP reflection cluster ID is the Router-ID of BGP. If multiple reflection clusters are deployed within an AS, different reflection cluster IDs must be configured for these reflection clusters.

You can run the **bgp cluster-id cluster-id** command to manually configure the cluster ID of a route reflector.

### 7.3.3 Configuring a BGP Alliance

An alliance is another method for reducing the IBGP peer connections within an AS.

#### Working Principle

Divide an AS into multiple sub-ASs and configure a unified alliance ID (namely, the alliance AS NUMBER) for these sub-ASs to form an alliance. Outside the alliance, the entire alliance is still considered as an AS and only the AS number of the alliance is visible. Inside the alliance, full mesh of IBGP peers can be established for BGP speakers within a sub-AS, and EBGP connections can be established for BGP speakers in different sub-ASs. Though EBGP connections are established between BGP speakers within a sub-AS, when information is exchanged, NEXT\_HOP, MED, LOCAL\_PREF and other path attributes keep unchanged.

#### Related Configuration

##### ✚ Configuring a BGP Alliance ID

By default, no alliance ID is configured for a BGP speaker.

You can run the **bgp confederation identifier as-number** command to configure a BGP alliance ID. After the configuration is successful, the local AS (specified by the **router bgp as-number [instance instance-name]** command) of BGP becomes the private AS inside the alliance and is invisible to other ASs.

##### ✚ Configuring a BGP Alliance Neighbor

By default, no alliance neighbor is configured for BGP.

You can run the **bgp confederation peers as-number [... as-number]** command to configure a BGP alliance neighbor. After the configuration succeeds, the AS specified by this command and the local AS belong to the same alliance.

### 7.3.4 Re-distributing Local AS Network Information to BGP

BGP cannot automatically discover or learn accessible networks. The accessible network information of a local AS must be re-distributed to BGP. Then, BGP can advertise the information to neighbors.

#### Working Principle

Two methods can be used to re-distribute local AS network information to BGP:

- Manual static configuration: re-distribute the accessible network information within a specified range to BGP.
- Configuring route re-distribution: re-distribute accessible IGP network information to BGP.
-  In addition, you can also re-distribute local AS network information to BGP routes by configuring route aggregation.

#### Related Configuration

##### ▾ Configuring a BGP Network

By default, no network is configured for BGP.

You can run the **network** *network-number* [**mask** *mask*] [**route-map** *map-tag*] [**backdoor**] command to configure a BGP network to re-distribute specified accessible network information to BGP. The prerequisite for successfully re-distributing routing information to BGP is that a route is available in the core routing table and this route can be an IGP, directly-connected or static route.

##### ▾ Configuring BGP Route Re-distribution

By default, BGP is not configured with route re-distribution.

Run the **redistribute** *protocol-type* command to import routes of other protocols to BGP, including OSPF, RIP, ISIS, static, and direct routes, host routes converted by ARP, routes converted by ND and aggregation route.

##### ▾ Importing Routes with Multiple Paths or Next Hops to BGP

By default, routes imported to BGP have only one next hop.

Run the **bgp sourced-paths** *protocol-type* **all** command to import routes with multiple next hops of other protocols to BGP.

### 7.3.5 Controlling Route Exchange Between BGP Peers

BGP provides powerful route management functions. You can actively control the route exchange between BGP peers.

#### Working Principle

Configure the route exchange policy for a BGP peer and control routes to be received by and to be advertised to this peer.

#### Related Configuration

##### ▾ Configuring the Default Route to Be Advertised to a Peer

By default, BGP does not advertise the default route.

You can run the **neighbor** {*address*|*peer-group-name*} **default-originate** [**route-map** *map-tag*] command to advertise the default route to a peer (or a peer group).

##### ▾ Configuring Next-Hop-Self for a Peer

By default, BGP does not change the next hop of a route when it advertises the route to an IBGP neighbor and sets the next hop to the local BGP speaker when it advertises the route to an EBGP neighbor.

You can run the **neighbor** {*address*|*peer-group-name*} **next-hop-self** command to configure the next hop of a route to the local BGP speaker when distributing the route to a specified BGP peer (group).

##### ▾ Configuring Remove-Private-AS for a Peer

By default, BGP does not delete the private AS in the AS-PATH attribute when it advertises routing information to a peer.

You can run the **neighbor { address | peer-group-name } remove-private-as** command to require that the private AS number recorded in the AS path attribute should be deleted when routing information is distributed to an EBGP peer (group). This command does not apply to an IBGP neighbor.

#### ✚ Configuring Send-Community for a Peer

By default, BGP does not send the community attribute when it advertises routing information to a peer.

You can run the **neighbor { address | peer-group-name } send-community** command to specify that the community attribute can be sent to a specified BGP peer (group).

#### ✚ Configuring Maximum-Prefix for a Peer

By default, BGP does not restrict the records of routing information that can be received by a peer.

You can run the **neighbor { neighbor-address | peer-group-name } maximum-prefix maximum [ threshold ] { [ restart-time time ] | [ warning-only [ suppress ] ] }** command to specify the records of routing information received from a specified peer (group).

#### ✚ Configuring Route Filtering for a BGP Neighbor

By default, a BGP neighbor is not enabled with any filtering policy and receives all legal routing information advertised by a neighbor.

BGP supports multiple methods of configuring the route filtering policies for a neighbor, including:

- **neighbor { peer-address | peer-group-name } distribute-list { access-list-number | access-list-name } { in | out }**

Use an ACL to filter routes in the input and output directions of the neighbor.

- **neighbor { peer-address | peer-group-name } filter-list access-list-number { in | out }**

Use an AS-PATH list to filter routes in the input and output directions of the neighbor.

- **neighbor { peer-address | peer-group-name } prefix-list prefix-list-name { in | out }**

Use a prefix-list to filter routes in the input and output directions of the neighbor.

- **neighbor { peer-address | peer-group-name } route-map map-tag { in | out }**

Use a route map to filter routes in the input and output directions of the neighbor.

- **neighbor { peer-address | peer-group-name } unsuppress-map map-tag**

Allow for advertising certain routing information previously suppressed by the **aggregate-address** command when distributing routing information to a specified peer.

- **bgp advertise-map map-tag**

Use command **bgp advertise-map map-tag** to advertise route policy to all neighbors

### 7.3.6 Obtaining Accessible Networks of Other ASs from BGP

Send routing information of other ASs exchanged by BGP to the routing table of a device so that the device can forward packets to other ASs.

Send routing information of other ASs exchanged by BGP to the routing table of a device so that the device can forward packets to other ASs.

#### Working Principle

##### ✚ BGP Sends Routing Information to a Core Routing Table

BGP controls routing information sent to the core routing table by using **table-map**. **table-map** can modify the attributes of routing information sent to the core routing table. If the route is matched, BGP modifies the attribute of the routing information and sends the route. If the route is not matched or route matching is denied, BGP does not modify the attribute of the routing information but sends the route.

Changes of **table-map** are not reflected in the core routing table immediately, but reflected a moment later. To update the application of **table-map** immediately, you can run the **clear ip bgp [instance as-number] [vrf vrf-name] table-map** command to update the routing information in the core routing table immediately. This command does not clear the existing routes in the core routing table, but directly applies **table-map** to send the updated routing information, thereby not causing forwarding flapping.

### ↘ Re-distributing BGP Routes to IGP

Re-distribute BGP routes on a BGP speaker to IGP to ensure that routers within an AS can obtain routes to other ASs.

#### Related Configuration

### ↘ Configuring table-map

By default, BGP is not configured with a table-map and allows for sending all routes without modifying the attributes of the routes.

You can run the **table-map route-map-name** command to set a table-map and control the routing information to be sent to the core routing table. *route-map-name* specifies a route-map to be associated.

**i** Run the **table-map** command in the BGP configuration mode or in the IPv4 address family mode.

The Match and Set statements supported in the table-map are as follows:

Match statements: as-path, community, ip address, ip next-hop, metric, origin and route-type

Set statements: metric, tag and next-hop

**i** You can run the **no table-map** command to delete the table-map configurations.

### ↘ Configuring BGP Route Re-distribution by IGP

By default, IGP does not re-distribute BGP routes.

You can run the **redistribute bgp [route-map map-tag] [metric metric-value]** command to re-distribute BGP routes to IGP (RIP\OSPF\ISIS).

The **bgp redistribute-internal** command controls only whether to re-distribute routes learned from IBGP to IGP. By default, routes learned from IBGP can be re-distributed to IGP.

**i** You can run the **bgp redistribute-internal** command in the BGP configuration mode, IPv4/IPv6 address family mode or the IPv4 VRF address family mode.

**i** You can run the **no bgp redistribute-internal** command to delete the configuration.

### 7.3.7 Configuring Synchronization Between BGP and IGP

Generally, BGP speakers working as mutual IBGP neighbors are not directly connected. IGP devices between the BGP speakers may fail to learn routing information same as that learned by the BGP speakers. When a BGP speaker at the border of an AS forwards packets received from other domains to the next-hop IBGP neighbor, the packets pass an IGP device in the middle. In this case, the packets may be lost due to no routing information on the IGP device.

#### Working Principle

To keep synchronization between BGP and IGP, you must ensure that all routers within an AS can learn routing information to be sent to another AS before the routing information is advertised to this AS.

Synchronization between BGP and IGP is not required only in the following cases:

- Routing information passing through an AS is not available. For example, the AS is an end AS.
- All routers within an AS run BPG. Full mesh is established among all BGP speakers (neighborship is established between each two BGP speakers).

## Related Configuration

### ▾ Configuring BGP Route Synchronization

By default, synchronization between BGP and IBGP routes is disabled.

You can run the **synchronization** command to enable synchronization between BGP and IGP.

#### Note

You can run the **no synchronization** command to disable synchronization between BGP and IGP.

### 7.3.8 Configuring BGP Soft Reset

If routing policies (including **neighbor distribute-list**, **neighbor route-map**, **neighbor prefix-list** and **neighbor filter-list**) change, an effective method must be provided to implement new routing policies. A traditional method is to terminate a BGP connection and then create a new BGP connection. By configuring BGP Soft Reset, you can execute a new routing policy without terminating a BGP session connection.

#### Working Principle

- i** Routing policies that affect inbound routing information are called inbound routing policies (such as In-route-map and In-dist-list) and routing policies that affect outbound routing information are called outbound routing policies (such as Out-route-map and Out-dist-list).

When outbound routing policies change, BGP soft reset will re-advertise all routing information of a BGP speaker to its neighbors.

If inbound routing policies change, the operation is more complex than that when outbound routing policies change. This is because outbound routing policies are executed in the routing table of the local BGP speaker whereas inbound routing policies are executed for routing information received from the BGP peer. To reduce cost, the local BGP speaker does not store the original routing information received from the BGP peer.

If inbound routing policies change and a neighbor device supports route update, you can configure soft reset to send a route update request to the neighbor device. After receiving the request, the neighbor device re-advertises all routing information. You can also perform configuration to ensure that each BGP peer stores original routing information on the local BGP speaker and provides original routing information basis for modifying inbound routing policies subsequently.

- i** The "route update capability" allows for modifying and executing routing policies without storing original routing information. This product supports the route update capability. You can run the **show ip bgp [instance as-number] neighbors** command to check whether a BGP peer supports route update. If yes, you do not need to run the **neighbor soft-reconfiguration inbound** command when inbound routing policies change.

## Related Configuration

### ▾ Configuring BGP Soft Reset

Run the **clear ip bgp [ instance as-number ] { \* | neighbor-address | peer-group peer-group-name | external } soft out** command to soft reset a BGP connection. You can activate execution of a routing policy without restarting the BGP session.

#### ▾ Saving Original Routing Information of Neighbors

By default, BGP does not save original routing information of neighbors.

Run the **neighbor { peer-address | peer-group-name } soft-reconfiguration inbound** command to save unmodified routing information sent by a BGP peer (group).

### 7.3.9 Configuring the Route Attributes of BGP

BGP provides various control policies for route attributes. You can apply the policies based on actual conditions.

#### Working Principle

##### ▾ AS\_PATH Attribute

BGP can control distribution of routing information in three modes:

- IP address. You can run the **neighbor distribute-list** and **neighbor prefix-list** commands for implementation.
- AS\_PATH attribute. See the description in this section.
- COMMUNITY attribute. See the related configuration of the COMMUNITY attribute.

You can use an AS path-based access control list (ACL) to control the distribution of routing information. Where, the AS path-based ACL uses a regular expression to parse the AS path.

Based on the standard (RFC1771), BGP does not consider the AS path length when selecting the optimum path. Generally, a shorter AS path length means a higher path priority; therefore, FS considers the AS path length when selecting the optimum path. You can determine whether to consider the AS path length when selecting the optimum path based on the actual conditions.

- i Within an AS, whether to consider the AS path should be consistent for all BGP speakers when the optimum path is selected; otherwise, the optimum paths selected by the BGP speakers may be different.

##### ▾ MULTI\_EXIT\_DISC Attribute

BGP uses the MED value as the basis for comparing priorities of paths learned from EBGP peers. A smaller MED value means a higher path priority.

- By default, the MED value is compared only for paths of peers from the same AS when the optimum path is selected.
- By default, the MED value is not compared for paths of peers from other sub ASs within an AS alliance.
- By default, if a path not configured with the MED attribute is received, it is considered that the MED value of this path is 0. Since a smaller MED value means a higher path priority, this path has the highest priority.
- By default, the MED value is not compared with paths from different ASs; instead, the sequence of receiving the paths is compared.

##### ▾ LOCAL\_PREF Attribute

When sending routes received from EBGP peers to IBGP peers, a BGP speaker adds the LOCAL\_PREF attribute. BGP uses the LOCAL\_PREF attribute as the basis for comparing priorities of paths learned from IBGP peers. A larger value of LOCAL\_PREF means a higher path priority.

You can also run the **set local-preference** command of a route map to modify the LOCAL\_PREF attribute of the specified path.

## ▾ COMMUNITY Attribute

The COMMUNITY attribute is another mode for controlling distribution of routing information.

A community is a set of destination addresses. The COMMUNITY attribute is intended to facilitate execution of a routing policy based on a community and thereby simplify the configuration of routing information distribution control on BGP speakers. Each destination address may belong to multiple communities. An AS administrator can define the communities to which a destination address belongs.

By default, all destination addresses belong to the Internet community and are carried in the community attribute of the path.

At present, four common community attribute values are pre-defined:

- Internet: Indicates the Internet community. All paths belong to this community.
- no-export: Indicates that the path is not advertised to EBGp peers.
- no-advertise: Indicates that the path is not advertised to any BGP peer.
- local-as: Indicates that a path is not advertised to other ASs. When an AS alliance is configured, the path is not advertised to other ASs or sub ASs.

By using the community attribute, you can control the receiving, prioritization and distribution of routing information. BGP speakers can set, add or modify the community attribute when learning, advertising or re-distributing routes. An aggregation path will contain the community attribute values of all aggregated paths.

-  BGP supports up to 32 COMMUNITY attributes for each route and allows for up to 32 COMMUNITY attributes when match and set COMMUNITY of a route map are configured.

## ▾ Others

During selection of the optimum path, if two paths with the same path attributes are received from different EBGp peers, the optimum path is selected based on the receiving sequence by default. You can disable comparison of the receiving sequence but use the path with a smaller router ID as the optimum path.

## Related Configuration

### ▾ Configuring AS\_PATH Attribute

- **ip as-path access-list** *path-list-name* { **permit** | **deny** } *as-regular-expression*

Defines an AS path list.

- **neighbor** { *peer-address* | *peer-group-name* } **filter-list** *path-list-name* { **in** | **out** }

By default, no filtering policy is configured for BGP peers.

The configuration is the same as that for routing information receiving and sending for a specified BGP peer (group). Routing policies are executed based on the AS path list to advertise or receive only routes that match the policies.

- **neighbor** { *peer-address* | *peer-group-name* } **route-map** *map-tag* { **in** | **out** }

By default, no filtering policy is configured for BGP peers.

The configuration is the same as when receiving and sending routing information for a specified BGP peer (group). Routing policies are executed based on a route map or the set rules in the route map are used to modify routing attributes.

-  In the route-map configuration mode, you can run the **match as-path** command to modify AS path attributes by using an AS path list or directly run the **set as-path** command to modify AS attribute values.

- **bgp bestpath as-path ignore**

Allows BGP not to consider the AS path length when selecting the optimum path. The AS path length is compared by default.

By default, a smaller AS path length means a higher path priority.

- ▾ **Configuring MULTI\_EXIT\_DISC Attribute**

- **bgp always-compare-med**

Allows for comparing the MED values of paths from different ASs, which is disabled by default.

- **bgp bestpath med confed**

Allows for comparing the MED values of paths of peers from other sub ASs in the same AS alliance, which is disabled by default.

- **bgp bestpath med missing-as-worst**

Sets a path not configured with the MED attribute to the lowest priority, which is disabled by default.

- **bgp deterministic-med**

Allows for comparing the paths of peers within the same AS, which is disabled by default.

- ▾ **Configuring LOCAL\_PREF Attribute**

- **bgp default local-preference *value***

Changes the default local preference value, ranging from 0 to 4,294,967,295. A larger value means a higher priority. The default value is 100.

- ▾ **Configuring COMMUNITY Attribute**

- **ip community-list standard *community-list-name* { permit | deny } *community-number***

Creates a community list. **community-list-name** indicates the name of the community list.

- ***community-number***: Indicates a value (0 to 4,294,967,295) specified by a user or a known community attribute (internet, local-AS, no-advertise or no-export).

- **neighbor { *peer-address* | *peer-group-name* } send-community**

Allows for sending the community attribute to a specified BGP peer (group), which is not configured by default.

- **neighbor { *peer-address* | *peer-group-name* } route-map *map-tag* { in | out }**

The configuration is the same as that for routing information receiving and sending for a specified BGP peer (group). Routing policies are executed based on a route map. No filtering policy is configured for peers by default.

- ***community-number***: In the route-map configuration mode, you can run the **match community-list [exact]** and **set community-list delete** commands to modify the community attribute by using a community list or directly run the **set community** command to modify the community value.

- ▾ **Others**

- **bgp bestpath compare-routerid**

Allows BGP to compare the router ID when selecting the optimum path, which is disabled by default.

### 7.3.10 Configuring BGP Route Aggregation

BGP-4 supports CIDR and therefore allows for creating aggregation entries to reduce the size of a BGP routing table. BGP aggregation entries can be added to a BGP routing table only when valid paths are available within the aggregation range.

#### Working Principle

Aggregate one or more detailed BGP routes into a BGP route with a shorter network mask.

-  By default, BGP advertises all path information before and after aggregation. If you hope that only aggregated path information is advertised, you can run the **aggregate-address summary-only** command.
-  When the **aggregate-address** command is used to configure an aggregated route, the aggregated route takes effect immediately as long as there are routes in the configured address range.

#### Related Configuration

##### ▾ Configuring BGP Route Aggregation

Run the **aggregate-address address mask** command to configure BGP route aggregation.

Run the **aggregate-address address mask as-set** command to configure aggregation address and reserves AS paths in the aggregation address. By default, BGP does not reserve AS paths.

Run the **aggregate-address address mask summary-only** command to configure and only advertise aggregation address. By default, all paths in the aggregation address will be advertised.

Run the **aggregate-address address mask as-set summary-only** command to configure aggregation address and reserves AS paths in the aggregation address. Only aggregation address will be advertised.

### 7.3.11 Configuring BGP Route Dampening

If a route changes between being valid and invalid, route flapping occurs.

Route flapping often causes transmission of unstable routes in a network, and thereby causes network instability. BGP route dampening is a method for reducing route flapping. It reduces possible route flapping by monitoring routing information from EBGP peers.

#### Working Principle

Terms used in BGP route dampening are as follows:

- Route Flap: A route changes between being valid and invalid.
- Penalty: Once route flapping occurs, a BGP speaker enabled with route dampening adds a value to the penalty for this route. The penalty is accumulated until the Suppress Limit is reached.
- Suppress Limit: When the penalty of a route is greater than this value, the route will be suppressed.
- Half-life-time: The time used for the penalty to be halved.
- Reuse Limit: When the penalty value of a route is smaller than this value, route suppression will be canceled.
- Max-suppress-time: The longest time that a route can be suppressed.

A brief description of route dampening processing: BGP speaker punishes a route once (adds to the penalty) route flapping occurs. When the penalty reaches the Suppress Limit, the route will be suppressed. When the Half-life-time reaches, the penalty is halved.

When the penalty is reduced to the Reuse Limit, the route is activated again. The Max-suppress-time indicates the longest time that the route can be suppressed.

### Related Configuration

#### ▾ Configuring BGP Route Dampening

By default, BGP route dampening is not enabled.

Run the **bgp dampening half-life-time reuse suppress max-suppress-time** command to configure parameters of BGP route dampening.

half-life-time (1~45minutes): The default value is 15 minutes. A larger value means a longer flapping suppression and dampening period.

reuse (1~20000): The default value is 750. A smaller value means longer time for continuous stabilization before a flapping route is enabled again.

suppress (1~20000): The default value is 2,000. A smaller value means more flapping times allowed before suppression.

max-suppress-time (1~255minutes): The default value is 4\*half-life-time. A larger value means longer maximum suppression time.

#### ▾ Displaying BGP Route Dampening

- **show ip bgp [ instance as-number ] dampening flap-statistics**

Displays the flapping statistics about all routes.

- **show ip bgp [ instance as-number ] dampening dampened-paths**

Displays the statistics about suppressed routes.

#### ▾ Resetting BGP Route Dampening

- **clear ip bgp [ instance as-number ] flap-statistics**

Clears the flapping statistics about all routes that are not suppressed.

- **clear ip bgp [ instance as-number ] flap-statistics address mask**

Clears the flapping statistics about specified routes (excluding suppressed routes).

- **clear ip bgp [ instance as-number ] dampening [ address [ mask ] ]**

Clears the flapping statistics about all routes, including routes whose suppression is cancelled.

### 7.3.12 Configuring the Management Distance of BGP

The management distance is used to evaluate the reliability of various route sources. A smaller management distance means a better route.

#### Working Principle

##### ▾ Management Distance of BGP

The management distance indicates the reliability of a route source, ranging from 1 to 255. A larger value means lower reliability. BGP sets different management distances for routing information learned from different sources, including External-distance, Internal-distance and Local-distance.

- **External-distance:** Indicates the management distance of routes learned from EBGp peers.
  - **Internal-distance:** Indicates the management distance of routes learned from IBGP peers.
  - **Local-distance:** Indicates the management distance for routes learned from peers but it is considered that better routes can be learned from IGP. Generally, these routes can be indicated by the **Network Backdoor** command.
- i** You are not advised to change the management distance of BGP. If you really need to change the management distance of BGP, please remember:
- The external-distance should be shorter than the management distances of other IGP routing protocols (OSPF and RIP).
  - The internal-distance and local-distance should be longer than the management distances of other IGP routing protocols.

### ▾ Backdoor Route

If you prefer an IGP route but do not use an EBGp route, you can set the EBGp route as the backdoor route. By default, the management distance for routes learned from a BGP speaker for which an EBGp connection is established is 20. You can run the **network backdoor** command to set the management distance of the network information to 200 so that the same network information learned from IGP has the highest priority. The networks learned from IGP are considered backdoor networks and are not advertised.

### Related Configuration

#### ▾ Configuring the Management Distance of BGP

You can run the **distance bgp external-distance internal-distance local-distance** command to configure the management distance of BGP. The value ranges from 1 to 255.

The default value of *external-distance* is 20; the default value of *internal-distance* is 200; the default value of *local-distance* is 200. A longer management distance means a lower route priority.

#### ▾ Configuring a Backdoor Route

Run the **network network-number mask network-mask backdoor** command to configure a backdoor route. By default, no backdoor route is configured.

### 7.3.13 Configuring Multi-path Load Balancing of BGP

Multi-path load balancing means that there are multiple paths to the same network and data packets are evenly forwarded by these paths. In a routing table, one route has multiple next hops.

According to the types of equivalent routes, multi-path load balancing of BGP is classified into the following types:

- **EBGP load balancing:** implement load balancing for routes learned from EBGp neighbors.
  - **IBGP load balancing:** implement load balancing for routes learned from IBGP neighbors.
- i** Both the IPv4 and IPv6 protocol stacks support multi-path load balancing.
- i** Load balancing cannot be implemented between IBGP and EBGp routes (including EBGp routes in an alliance).

### Working Principle

If a BGP routing table has multiple paths to the same network, BGP calculates the route with the highest priority by default. If there are optimum multiple routes with the same priorities, BGP still selects a unique route by using comparison rules, notifies the route to the forwarding plane and controls the forwarding of data streams. After multi-path load balancing is enabled, BGP calculates a unique

optimum route and also lists paths with the same priorities as equivalent routes. Then, BGP notifies the optimum route and the equivalent routes to the forwarding plane to implement load balancing.

Equivalent routes have the same basic attributes and priorities. That is, according to the optimum path selection rules of BGP, the paths have the same priorities before router-IDs are compared.

### ↘ AS\_PATH Loose Comparison

By default, equivalent routes must have the same AS-PATH attributes. Under such strict conditions, load balancing cannot be implemented in certain environments. In this case, you are advertised to enable the AS-PATH loose comparison mode. In the AS-PATH loose comparison mode, when other conditions for equivalent routes are met, as long as the AS-PATH lengths of routes and the AS-PATH lengths of routes from an alliance are the same respectively, it is considered that the conditions for equivalent routes are met.

 When the next hops of multiple BGP equivalent paths recur to the same IGP output interface, load balancing cannot be implemented.

### Related Configuration

#### ↘ Configuring Multi-path Load Balancing of BGP

- **maximum-paths { ebgp | ibgp } number**

Enables the multi-path load balancing function of BGP.

*number* indicates the number of equivalent next hops, ranging from 1 to device capacity. The default value is 1. A larger value means more equivalent next hops allowed.

#### ↘ Configuring AS\_PATH Loose Comparison

- **bgp bestpath as-path multipath-relax**

Enables the BGP AS-PATH loose comparison mode.

### 7.3.14 Configuring BGP FRR

With high-speed development of IP technologies and application of various complex services, the requirements for network security and stability become increasingly higher. Especially, certain real-time services (audios and videos) are sensitive to network running status and may be largely affected by unstable networks. Therefore, more and more focus and importance are attached to network reliability. With these requirements, the IP FRR function comes into being. It is intended to use a backup link to maintain data forwarding during route platform convergence after a faulty link is detected, in order to achieve the ideal targets of "zero delay" and "zero loss" in packet forwarding.

BGP FRR is shorted for Fast Reroute.

#### Working Principle

If a BGP routing table has multiple paths to the same network, BGP calculates the route with the highest priority by default. After the BGP FRR function is used, BGP selects a backup route for each optimum route. After BFD FRR detects that the master link is faulty, it switches the data to the originally calculated backup link for forwarding. After route convergence is completed, data is switched to the optimum route re-calculated for forwarding. In this way, BGP FRR can avoid route disconnection due to a link fault before BGP route convergence is completed.

 Only supported in IPv4 Unicast/VRF configuration mode.

- i** Only one backup route can be generated and the next hop of the backup route cannot be the same as that of the preferred route.
- i** A backup next hop cannot be generated for an Equal-Cost Multi-Path Routing (ECMP) route.
- i** In IPv4 VRF configuration mode, BGP FRR has a lower priority than VPN FRR. That is, if VPN FRR is enabled in the VRF mode, BGP FRR takes effect only when VPN FRR fails to calculate a backup route.

### Related Configuration

#### ▾ Configuring BGP FRR

Run the **bgp fast-reroute** command to enable the BGP FRR function, which is disabled by default.

#### ▾ Configuring a BFD Session to a BGP Neighbor

Run the **neighbor { peer-address } fall-over bfd** command to configure a BFD session to a BGP neighbor, which is not configured by default.

#### ▾ Manually Configuring a BGP BFD Session

If the BFD session to a BGP neighbor cannot be used to fast detect the failure of the master link, you can run the **bfd bind bgp peer-ip ip-address interface interface-type interface-index source-ip ip-address** command to configure a BGP BFD session, which is not configured by default.

### 7.3.15 Configuring Fast Withdrawal of Specified BGP Routes

With the rapid development of IP technologies and the application of various complex services, increasingly higher requirements are imposed on the network. Customers may need to implement fast convergence on specific routes. Fast route withdrawal can meet customers' requirements for preferentially withdrawal of specific routes.

#### Working Principle

By default, routes are withdrawn based on preferential calculation according to the sequence in the routing table. Fast route withdrawal adds the routes meeting conditions to a high-priority queue to implement preferential processing of specified routes, so that the specified routes can be withdrawn quickly.

- i** The L2VPN address family supports the route map mode only.
- i** Only one of the access list and prefix list takes effect.

### Related Configuration

#### ▾ Activating the Address Family Capability

By default, only the IPv4 unicast address family capability is activated for the neighbors created in BGP configuration mode.

Run the **address-family** command to enter the corresponding address family mode.

#### ▾ Configuring Fast Withdrawal of Specified BGP Routes

Run the **bgp fast-withdraw { access-list { access-list-number | access-list-name } | prefix-list prefix-list-name | route-map map-tag }** command to enable fast withdrawal of specified BGP routes in the address family. This function is disabled by default.

### 7.3.16 Configuring BGP Multi-path Bypass Protection

The original BGP FRR supports only 1:1 protection. After the ECMP function is enabled, the FRR becomes unavailable. The multi-path bypass protection enables BGP to support 1:N protection. Users can configure BGP multi-path bypass protection to enable the system to select a backup bypass path even if ECMP is configured. When all ECMP routes fail, the bypass route becomes the primary route for forwarding.

#### Working Principle

By default, when there are multiple paths reachable to the same network in the BGP routing table, BGP calculates one route with the highest priority. After the BGP multi-path bypass protection function is enabled, BGP preferentially selects a backup route when ECMP routes exist. When BFD detects a fault occurring on the master path, the system switches to the selected backup path for data forwarding. After route convergence is completed, the system switches to the optimum path that is re-calculated based on routes to forward data.

-  Only supported in IPv4 Unicast/VRF configuration mode.
-  Only one bypass route is generated and the next hop of the bypass route cannot be the same as next hops of ECMP routes.
-  The BGP FRR function conflicts with the BGP multi-path bypass protection function. If either of them is configured when the other function is already available, a conflict prompt will be displayed.

#### Related Configuration

##### ▾ Configuring BGP Multi-path Bypass Protection

Run the **bgp install standby-path** command to enable BGP multi-path bypass protection, which is disabled by default.

##### ▾ Configuring a BFD Session to a BGP Neighbor

Run the **neighbor peer-address} fall-over bfd** command to configure a BFD session to a BGP neighbor, which is not configured by default.

### 7.3.17 Allowing the BGP Route Reflector to Modify Route Attributes

According to RFC4456, the BGP route reflector cannot modify route attributes when reflecting routes (the purpose is to prevent route loops). However, relevant route attributes need to be modified when network traffic paths need to be re-planned. This command is configured to allow the route reflector to modify route attributes (including **Route-map** or **nexthop-self**).

#### Working Principle

The route reflector is not allowed to modify route attributes by default. After this command is configured, the route reflector is allowed to modify route attributes.

#### Related Configuration

##### ▾ Configuring a BGP Route Reflector and Reflection Client

No BGP route reflector is configured by default.

Run the **neighbor peer-address route-reflector-client** command to configure the local device as the route reflector and the neighbor as the route reflection client.

##### ▾ Configuring BGP Client-Client Reflection

By default, client-client route reflection is automatically enabled on the BGP route reflector, and routes received from the reflection client are allowed to be advertised to other clients.

Run the **bgp client-to-client reflection** command to enable client-client reflection. Run the **no** form of this command to disable client-client reflection.

#### ✚ Configuring a BGP Reflection Cluster Identifier

By default, the BGP reflection cluster identifier directly uses the BGP Route-ID. When multiple reflection clusters are deployed in one AS domain, different reflection cluster identifiers need to be configured for them.

Run the **bgp cluster-id** *cluster-id* command to manually configure a cluster identifier for the route reflector.

#### ✚ Allowing the BGP Route Reflector to Modify Route Attributes

By default, BGP does not allow the route reflector to modify route attributes.

Run the **bgp route-reflector attribute-change** command to allow the route reflector to modify route attributes.

### 7.3.18 Configuring the BGP Device to Advertise Routes with the Lowest Priority upon Restart

By default, after the device is restarted and a neighborhood is established, a BGP peer can advertise routes to its neighbors. However, in some cases, for example, there are a large number of neighbors or routes when the device is started but is slow in writing entries to hardware. The neighbors have learnt routes and start forwarding traffic, but the local device has not completed entry writing to the hardware, resulting in a traffic forwarding failure. Therefore, BGP needs to advertise routes with the lowest priority after device restart. In this way, other available routes instead of routes that pass through the local device are preferentially selected.

#### Working Principle

Configure the BGP device to advertise routes with the lowest priority upon restart. In this way, after the BGP device is restarted and neighborhoods are established, the BGP device advertises routes with the lowest priority to its neighbors. Adjust the **MED** value of routes to **4,294,967,295** for EBGP neighbors and adjust the value of **local-pref** to **0** for IBGP neighbors. After all ARP entries are delivered and all forwarding entries are written into hardware, run the **clear bgp [instance as-number] advertise lowest-priority on-startup** command to restore the priority of advertised routes. If a user does not configure to restore the priority of advertised routes, the device automatically restores the priority of advertised routes after a period of time.

#### Related Configuration

#### ✚ Configuring the BGP Device to Advertise Routes with the Lowest Priority upon Restart

##### ● **bgp advertise lowest-priority on-startup** [*recover-time*]

Configure BGP to adjust the priority of advertised routes to the lowest upon device restart. The priority is not adjusted by default. **recover-time** indicates the time (in seconds) of the timer for restoring the priority of advertised routes. The value range is from **1** to **65,535** and the default value is **600**.

### 7.3.19 Configuring BGP Timers

You can manually configure various timers within BGP to meet the neighbor keepalive and route management requirements in different network environments.

#### Working Principle

#### ✚ BGP Neighbor Keepalive Timer

BGP uses the Keepalive timer to maintain a valid connection with a peer and uses the Holdtime timer to identify whether a peer is valid. By default, the value of the Keepalive timer is 60 seconds and the value of the Holdtime timer is 180 seconds. When a BGP connection is established between two BGP speakers, the two BGP speakers negotiate about the Holdtime timer value and select a smaller value. 1/3 of the negotiated Holdtime timer value and the configured Keepalive timer value are compared and the smaller value is used as the Keepalive timer value.

### ✚ Neighbor Reconnection Timer

To reduce the impacts of frequent BGP reconnection to a neighbor on the network bandwidth, after a BGP speaker detects failure of a neighbor connection, the BGP speaker attempts to reconnect the neighbor after the connect-retry timer expires. By default, the value of the connect-retry timer is 15s.

### ✚ Route Advertisement Timer

To reduce the impacts of route update packets on the network bandwidth, after a BGP speaker detects a network topology change, the BGP speaker does not advertise the route update to its neighbors immediately. Instead, the BGP speaker uses a regular update mechanism to advertise all changed routing information to its neighbors.

## Related Configuration

### ✚ Configuring the BGP Neighbor Keepalive Timer

- **timers bgp *keepalive holdtime***

Adjusts the BGP *keepalive* and *holdtime* values for all peers.

The *keepalive* value ranges from 0 to 65,535. The default value is 60 seconds.

The *holdtime* value ranges from 0 to 65,535. The default value is 180 seconds.

- **neighbor { *neighbor-address* | *peer-group-name* } timers *keepalive holdtime***

Configures the *keepalive* and *holdtime* values used for connecting to a specified BGP peer (group).

The *keepalive* value ranges from 0 to 65,535. The default value is 60 seconds.

The *holdtime* value ranges from 0 to 65,535. The default value is 180 seconds.

### ✚ Configuring the Neighbor Re-connection Timer

- **neighbor { *address* | *peer-group-name* } timers connect *connect-retry***

Configures the *connect-retry* value used for reconnecting to a specified BGP peer (group).

The value of *connect-retry* ranges from 1 to 65,535. The default value is 15 seconds.

### ✚ Configuring the Route Advertisement Timer

- **neighbor { *address* | *peer-group-name* } advertisement-interval *seconds***

Configures the minimum interval for sending route updates to a specified BGP peer (group). The value of *advertisement-interval* ranges from 0 to 600 seconds. The default value for IBGP peers is 0 seconds and the default value for EBGP peers is 30 seconds.

- **neighbor { *address* | *peer-group-name* } as-origination-interval *seconds***

Configures the minimum interval for sending local initial route updates to a specified BGP peer (group). The value of *As-origination-interval* ranges from 1 to 65,535. The default value is 1 second.

### 7.3.20 Configuring BGP Route Update Mechanisms

#### Working Principle

BGP provides two route update mechanisms: regular-scanning update and event-triggering update. Regular-scanning update indicates that BGP uses an internal timer to start scanning regularly and update the routing table. Event-triggering update indicates that BGP starts scanning and updates the routing table when the BGP configuration commands are changed due to user configuration or the next hop of a BGP route changes.

-  This function is configured based on address families and can be configured in the IPv4, IPv6, VPNv4, VPNv6, IPv4 vrf and IPv6 VRF address family modes.
-  If you set the BGP route update mechanism to event-triggering update (by running the **bgp scan-rib disable** command), you must disable synchronization (by running the **no synchronization** command) and enable the BGP next-hop triggering update function (by running the **bgp nexthop trigger enable** command). On the other hand, if you enable synchronization or disable the BGP next-hop triggering update function, the BGP routing table must be updated in the regular scanning mode.

#### Related Configuration

##### ▾ Configuring Route Update Mechanisms

- **bgp scan-rib disable**  
Sets the BGP route update mechanism to event-triggering update. Regular-scanning update is used by default.
- **bgp scan-time** *scan-time*  
Configures the regular update interval of BGP. The value of *scan-time* ranges from 5 to 60 seconds. The default value is 60 seconds.

### 7.3.21 Configuring the Next-Hop Triggering Update Function of BGP

The next-hop triggering update function of BGP is a method for reducing the BGP convergence time. This function is used to optimize the method for monitoring the next hop of a route to ensure that BGP can increase the BGP route convergence speed when the network topology is stable.

#### Working Principle

When BGP connects to a neighbor, BGP automatically monitors the next hop of the BGP route learned from the neighbor. When the next hop changes in the core routing table, BGP receives an advertisement about the next hop change and updates the BGP routing table. This optimization measure improves the BGP route convergence performance by reducing the time for detecting next-hop changes.

If this function is disabled, BGP next hop update will be discovered through regular scanning specified by scan-timer.

-  This function is configured based on address families and can be configured in the IPv4, IPv6, VPNv4 and IPv4 vrf address family modes.
-  **bgp nexthop trigger delay** and **bgp scan-time** control the same timer. When bgp scan is enabled (it is enabled by default and can be disabled by the **bgp scan-rib disable** command), if the value of **bgp nexthop trigger delay** is larger than 60s, bgp scan does not take effect because the scan timer is always triggered before the delay.
-  If the network environment is unstable (with frequent next-hop changes), especially with many routes, this function performs unnecessary route calculations, which consumes more CPU resources. Therefore, you are advised to disable this function in this environment.

## Related Configuration

### ▾ Configuring the Next-Hop Triggering Update Function of BGP

- **bgp nexthop trigger enable**

Enables the BGP next-hop triggering function, which is enabled by default.

- **bgp nexthop trigger delay *delay-time***

Configures the delay of BGP next-hop triggering update. The value of *delay-time* ranges from 0 to 100 seconds. The default value is 5 seconds.

### 7.3.22 Configuring BGP LOCAL AS

The Local AS function of BGP is used to configure a local AS different from a router BGP AS for a specific peer. This is similar to deploying a new virtual AS between the peer devices. When the local router BGP AS changes, you can establish a BGP connection without changing the BGP configurations on the peer device. This function is mainly used for AS migration and merging of large networks and ensures that the device configurations in other interconnected ASs are not affected.

#### Working Principle

In BGP, when a local device connects to a peer, the local device advertises the local AS number to the peer by using an Open message. The peer checks whether the BGP AS number advertised is the same as the local AS number. If the AS numbers are different, the peer will deny the BGP connection. By default, the local AS in the BGP connection is a route BGP AS. However, if a local AS is configured for the peer, the configured local AS will replace the route BGP AS when a BGP connection is established between the local device and the peer.

 The **neighbor *peer-address* local-as *as-num*** command for configuring the BGP Local AS function can be followed by more options. For details, see the Command Reference.

 The BGP Local AS function is applied only to EBGP peers, but is not applied to IBGP peers and alliance EBGP peers. In addition, the BGP Local AS function has the following restrictions:

- 1) The configured local AS cannot be the same as the remote AS of a peer.
- 2) The local AS cannot be configured independently for a member of a peer group.
- 3) The configured local AS cannot be the same as the route BGP AS.
- 4) If a device is a member of an AS alliance, the local AS cannot be the same as the AS alliance number.

## Related Configuration

### ▾ Configuring BGP LOCAL AS

- **neighbor { *address* | *peer-group-name* } local-as *as-number***

Configures a local AS for a peer. By default, no local AS is configured for any peer. The local AS of a peer is the route BGP AS.

### 7.3.23 Configuring BGP Capacity Protection

There are often a large number of BGP routes, which may cause overload of a device, especially for a device with small memory. Protecting BGP capacity helps avoid non-predictable running status caused by consumption of device capacity.

#### Working Principle

### ▾ Restricting the Number of BGP Routes

Restrict the number of BGP routes by setting the maximum number of routes in a BGP address family and the maximum number of routes that can be learned by a BGP neighbor.

#### ▾ **Configuring the Number of BGP Neighbors to Send Warnings**

Set the maximum number of BGP neighbors. When the neighbor number exceeds the limit, LOG prompt will be displayed.

#### ▾ **Entering the OVERFLOW State in case of Insufficient Memory**

If the memory is insufficient, BGP can enter the OVERFLOW state. In the OVERFLOW state, BGP generates a default route pointing to a NULL interface. If a newly learned route is not a refined route other than the default route in the current routing table, the route is discarded. In other words, general newly learned routes are discarded to ensure that the system memory is stable. The purpose of not discarding all routes is to avoid route loops in the entire network. Therefore, it is safe for BGP to enter the OVERFLOW state. BGP is allowed to enter the OVERFLOW state by default.

- i By default, BGP enters the OVERFLOW state in case of insufficient memory. If you do not want BGP to enter the OVERFLOW state, you can run the **no overflow memory-lack** command to disable this function.
- i In the OVERFLOW state, BGP supports only the **clear bgp [ instance as-number ] { addressfamily | all } \*** command at present. You can also exit from the OVERFLOW state by disabling and enabling BGP again. When the memory becomes sufficient again, BGP can also automatically exit from the OVERFLOW state.

### **Related Configuration**

#### ▾ **Restricting the Number of BGP Routes**

- **neighbor** { *neighbor-address* | *peer-group-name* } **maximum-prefix** *maximum* [ *threshold* ] { [ **restart-time** *time* ] | [ **warning-only** [ **suppress** ] ] }

Restricts the maximum number of routes that can be learned from a BGP neighbor, which is not restricted by default.

- **maximum-prefix** *maximum*

Restricts the maximum number of routes in a BGP address family, which is not restricted by default.

- Run the **bgp maximum-prefix** *maximum* [ **vrf** *vrf-name* ] command to restrict the maximum number of routes in the BGP global or specified VRF. When a route advertisement in an address family causes the current number of BGP routes to exceed the maximum number, a prompt indicating route overflow in the global or specified VRF is displayed, and the BGP global or specified VRF is set to the overflow state. This function is disabled by default.

#### ▾ **Configuring the Number of BGP Neighbors**

Run the **bgp maximum-neighbor numbers warning-only** command to send the LOG warning when neighbors exceed the limit.

#### ▾ **Configuring BGP Overflow**

- **overflow memory-lack**

Enable BGP to enter the OVERFLOW state in case of insufficient memory, which is enabled by default.

### 7.3.24 Configuring BGP GR

Graceful Restart (GR) is intended to implement uninterrupted data forwarding during restart of BGP. During active/standby switching of the management boards, the GR function keeps the network topology stable, maintains the forwarding table and ensures that key services are not interrupted.

#### Working Principle

 Comply with RFC4724: Graceful Restart Mechanism for BGP. [BGP GR] is used in the following description to indicate the RFC. BGP GR is not an independent process, but is jointly completed by the Restarter and Helper.

- The Restarter performs restart and maintains the working capability of the route forwarding plane when the route control plane is faulty.
- The Helper is the BGP neighbor of the Restarter and helps the Restarter to complete GR.

A capability indicating GR is added to the OPEN message of BGP, which is called "Graceful Restart Capability". This capability is used by BGP to tell its neighbor it supports the graceful restart capability. During initialization of a BGP connection, two neighbors negotiate about the GR capability.

The route update end flag (End-of-RIB, shorted as EOR) is added to the Update packet of BGP, which indicates that the routing information update to the neighbor is completed.

Figure 7- 3 BGP GR Interaction Process

5. ① When BGP establishes neighborhood at the beginning, BGP uses the GR capability field in the OPEN message to negotiate about the GR capabilities of the two neighbors.
6. ② At a moment, the Restarter starts restart, and the BGP session is disconnected. The Helper detects the disconnection, keeps the route of the Restarter valid but adds the "Stale (aged but not updated)" flag to the route.
7. ③ and ④ The Restarter completes restart and connects to the Helper again.
8. ⑤ The Restarter waits for the route update message and EOR flag from the Helper.
9. ⑥ After receiving the EOR flag from all neighbors, the Restarter performs route calculation, update routing entries and then sends updated routes to the Helper.
10. ⑦ After receiving the updated routes, the Helper cancels the "Stale" flag of the routes. After receiving the EOR flag from the Restarter, the Helper deletes routes with the "Stale" flag (these routes are not updated), performs route calculation, and updates the routing entries. The entire GR process is completed.

BGP GR defines several extended and important timers:

- **Restart-Timer:** The GR Restarter advertises the time value to the GR Helper, which indicates the maximum waiting time that the GR Restarter hopes the Helper to wait before a new connection is established between them. You can run the **bgp graceful-restart restart-time** command to modify the time value.

- **Wait-For-EOR Timer:** Indicates the maximum time that the GR Restarter waits for the EOR flag from all GR Helpers. After receiving the EOR flag from all GR Helpers or after the Wait-For-EOR timer expires, the GR Restarter calculates the preferred route and updates the routing entries. You can run the **bgp update-delay** command to modify the time value.
- **StalePath Timer:** Indicates the maximum time that the GR-Helper waits for the EOR flag from the GR Restarter after a new connection is established between them. Within this period, the Helper keeps the original route of the Restarter valid. After receiving the EOR flag or after the StalePath timer expires, the Helper clears the routing entries still with the "Stale" tag. You can run the **bgp graceful-restart stalepath-time** command to modify the time value.

## Related Configuration

### ▾ Configuring BGP GR

- **bgp graceful-restart**

Enables the Restarter capability, which is enabled by default.

- **bgp graceful-restart restart-time *time***

Sets the Restart Timer. The default value is 120 seconds.

- **bgp update-delay *delay***

Sets the Wait-For-EOR Timer. The default value is 120 seconds.

- **bgp graceful-restart stalepath-time *time***

Sets the StalePath Timer. The default value is 360 seconds.

- **bgp graceful-restart disable**

Disables the address family GR capability. The address family GR capability is enabled by default. After the global BGP GR is enabled, the GR capability is automatically enabled for all address families.

- **i** When BGP GR is implemented, all BGP peers must enable the BGP GR capability. If certain peers do not support or enable GR, BGP GR may fail to be implemented. GR failure may cause a short route black-hole or route loop, which may affect the network. Therefore, you are advised to verify that all neighbors are enabled with the BGP GR capability. You can run the **show ip bgp [ instance as-number ] neighbors** command to display the capabilities successfully negotiated between BGP peers and verify that the GR capability negotiation is successful. In the BGP route configuration mode, run the **bgp graceful-restart** command to enable the BGP GR capability.

- **i** The **bgp graceful-restart** command will not be applied to a successfully established BGP connection immediately. That is, when the BGP connection is in the Established state, the BGP peers will not re-negotiate about the GR capability immediately. To enable the BGP peers of the BGP connection to negotiate about the GR capability immediately, you need to forcibly restart the BGP peers to re-negotiate about the GR capability by running the **clear ip bgp 192.168.195.64** command (for example). To make GR enabling or disabling take effect immediately, you must restart the neighborhood for capability negotiation, which may cause network flapping and affect normal use of users. Therefore, you can explicitly control whether to restart the neighborhood.

- **i** Supporting BGP GR does not mean that a device can be used as the Restarter to implement BGP GR. Whether to implement BGP GR also depends on the hardware capabilities of the device. FS devices must support the dual-engine hot backup when being used as the GR Restarter.

- **i** The restart period configured by the **bgp graceful-restart restart-time** command should not be longer than the Hold Time of the BGP peers; otherwise, the Hold Time will be used as the restart time to be advertised to the BGP peers during GR capability negotiation.

- i** The **bgp graceful-restart disable** command is used to disable the GR capability in an address family in the address family configuration mode, which is not configured by default.

### 7.3.25 Configuring 4-Byte AS Numbers of BGP

A traditional AS number consists of 2 bytes, ranging from 1 to 65,535. A newly defined AS number consists of 4 bytes, ranging from 1 to 4,294,967,295. Newly defined AS numbers are used to cope with exhaustion of AS number resources.

#### Working Principle

4-byte AS numbers support two expression modes: the decimal mode and dot mode. The decimal mode is the same as the original expression mode, that is, expressing the 4 bytes of an AS number as decimal digits. The dot mode is expressed as ([higher 2 bytes.]lower 2 bytes). If the higher 2 bytes are 0, they will not be displayed.

For example, an AS number is 65534 in the decimal mode and is 65,534 in the dot mode (the 0 at the beginning is not displayed).

For example, an AS number is 65,536 in the decimal mode, and is 1.0 in the dot mode.

For example, an AS number is 65,538 in the decimal mode, and is 1.2 in the dot mode.

- i** Related protocols are as follows: RFC 4893 and RFC 5396.

#### ▾ Configuring the Display Mode of a 4-Byte AS Number

A 4-byte AS number is displayed in the decimal mode by default. You can manually set the display mode to the dot mode. After the setting, a regular expression will use the dot mode for matching 4-byte AS numbers.

#### ▾ Compatibility with Devices Supporting Only 2-Byte AS Numbers

With introduction of 4-byte AS numbers, BGP connections may be established between old BGP speakers supporting only 2-byte AS numbers and new BGP speakers supporting 4-byte AS numbers. If the AS where a new BGP speaker resides has a 4-byte AS number, when an old BGP speaker creates neighborhood with the new BGP speaker, the old BGP speaker uses the reserved AS number 23,456 to replace the 4-byte AS number of the new BGP speaker. In the OPEN packets sent by the new BGP speaker to the old BGP speaker, the 4-byte AS number in the **My Autonomous System** field will be replaced by 23,456. In addition, in UPDATE packets sent to the old BGP speaker, the 4-byte AS number in the AS-PATH and AGGREGATOR attributes will also be replaced by 23,456. In addition, new optional transfer attributes AS4-PATH and AS4-AGGREGATOR will be used to record the real 4-byte AS number so that the real AS-PATH and AGGREGATOR attributes can be restored when the route reaches a next new BGP speaker.

In other cases, the real AS number of the remote end is used to create neighborhood.

#### Related Configuration

#### ▾ Configuring the Display Mode of a 4-Byte AS Number

- **bgp asnotation dot**

Displays a 4-byte AS number in the dot mode. The decimal mode is used by default.

### 7.3.26 Configuring a Regular Expression

A regular expression is a formula that matches strings based on a template.

The formula is used to assess text data and return True or False to indicate whether the expression can correctly describe the data.

#### Working Principle

Regular expressions are used in BGP path attributes. The following table describes the usages of special characters in a regular expression.

Character	Symbol	Special Meaning
Period	.	Matches any single character.
Asterisk	*	Matches zero or any sequence in a string.
Plus sign	+	Matches one or any sequence in a string.
Question mark	?	Matches zero or one symbol in a string.
Caret	^	Matches the start of a string.
Dollar sign	\$	Matches the end of a string.
Underline	_	Matches the start, end and space of commas, brackets and strings.
Square brackets	[ ]	Matches a single character within a range.

## Related Configuration

### ↳ Using a Regular Expression in a show Command

- **show ip bgp [ instance *as-number* ] regexp *regexp***  
Displays the BGP routing information in a specified regular expression matched by the AS-PATH attribute.
- **show ip bgp [ instance *as-number* ] quote-regexp *regexp***  
Displays the BGP routing information in a regular expression within the specified double quotation marks matched by the AS-PATH attribute.

### 7.3.27 Configuring BGP Session Retention

By default, when an UPDATE packet is received from a neighbor, a BGP session will be disconnected if an error is detected on the multi-protocol routing attribute. This will cause flapping of the routes in all address families of this neighbor. That is, the routing error in an address family will affect the route stability in other address families.

#### Working Principle

After the BGP session retention function is enabled, if an error occurs in the routing attribute of an address family, only the routing information in this address family related to the neighbor is deleted. In addition, the BGP session and other address families are not affected, which enhances the stability of BGP.

**recovery-time** is used to configure the time for waiting for automatic route recovery, which requires that a neighbor should support the route-refresh capability. After the recovery-time, BGP sends the route-refresh message of the address family to the neighbor and re-advertises all routing information in the address family to this neighbor.

-  In the session retention state, you can manually reset the neighbor to exit from the session retention state.

## Related Configuration

### ↳ Configuring BGP Session Retention

- **bgp mp-error-handle session-retain [ recovery-time *time* ]**  
Enables the BGP session retention function, which is disabled by default.

**recovery-time** *time* configures the time for waiting for automatic route recovery, ranging from 10 to 65535 seconds. The default value is 120.

### 7.3.28 Configuring BGP Delayed Advertisement upon System Restart

By default, after the neighborhood is established after system restart, a BGP peer can advertise route information to its neighbors. This is normal in most cases. However, in certain cases, for example, there are many neighbors or routes during startup but writing entries into the hardware is slow. In this case, the neighbors have learned the routes and started forwarding traffic, but the hardware has not completed writing of entries at the local end, which causes failure of traffic forwarding.

#### Working Principle

The BGP delayed advertisement upon system restart ensures that routes are not advertised to neighbors immediately after the neighborhood is established upon system restart and that the routes are advertised after a period. This function has no effect on other behaviors such as route receiving performed by the neighbors. If part of the routes is not affected by the delay, configure prefix-list policy to match this part of routes so that route advertisement can be more flexible.

**delay-time** is used to configure the waiting time before routes are advertised to the neighbors. **startup-time** is used to configure the startup time. Within the startup-time, BGP sends routing information to the neighbors at the interval specified by **delay-time**.

 After the startup-time ends, the default route advertisement behavior recovers.

#### Related Configuration

##### ▾ Configuring BGP Delayed Advertisement upon System Restart

##### ● **bgp initial-advertise-delay delay-time [ startup-time ] [ wait-for-controller ]**

Enables BGP delayed advertisement upon system restart, which is disabled by default.

*delay-time* configures the delay time for advertising routes after the BGP neighborhood is established upon system restart, ranging from 1 to 600 seconds. The default value is 1s.

*startup-time* configures the time range for system restart, ranging from 5 to 58,400 seconds. The delayed route advertisement mechanism is used within this range. The default value is 600s.

### 7.3.29 Configuring BGP Delayed Advertisement for First Routes

By default, after the neighborhood is established, a BGP peer can advertise route information to its neighbors. However, neighbors with the neighborhood newly established will send out the route information after a delayed period of time.

#### Working Principle

After BGP starts, BGP peers negotiate to establish the neighborhood before sending route information (update packets).

 If update delay is configured on the local end, the route received from the specified neighbor will be sent to other neighbors after the delay time. If BGP delayed advertisement upon system restart and BGP delayed advertisement for first routes are enabled at the same time, BGP delayed advertisement upon system restart takes precedence over BGP delayed advertisement for first routes.

 BGP GR is not affected by either BGP delayed advertisement upon system restart or BGP delayed advertisement for first routes, that is, the BGP GR route advertisement is not affected by the delay time.

## Related Configuration

### ↳ Creating a BGP Neighbor

By default, no neighbor is specified on a BGP speaker. You need to manually configure a BGP neighbor.

Run the **neighbor** {*peer-address* | *peer-group-name*} **remote-as** *as-number* command to manually create a BGP neighbor and specify the AS number of the neighbor.

### ↳ Configuring BGP Delayed Advertisement for First Routes

By default, BGP delayed advertisement for first routes is disabled for neighbors.

Run the **neighbor** {*peer-address* | *peer-group-name*} **update-delay** *delay-time* command to enable BGP delayed advertisement for first routes.

## 7.3.30 Configuring BGP Tracking

The BGP tracking function provides fast link fault detection for BGP speakers, accelerating route convergence.

### Working Principle

When the BGP tracking function is enabled for a BGP speaker, the BGP speaker is associated with the corresponding track session of the track module to monitor status change. In normal cases, the BGP speaker associates with the track module to perceive link changes. When a link is faulty, the track module notifies the BGP speaker rapidly, implementing fast route convergence. BGP tracking configuration is simpler than BFD configuration because only local configuration is required.

 For details about the track session configuration and related commands, see *TRACK-RNS-SCG.doc*.

## Related Configuration

### ↳ Configuring Association Between the BGP Neighbor and Track Instance

Run the **neighbor** *neighbor-address* **track** *track-obj-number* command to configure association between a BGP neighbor and a track instance, which is not configured by default.

## 7.3.31 Configuring BGP NSR

None-Stop-Routing (NSR) is used to ensure uninterrupted routes during protocol restart upon a switchover between the active and standby management boards. During a switchover between the active and standby management boards, the NSR function ensures stable network topology, maintains neighbor status and forwarding tables, and guarantees uninterrupted key services.

### Working Principle

Different from BGP GR, BGP NSR is a function implemented individually by a BGP speaker and does not rely on neighbors.

- During a switchover between the active and standby management boards, connections between BGP neighbors are not interrupted.
- Neighbors do not perceive the restart behavior on the local end. The GR technology is used for restart restoration.

Neighbors with the BGP NSR function enabled do not need to negotiate the GR capability. In addition, neighbor assistance is not required and interworking problems do not exist as NSR is a reliability technology not perceived by neighbors.

## Related Configuration

### ✚ Creating a BGP Neighbor

By default, no neighbor is specified on a BGP speaker. You need to manually configure a BGP neighbor.

Run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify the AS number of the neighbor.

### ✚ Enabling the NSR Function for BGP Neighbors

By default, the NSR function is disabled for BGP neighbors.

Run the **neighbor** { *peer-address* | *peer-group-name* } **ha-mode nsr** command to enable the NSR function for BGP neighbors.

### ✚ Enabling the NSR Function for BGP Neighbors Globally

By default, the NSR function is disabled.

Run the **bgp nsr** command to enable the NSR function for BGP neighbors globally.

-  When the BGP NSR function is enabled for a neighbor, the connection to the neighbor will be reset, the tcp nss (none-stop-service) of the neighbor will be enabled, and the related neighbor and route information are backed up to the standby management board. In this case, if the NSR function is enabled after the neighborship is established, the neighborship will be re-established, causing neighbor down. It is recommended that the NSR function be enabled before the neighborship is established.
-  The NSR function does not take effect on a neighbor that fails to establish the BGP connection, that is, if the BGP connection is not in the **Established** state, the neighbor will not execute NSR related backup operations. Only if the BGP connection is in the **Established** state, the neighbor performs NSR related backup operations.
-  Not all devices that support the BGP NSR function can perform switchovers between the active and standby management boards. To perform switchovers between the active and standby management boards, the device hardware must meet specific requirements. NSR devices on FS networks must support the dual engine redundancy hot backup function.
-  Currently, only the IPv4/IPv6 unicast address family and EVPN address family support the NSR function. If a neighbor activates other address families except the unicast address family, NSR switchovers cannot be performed.
-  If the BGP or TCP backup is not complete, the BGP NSR switchover may fail. When this status occurs, the BGP GR will reconnect the route. It is recommended to enable the BGP NSR and BGP GR at the same time.

### 7.3.32 Configuring BGP Routes to Be Recursive Only to Host Routes

BGP routes use optimal matching for route recursion by default. Therefore, BGP routes may be recursive to default routes or incorrect network segment routes, resulting in an egress or next hop error. After the function of making BGP routes recursive only to host routes is enabled, BGP routes are recursive only to 32-bit IPv4 host routes or 128-bit IPv6 host routes. This function is applied to routes learnt by neighbors of IBGP or multi-hop EBGP neighborships established using the Loopback interface.

#### Working Principle

After the function of making BGP routes recursive only to host routes is enabled, the function checks the validity of the next-hop addresses of IBGP or multi-hop EBGP routes via exact matching, and conducts route recursion on the IBGP or multi-hop EBGP routes via exact matching after they are written into the FIB. For example, the next-hop address of the IBGP route 192.168.2.0/24 is 1.1.1.1. The next-hop address of the IBGP route 192.168.2.0/24 is valid only when the route 1.1.1.1/32 exists, and the egress of the route written into the FIB is the egress of the route 1.1.1.1/32.

#### Related Configuration

### ↘ Creating a BGP Neighbor

By default, no neighbor is specified for a BGP speaker. You need to manually configure a BGP neighbor.

Run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify an AS number for the neighbor.

### ↘ Enabling BGP Routes to Be Recursive Only to Host Routes

By default, recursion is performed on BGP routes via exact matching.

Run the **bgp recursion host** command to enable BGP routes to be recursive only to host routes.

## 7.3.33 Configuring Outbound Loop Detection for a BGP Neighbor

By default, BGP conducts loop detection on BGP routes when receiving the BGP routes from a neighbor. When the **AS Path** attribute carried in a BGP route contains the local AS number, BGP filters out the BGP route. The outbound loop detection function of a neighbor is to conduct loop detection on routes in advance when the routes are transmitted to a neighbor, so as to filter out loop routes.

### Working Principle

When sending a route to an EBGP neighbor, the device judges whether the **AS Path** attribute carried in the BGP route contains the AS number of the neighbor. If yes, the route is looped and the device does not send the route to the EBGP neighbor.

### Related Configuration

#### ↘ Creating a BGP Neighbor

By default, no neighbor is specified for a BGP speaker. You need to manually configure a BGP neighbor.

Run the **neighbor** { *peer-address* | *peer-group-name* } **remote-as** *as-number* command to manually create a BGP neighbor and specify an AS number for the neighbor.

#### ↘ Enabling Outbound Loop Detection for a Neighbor

The outbound loop detection is disabled for a neighbor by default.

Run the **neighbor** { *peer-address* | *peer-group-name* } **as-loop-check out** command to enable the outbound loop detection for the BGP neighbor.

## 7.3.34 Shutting Down BGP Connections Gracefully

The RFC 6198 *Requirements for the Graceful Shutdown of BGP Sessions* defines a requirement for shutting down BGP connections gracefully, and requests that a BGP neighbor shut down connections under the precondition that service traffic is not interrupted or is interrupted for a very short period of time.

### Working Principle

This feature adopts the "Make-Before-Break" mode to shut down BGP connections, to ensure that service traffic is not interrupted or is interrupted for a very short period of time in the process from the feature configuration to actual BGP connection shutdown. The steps are as follows:

- The feature enables the device to advertise a route with the lowest priority (the value of **local-preference** is **0** or the value of **med** is **4,294,967,295**) to a neighbor and carry the **gshut community** attribute in the route so that the neighbor updates routes and switch traffic to a backup link or other equivalent links in advance.
- The device shuts down the BGP connection with the neighbor after a period of time.

The delay period of time for BGP connection shutdown can be manually specified or automatically calculated. The automatically calculated delay time is 1 second for 500 routes.

- i** If the **local-preference** or **med** attribute of the route with the lowest priority cannot enable the neighbor to switch traffic to backup links or other equivalent links in advance, configure an inbound policy on the neighbor to change the priority of routes carrying the **gshut community** or specified **community** attribute or to filter such routes.

### Related Configuration

#### ✎ Shutting Down All Connections of a BGP Instance Gracefully

By default, all connections of BGP instances are not shut down.

Run the **bgp shutdown graceful [ community value ] [ delay time ]** command to shut down all connections of a BGP instance.

#### ✎ Shutting Down Connections of the BGP Neighbor Gracefully

By default, the connections of BGP neighbors are not shut down.

Run the **neighbor { peer-address | peer-group-name } shutdown graceful [ community value ] [ delay time ]** command to disable connections of a BGP neighbor.

### 7.3.35 Configuring Enhanced VPN Route Import

#### Working Principle

During inter-VRF route import, import of L3VPN remote routes to VRF, or import of EVPN routes to the IP route table, only routes with preferred next hops are imported by default.

The enhanced VPN route import function is an extension of the inter-import of the preceding routes. It enables all routes with next hops or equivalent next hops to be imported.

#### Related Configuration

#### ✎ Configuring the Route Import Policy

By default, only routes with preferred next hops are imported.

Run the **import path selection { all | bestpath | multipath }** command to import all routes with next hops, routes with preferred next hops, or routes with equivalent next hops.

### 7.3.36 BGP Route Update Group

The BGP route update group function is used to enhance the performance for advertising routes to neighbors.

#### Working Principle

The BGP route update group function automatically classifies neighbors with the same outbound policy to the same update group. When routes are sent to neighbors, the update packet is encapsulated based on the update group and sent to all neighbors in the

update group. In this case, the update packet is encapsulated for once and sent multiple times, improving the performance of route advertisement to neighbors.

### 7.3.37 Configuring BGPEVPN

As a layer-2 VPN technology, the Ethernet Virtual Private Network (EVPN) uses the MB-BGP on the control plane to distribute layer-2 and layer-3 routing information and uses the Virtual eXtensible Local Area Network (VXLAN) on the data plane to encapsulate service traffic..

#### Working Principle

The EVPN is a layer-2 VPN technology extended based on the MP-BPG. The MP-BPG expands the EVPN address family to transfer the required layer-2 and layer-3 routing information, and support multiple types of data planes. At present, only the VXLAN can serve as the data plane of the EVPN.

The MP-BGP adds not only the EVPN address family, but also the EVPN network layer reachability information, which includes the following:

1. Ethernet Auto-discovery Route: Automatically discovers Ethernet Segment (ES) information in a multi-homed network.
2. MAC/IP Advertisement Route: Advertises the MAC address and host ARP information.
3. Inclusive Multicast Ethernet Tag (IMET) Route: Automatically discovers VXLAN tunnel end points (VTEPs) and creates VXLAN tunnels.
4. Ethernet Segment Route: Advertises ES information and information about connected VTEPs.
5. IP Prefix Route: Advertises routing information of IP network segments.

At present, Ethernet Auto-discovery Route and Ethernet Segment Route are not supported.

The preceding EVPN routing information includes the RD (for EVPN routes of different VNIs) and route target (for importing EVPN routes between different devices).

#### Related Configuration

##### 📄 Configuring EVPN

By default, the EVPN mode is not activated.

Run the **evpn** command to enter the EVPN mode.

##### 📄 Creating an EVI Instance

By default, no EVI instance is configured.

Run the **vni vni-id** command to create an EVI instance and enter the EVI instance configuration mode.

Run the **vni range vni-id-list** command to create EVI instances in batches and enter the EVI instance batch configuration mode.

##### 📄 Configuring RD

By default, no RD is configured in evpn-vni mode.

Run the **rd{auto|rd\_value}** command to add RD.

##### 📄 Configuring Route Target

By default, no route target is configured in evpn-vni mode.

Run the **route-target** { **import** | **export** | **both** } command to configure route target.

#### ↘ **Configuring a Route Map for EVI Instances**

By default, no route map is configured for EVI instances.

Run the **export map** *route-map-name* command to configure the route map for exporting the extended community attribute of EVPN routes from the local device to the remote device.

Run **import map** *route-map-name* command to configure the route map for importing the remote EVPN routes to the local VNI instance.

#### ↘ **Configuring an EVPN Address Family**

By default, no EVPN address family is activated.

Run the **address-family l2vpn evpn** command to activate an EVPN address family.

#### ↘ **Configuring MAC Mobility Parameters**

By default, if five MAC address moves are detected within 180s, it is considered that a MAC address conflict occurs.

Run the **bgp mac-mobility timer count** [*delay-timer*] command to adjust the MAC mobility detection parameters.

#### ↘ **Modifying the Router MAC Attribute to Router MAC Address or Anycast MAC Address of Local Device**

By default, the router MAC attribute is not modified for EVPN routes.

Run the **neighbor** { *neighbor-address* | *peer-group-name* } **router-mac-self** command to set the router MAC attribute of EVPN routing information to the router MAC address or anycast MAC address of the local device.

### 7.3.38 Configuring BMP

BGP Monitor Protocol (BMP) monitors BGP running on a device, focusing on the status, entry sending and receiving, and all kinds of statistics of BGP peers.

#### Working Principle

A BGP speaker proactively sends a TCP connection request carrying a destination IP address and a port number (the destination IP address is the BMP server address, and both of the address and port number are specified by the client) to the specified BMP server. After the TCP connection is successfully established, the BGP speaker advertises BMP packets to the BMP server.

#### Related Configuration

##### ↘ **Creating a BMP Server Instance**

By default, no BMP server instance is configured.

Run the **bmp server** *server-number* command to create a BMP server instance and enter the BMP instance configuration mode.

##### ↘ **Configuring the Address and Port Number of the BMP Server**

By default, the BMP server address and port number are not configured in BMP configuration mode.

Run the **address** *bmp-server-address* **port** *port-number* command to configure the address and port number of the BMP server.

##### ↘ **Configuring the update-source**

By default, the outbound interface of a TCP connection is automatically selected based on the IP address of the BMP server. In normal cases, the outbound interface of the local packet is used.

Run the **update-source** *interface-type interface-number* command to set the outbound interface of the TCP connection to the BMP server.

#### ↘ **Configuring VRF**

By default, a TCP connection is established to the BMP server under the default VRF instance.

Run the **vrf** *vrf-name* command to establish a TCP connection to the BMP server under a specific VRF instance.

#### ↘ **Configuring failure-retry-delay**

By default, the interval to reconnect to the BMP server increases from 30s.

Run the **failure-retry-delay** *second* command to set the interval to establish a TCP connection to the BMP server.

#### ↘ **Configuring description**

By default, no description is configured.

Run the **description** *text* command to add the description to BMP instance.

#### ↘ **Configuring buffer-size**

By default, no limit is set for the max bytes of packet in buffer.

Run the **buffer-size** *maximum* command to limit the max bytes of packet in buffer for BMP instance.

#### ↘ **Configuring the BMP Server to Monitor BGP Peers**

By default, BGP peers are not monitored by the BMP server.

Run the **neighbor** { *neighbor-address* | *peer-group-name* } **bmp-active** { **all** | **server** *server-number* [ *server-number* [ *server-number* ] ] } command to enable the BMP server to monitor BGP peers.

#### ↘ **Configuring All BMP Servers to Monitor BGP Peers**

By default, BGP peers are not monitored by all BMP servers.

Run the **bgp bmp-active** command to enable all BMP servers to monitor BGP peers.

#### ↘ **Configuring the BMP Server to Monitor BGP Peer Packets**

By default, the BMP server does not enable route mirroring packet sending.

Run the **route mirroring** command to enable route mirroring packet sending to send real-time mirroring BGP packets to the BMP server.

#### ↘ **Configuring the Interval for Sending Status Statistics to the BMP Server**

By default, when status statistics of a monitored peer are changed, the BMP module sends the status statistics to the BMP server.

Run the **stats-reporting-period** *time* command to specify the interval for sending status statistics to the BMP server.

#### ↘ **Configuring the BMP Server to Monitor Unchanged Routing Information Received from a BGP Peer**

By default, the BMP server does not monitor unchanged routing information received from a BGP peer.

Run the **adj-rib-in pre-policy** command to enable the BMP server to monitor unchanged routing information received from a BGP peer.

#### ↘ **Configuring the BMP Server to Monitor Routing Information Received from a BGP Peer After the Routing Policy Is Applied**

By default, the BMP server does not monitor routing information received from a BGP peer after the routing policy is applied.

Run the **adj-rib-in post-policy** command to enable the BMP server to monitor routing information received from a BGP peer after the routing policy is applied.

#### ↘ **Configuring the BMP Server to Monitor Routing Information Sent to a BGP Peer After the Routing Policy Is Applied**

By default, the BMP server does not monitor routing information sent to a BGP peer after the routing policy is applied.

Run the **adj-rib-out post-policy** command to enable the BMP server to monitor routing information sent to a BGP peer after the routing policy is applied.

### 7.3.39 Configuring Domain

Assign neighbors to a specified domain group, and process neighbors in the same domain group.

#### Working Principle

Run the command to specify the domain for neighbors, and do not suppress detailed routings of neighbors in the domain group.

#### Related Configuration

##### ↘ **Specifying a Domain Group for Neighbor**

By default, no domain is specified.

Run the **neighbor { neighbor-address | peer-group-name } domain domain-name** command to specify the domain group for peer.

##### ↘ **Configuring not to Suppress Detailed Routing in Domain Group of Neighbor**

By default, the function is disabled in domain group of neighbor.

Run the **neighbor { neighbor-address | peer-group-name } domain-unsuppress** command to not suppress detailed routing in the domain group of neighbor.

### 7.3.40 Configuring Link State Tracking Group

Associate the neighbor with link state tracking group, so that neighbor status will affect the statue of downlink port of the link state tracking group.

#### Working Principle

Associate the neighbor with a specified link state tracking group. When the neighbor is down, the downlink port of the group is down; when the neighbor is up, the downlink port of the group is up.

#### Related Configuration

##### ↘ **Configuring Link State Tracking Group for Neighbor**

By default, neighbor is not associated with any link state tracking group.

Run the **neighbor** { *neighbor-address* | *peer-group-name* } **link state group** *num* command to specify the link state tracking group.

#### ✎ Configuring the Delay Time to Enable Downlink Port of Link State Tracking Group after Neighbor is Up

By default, the delay time is 5 s.

Run the **bgp link-state-group up-delay** *delay-time* command to configure the delay time to enable the downlink port of link state tracking group after neighbor is up.

#### ✎ Adding the Port to Specified Link State Tracking Group

By default, a port is not added to any tracking group.

Run the **link state group** *num* { **upstream** | **downstream** } command to add a port to the specified link state tracking group.

### 7.3.41 Configuring BGP Additional Paths

In BGP, the routes with the same prefix from a neighbor are regarded as one entry. Configure BGP add-path to receive multiple routes with the same prefix.

#### Working Principle

By default, when BGP receive a route with the same prefix from a peer, it will replace the previous route with the new one, namely, it regards the route with the same prefix as one entry. After configuring the add-path function, BGP will add a path-id field to the route advertised by the peer that can therefore judge whether the route is the same according to prefix, peer and path-id. When the received route is different, the peer will add it as a new entry so as to obtain multiple routes with the same prefix from a peer.

BGP add-path is only available for the IBGP peer.

#### Related Configuration

##### ✎ Configuring add-path Route Preference

By default, add-path route preference is disabled.

Run the **bgp additional-paths select** { **all** | **best number** | **ecmp** } command to select the add-path route of the specified type.

##### ✎ Enabling add-path Capability on Specified Peer

By default, the add-path capability is disabled.

Run the **neighbor** { *peer-address* | *peer-group-name* } **additional-paths** { **send** [ **receive** ] | **receive** } command to enable the device to advertise/receive the add-path route.

##### ✎ Advertising add-path Route to Peer

By default, BGP does not advertise the add-path route to its peers.

Run the **neighbor** { *peer-address* | *peer-group-name* } **advertise additional-paths** { **all** | **best number** | **ecmp** } command to advertise the add-path route of the specified type to peers when the add-path negotiation succeeds.

Run the **bgp additional-paths select** command to select the add-path routes of the specific type. If the type of selected add-path routes is different from that of advertised ones, then the add-path route is not advertised but only the optimal route is advertised.

**i** Only when the local device is enabled to send the add-path route and the peer is enabled to receive the add-path route, the local device is allowed to advertise the add-path route.

### 7.3.42 Other Related Configurations

- i** For configuration and application of BGP MCE, see section "VRF Configuration Guide".
- i** For configuration and application of BGP L2VPN, see section "L2VPN Configuration Guide".
- i** For configuration and application of BGP/MPLS VPN, see section "BGP/MPLS VPN Configuration Guide".
- i** For configuration and application of the BGP MDT address family, see section "Multicast VPN (MD Configuration Guide)".

## 7.4 Configuration

Configuration	Description and Command	
Configuring a BGP Peer (Group)	<b>!</b> (Mandatory) It is used to create a BGP neighbor.	
	<b>router bgp</b>	Enables BGP.
	<b>neighbor { peer-address   peer-group-name }</b> <b>remote-as as-number</b>	Creates a BGP neighbor.
Configuring MD5 Authentication	<b>!</b> (Optional) It is used to perform encrypted authentication for the BGP neighbor.	
	<b>neighbor { peer-address   peer-group-name }</b> <b>password [ 0   7 ] string</b>	Configures the password for encryption.
Configuring a Route Reflector	(Optional) It is used to reduce the number of BGP neighbor connections.	
	<b>neighbor { peer-address   peer-group-name }</b> <b>route-reflector-client</b>	Specifies a peer (group) as a reflector client.
Configuring an AS Alliance	<b>!</b> (Optional) It is used to reduce the number of BGP neighbor connections.	
	<b>bgp confederation identifier as-number</b>	Configures the BGP alliance ID.
	<b>bgp confederation peers as-number [... as-number ]</b>	Configures a BGP alliance neighbor.
Configuring Multi-path Load Balancing of BGP	<b>!</b> (Optional) It is used to implement multi-path load balancing.	
	<b>maximum-paths ibgp number</b>	Configures IBGP load balancing.
	<b>maximum-paths ebgp number</b> <b>bgp bestpath as-path multipath-relax</b>	Configures EBGP load balancing. Enables the BGP AS-PATH loose comparison mode.
Configuring EBGP FRR	<b>!</b> (Optional) It is used to increase the convergence speed when a network fault occurs.	
	<b>bgp fast-reroute</b>	Configures BGP FRR.
	<b>neighbor { neighbor-address   peer-group-name }</b> <b>fall-over bfd</b>	Configures a BFD session to a BGP neighbor.
Configuring Fast Withdrawal of Specified BGP Routes	<b>!</b> (Optional) It is used to fast withdraw the specified BGP routes.	
	<b>bgp fast-withdraw { access-list { access-list-number   access-list-name }   prefix-list prefix-list-name   route-map map-tag }</b>	Configures fast withdrawal of specified BGP routes.
Configuring FRR in an IBGP	<b>!</b> (Optional) It is used to increase the convergence speed when a network fault occurs.	

Configuration	Description and Command	
Route Reflection Environment	<b>bgp fast-reroute</b>	Configures BGP FRR.
Configuring Local ASs	(Optional) It is used for transitional deployment during network migration.	
	<b>neighbor { peer-address   peer-group-name } local-as as-number [ no-prepend [ replace-as [ dual-as ] ] ]</b>	Configures the local AS for a BGP neighbor.
Configuring BGP GR	 (Recommended) It is used to improve the network reliability.	
	<b>bgp graceful-restart</b>	Enables the BGP GR capability.
	<b>bgp graceful-restart restart-time restart-time</b>	Configures the maximum time for BGP GR.
	<b>bgp graceful-restart stalepath-time time</b>	Configures the maximum retention time for BGP stable route.
Configuring a BGP IPv6 Address Family	 (Optional) It is used to deploy an IPv6 network by using BGP.	
	<b>address-family ipv6 unicast</b>	Enters the BGP IPv6 unicast configuration mode.
	<b>neighbor { neighbor-address   peer-group-name } activate { ipv4   ipv6 }</b>	Activates the address family capability of a BGP neighbor in the current configuration mode.
Configuring BGP EVPN	 Optional. It is used to configure the EVPN VXLAN network.	
	<b>address-family l2vpn evpn</b>	<b>address-family l2vpn evpn</b>
	<b>vni vni-id</b>	Creates EVI instance
	<b>rd { auto   rd_value }</b>	Configures RD
	<b>route-target { import   export   both } { auto   rt_value }</b>	
	<b>export map routemap-name</b>	Configures the extended group attribute policy of the local end to EVPN route
	<b>import map routemap-name</b>	Configures the policy of the EVPN route to the local VNI instance
	<b>bgp mac-mobility timer count</b>	Configures MAC mobility parameter
	<b>neighbor { peer-address   peer-group-name } router-mac-self</b>	Changes router MAC to the local address.
	<b>bgp bestpath evpn-seq-relax</b>	Configure BGP not to compare the serial number of EVPN router from the same VTEP when selecting the optimal route
<u>Configuring Domain Group</u>	 Optional. It is used to configure domain group.	
	<b>neighbor { neighbor-address   peer-group-name } domain domain-name</b>	Configures the domain group of neighbor
	<b>neighbor { neighbor-address   peer-group-name } domain-unsuppress</b>	Configures not to suppress detailed routings in the same domain group.
<u>Configuring BGP Associated Link State Tracking Group</u>	 Optional. It is used to configure the link state tracking group associated with BGP neighbor.	
	<b>neighbor { neighbor-address   peer-group-name } link state group num</b>	Configures the link state tracking group associated with BGP neighbor.
	<b>bgp link-state-group up-delay delay-time</b>	Configures the delay time to enable the downlink port of link state tracking group after the

Configuration	Description and Command
	neighbor is up.
<u>Disabling Private PIC Process</u>	<p> Optional. It is used to disable the private PIC process for BGP neighbor</p> <p><b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>pic-disable</b></p> <p>Disables private PIC process</p>
<u>Configuring add-path</u>	<p> Optional. It is used to enable the BGP neighbor to advertise the routes with the same prefix.</p> <p><b>bgp additional-paths select</b> { <b>all</b>   <b>best</b> <i>number</i>   <b>ecmp</b> }</p> <p>Selects all valid routes as the add-path routes.</p> <p><b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>advertise additional-paths</b> { <b>all</b>   <b>best</b> <i>number</i>   <b>ecmp</b> }</p> <p>Advertises the add-path route to the peer.</p> <p><b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>additional-paths</b> { <b>send</b> [<b>receive</b>]   <b>receive</b> }</p> <p>Configures the add-path capability of the peer.</p>
Configuring Interconnection with Devices Supporting Only 2-Byte AS Numbers	<p> Optional. It is used for interconnecting with an old device that supports only 2-byte AS numbers.</p> <p><b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i></p> <p>Creates a BGP neighbor.</p>

#### 7.4.1 Configuring a BGP Peer (Group)

##### Configuration Effect

- Configure BGP and create IBGP and EBGP neighbors.

##### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.
- If an EBGP neighbor is not directly connected, you need to configure the **ebgp-multihop** parameter for the neighbor.

##### Configuration Steps

###### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

###### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

###### ↳ Configuring a Source Interface for a BGP Neighbor

- (Optional) Perform this configuration in the BGP configuration mode. By default, BGP automatically selects a local interface that reaches the destination IP address of a peer as the source interface.

 For an IBGP neighbor, you are advised to use a Loopback interface as the source interface.

##### Verification

- Run the **show** command to display the neighbor status.

##### Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Creating a Source Interface for a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>update-source</b> { <i>interface-type interface-number</i>   <i>address</i> }
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>interface-type interface-number</i> : Indicates an interface name. <i>address</i> : Directly specifies the network interface address used for creating a BGP connection.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The source interface of a neighbor must be a local valid interface or address.

### ↳ Disabling Private PIC process to BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>pic-disable</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the IPv4 or IPv6 address of a peer. <i>peer-group-name</i> : Specifies a peer group name.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	When the neighbor uses other vendors' device and it sends extended community attributes whose type is CF and sub type is E1, it is recommended to run this command.

## Configuration Example

### ↳ Configuring a BGP Peer (Group)

<p><b>Scenario</b></p> <p><b>Figure 1- 4</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1- 4.</li> <li>● Configure a loopback interface on A, B, and C and create an IBGP neighbor based on the loopback interface.</li> <li>● Create an EBGP neighborhood by using the directly connected interfaces on C and D.</li> <li>● Create an IBGP peer group on C.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# interface loopback 0 A(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255 A(config-if-Loopback 0)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)# ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# router bgp 65536 A(config-router)# neighbor 10.1.1.3 remote-as 65536 A(config-router)# neighbor 10.1.1.3 update-source loopback 0</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# interface loopback 0 B(config-if-Loopback 0)# ip address 10.1.1.2 255.255.255.255 B(config-if-Loopback 0)# exit B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet0/1)# ip address 192.168.2.2 255.255.255.0 B(config-if-GigabitEthernet 0/1)# exit B(config)# router bgp 65536 B(config-router)# neighbor 10.1.1.3 remote-as 65536 B(config-router)# neighbor 10.1.1.3 update-source loopback 0</pre>
<p><b>C</b></p>	<pre>C# configure terminal</pre>

	<pre> C(config)# interface loopback 0 C(config-if-Loopback 0)# ip address 10.1.1.3 255.255.255.255 C(config-if-Loopback 0)# exit C(config)# interface GigabitEthernet 0/1 C(config-if-GigabitEthernet 0/1)# ip address 192.168.1.3 255.255.255.0 C(config-if-GigabitEthernet 0/1)# exit C(config)# interface GigabitEthernet 0/2 C(config-if-GigabitEthernet 0/2)# ip address 192.168.2.3 255.255.255.0 C(config-if-GigabitEthernet 0/2)# exit C(config)# interface GigabitEthernet 0/3 C(config-if-GigabitEthernet 0/3)# ip address 192.168.3.3 255.255.255.0 C(config-if-GigabitEthernet 0/3)# exit C(config)# router bgp 65536 C(config-router)# neighbor ibgp-group peer-group C(config-router)# neighbor ibgp-group remote-as 65536 C(config-router)# neighbor ibgp-group update-source loopback 0 C(config-router)# neighbor 10.1.1.1 peer-group ibgp-group C(config-router)# neighbor 10.1.1.2 peer-group ibgp-group C(config-router)# neighbor 192.168.3.4 remote-as 65537 </pre>
<b>D</b>	<pre> D# configure terminal D(config)# interface GigabitEthernet 0/1 D(config-if-GigabitEthernet0/1)# ip address 192.168.3.4 255.255.255.0 D(config-if-GigabitEthernet 0/1)# exit D(config)# router bgp 65537 D(config-router)# neighbor 192.168.3.3 remote-as 65536 </pre>
<b>Verification</b>	Run the <b>show</b> command to display the BGP neighbor status.
<b>A</b>	<pre> A# show ip bgp neighbor BGP neighbor is 10.1.1.3, remote AS 65536, local AS 65536, internal link   BGP version 4, remote router ID 10.1.1.3   BGP state = Established, up for 00:00:05   Last read          , holdtime is 180, keepalive interval is 60 seconds   Neighbor capabilities:     Route refresh: advertised and received (old and new) </pre>

### Common Errors

- IGP is not enabled and the interconnection between the local loopback address and the loopback address on the IBGP neighbor fails, which causes that the neighbor fails to be created.
- ebgp-multihop is not configured when an EBGP is not directly connected, which causes that a TCP connection fails to be created.

### 7.4.2 Configuring MD5 Authentication

#### Configuration Effect

- Configure MD5 for encrypted authentication between EBGP and IBGP neighbors.

### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.
- If an EBGP neighbor is not directly connected, you need to configure the **ebgp-multihop** parameter for the neighbor.

### Configuration Steps

#### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

#### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### Verification

- Run the **show** command to display the neighbor status.

### Related Commands

#### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

#### ↳ Configuring an MD5 Password for a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>password</b> [ <b>0</b>   <b>7</b> ] <i>string</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <b>0</b> : Displays a password not encrypted.

	<p><b>7:</b> Displays a password encrypted.</p> <p><i>string:</i> Indicates a password for TCP MD5 authentication, consisting of a maximum of 80 characters.</p>
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The same passwords must be configured on the two ends of a BGP neighborship.

### Configuration Example

#### ↳ Configuring BGP MD5 Authentication

<p><b>Scenario</b> Figure 1- 5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1- 5.</li> <li>● Configure a loopback interface on B and C and create an IBGP neighbor based on the loopback interface.</li> <li>● Create an EBGP neighborship by using the directly connected interfaces on A and B.</li> <li>● Configure the passwords on A, B and C for their neighbors.</li> </ul>

--

### Common Errors

- The passwords for MD5 encrypted authentication at the two ends of a BGP neighborhood are different.

### 7.4.3 Configuring a Route Reflector

#### Configuration Effect

- Configure a route reflector in the IBGP environment to reduce the number of BGP neighbor connections.

#### Notes

- If an IBGP neighbor is not directly connected, you need to configure IGP or a static routing protocol to implement interconnection.

#### Configuration Steps

##### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

##### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

##### ↘ Creating a BGP Reflector

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### Verification

- Run the **show** command to display the neighbor status.

**Related Commands**

↳ **Enabling BGP**

<b>Command</b>	<code>router bgp as-number [ instance instance-name ]</code>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <i>instance</i> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

↳ **Creating a BGP Neighbor**

<b>Command</b>	<code>neighbor { neighbor-address   peer-group-name } remote-as as-number</code>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↳ **Creating a BGP Reflector**

<b>Command</b>	<code>neighbor { neighbor-address   peer-group-name } route-reflector-client</code>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

**Configuration Example**

↳ **Configuring a BGP Route Reflector**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1- 6.</li> <li>● Configure a loopback interface on all devices and create an IBGP neighborhood by using the loopback interface according to the connection lines as shown in Figure 1- 6.</li> <li>● Configure route reflection on the device RR and specify A, B, C and D as reflector clients.</li> </ul>

#### 7.4.4 Configuring an AS Alliance

##### Configuration Effect

- Configure a BGP alliance to reduce the number of BGP neighbor connections.

##### Notes

- It is advised to use private AS numbers for sub ASs (also called member ASs) within an alliance. Private AS numbers range from 64,512 to 65,535.
- Within a sub AS of an alliance, full mesh must be established for all BGP speakers (route reflectors can be further configured within the sub AS).
- An EBGP neighborhood must be established between sub ASs of an alliance.
- All BGP speakers within an alliance must belong to a sub AS within the alliance.

##### Configuration Steps

###### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

###### ↳ Configuring a BGP Alliance ID

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring a BGP Alliance Member

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring Multiple Hops for an EBGp Neighbor

- Perform this configuration in the BGP configuration mode. It is mandatory when an EBGp neighbor is not directly connected.

### ↳ Configuring BGP Route Re-distribution to a Network

- (Optional) Perform this configuration in the BGP configuration mode. Perform this configuration when a local route needs to be advertised. You can also configure an alternative network by means of re-distribution.

#### Verification

- Run the **show** command to display the BGP neighbor status.
- Run the **show** command to display the BGP routing table information.

#### Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Enabling a BGP Alliance ID

<b>Command</b>	<b>bgp confederation identifier</b> <i>as-number</i>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↳ Configuring a BGP Alliance Member

<b>Command</b>	<b>bgp confederation peers</b> <i>as-number</i> [... <i>as-number</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	All member ASs of a local EBGp alliance must be identified.

↳ **Creating a BGP Neighbor**

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↳ **Configuring Multiple Hops for an EBGP Neighbor**

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>ebgp-multihop</b> [ <i>ttl</i> ]
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>ttl</i> : Indicates the maximum number of hops that are allowed, ranging from 1 to 255.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↳ **Configuring BGP Route Re-distribution to a Network**

<b>Command</b>	<b>network</b> <i>network-number</i> [ <i>mask mask</i> ] [ <i>route-map map-tag</i> ] [ <i>backdoor</i> ]
<b>Parameter Description</b>	<i>network-number</i> : Indicates the network address. <i>mask</i> : Indicates the subnet mask. <i>map-tag</i> : Indicates the name of a route map, consisting of no more than 32 characters. <b>backdoor</b> : Indicates that the route is a backdoor route.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The core routing table must contain same IGP (or static and directly connected) routes.

**Configuration Example**

↳ **Configuring a BGP Alliance**

<b>Scenario</b> Figure 1- 7	<p>The diagram illustrates a BGP alliance configuration. A dashed box encloses three ASes: AS 65536 (Member AS 100), AS 65537 (Member AS 100), and AS 65538 (Member AS 100). These three ASes are interconnected via Confed EBGP. AS 65536 is connected to AS 65537 via GE0/2, and AS 65537 is connected to AS 65538 via GE0/3. AS 65538 is connected to AS 200 via GE0/2. AS 200 is connected to AS 65536 via GE0/1. The diagram also shows ASBR1 and ASBR2 at the boundaries of the confederation and AS 200 respectively.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure BGP on A and B, set the AS number to 65,536 and configure an IBGP neighborship.</li> <li>● Configure BGP on C and D, set the AS number to 65,537 and configure an IBGP neighborship.</li> </ul>

	<ul style="list-style-type: none"> <li>● Configure BGP on ASBR1 and E, set the AS number to 65,538 and configure an IBGP neighborhood.</li> <li>● Configure an alliance ID 100 on A, B, C, D, E and ASBR1.</li> <li>● Configure the alliance member 65,537 on A, configure C as an EBGP neighbor, and set the peer AS number to 65,537.</li> <li>● Configure the alliance members 65,536 and 65,538 on C, configure A as an EBGP neighbor and set the peer AS number to 65,536, configure ASBR1 as an EBGP neighbor and set the peer AS number to 65,538.</li> <li>● Configure the alliance members 65,537 on ASBR1, configure C as an EBGP neighbor and set the peer AS number to 65,537, configure ASBR2 as an EBGP neighbor and set the peer AS number to 200.</li> <li>● Configure BGP on ASBR2 and set the AS number to 200; configure ASBR1 as an EBGP neighbor and set the peer AS number to 100.</li> </ul>

### Common Errors

- No BGP alliance neighbor is configured.
- Full mesh is not established within sub ASs of an alliance.

### 7.4.5 Configuring Multi-path Load Balancing of BGP

#### Configuration Effect

- Implement multi-path load balancing for IBGP routes.
- Support AS-PATH loose comparison.

#### Notes

- Routes learned from an IBGP neighbor must have the same priority (the router-ID does not need to be compared).

#### Configuration Steps

##### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

##### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

##### ↘ Configuring BGP Load Balancing

- (Mandatory) Perform this configuration in the BGP configuration mode.

##### ↘ Configuring AS-PATH Loose Comparison

- (Optional) Perform this configuration in the BGP configuration mode. Perform this configuration when load balancing needs to be implemented for routes learned from different ASs.

## Verification

- Run the **show** command to display BGP routing information.
- Run the **show** command to display the core routing table information.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring BGP Load Balancing

<b>Command</b>	<b>maximum-paths</b> { <b>ebgp</b>   <b>ibgp</b> } <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of equivalent paths, ranging from 1 to device capacity. If the value is 1, multi-path load balancing of IBGP will be disabled.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↳ Configuring AS-PATH Loose Comparison

<b>Command</b>	<b>bgp bestpath as-path multipath-relax</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### ↳ Configuring Multi-path Load Balancing of IBGP

<p><b>Scenario</b></p> <p><b>Figure 1- 8</b></p>

## Common Errors

- The priorities of multi-hop BGP routes are different, which causes load balancing failure.

## 7.4.6 Configuring EBGPFRR

### Configuration Effect

- Implement EBGP FRR.

## Notes

- (Optional) Configure a neighbor BFD session to implement fast link fault detection.

## Configuration Steps

### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring BGP FRR

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring a Neighbor BFD Session

- (Optional) Perform this configuration in the BGP configuration mode.

## Verification

- Run the **show** command to display routing information.

<b>Command</b>	<b>bgp fast-reroute</b>
<b>Parameter</b>	-
<b>Description</b>	
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.
<b>Description</b>	<i>peer-group-name</i> : Specifies the name of a peer group.

	<i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↳ **Creating a BFD Session to a BGP Neighbor**

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>fall-over bfd</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

**Configuration Example**

↳ **Configuring EBGPFRR**

<p><b>Scenario</b> Figure 1- 9</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices.</li> <li>● Configure the addresses of the directly connected interfaces on A, B and C to establish EBGPFRR neighborships.</li> <li>● Configure a BFD session for the EBGPFRR neighborship between B and C.</li> <li>● Configure FRR on C.</li> </ul>
<p><b>A</b></p>	<pre> A# conf terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)# ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet0/2)# ip address 192.168.2.1 255.255.255.0 A(config-if-GigabitEthernet 0/2)# exit A(config)# router bgp 100 A(config-router)# neighbor 192.168.1.2 remote-as 300 A(config-router)# neighbor 192.168.2.2 remote-as 200 A(config-router)# redistribute connect                     </pre>

<b>B</b>	<pre> B# configure terminal  B(config)# interface GigabitEthernet 0/1  B(config-if-GigabitEthernet 0/1)# ip address 192.168.3.1 255.255.255.0  B(config-if-GigabitEthernet0/1)#bfdinterval200min_rx200multiplier5  B(config-if-GigabitEthernet 0/1)#exit  B(config)# interface GigabitEthernet 0/2  B(config-if-GigabitEthernet0/2)#ipaddress192.168.2.2255.255.255.0  B(config-if-GigabitEthernet 0/2)#exit  B(config)# router bgp 200  B(config-router)# neighbor 192.168.3.2 remote-as 300  B(config-router)# neighbor 192.168.3.2 fall-over bfd  B(config-router)# neighbor 192.168.2.1 remote-as 100  B(config-router)# redistribute connect </pre>
<b>C</b>	<pre> C# configure terminal  C(config)# interface GigabitEthernet 0/1  C(config-if-GigabitEthernet 0/1)# ip address 192.168.1.2 255.255.255.0  C(config-if-GigabitEthernet 0/1)# exit  C(config)# interface fastEthernet 0/2  C(config-if-GigabitEthernet 0/2)# ip address 192.168.3.2 255.255.0.0  C(config-if-GigabitEthernet0/2)#bfdinterval200min_rx200multiplier5  C(config-if-GigabitEthernet 0/2)#exit  C(config)# router bgp 300  C(config-router)# neighbor 192.168.1.1 remote-as 100  C(config-router)# neighbor 192.168.3.1 remote-as 200  C(config-router)# neighbor 192.168.3.1 fall-over bfd  C(config-router)# address-family ipv4 unicast  C(config-router-af)# bgp fast-reroute  C(config-router-af)# redistribute connect </pre>
<b>Verification</b>	Run the <b>show</b> command to display the information.

```

### Common Errors

- No BFD session is configured for BGP neighbors.

### 7.4.7 Configuring Fast Withdrawal of Specified BGP Routes

#### Configuration Effect

- Implement fast withdrawal of specified BGP routes.

#### Notes

- Configure fast withdrawal of specified routes to preferentially advertise the withdrawal of specified routes.

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in global configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

#### ↳ Configuring Fast Withdrawal of Specified BGP Routes

- (Mandatory) Perform this configuration in BGP configuration mode.

#### Verification

- Run the **show** command to display the configurations.

#### Related Commands

##### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number. The value ranges from <b>1 to 4,294,967,295</b> , which is <b>1 to 65535.65535</b> in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

##### ↳ Configuring Fast Withdrawal of Specified BGP Routes

<b>Command</b>	<b>bgp fast-withdraw</b> { <b>access-list</b> { <i>access-list-number</i>   <i>access-list-name</i> }   <b>prefix-list</b> <i>prefix-list-name</i>   <b>route-map</b> <i>map-tag</i> }
<b>Parameter Description</b>	<i>access-list-number</i> : Indicates the ACL number. The value ranges from <b>1 to 199</b> and <b>1300 to 2699</b> . <i>access-list-name</i> : Indicates an ACL name. <i>prefix-list-name</i> : Indicates the name of a prefix list. <i>map-tag</i> : Indicates the name of a route map.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

##### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group). The value ranges from <b>1 to 4,294,967,295</b> .
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS number specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

#### Configuration Example

##### ↳ Configuring Fast Withdrawal of Specified BGP Routes

<p><b>Scenario</b> Figure 1- 10</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices.</li> <li>● Establish a BGP neighbor relationship between Routers A and B.</li> <li>● Configure ACLs on Router A.</li> <li>● Configure fast withdrawal of specified routes on Router A.</li> </ul>
<p><b>A</b></p>	<p>A# conf terminal</p>
<p><b>Verification</b></p>	<p>Run the <b>show</b> command to display the configurations.</p>
<p><b>A</b></p>	<p>A#show run router bgp</p>

### 7.4.8 Configuring Local ASs

#### Configuration Effect

- Smoothly migrate the network configurations of router A from AS 23 to AS 3600.

#### Notes

N/A

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

##### ↳ Configuring the Local AS for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### Verification

- Run the **show** command to display the information.

#### Related Commands

##### ↳ Enabling BGP

<p><b>Command</b></p>	<p><b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]</p>
<p><b>Parameter</b></p>	<p><i>as-number</i>: Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.</p>
<p><b>Description</b></p>	<p><b>instance</b>: The instance should be specified for the non-default instance, and the instance name is required.</p>

	<i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring the Local AS for a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>local-as</b> <i>as-number</i> [ <b>no-prepend</b> [ <b>replace-as</b> [ <b>dual-as</b> ] ] ]
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates a local AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>no-prepend</b> : Does not add the local AS to the AS-PATH in the routing information received by a peer. This option is not available by default. <b>replace-as</b> : For the AS-PATH in the routing information sent by a peer, the local AS is used to replace the BGP AS. This option is not available by default. <b>dual-as</b> : Enables a peer to use the BGP AS or Local AS to establish a BGP connection with a device. This option is not available by default.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### ↳ Configuring BGP Local-AS

<b>Scenario</b> Figure 1- 12	
---------------------------------	--

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Create an EBGP neighborhood with B on A and specify the Local-AS for the EBGP neighborhood.</li> <li>● Create an EBGP neighborhood for connecting to A on B.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# router bgp 3600 A(config-router)# neighbor 57.50.1.1 remote-as 5750 A(config-router)# neighbor 57.50.1.1 update-source loopback 0 A(config-router)# neighbor 57.50.1.1 ebgp-multihop 255 A(config-router)# neighbor 57.50.1.1 local-as 23 no-prepend replace-as dual-as</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router bgp 5750 B(config-router)# neighbor 36.0.1.1 remote-as 23 B(config-router)# neighbor 36.0.1.1 update-source loopback 0 B(config-router)# neighbor 36.0.1.1 ebgp-multihop 255</pre>
<p><b>Verification</b></p>	<p>Run the <b>show</b> command to display the BGP neighbor status.</p>
<p><b>A</b></p>	<pre>A# show ip bgp neighbors 57.50.1.1 BGP neighbor is 57.50.1.1, remote AS 5750, local AS 23 (using Peer's Local AS, no-prepend, replace-as, dual-as), external link BGP version 4, remote router ID 0.0.0.0 BGP state = Idle Last read, hold time is 180, keepalive interval is 60 seconds Received 0 messages, 0 notifications, 0 in queue open message:0 update message:0 keepalive message:0 refresh message:0 dynamic cap:0 notifications:0</pre>

### 7.4.9 Configuring BGP GR

#### Configuration Effect

- Configure BGP GR to implement network deployment with high reliability.

#### Notes

- To successfully deploy the BGP GR function, you need to use a neighbor device as the GR Helper.
- In an BGP environment, you also need to configure IGP GR.
- After BGP GR is enabled, you need to reset a BGP neighbor connection to make it take effect.

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

##### ↳ Configuring BGP GR

- Perform this configuration in the BGP configuration mode, which is configured by default.

##### ↳ Configuring a BGP GR Timer

- (Optional) Perform this configuration in the BGP configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

#### Verification

- Run the **show** command to display the neighbor status.

#### Related Commands

##### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.
<b>Description</b>	<b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

##### ↳ Configuring BGP GR

<b>Command</b>	<b>bgp graceful-restart</b>
<b>Parameter</b>	-
<b>Description</b>	

<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

#### ↘ Configuring the BGP GR Restart Timer

<b>Command</b>	<b>bgp graceful-restart restart-time</b> <i>restart-time</i>
<b>Parameter Description</b>	<i>restart-time</i> : Indicates the maximum waiting time that the GR Restarter hopes the GR Helper to wait before a new connection is created, ranging from 1 to 3600 seconds.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

#### ↘ Configuring the BGP GR Route Stale Timer

<b>Command</b>	<b>bgp graceful-restart stalepath-time</b> <i>time</i>
<b>Parameter Description</b>	<i>time</i> : Indicates the maximum time that a stale route keeps valid after the connection with a neighbor GR device is recovered, ranging from 1 to 3600 seconds.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

#### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### Configuration Example

#### ↘ Configuring BGPGR

<p><b>Scenario</b> <b>Figure 1- 13</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1- 13.</li> <li>● Configure a loopback interface on R2, R3, and R4 and create an IBGP neighborhood based on the loopback interface.</li> <li>● Create an EBGP neighborhood by using the directly connected interfaces on R1 and R2.</li> <li>● Enable BGP GR on R1, R2, R3, and R4.</li> </ul>
<p><b>R1</b></p>	<pre>R1# configure terminal R1(config-router)# exit R1(config)# router bgp 100 R1(config-router)# bgp graceful-restart</pre>

--	---

### Common Errors

- GR is not enabled for IGP.
- GR is not enabled for a BGP neighbor device.

### 7.4.10 Configuring a BGP IPv6 Address Family

#### Configuration Effect

- Configure BGP IPv6 routes to implement IPv6 network access in different ASs.

#### Notes

- Generally, BGP uses IPv6 addresses to create neighborships and implement exchange of IPv6 routes.
- In special scenarios (such as the 6PE function, see the MPLS-L3VPN-SCG.doc), BGP supports exchange of IPv6 routes on the neighbors with IPv4 addresses.
- Configurations related to BGP IPv6 services must be configured in the BGP IPv6 address family mode.

#### Configuration Steps

##### ↘ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

##### ↘ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

##### ↘ Configuring the BGP IPv4 Address Family Mode

- (Optional) Perform this configuration in the BGP configuration mode.

##### ↘ Disabling the IPv4 Address Family Capability for a BGP Neighbor

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

### ↳ Configuring the BGP IPv6 Address Family Mode

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring the IPv6 Address Family Capability for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP IPv6 configuration mode.

### ↳ Configuring IPv6 Route Advertisement in BGP

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

#### Verification

- Run the **show** command to display the neighbor status.
- Run the **show** command to display the routing status.

#### Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring the BGP IPv4 Address Family Mode

<b>Command</b>	<b>address-family ipv4 unicast</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### ↳ Disabling the IPv4 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>no neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>activate</b> { <b>ipv4</b>   <b>ipv6</b> }
<b>Parameter</b>	<i>neighbor-address</i> : Indicates the address of a peer, which is usually an IPv6 address.

<b>Description</b>	<i>peer-group-name</i> : Specifies the name of a peer group. ipv4: Activate only IPv4 neighbors in the peer group ipv6: Activate only IPv6 neighbors in the peer group
<b>Command Mode</b>	BGP IPv4 address family mode
<b>Usage Guide</b>	Neighbors with IPv6 addresses are used to exchange IPv6 routes. However, when a neighbor is configured in the BGP mode, BGP automatically activates the IPv4 unicast address family capability for the neighbor. Therefore, you are advised to manually disable the IPv4 unicast address family capability.

#### ↘ Configuring the BGP IPv6 Address Family Mode

<b>Command</b>	<b>address-family ipv6 unicast</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

#### ↘ Configuring the IPv6 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } activate { ipv4   ipv6 }</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Indicates the address of a peer, which is usually an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. ipv4: Activate only IPv4 neighbors in the peer group ipv6: Activate only IPv6 neighbors in the peer group
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

#### ↘ Configuring IPv6 Route Advertisement in BGP

<b>Command</b>	<b>network <i>network-number</i> [ <i>mask mask</i> ] [ <i>route-map map-tag</i> ] [ <i>backdoor</i> ]</b>
<b>Parameter Description</b>	<i>network-number</i> : Indicates the network number. <i>mask</i> : Indicates the subnet mask. <i>map-tag</i> : Indicates the name of a route map, consisting of no more than 32 characters. <b>backdoor</b> : Indicates that the route is a backdoor route.
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

### Configuration Example

#### ↘ Configuring BGP to Implement IPv6 Route Exchange in Different ASs

<b>Scenario</b> <b>Figure 1- 14</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1- 14.</li> <li>● Configure a BGP neighbor, disable the IPv4 address family capability for the neighbor and activate the IPv6 address family capability.</li> <li>● Configure IPv6 route advertisement in BGP.</li> </ul>
<b>A</b>	<pre> A# configure terminal A(config)#intloopback0 A(config-if-Loopback)# ipv6 address 30::1/128 A(config-if-Loopback)# exit A(config)# router bgp 65530 A(config-router)# neighbor 100::1 remote-as 65531 A(config-router)# address-familyipv4 A(config-router-af)# no neighbor 100::1 activate A(config-router-af)# exit-address-family A(config-router)# address-familyipv6 A(config-router-af)# neighbor 100::1 activate A(config-router-af)# network 30::1/128 </pre>
<b>B</b>	<pre> B# configure terminal B(config)# router bgp 65531 B(config-router)# neighbor 100::2 remote-as 65530 B(config-router)# address-familyipv4 B(config-router-af)# no neighbor 100::2 activate B(config-router-af)# exit-address-family B(config-router)# address-familyipv6 B(config-router-af)# neighbor 100::2 activate </pre>
<b>Verification</b>	Run the <b>show</b> command to display the BGP neighbor status.
<b>A</b>	<pre> A# show bgp ipv6 unicast summary  BGP router identifier 1.1.1.1, local AS number 65530  BGP table version is 1  1 BGP AS-PATH entries </pre>

*>30::1/128	100::2	0		065530i																

**Common Errors**

- The IPv6 address family capability is not activated for BGP neighbors.
- In non-6PE scenarios, IPv4 addresses are used to establish IPv6 routes for exchange between neighbors.

**7.4.11 Configuring a BGPEVPN**

**Configuration Effect**

- Configure BGP protocol to use RR in the VXLAN scenario for L2VPN EVPN deployment.

**Notes**

- By default, the BGP routing mode is located in the IPv4 unicast address family and a BGP EVPN must be configured in L2VPN EVPN address family mode.

**Configuration Steps**

▾ **Enabling BGP**

- (Mandatory) Perform this configuration in global configuration mode.

▾ **Creating a BGP Neighbor**

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↘ Activating the EVPN Capability for a BGP Neighbor

- (Mandatory) Perform this configuration in BGP L2VPN EVPN address family mode.

### ↘ Creating an EVI Instance

- (Mandatory) Perform this configuration in EVPN configuration mode.

### ↘ Creating EVI Instances in Batch

- (Optional) Perform this configuration in EVPN configuration mode.

### ↘ Creating RD

- (Mandatory) Perform this configuration in EVPN-VNI configuration mode.

### ↘ Creating Route Target

- (Mandatory) Perform this configuration in EVPN-VNI configuration mode.

### ↘ Configuring Route Map for EVI Instance

- (Optional) Perform this configuration in EVPN-VNI address family mode.

### ↘ Configuring MAC Mobility Parameters

- (Optional) Perform this configuration in BGP L2VPN EVPN configuration mode.

#### Verification

- Run the **show** command to display the information.

#### Related Commands

### ↘ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group, consisting of no more than 32 characters. <i>as-number</i> : Indicates the AS number of a BGP peer (group).

<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

#### ↘ Entering the L2VPN EVPN Address Family

<b>Command</b>	<b>address-family l2vpn evpn</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

#### ↘ Activating the EVPN Capability for a BGP Neighbor

<b>Command</b>	<b>neighbor { neighbor-address   peer-group-name } activate { ipv4   ipv6 }</b>
<b>Parameter Description</b>	<p><i>neighbor-address</i>: Specifies the address of a peer. This address must be an IPv4 address.</p> <p><i>peer-group-name</i>: Specifies the name of a peer group, consisting of no more than 32 characters.</p> <p>ipv4: Activate only IPv4 neighbors in the peer group</p> <p>ipv6: Activate only IPv6 neighbors in the peer group</p>
<b>Command Mode</b>	BGP L2VPN EVPN address family mode
<b>Usage Guide</b>	-

#### ↘ Creating an EVI Instance

<b>Command</b>	<b>vni vni-id</b>
<b>Parameter Description</b>	<i>vni-id</i> : indicates the VNI ID. Ranges from 1 to 16777215.
<b>Command Mode</b>	EVPN configuration mode
<b>Usage Guide</b>	After VNI configuration is completed, related RD/RT needs to be configured.

#### ↘ Creating EVI Instances in Batches

<b>Command</b>	<b>vni range vni-id-list</b>
<b>Parameter Description</b>	<i>vni-id-list</i> : Specifies the name of a VNI ID list.
<b>Command Mode</b>	EVPN configuration mode
<b>Usage Guide</b>	<p>The configuration fails if the number of configured VNI instances exceeds the capacity or a VNI instance is being deleted.</p> <p>The RD values of different VNI instances must be different. Therefore, only the automatic RD configuration mode is available for configuring VNI instances in batches, and VNI instances cannot be configured manually.</p>

### ▾ Configuring an RD

<b>Command</b>	<code>rd { auto   rd_value }</code>
<b>Parameter Description</b>	<p><b>auto</b>: Generates an RD value automatically.</p> <p><b>rd_value</b>: Specifies the value of an RD.</p> <p>The parameter <i>rd_value</i> has three forms:</p> <p>(1) <code>rd_value = as_num:nn</code>  <b>as_num</b> indicates the 2-byte public AS number. <b>nn</b> is user-defined and ranges from <b>0</b> to <b>4294967295</b>.</p> <p>(2) <code>rd_value = ip_addr:nn</code>  <b>ip_addr</b> refers to the global IP address. <b>nn</b> is user-defined and ranges from <b>0</b> to <b>65535</b>.</p> <p>(3) <code>rd_value = as4_num:nn</code>  <b>as4_num</b> indicates the 4-byte public AS number. <b>nn</b> is user-defined and ranges from <b>1</b> to <b>65535</b>.  The 4-byte AS number ranges from <b>1</b> to <b>4294967295</b>, which is <b>1</b> to <b>65535.65535</b> in dot mode.</p>
<b>Command Mode</b>	EVPN VNI configuration mode
<b>Usage Guide</b>	<p>If an EVI is defined and has an RD value configured, the RD value cannot be modified. To modify it, you need to delete the EVI first, and then define the EVI again and configure a new RD value for it.</p> <p>One EVI has only one RD value.</p> <p> The RD value of the 4-byte AS is in the format of <b>AS4:NN</b>. <b>AS4</b> can be expressed in decimal or dot mode. <b>AS4</b> ranges from <b>1</b> to <b>4294967295</b>, which is <b>1</b> to <b>65535.65535</b> in dot mode. <b>NN</b> ranges from <b>1</b> to <b>65535</b>.</p> <p> The AS number in the range of <b>1</b> to <b>65535</b> is displayed the same in both decimal mode and dot mode. Therefore, save the AS number in the range of <b>1</b> to <b>65535</b> as a 2-byte AS number.</p>

### ▾ Configuring a Route Target

<b>Command</b>	<code>route-target { import   export   both } { auto   rt_value }</code>
<b>Parameter Description</b>	<p><b>import</b>: Specifies the import RT value.</p> <p><b>export</b>: Specifies the export RT value.</p> <p><b>both</b>: Specifies the import and export RT values.</p> <p><b>auto</b>: Generates an RT value automatically.</p> <p><b>rt_value</b>: Specifies the value of an RT.</p> <p>The parameter <i>rt_value</i> has three forms:</p> <p>(1) <code>rt_value = as_num:nn</code>  <b>as_num</b> indicates the 2-byte public AS number. <b>nn</b> is user-defined and ranges from <b>0</b> to <b>4294967295</b>.</p> <p>(2) <code>rt_value = ip_addr:nn</code>  <b>ip_addr</b> refers to the global IP address. <b>nn</b> is user-defined and ranges from <b>0</b> to <b>65535</b>.</p> <p>(3) <code>rt_value = as4_num:nn</code>  <b>as4_num</b> indicates the 4-byte public AS number. <b>nn</b> is user-defined and ranges from <b>1</b> to <b>65535</b>.  The 4-byte AS number ranges from <b>1</b> to <b>4294967295</b>, which is <b>1</b> to <b>65535.65535</b> in dot mode.</p>
<b>Command Mode</b>	EVPN VNI configuration mode
<b>Usage Guide</b>	<p>One EVI supports multiple import and export RT values.</p> <p> The automatically generated RT value is in the format of <b>AS2:nn</b>. <b>AS2</b> indicates the 2-byte AS number. If a 4-byte AS number is used, it is split, and a two 2-byte part is filled in the position for <b>nn</b> while the other 2-byte part is filled in</p>

	<p>the position for the RT value. <b>nn</b> indicates the VNI ID. There are four bytes of space provided for accommodating the 3-byte VNI ID.</p> <ul style="list-style-type: none"> <li> If the BGP AS number changes, the automatically-generated RT value will also be changed.</li> <li> If the manually configured RT value is consistent with the automatically generated one, both of them are displayed. If the automatically generated RT value is 100:1, it is directly deleted. Deleting this value does not cancel the <b>auto</b> configuration mode. To cancel the <b>auto</b> configuration mode, run the <b>no</b> form of the <b>route-target auto</b> command.</li> </ul>
--	---

### ↘ Configuring a Route Map for EVI Instances

<b>Command</b>	<b>export map</b> <i>routemap-name</i>
<b>Parameter Description</b>	<i>routemap-name</i> : Specifies the name of a route map.
<b>Command Mode</b>	EVPN VNI configuration mode
<b>Usage Guide</b>	<p>This command is used to modify the extended community attribute advertised by a type 5 route converted from a local EVPN route or IP route.</p> <p>This command supports only one route map, and the old configuration is overwritten by the new configuration.</p>

<b>Command</b>	<b>import map</b> <i>routemap-name</i>
<b>Parameter Description</b>	<i>routemap-name</i> : Specifies the name of a route map.
<b>Command Mode</b>	EVPN VNI configuration mode
<b>Usage Guide</b>	<p>This command is used to filter the remote EVPN routes to be imported to the local VNI instance, or modify the attribute of the remote EVPN routes imported to the local VNI instance.</p> <p>This command supports only one route map, and the old configuration is overwritten by the new configuration.</p>

### ↘ Configuring MAC Mobility Parameters

<b>Command</b>	<b>bgp mac-mobility</b> <i>timer count</i>
<b>Parameter Description</b>	<p><i>timer</i>: Specifies the timer duration (in seconds) for MAC mobility detection. If a number of <i>count</i> MAC address moves are detected within the duration, it is considered that a MAC conflict occurs and syslogs are displayed to warn users. The value is <b>180</b> by default and ranges from <b>1</b> to <b>3600</b>.</p> <p><i>count</i>: Specifies the detection times. The value is <b>5</b> by default and ranges from <b>1</b> to <b>360</b>.</p>
<b>Command Mode</b>	BGP L2VPN EVPN address family mode
<b>Usage Guide</b>	<p>One MAC address may move for many times. When a MAC address move is detected by a PE through local learning, a timer of <i>timer</i> seconds (default value = 180s) will be enabled. If a number of <i>count</i> (default value = 5) MAC address moves are detected before the timer times out, it is considered that a MAC conflict occurs.</p>

### Configuration Example

#### ↘ Configuring a BGP EVPN Address Family

<b>Scenario Figure</b> 7-14	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1-14.</li> <li>● Configure BGP neighborships as shown in Figure 1-14.</li> <li>● Activate the L2VPN EVPN address family capability for BGP neighbors.</li> </ul>
<b>A</b>	<pre> A# config terminal A(config)# interface gigabitEthernet 0/1 A(config-GigabitEthernet 0/1)# no shutdown A(config-GigabitEthernet0/1)#ipaddress 172.18.2.1255.255.255.0 A(config-GigabitEthernet 0/1)#exit A(config)# interface gigabitEthernet 0/2 A(config-GigabitEthernet 0/1)# no shutdown A(config-GigabitEthernet0/1)#ipaddress 172.18.1.1255.255.255.0 A(config-GigabitEthernet 0/1)#exit A(config)# router bgp 100 A(config-router)# neighbor 172.18.2.3 remote-as 100 A(config-router)# neighbor 172.18.1.2 remote-as 100 A(config-router)# address-family l2vpn evpn A(config-router-af)# neighbor 172.18.2.3 activate A(config-router-af)# neighbor 172.18.1.2 activate A(config-router-af)# neighbor 172.18.2.3 route-reflector-client A(config-router-af)# neighbor 172.18.1.2 route-reflector-client A(config-router-af)# exit-address-family </pre>

### Common Errors

- No L2VPN EVPN address family neighbor is configured.
- No VXLAN network is configured.
- The EVPN address family capability is not activated for BGP neighbors.

### 7.4.12 Configuring Interconnection with Devices Supporting Only 2-Byte AS Numbers

#### Configuration Effect

- Successfully interconnect devices supporting 4-byte AS numbers with devices supporting only 2-byte AS numbers.

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

##### ↳ Configuring the Display Mode of a 4-Byte AS Number

- (Optional) Perform this configuration in the BGP configuration mode. By default, a 4-byte AS number is displayed as decimal digits.

#### Verification

- Run the **show** command to display the neighbor status.

#### Related Commands

##### ↳ Enabling BGP

<b>Command</b>	<b>router bgp <i>as-number</i> [ instance <i>instance-name</i> ]</b>
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

↳ **Creating a BGP Neighbor**

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↳ **Configuring the Display Mode of a BGP 4-Byte AS Number**

<b>Command</b>	<b>bgp asnotation dot</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode

**Common Errors**

N/A

**7.4.13 Using Local IPv6 Link Addresses to Establish BGP Neighborships**

**Configuration Effect**

- Use local IPv6 link addresses to establish BGP neighborships.

**Notes**

- Local IPv6 link addresses can be used for establishing only single-hop BGP neighborships.
- When local IPv6 link addresses are used for establishing neighborships, local IPv6 link addresses must be configured in address%interface name format, for example, neighbor fe80::1%Te0/1 remote-as 100.
- When local IPv6 link addresses are used for establishing neighborships, using local IPv6 link addresses as information sources must be specified on the peer end.
- When local IPv6 link addresses are used for establishing neighborships, local IPv6 link addresses must be configured on both ends.

## Configuration Steps

### ↳ Enabling BGP

- (Mandatory) Perform this configuration in the global configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring the BGP IPv4 Address Family Mode

- (Optional) Perform this configuration in the BGP configuration mode.

### ↳ Disabling the IPv4 Address Family Capability for a BGP Neighbor

- (Optional) Perform this configuration in the BGP IPv4 configuration mode.

### ↳ Configuring the BGP IPv6 Address Family Mode

- (Mandatory) Perform this configuration in the BGP configuration mode.

### ↳ Configuring the IPv6 Address Family Capability for a BGP Neighbor

- (Mandatory) Perform this configuration in the BGP IPv6 configuration mode.

### ↳ Configuring IPv6 Route Advertisement in BGP

- (Optional) Perform this configuration in the BGP IPv6 configuration mode.

## Verification

- Run the **show** command to display the neighbor status.
- Run the **show** command to display the routing status.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<p><i>as-number</i>: Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in the dot mode.</p> <p><b>instance</b>: The instance should be specified for the non-default instance, and the instance name is required.</p> <p><i>instance-name</i>: Instance name of 1 to 32 characters.</p>

<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

#### ↘ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> <i>neighbor-address</i> <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Indicates the peer address, which must be in Linklocal address%interface name format. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer must be the same as the BGP AS number of a BGP speaker at the peer end.

#### ↘ Configuring the BGP IPv4 Address Family Mode

<b>Command</b>	<b>address-family ipv4 unicast</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

#### ↘ Disabling the IPv4 Address Family Capability for a BGP Neighbor

<b>Command</b>	<b>no neighbor</b> <i>neighbor-address</i> <b>activate</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Indicates the address of a peer, which is usually an IPv6 address.
<b>Command Mode</b>	BGP IPv4 address family mode
<b>Usage Guide</b>	Neighbors with IPv6 addresses are used to exchange IPv6 routes. However, when a neighbor is configured in the BGP mode, BGP automatically activates the IPv4 unicast address family capability for the neighbor. Therefore, you are advised to manually disable the IPv4 unicast address family capability.

#### ↘ Configuring the BGP IPv6 Address Family Mode

<b>Command</b>	<b>address-family ipv6 unicast</b>
<b>Parameter Description</b>	-

<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

↘ **Configuring the IPv6 Address Family Capability for a BGP Neighbor**

<b>Command</b>	<b>neighbor neighbor-address activate</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Indicates the address of a peer, which is usually an IPv6 address.
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

↘ **Configuring IPv6 Route Advertisement in BGP**

<b>Command</b>	<b>network network-number [ mask mask ] [ route-map map-tag ] [ backdoor ]</b>
<b>Parameter Description</b>	<i>network-number</i> : Indicates the network number. <i>mask</i> : Indicates the subnet mask. <i>map-tag</i> : Indicates the name of a route map, consisting of no more than 32 characters. <b>backdoor</b> : Indicates that the route is a backdoor route.
<b>Command Mode</b>	BGP IPv6 address family mode
<b>Usage Guide</b>	-

**Configuration Example**

↘ **Using a Local IPv6 Link Address for Configuring a BGP Neighborhood to Implement IPv6 Route Exchange in Different ASs**

<b>Scenario</b> Figure 1- 19	<p>The diagram shows two routers, Router A and Router B, connected by a horizontal line. Router A is on the left and is associated with AS 65530. Router B is on the right and is associated with AS 65531. Each router is represented by a blue cube with a cross on top and a cloud-like shape behind it.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1- 19.</li> <li>● Configure a BGP neighbor, specify the update-source, disable the IPv4 address family capability for the neighbor</li> </ul>

	<p>and activate the IPv6 address family capability.</p> <ul style="list-style-type: none"> <li>● Configure IPv6 route advertisement in BGP.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)#intloopback0 A(config-if-Loopback)# ipv6 address 30::1/128 A(config-if-Loopback)# exit  A(config)# int GigabitEthernet 0/1 A(config-if-Loopback)#ipv6address fe80:100::2/64 A(config-if-Loopback)# exit A(config)# router bgp 65530 A(config-router)# neighbor fe80:100::1%Gi0/1 remote-as 65531 A(config-router)# address-family ipv4 A(config-router-af)# no neighbor fe80:100::1%Gi0/1 activate A(config-router-af)# exit-address-family A(config-router)# address-family ipv6 A(config-router-af)# neighbor fe80:100::1%Gi0/1 activate A(config-router-af)# network 30::1/128</pre>
<b>B</b>	<pre>B# configure terminal B(config)# int GigabitEthernet 0/1 B(config-if-Loopback)# ipv6 address fe80:100::1/64 B(config-if-Loopback)# exit B(config)# router bgp 65531 B(config-router)#neighbor fe80:100::2%Gi0/1 remote-as 65530 B(config-router)# address-family ipv4 B(config-router-af)# no neighbor fe80:100::2%Gi0/1 activate B(config-router-af)# exit-address-family B(config-router)# address-family ipv6 B(config-router-af)# neighbor fe80:100::2%Gi0/1 activate</pre>
<b>Verification</b>	<p>Run the <b>show</b> command to display the BGP neighbor status.</p>
<b>A</b>	<pre>A# show bgp ipv6 unicast summary BGP router identifier 1.1.1.1, local AS number 65530 BGP table version is 1 1 BGP AS-PATH entries 0 BGP Community entries 1 BGP Prefix entries (Maximum-prefix:4294967295)  Neighbor          V      AS MsgRcvd MsgSent  TblVer  InQ  OutQ  Up/Down  State/PfxRcd fe80:100::1%Gi0/1 4      65531    4      6        1    0    000:01:49    0  Total number of neighbors 1</pre>

<b>B</b>	<p>Run the <b>show</b> command to display BGP routing information.</p> <pre> B# show bgp ipv6 unicast BGP table version is 4, local router ID is 2.2.2.2 Status codes: s suppressed, d damped, h history, * valid, &gt; best, i - internal,                 S Stale, b - backup entry Origin codes: i - IGP, e - EGP, ? - incomplete     Network          Next Hop          Metric      LocPrf      Weight Path *&gt; 30::1/128        fe80:100::2          0                   0 65530 i  Total number of prefixes 1 </pre>
----------	--

### Common Errors

- When a neighborship is configured, a local IPv6 link address is used to specify the neighborship; however, no update source is specified as the interface for this local IPv6 link address during local configuration.
- Only one end uses a local IPv6 link address for establishing a neighborship.

### 7.4.14 Configuring BGP Tracking

#### Configuration Effect

- Configure the BGP tracking function to ensure fast route convergence.

#### Notes

N/A

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in global configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

##### ↳ Configuring the Tracking Function for BGP Neighbors

- (Mandatory) Perform this configuration in BGP configuration mode.

#### Verification

- Run the **show** command to display the information.

#### Related Commands

##### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
----------------	---

<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <i>instance</i> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring the Tracking Function for BGP Neighbors

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>track</b> <i>track-obj-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>track-obj-number</i> : Specifies the number of the tracked object.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

## Configuration Example

### ↳ Configuring BGP Tracking

<b>Scenario</b> Figure 1- 20	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Establish an EBGP neighborhood between routers A and B.</li> <li>Configure the loopback interface (2.2.2.2/32) on A for tracking B.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ip rns 1</pre>

<p><b>Verification</b></p>	<p>Run the <b>show</b> command to query the BGP neighbor status.</p>
<p><b>A</b></p>	<pre>A#BGP neighbor is 192.168.182.34, remote AS 65531, local AS 65530, external link Using TRACK to detect state BGP version 4, remote router ID 88.5.5.5 BGP state = Established, up for 00:00:16 Last read          , hold time is 180, keepalive interval is 60 seconds Neighbor capabilities:   Route refresh: advertised and received (old and new)   Four-octets ASN Capability: advertised and received   Address family IPv4 Unicast: advertised and received   Address family L2VPN VPLS: advertised and received   Address family L2VPN EVPN: advertised and received   Graceful Restart Capability: advertised and received   Remote Restart timer is 120 seconds   Address families preserved by peer:     IPv4 Unicast (was not preserved)     IPv4 Labeled (was not preserved)     VPNv4 Unicast (was not preserved)     IPv6 Unicast (was not preserved)     IPv6 Labeled (was not preserved)     L2VPN VPLS (was not preserved)     L2VPN EVPN (was not preserved)     L2VPN VPWS (was not preserved) .....</pre>

**Common Errors**

N/A

### 7.4.15 Configuring BGP NSR

#### Configuration Effect

- Configure the BGP NSR function to ensure highly reliable network deployment.

#### Notes

- To deploy the BGP NSR function successfully, the device must support the dual engine redundancy hot backup function.
- After the BGP NSR function is enabled, connections to the BGP neighbors will be reset for the function to take effect.

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in global configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

##### ↳ Configuring the NSR Function for BGP Neighbors

- (Mandatory) Perform this configuration in BGP configuration mode.

#### Verification

- Run the **show** command to query the BGP neighbor status.

#### Related Commands

##### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number, ranging from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

##### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command</b>	BGP configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	The AS specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Configuring the NSR Function for BGP Neighbors

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>ha-mode nsr</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	-

### Configuration Example

#### ↳ Configuring BGPNSR

<b>Scenario</b> Figure 1- 21	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in Figure 1-21.</li> <li>● Establish the EBGP neighborhood between routers A and B via the directly connected port.</li> <li>● Enable the BGP NSR function on A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config-router)# exit A(config)# router bgp 65530 A(config-router)# neighbor 192.168.195.182 ha-mode nsr</pre>
<b>Verification</b>	Run the <b>show</b> command to query the BGP neighbor status.
<b>A</b>	<pre>A# show ip bgp neighbors BGP neighbor is 192.168.195.183, remote AS 65530, local AS 65531, external link Using BFD to detect fast fallover - BFD session state up   BGP version 4, remote router ID 10.0.0.1   BGP state = Established, up for 00:06:37   Last read 00:06:37, hold time is 180, keepalive interval is 60 seconds   Neighbor capabilities:     Route refresh: advertised and received (old and new)   Address family IPv4 Unicast: advertised and received</pre>

	<p>Graceful restart: advertised and received</p> <p>RemoteRestarttimeris 120seconds</p> <p>Address families preserved by peer:</p> <p>None</p> <p>.....</p>
<p><b>B</b></p>	<p>B# show ip bgp neighbors</p> <p>BGP neighbor is 192.168.195.183, remote AS 65530, local AS 65531, external link</p> <p>Using BFD to detect fast fallover - BFD session state up</p> <p>BGP version 4, remote router ID 10.0.0.1</p> <p>BGP state = Established, up for 00:06:37</p> <p>Last read 00:06:37, hold time is 180, keepalive interval is 60 seconds</p> <p>Neighbor capabilities:</p> <p>Route refresh: advertised and received (old and new)</p> <p>Address family IPv4 Unicast: advertised and received</p> <p>Graceful restart: advertised and received</p> <p>Remote Restart timer is 120 seconds</p> <p>Address families preserved by peer:</p> <p>None</p> <p>.....</p>

**Common Errors**

- IGP is not configured.
- The NSR function is not enabled for BGP neighbors.

**7.4.16 Configuring BGP Routes to Be Recursive Only to Host Routes**

**Configuration Effect**

- Configure BGP routes to be recursive only to host routes, to enable IBGP or multi-EBGP routes to be recursive only to host routes.

**Notes**

- This feature is effective only to IBGP or multi-hop EBGP routes. It is unavailable to direct EBGP routes or routes whose next-hop addresses are direct connection addresses.
- IBGP or multi-hop EBGP neighborships of the device need to be established using the address of the Loopback interface. Otherwise, this feature is unavailable.

**Configuration Steps**

↳ **Enabling BGP**

- (Mandatory) Perform this configuration in global configuration mode.

↳ **Configuring BGP Routes to Be Recursive Only to Host Routes**

- (Mandatory) Perform this configuration in BGP address family mode.

**Verification**

- Run the **show running-config** command to display the configuration.

**Related Commands**

↳ **Enabling BGP**

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number. The value range is from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

↳ **Configuring BGP Routes to Be Recursive Only to Host Routes**

<b>Command</b>	<b>Bgp recursion host</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BGP address family mode
<b>Usage Guide</b>	N/A

**Configuration Example**

↳ **Configuring BGP Routes to Be Recursive Only to Host Routes**

<b>Scenario</b> Figure 1- 22	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in the preceding figure.</li> <li>● Establish the multi-hop EBGP neighborships on Router A and Router B through the Loopback interface.</li> <li>● Enable the function of making BGP routes recursive only to host routes on Router A and Router B.</li> </ul>
<b>Verification</b>	Run the <b>show</b> command to display the BGP neighbor status.

## Common Errors

- If the feature is enabled on a device but IBGP or multi-hop EBGp neighborships are not established using the address of the Loopback interface, the device cannot find a host route that matches the next-hop address of a BGP route. As a result, the next hop of the BGP route is invalid and routes cannot be preferentially selected.

### 7.4.17 Configuring Outbound Loop Detection for a BGP Neighbor

#### Configuration Effect

- Configure outbound loop detection for a BGP neighbor

#### Notes

- This feature is available only to EBGp neighbors.

#### Configuration Steps

##### ↳ Enabling BGP

- (Mandatory) Perform this configuration in global configuration mode.

##### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

##### ↳ Configuring Outbound Loop Detection for a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

#### Verification

- Run the **show** command to display the neighbor status.

#### Related Commands

##### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number. The value range is from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

##### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).

<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS number specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↘ **Configuring Outbound Loop Detection for a BGP Neighbor**

<b>Command</b>	<b>neighbor { neighbor-address   peer-group-name } as-loop-check out</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

↘ **Configuring Outbound Loop Detection for a BGP Neighbor**

#### 7.4.18 Shutting Down BGP Connections Gracefully

##### Configuration Effect

- Shut down BGP connections gracefully. Service traffic is not interrupted or is interrupted for a very short period of time in the process from feature configuration to actual BGP connection shutdown.

##### Notes

N/A

##### Configuration Steps

###### ↳ Enabling BGP

- (Mandatory) Perform this configuration in global configuration mode.

###### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

###### ↳ Shutting Down Connections of the BGP Neighbor Gracefully

- (Optional) Perform this configuration in BGP configuration mode.

### ↳ Shutting Down All Connections of a BGP Instance Gracefully

- (Optional) Perform this configuration in BGP configuration mode.

#### Verification

- Run the **show** command to display the neighbor status.

#### Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number. The value range is from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS number specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

### ↳ Shutting Down Connections of the BGP Neighbor Gracefully

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>shutdown graceful</b> [ <b>community</b> <i>value</i> ] [ <b>delay</b> <i>time</i> ]
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group. <b>community</b> <i>value</i> : Indicates the community value carried in the route sent to the neighbor. <b>delay</b> <i>time</i> : Indicates the delay time (in seconds) for shutting down BGP connections. The value range is from 1 to 65,535.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

### ↳ Shutting Down All Connections of a BGP Instance Gracefully

<b>Command</b>	<b>bgp shutdown graceful</b> [ <b>community</b> <i>value</i> ] [ <b>delay</b> <i>time</i> ]
<b>Parameter</b>	<b>community</b> <i>value</i> : Indicates the community value carried in the route sent to the neighbor.

<b>Description</b>	<b>delay time:</b> Indicates the delay time (in seconds) for shutting down BGP connections. The value range is from 1 to 65,535.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

↳ **Shutting Down BGP Connections Gracefully**

<p><b>Scenario</b> Figure 1- 24</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices and set the AS numbers as shown in the preceding figure.</li> <li>● Establish the EBGP neighborhood between Device A and Device C and between Device B and Device C.</li> <li>● On Device A, shut down all connections of a BGP instance gracefully.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# router bgp 65536 A(config-router)# neighbor 10.1.1.1 remote-as 65537 A(config-router)# bgp shutdown graceful med 4294967295</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# router bgp 65536 B(config-router)# neighbor 20.1.1.1 remote-as 65537</pre>
<p><b>C</b></p>	<pre>C# configure terminal C(config)# router bgp 65537 C(config-router)# neighbor 10.1.1.2 remote-as 65536 C(config-router)# neighbor 10.1.1.2 as-loop-check out C(config-router)# neighbor 20.1.1.2 remote-as 65536 C(config-router)# neighbor 20.1.1.2 as-loop-check out</pre>
<p><b>Verification</b></p>	<p>Run the <b>show</b> command to display the BGP neighbor status.</p>
<p><b>A</b></p>	<pre>A(config)#show ip bgp neighbor 10.1.1.2</pre>

```

For address family: IPv4 Unicast
BGP neighbor is 10.10.10.2, remote AS 65537, local AS 65536, external link
Administratively graceful shut down
  BGP version 4, remote router ID 0.0.0.0
  BGP state = Idle
  Last read          , hold time is 30, keepalive interval is 1 seconds
  Configured hold time is 30, keepalive interval is 1 seconds
  Received 0 messages, 0 notifications, 0 in queue
    open message:0 update message:0 keepalive message:0

#### 7.4.19 Configuring EBGP Multi-path Bypass Protection

##### Configuration Effect

- Implement EBGP multi-path bypass protection.

##### Notes

- BFD sessions can be configured for neighbors to implement fast link fault detection.

## Configuration Steps

### ↳ Enabling BGP

- (Mandatory) Perform this configuration in global configuration mode.

### ↳ Creating a BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Configuring BGPECMP

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Configuring BGP Multi-path Bypass Protection

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Configuring a BFD Session to a BGP Neighbor

- (Optional) Perform this configuration in BGP configuration mode.

## Verification

- Run the **show** command to display route information.

## Related Commands

### ↳ Enabling BGP

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number. The value range is from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↳ Configuring BGP Multi-path Bypass Protection

<b>Command</b>	<b>bgp install standby-path</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

### ↳ Creating a BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address.

<b>Description</b>	<i>peer-group-name</i> : Specifies the name of a peer group. <i>as-number</i> : Indicates the AS number of a BGP peer (group).
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	The AS number specified for a peer (group) must be the same as the BGP AS number of a BGP speaker at the peer end.

↳ **Creating a BFD Session to a BGP Neighbor**

<b>Command</b>	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } fall-over bfd</b>
<b>Parameter Description</b>	<i>neighbor-address</i> : Specifies the address of a peer. This address may be an IPv4 address or an IPv6 address. <i>peer-group-name</i> : Specifies the name of a peer group.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

The following configuration example describes only the configuration relevant to BGP multi-path bypass protection.

↳ **Configuring BGP Multi-path Bypass Protection**

<p><b>Scenario</b> <b>Figure 1- 25</b></p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable BGP on all devices.</li> <li>● Configure addresses for directly-connected ports on Device A, Device B, and Device C, and mutually establish the EBGP neighborhood between every two of them.</li> <li>● Configure a BFD session for the EBGP neighborhood between Device A and Device C.</li> </ul>

	<ul style="list-style-type: none"> <li>● Configure BGP multi-path bypass protection on Device C.</li> <li>● Configure ECMP on Device C.</li> </ul>

## 7.5 Configuring Inter-VRF Multi-Path Route Import

### Configuration Effect

- Ensure inter-VRF route import and ECMP multi-path for inter-imported routes.

### Notes

- N/A

## Configuration Steps

### ↳ Configuring a BGP VRF Address Family

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Importing Static Routes to BGP

- (Mandatory) Perform this configuration in BGP address family mode.

### ↳ Importing Multi-Path Static Routes to BGP

- (Mandatory) Perform this configuration in BGP address family mode.

### ↳ Configuring BGPECMP

- (Mandatory) Perform this configuration in BGP address family mode.

### ↳ Configuring Inter-VRF Import for All Path Routes

- (Mandatory) Perform this configuration in BGP address family mode.

## Verification

- Run the **show** command to display route information.

## Related Commands

### ↳ Configuring a BGP VRF Address Family

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter Description</b>	<i>as-number</i> : Indicates an AS number. The value range is from 1 to 4,294,967,295, which is 1 to 65535.65535 in dot mode. <b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

### ↳ Importing Static Routes to BGP

<b>Command</b>	<b>redistribute</b> <i>protocol-type</i> [ <b>route-map</b> <i>map-tag</i> ] [ <b>metric</b> <i>metric-value</i> ]
<b>Parameter Description</b>	<i>protocol-type</i> : Indicates the source protocol type of a redistributed route. <b>route-map</b> <i>map-tag</i> : Indicates the name of an associated route map. <b>metric</b> <i>metric-value</i> : Indicates the default metric value of a redistributed route. The value range is from <b>0</b> to <b>4,294,967,295</b> .
<b>Command Mode</b>	BGP address family mode
<b>Usage Guide</b>	N/A

### ↳ Importing Multi-Path Static Routes to BGP

<b>Command</b>	<b>bgp sourced-paths</b> <i>protocol-type</i> <b>all</b>
<b>Parameter</b>	<i>protocol-type</i> : Indicates the source protocol type of a redistributed route.

<b>Description</b>	
<b>Command Mode</b>	BGP address family mode
<b>Usage Guide</b>	This command needs to be used together with the redistribution command to import routes with multiple next hops from other protocols to BGP.

↳ **Configuring BGPECMP**

<b>Command</b>	<b>maximum-paths { ebgp   ibgp } number</b>
<b>Parameter Description</b>	<b>ebgp:</b> Specifies the number of equivalent paths of the EBGP multipath load balancing function. <b>ibgp:</b> Specifies the number of equivalent paths of the IBGP multipath load balancing function. <b>number:</b> Indicates the maximum number of equivalent paths. The minimum value is 1, and the maximum value depends on the device capability. If the value is 1, the EBGP multipath load balancing function is disabled.
<b>Command Mode</b>	BGP address family mode
<b>Usage Guide</b>	The <b>maximum-paths ebgp</b> command is also used to configure equivalence of confederation EBGP multiple paths and local inter-VRF import routes.  IBGP and EBGP routes cannot form equivalent routes.

↳ **Configuring Inter-VRF Import for All Path Routes**

<b>Command</b>	<b>import path selection { all   bestpath   multipath }</b>
<b>Parameter Description</b>	<b>all:</b> Imports all routes with next hops. <b>bestpath:</b> Imports routes with preferred next hops. By default, only routes with preferred next hops are imported. <b>multipath:</b> Imports routes with preferred and equivalent next hops.
<b>Command Mode</b>	BGP address family mode
<b>Usage Guide</b>	This command can be used to control inter-VRF route import, L3VPN remote routes import to VRF, and EVPN routes import to the IP route table.

**Configuration Example**

↳ **Configuring BGP Multi-Path Bypass Protection**

<b>Scenario</b> Figure 1- 26	<p>The diagram shows a central router labeled 'A' at the top. Below it are two VRFs: 'VRF vpn1' on the left and 'VRF vpn2' on the right. Each VRF is connected to a separate network represented by a dark blue cloud. The router 'A' has a central icon with four arrows pointing outwards.</p>
	Device A connects to two networks through VRF vpn1 and vpn2, and cross-VRF access is implemented through device A.
<b>Configuration</b>	Configure VRF.

<b>Steps</b>	<p>Configure VRF static routes.  Configure a VRF address family.  Import VRF static routes to BGP.  Enable multi-path static route import to BGP.  Configure BGPECMP.  Configure inter-VRF import for all path routes.</p>
<b>A</b>	<pre> A# conf terminal A(config)# ip vrf vpn1 A(config-vrf)# rd 200:1 A(config-vrf)# route-target both 100:100 A(config-vrf)# exit A(config)# ip vrf vpn2 A(config-vrf)# rd 300:1 A(config-vrf)# route-target both 100:100 A(config-vrf)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# A(config-if-GigabitEthernet 0/1)# ip vrf forwarding vpn1 A(config-if-GigabitEthernet 0/1)# ip address 44.1.1.2 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)# ip vrf forwarding vpn1 A(config-if-GigabitEthernet 0/2)# ip address 45.1.1.2 255.255.255.0 A(config-if-GigabitEthernet 0/2)# exit A(config)# interface GigabitEthernet 0/3 A(config-if-GigabitEthernet 0/3)# ip vrf forwarding vpn2 A(config-if-GigabitEthernet 0/3)# ip address 46.1.1.2 255.255.255.0 A(config-if-GigabitEthernet 0/3)# exit A(config)# interface GigabitEthernet 0/4 A(config-if-GigabitEthernet 0/4)# ip vrf forwarding vpn2 A(config-if-GigabitEthernet 0/4)# ip address 47.1.1.2 255.255.255.0 A(config-if-GigabitEthernet 0/4)# exit A(config)# ip route vrf vpn1 100.1.1.1 255.255.255.255 44.1.1.1 A(config)# ip route vrf vpn1 100.1.1.1 255.255.255.255 45.1.1.1 A(config)# ip route vrf vpn2 200.1.1.1 255.255.255.255 46.1.1.1 </pre>

### 7.5.1 Configuring BMP Monitoring

#### Configuration Effect

- Enable BGP to be monitored by the BMP server.

#### Notes

None

#### Configuration Steps

##### ↳ Creating a BMP Server Instance

- (Mandatory) Perform this configuration in global configuration mode.

##### ↳ Configuring the Address and Port Number of the BMP Server

- (Mandatory) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the Source Address of a TCP Connection to the BMP Server**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the VRF Instance to Which a TCP Connection to the BMP Server Belongs**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the Interval to Establish a TCP Connection to the BMP Server**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the Description for BMP Instance**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the Max Bytes of Packet in Buffer for BMP Instance**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the BMP Server to Monitor Routing Information Received from a BGP Peer After the Routing Policy Is Applied**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the BMP Server to Monitor Unchanged Routing Information Received from a BGP Peer**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the BMP Server to Monitor Routing Information Sent to a BGP Peer After the Routing Policy Is Applied**
- (Optional) Perform this configuration in BMP configuration mode.
  - ↳ **Configuring the BMP Server to Monitor BGP Peers**
- (Mandatory) Perform this configuration in BGP configuration mode.
  - ↳ **Configuring All BMP Servers to Monitor BGP Peers**
- (Optional) Perform this configuration in BGP configuration mode.
  - ↳ **Configuring the BMP Server to Monitor BGP Packets**
- (Optional) Perform this configuration in BGP configuration mode.
  - ↳ **Configuring the Interval for Sending Status Statistics to the BMP Server**
- (Optional) Perform this configuration in BGP configuration mode.

#### Verification

- Run the **show running-config** command to display the configurations.

#### Related Commands

- ↳ **Creating a BMP Server Instance**

<b>Command</b>	<b>bmp server</b> <i>server-number</i>
<b>Parameter Description</b>	<i>server-number</i> : Specifies the ID of a BMP server instance.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Address and Port Number of the BMP Server

<b>Command</b>	<b>address</b> <i>bmp-server-address</i> <b>port</b> <i>port-number</i>
<b>Parameter Description</b>	<i>bmp-server-address</i> : Specifies the address of the BMP server. <i>port-number</i> : Specifies the port number of the BMP server.
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Source Address of a TCP Connection to the BMP Server

<b>Command</b>	<b>update-source</b> <i>interface-type interface-number</i>
<b>Parameter Description</b>	<i>interface-type interface-number</i> : Indicates an interface name.
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the VRF Instance to Which a TCP Connection to the BMP Server Belongs

<b>Command</b>	<b>vrf</b> <i>vrf-name</i>
<b>Parameter Description</b>	<i>vrf-name</i> : Specifies the VRF instance name.
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Interval to Establish a TCP Connection to the BMP Server

<b>Command</b>	<b>failure-retry-delay</b> <i>time</i>
<b>Parameter Description</b>	<i>Time</i> : Specifies the interval
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Description for BMP instance

<b>Command</b>	<b>description</b> <i>text</i>
<b>Parameter Description</b>	<i>text</i> : Specifies the description for BMP instance.

<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Max Bytes of Packet in Buffer for BMP Instance

<b>Command</b>	<b>buffer-size</b> <i>maximum</i>
<b>Parameter Description</b>	<i>Maximum</i> : Configure the max bytes of packet in buffer for BMP instance.
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	Use this command to configure the max bytes of packet in buffer for BMP instance. When the device can not forward monitor packets due to insufficient server memory or other reasons, these packets will continually occupy the memory space, so there should be a limit of the max bytes of packet in buffer. When bytes reach the limit, the session with BMP server will be reset to release the space.

#### ↘ Configuring the BMP Server to Monitor Routing Information Received from a BGP Peer After the Routing Policy Is Applied

<b>Command</b>	<b>adj-rib-in post-policy</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the BMP Server to Monitor Unchanged Routing Information Received from a BGP Peer

<b>Command</b>	<b>adj-rib-in pre-policy</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the BMP Server to Monitor Routing Information Sent to a BGP Peer After the Routing Policy Is Applied

<b>Command</b>	<b>adj-rib-out post-policy</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the BMP Server to Monitor BGP Peers

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>bmp-active</b> { <b>all</b>   <b>server</b> <i>server-number</i> [ <i>server-number</i> ] }
<b>Parameter</b>	<i>neighbor-address</i> : Specifies the IPv4 or IPv6 address of a peer.

<b>Description</b>	<i>peer-group-name</i> : Specifies a peer group name. <i>server-number</i> : Specifies the ID of a BMP server instance.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring All BMP Servers to Monitor BGP Peers

<b>Command</b>	<b>bgp bmp-active</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the BMP Server to Monitor BGP Packets

<b>Command</b>	<b>route mirroring</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Interval for Sending Status Statistics to the BMP Server

<b>Command</b>	<b>stats-reporting-period <i>time</i></b>
<b>Parameter Description</b>	<i>time</i> : Specifies the interval.
<b>Command Mode</b>	BMP configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

## 7.5.2 Configuring Domain of Neighbor

### Configuration Effect

- Configure to not suppress detailed routings in the domain group of neighbor.

### Notes

None

### Configuration Steps

#### ↳ Configuring Domain Group of Neighbor

- (Mandatory) Perform this configuration in global configuration mode.

#### ↳ Configuring to not Suppress Detailed Routings in Domain Group of Neighbor

- (Mandatory) Perform this configuration in global configuration mode.

### Verification

- Run the **show running-config** command to display the configurations.

### Related Commands

#### ↳ Configuring Domain Group of Neighbor

<b>Command</b>	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } domain <i>domain-name</i></b>
<b>Parameter</b>	<i>neighbor-address</i> : IP address of the peer
<b>Description</b>	<i>peer-group-name</i> : Name of the peer group <i>domain-name</i> : Domain name
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ↳ Configuring to not Suppress Detailed Routing in Domain Group of Neighbor

<b>Command</b>	<b>neighbor { <i>neighbor-address</i>   <i>peer-group-name</i> } domain-unsuppress</b>
<b>Parameter</b>	<i>neighbor-address</i> : IP address of the peer
<b>Description</b>	<i>peer-group-name</i> : Name of the peer group
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ↳ Configuring Domain Group of Neighbor

**Scenario**

**Figure 1-27**

**Configuration Steps**

- Run BGP protocol on all devices, set AS numbers as the figure shows
- Configure Loopback on A, B and C to establish IBGP neighbor
- Establish EBGP neighbor between C and D
- Create IBGP peer group on C
- Configure host route 11.1.1.1 on D
- Configure domain test on C to neighbors of A and D, and configure domain-suppress to neighbors of A

<b>A</b>	<pre>A# configure terminal A(config)# interface loopback 0 A(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255 A(config-if-Loopback 0)# exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)# ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# router bgp 65536 A(config-router)# neighbor 10.1.1.3 remote-as 65536 A(config-router)# neighbor 10.1.1.3 update-source loopback 0</pre>

### 7.5.3 Configuring Link State Tracking Group of Neighbor

#### Configuration Effect

- Associate the link state tracking group for the BGP neighbor.

#### Notes

None

#### Configuration Steps

##### ↳ Enabling BGP Protocol

- (Mandatory) Perform this configuration in global configuration mode.

### ↳ Creating BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Creating Link State Tracking Group Associated with BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Configuring Delay Time to Enable Downlink Port of Link State Tracking Group after BGP Neighbor is up

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Configuring Link State Tracking Group Associated with Port

- (Mandatory) Perform this configuration in interface configuration mode.

#### Verification

- Run the **show running-config** command to display the configurations.

#### Related Commands

### ↳ Enabling BGP Protocol

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter</b>	<i>as-number</i> : AS number. Range: 1..4294967295
<b>Description</b>	<b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↳ Creating BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter</b>	<i>neighbor-address</i> : IP address of the peer
<b>Description</b>	<i>peer-group-name</i> : Name of the peer group <i>as-number</i> : AS number of peer (group)
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	AS number specified for peer (group) should be consistent with the AS number of peer BGP Speaker

### ↳ Creating Link State Tracking Group Associated with BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>neighbor-address</i>   <i>peer-group-name</i> } <b>link state group</b> <i>num</i>
<b>Parameter</b>	<i>neighbor-address</i> : IP address of the peer
<b>Description</b>	<i>peer-group-name</i> : Name of the peer group <i>num</i> : Link state tracking group ID
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

↳ **Configuring Delay Time to Enable Downlink Port of Link State Tracking Group after BGP Neighbor is up**

<b>Command</b>	<b>bgp link-state-group up-delay</b> <i>delay-time</i>
<b>Parameter</b>	<i>delay-time</i> : Delay time
<b>Description</b>	
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	

↳ **Adding Port to Specified Link State Tracking Group**

<b>Command</b>	<b>link state group</b> <i>num</i> { <b>upstream</b>   <b>downstream</b> }
<b>Parameter</b>	<i>num</i> : Link state tracking group ID
<b>Description</b>	upstream: Configure the port as the uplink port of link state tracking group downstream: Configure the port as the downlink port of link state tracking group
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

↳ **Configuring BGP MD5 Verification**

<b>Scenario</b> Figure 1-28	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Run BGP protocol on all devices, set AS numbers as the figure shows</li> <li>● Configure Loopback on B and C to establish IBGP neighbor</li> <li>● Establish EBGP neighbor between A and B</li> <li>● Configure link state tracking group 1 on GE 0/2 on B</li> <li>● On B, associate link state tracking group 1 with A's neighbor</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)#ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)#exit A(config)# router bgp 65537 A(config-router)# neighbor 192.168.1.2 remote-as 65536 A(config-router)# neighbor 192.168.1.2 password 7 ebgpneighbor</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface loopback 0 B(config-if-Loopback 0)# ip address 10.1.1.1 255.255.255.255</pre>

#### 7.5.4 Configuring BGP Additional Paths

##### Configuration Effect

- Configure the BGP add-path to receive multiple routes with the same prefix from an IBGP neighbor.

##### Notes

None

##### Configuration Steps

###### ↳ Enabling BGP Protocol

- (Mandatory) Perform this configuration in global configuration mode.

###### ↳ Creating BGP Neighbor

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Enabling add-path Route Preference

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Advertising add-path Routes to Peer

- (Mandatory) Perform this configuration in BGP configuration mode.

### ↳ Enabling add-path Capability on Specified Peer

- (Mandatory) Perform this configuration in interface configuration mode.

#### Verification

- Run the **show running-config** command to display the configurations.

#### Related Commands

### ↳ Enabling BGP Protocol

<b>Command</b>	<b>router bgp</b> <i>as-number</i> [ <b>instance</b> <i>instance-name</i> ]
<b>Parameter</b>	<i>as-number</i> : AS number. Range: 1..4294967295
<b>Description</b>	<b>instance</b> : The instance should be specified for the non-default instance, and the instance name is required. <i>instance-name</i> : Instance name of 1 to 32 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↳ Creating BGP Neighbor

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>remote-as</b> <i>as-number</i>
<b>Parameter</b>	<i>peer-address</i> : IP address of the peer
<b>Description</b>	<i>peer-group-name</i> : Name of the peer group <i>as-number</i> : AS number of peer (group)
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	AS number specified for peer (group) should be consistent with the AS number of peer BGP Speaker

### ↳ Enabling add-path Route Preference

<b>Command</b>	<b>bgp additional-paths select</b> { <b>all</b>   <b>best</b> <i>number</i>   <b>ecmp</b> }
<b>Parameter</b>	<b>all</b> : Select all valid routes as the add-path routes in the type of "all".
<b>Description</b>	<b>best</b> <i>number</i> : Select the next-best routes as the add-path routes in the type of "best number". Range of number: 2-3. <b>ecmp</b> : Select the ecmp routes as the add-path routes in the type of "ecmp". Additional configuration is needed to select the ecmp routes.
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

### ↳ Advertising add-path Routes to Peer

<b>Command</b>	<b>neighbor</b> { <i>peer-address</i>   <i>peer-group-name</i> } <b>advertise additional-paths</b> { <b>all</b>   <b>best</b> <i>number</i>   <b>ecmp</b> }
----------------	---

<b>Parameter Description</b>	<p><i>peer-address</i>: IP address of the peer</p> <p><i>peer-group-name</i>: Name of the peer group</p> <p><b>all</b>: Select all valid routes as the add-path alternative routes in the type of “all”</p> <p><b>best number</b>: Select the next-best routes as the add-path alternative routes in the type of “best number”. Range of number: 2-3.</p> <p><b>ecmp</b>: Select the ecmp routes as the add-path alternative routes in the type of “ecmp”. Additional configuration is needed to select the ecmp routes.</p>
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	

↳ **Enabling add-path Capability on Specified Peer**

<b>Command</b>	<b>neighbor { <i>peer-address</i>   <i>peer-group-name</i> } additional-paths { send [<i>receive</i>]   receive }</b>
<b>Parameter Description</b>	<p><i>peer-address</i>: IP address of the peer</p> <p><i>peer-group-name</i>: Name of the peer group</p> <p><b>send</b>: Enable the device to send the add-path route. Only when the peer enables the receive capability, the device can advertise the add-path route.</p> <p><b>receive</b>: Enable the device to receive the add-path route. Only when the peer enables the send capability, the device can receive the add-path route.</p>
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

↳ **Configuring BGP add-path**

<b>Scenario</b> Figure 1-28	<p>The diagram illustrates a network topology with two Autonomous Systems (AS). AS 65535 (top) is connected to AS 65536 (bottom). AS 65536 contains routers A, B, C, and RR. Router D is the BGP RR. Connections between D and B/C are EBGP (solid lines), and connections between A, B, C, and RR are IBGP (dashed lines).</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the interconnection addresses among A, B, C, D and RR, configure the IBGP peer among A, B, C and RR which is the BGP RR, and configure the EBGP peer between B and D/C and D.</li> </ul>

	<ul style="list-style-type: none"> <li>● Configure the loopback address on D and advertise it to BGP.</li> <li>● Enable RR to advertise the add-path route, and enable A to receive the add-path route.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet0/1)#ip address 192.168.1.1 255.255.255.0 A(config-if-GigabitEthernet 0/1)# exit A(config)# router bgp 65536 A(config-router)# neighbor 192.168.1.5 remote-as 65536 A(config-router)# neighbor 192.168.1.5 additional-paths receive</pre>
<b>B</b>	<pre>B# configure terminal B(config)# interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)# ip address 192.168.2.2 255.255.255.0 B(config-if-GigabitEthernet 0/1)# exit B(config)# interface GigabitEthernet 0/2 B(config-if-GigabitEthernet 0/2)# ip address 192.168.4.2 255.255.255.0 B(config-if-GigabitEthernet 0/2)# exit B(config)# router bgp 65536 B(config-router)#neighbor 192.168.2.5 remote-as 65536 B(config-router)#neighbor 192.168.4.4 remote-as 65535</pre>
<b>C</b>	<pre>C# configure terminal C(config)# interface GigabitEthernet 0/1 C(config-if-GigabitEthernet 0/1)# ip address 192.168.3.3 255.255.255.0 C(config-if-GigabitEthernet 0/1)# exit C(config)# interface GigabitEthernet 0/2 C(config-if-GigabitEthernet 0/2)# ip address 192.168.5.3 255.255.255.0 C(config-if-GigabitEthernet 0/2)# exit C(config)# router bgp 65536 C(config-router)#neighbor 192.168.3.5 remote-as 65536 C(config-router)#neighbor 192.168.5.4 remote-as 65535</pre>

## 7.6 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears BGP IPv4 unicast routes.	<pre>clear ip bgp [instance as-number] [vrf vrf-name] { *   as-number   neighbor-address } [soft] [ in   out ] clear bgp [ instance as-number ] ipv4 unicast [ vrf vrf-name ] { *   as-number   neighbor-address } [ soft ] [ in   out ] clear ip bgp [ instance as-number ] [ vrf vrf-name ] update-group [ update-group-index   neighbor-address ] [ soft ] [ in   out ] clear bgp [ instance as-number ] ipv4 unicast [ vrf vrf-name ] update-group [ update-group-index   neighbor-address ] [ soft ] [ in   out ]</pre>
Clears BGP IPv6 unicast routes.	<pre>clear bgp [ instance as-number ] ipv6 unicast [ vrf vrf-name ] { *   as-number   neighbor-address } [ soft ] [ in   out ] clear bgp [ instance as-number ] ipv6 unicast [ vrf vrf-name ] update-group [ update-group-index   neighbor-address ] [ soft ] [ in   out ]</pre>
Clears BGP L2VPN EVPN routes.	<pre>clear bgp [ instance as-number ] l2vpn evpn { *   as-number   neighbor-address } [ soft ] [ in   out ] clear bgp [ instance as-number ] l2vpn evpn update-group [ update-group-index   neighbor-address ] [ soft ] [ in   out ]</pre>
Clears EVPN conflict MAC	<pre>clear evpn conflict mac [ vni-id ]</pre>

### Displaying

Description	Command
Displays the BGP IPv4 unicast routes.	<pre>show ip bgp show bgp ipv4 unicast</pre>
Displays the update-group information of BGP IPv4 unicast address family.	<pre>show ip bgp [ instance as-number ] [ vrf vrf-name ] update-group [ neighbor-address   update-group-index ] [ summary ] show bgp [ instance as-number ] ipv4 unicast [ vrf vrf-name ] update-group [ neighbor-address   update-group-index ] [ summary ]</pre>
Displays BGP IPv6 unicast routes.	<pre>show bgp [ instance as-number ] ipv6 unicast</pre>
Displays the update-group information of BGP IPv6 unicast address family.	<pre>show bgp [ instance as-number ] ipv6 unicast [ vrf vrf-name ] update-group [ neighbor-address   update-group-index ] [ summary ]</pre>
Displays BGP L2VPN EVPN routes.	<pre>show bgp [ instance as-number ] l2vpn evpn all</pre>
Displays the update-group information of BGP L2VPN EVPN address family.	<pre>show bgp [ instance as-number ] l2vpn evpn all update-group [ neighbor-address   update-group-index ] [ summary ]</pre>
Displays the MAC mobility or conflict.	<pre>show evpn mac { conflict   mobility } [ vni-id ]</pre>
Displays BGP statistics.	<pre>show bgp [ instance as-number ] statistics [ vrf vrf-name ]</pre>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Enables all BGP debugging.	<b>debug ip bgp all</b>
Debugs BGP route flapping.	<b>debug ip bgp dampening</b>
Debugs BGP event processing.	<b>debug ip bgp event</b>
Debugs BGP route filtering.	<b>debug ip bgp filter</b>
Debugs BGP status machine.	<b>debug ip bgp fsm</b>
Debugs BGP neighbor keepalive.	<b>debug ip bgp keepalives</b>
Debugs BGP core route processing.	<b>debug ip bgp nsm</b>
Debugs BGP UPDATE packets.	<b>debug ip bgp update</b>
Debugs BGP EVPN.	<b>debug ip bgp evpn</b>
Debugs BGP VXLAN exchanging.	<b>debug ip bgp vxlan</b>
Debugs BGP TRACK exchanging.	<b>debug ip bgp track</b>
Debugs BGP UPDATE-GROUP.	<b>debug ip bgp update-group</b>

## 8 Configuring RIPng

### 8.1 Overview

RIP next generation (RIPng) is a unicast routing protocol that applies to IPv6 networks. RIPng-enabled routers exchange routing information to obtain routes to remote networks.

As an Interior Gateway Protocol (IGP), RIPng can run only within the autonomous system (AS) and is applicable to small-sized networks with routes no more than 16 hops.

#### Protocols and Standards

- RFC2080: Defines the RIPng.

### 8.2 Application

RIPng is generally used on some small-sized networks, such as office networks of small companies.

As shown in the following figure, the company builds an IPv6 network, on which all routers support IPv6. The network is small in size, but the workload is still heavy if the network is maintained manually. In this case, RIPng can be configured to adapt to topological changes of the small-sized network, which reduces the workload.

**Figure 8- 1**

## 8.3 Features

### Basic Concepts

#### ↘ IGP and EGP

IGP runs within an AS. For example, RIPng is a type of IGP.

Exterior Gateway Protocol (EGP) runs between ASs. For example, BGP is a type of EGP.

### Feature

Feature	Description
RIPng and RIP	RIPng is an extension of RIPv2 on the basis of IPv6. Both are similar in functions and configurations.
Exchanging Routing Information	By exchanging routing information, RIPng-enabled devices can automatically obtain routes to a remote network and update routes in real time.
Routing Algorithm	RIPng is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.
Avoiding Route Loops	RIPng uses functions, such as split horizon and poison reverse, to avoid route loops.

### 8.3.1 RIPng and RIP

RIP applies to IPv4 networks. Two RIP versions are available, including RIPv1 and RIPv2.

RIPng is an extension of RIPv2 on the basis of IPv6. Both are similar in functions and configurations.

#### Working Principle

##### ↘ RIPv2

RIPv2 packets are multicast. The multicast address is 224.0.0.9, and the UDP port ID is 520. RIPv2 can identify the subnet mask.

##### ↘ RIPng

RIPng packets are multicast. The multicast address is FF02::9, the source address is FE80::/10, and the UDP port ID is 521. RIPng can identify the subnetmask.

 This chapter describes functions and configurations of RIPng. For details about RIPv2, see "Configuring RIP".

## Related Configuration

### ▾ Enabling the RIPng Process

By default, the RIPng process is disabled.

Run the **ipv6 router rip** command to enable the RIPng process.

You must enable the RIPng process on a device; otherwise, all functions related to RIPng cannot take effect.

### ▾ Running RIPng on an Interface

By default, RIPng does not run on an interface.

Run the **ipv6 rip enable** command to run RIPng on an interface.

After RIPng runs on an interface, RIPng packets can be exchanged on the interface and RIPng can learn routes to the network segments directly connected to the device.

### ▾ Prohibiting an Interface from Sending or Receiving Packets

By default, a RIPng-enabled interface is allowed to send and receive RIPng packets.

Run the **passive-interface** command to prohibit an interface from sending RIPng packets.

## 8.3.2 Exchanging Routing Information

Compared with static routing, the dynamic routing protocol has a significant advantage, that is, by exchanging routing information, devices can automatically obtain routes to a remote network and update the routes in real time.

### Working Principle

#### ▾ Initialization

After RIPng is enabled on a router, the router sends a request packet to its neighbor router, requesting for all routing information, that is, the routing table. After receiving the request message, the neighbor router returns a response packet containing the local routing table. After receiving the response packet, the router updates the local routing table, and sends an update packet to the neighbor router, informing the neighbor router of the route update information. After receiving the update packet, the neighbor router updates the local routing table, and sends the update packet to other adjacent routers. After a series of updates, all routers can obtain and retain the latest routing information.

#### ▾ Periodical Update

By default, periodical update is enabled for RIPng. Adjacent routers exchange complete routing information with each other every 30s (update timer), that is, the entire routing table is sent to neighbor routers.

-  For every non-local route, if the route is not updated within 180s (invalid timer), the metric of the route is changed to 16 (unreachable). If the route is still not updated in the next 120s (flush timer), the route is deleted from the routing table.

#### ▾ Default Route

In the routing table, a route to the destination network `::/0` is called default route.

The default route can be learned from a neighbor router, or sent to a neighbor router.

#### ▾ Route Redistribution

For RIPng, other types of routes (such as direct routes, static routes, and routes of other routing protocols) are called external routes.

External routes (excluding the default route) can be redistributed to RIPng and advertised to neighbors.

## ↘ Route Filtering

Filtering conditions can be configured to limit the routing information exchanged between adjacent routers. Only the routing information that meets filtering conditions can be sent or received.

### Related Configuration

## ↘ RIPng Timers

By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

Run the **timers basic** command to modify durations of RIPng timers.

Increasing the duration of the flush timer can reduce the route flapping. Decreasing the duration of the flush timer helps accelerate route convergence.

The durations of RIPng timers must be consistent on adjacent routers. Unless otherwise required, you are advised not to modify the RIPng timers.

## ↘ Default Route

Run the **ipv6 rip default-information** command to advertise the default route to neighbors on an interface.

## ↘ Route Redistribution

Run the **redistribute** command to redistribute external routes (excluding the default route) to RIPng and advertise them to neighbors.

## ↘ Route Filtering

Run the **distribute-list out** command to set filtering rules to limit the routing information sent by the device.

Run the **distribute-list in** command to set filtering rules to limit the routing information received by the device.

### 8.3.3 Routing Algorithm

RIPng is a protocol based on the distance-vector algorithm. It uses the vector addition method to compute the routing information.

#### Working Principle

## ↘ Distance-Vector Algorithm

RIPng is a protocol based on the distance-vector algorithm. The distance-vector algorithm treats a route as a vector that consists of the destination network and distance (metric). The router obtains a route from its neighbor and adds the distance vector from itself to the neighbor to the route to form its own route.

RIPng uses the hop count to evaluate the distance (metric) to the destination network. By default, the hop count from a router to its directly connected network is 0, the hop count from a router to a network that can be reached through a router is 1, and so on. That is, the metric is equal to the number of routers from the local network to the destination network. To restrict the convergence time, RIPng stipulates that the metric must be an integer between 0 and 15. If the metric is equal to or greater than 16, the destination network or host is unreachable. For this reason, RIPng cannot be applied to a large-scale network.

As shown in the following figure 8-2, Router A is connected to the network 2::/64. Router B obtains the route (2::/64, 0) from Router A and adds the metric 1 to the route to obtain its own route (2::/64, 1), and the next hop points to Router A.

**Figure 8- 2**

↘ **Selecting the Optimum Route**

RIPng selects an optimum route based on the following principle: If multiple routes to the same destination network is available, a router preferentially selects the route with the smallest metric.

As shown in the following figure 8-3, Router A is connected to the network 2::/64. Router C obtains the route (2::/64, 0) from Router A and the route (2::/64, 1) from Router B. Router C will select the route that is obtained from Router A and add metric 1 to this route to form its own route (2::/64, 1), and the next hop points to Router A.

**Figure 8- 3**

**i** When routes coming from different sources exist on a router, the route with the smaller distance is preferentially selected.

Route Source	Default Distance
Directly-connected network	0
Static route	1
OSPF route	110
IS-IS route	115
RIPng route	120
Unreachable route	255

**Related Configuration**

↘ **Modifying the Distance**

By default, the distance of a RIPng route is 120.  
Run the **distance** command to modify the distance of a RIPng route.

↘ **Modifying the Metric**

For a RIPng route that is proactively discovered by a device, the default metric is equal to the number of hops from the local network to the destination network. The metric offset of the interface is 1.

For a RIPng router that is manually configured (default route or redistributed route), the default metric is 1.

Run the **ipv6 rip metric-offset** command to modify the metric offset of the interface.

Run the **default-metric** command to modify the default metric of an external route (redistributed route).

Run the **redistribute** command to modify the metric of an external route (redistributed route) when advertising this route.

Run the **ipv6 rip default-information** command to modify the metric of a default route when advertising the default route.

### 8.3.4 Avoiding Route Loops

RIPng uses functions, such as split horizon and poison reverse, to avoid route loops.

#### Working Principle

##### Route Loop

A RIPng route loop occurs due to inherent defects of the distance-vector algorithm.

As shown in the following figure 8-4, Router A is connected to the network 2::/64, and sends an update packet every 30s. Router B receives the route to 2::/64 from Router A every 30s. If Router A is disconnected from 2::/64, the route to 2::/64 will be deleted from the routing table on Router A. Next time, the update packet sent by Router A no longer contains this route. As Router B does not receive an update packet related to 2::/64, Router B determines that the route to 2::/64 is valid within 180s and uses the update packet to send this route to Router A. As the route to 2::/64 does not exist on Router A, the route learned from Router B is added to the routing table. Router B determines that data can reach 2::/64 through Router A, and Router A determines that data can reach 2::/64 through Router B. In this way, a route loop is formed.

Figure 8- 4

##### Split Horizon

Split horizon can prevent route loops. After split horizon is enabled, a route received on this interface will not be sent out from this interface.

As shown in the following figure 8-5, after split horizon is enabled on Router B, Router B will not send the route to 2::/64 back to Router A. Router B will learn 180s later that 2::/64 is not reachable.

Figure 8- 5

⌵ **Poison Reverse**

Poison reverse can also prevent route loops. Compared with split horizon, poison reverse is more reliable, but brings more protocol packets, which makes network congestion more severe.

After poison reverse is enabled on an interface, a route received from this interface will be sent out from this interface again, but the metric of this router will be changed to 16 (unreachable).

As shown in the following figure, after poison reverse is enabled on Router A, if Router A detects a disconnection from 2::/64, Router A will not delete the route to 2::/64. Instead, Router A changes the number of hops to 16, and advertises the route through the update packet. On receiving the update packet, Router B learns that 2::/64 is not reachable.

Figure 8- 6

**Related Configuration**

⌵ **Split Horizon**

By default, split horizon is enabled.

Run the **no split-horizon** command to disable split horizon.

⌵ **Poison Reverse**

By default, poison reverse is disabled.

Run the **split-horizon poisoned-reverse** command to enable poison reverse. (After poison reverse is enabled, split horizon is automatically disabled.)

**8.4 Configuration**

Configuration	Related Commands	
Configuring RIPng Basic Functions	(Mandatory) It is used to build a RIPng routing domain.	
	<b>ipv6 router rip</b>	Enables a RIPng routing process and enters routing process configuration mode.
	<b>ipv6 rip enable</b>	Runs RIPng on an interface.

Configuration	Related Commands	
	<b>split-horizon</b>	Enables split horizon or poison reverse.
	<b>passive-interface</b>	Configures a passive interface.
Advertising the Default Route or External Routes	⚠ Optional.	
	<b>ipv6 rip default-information</b>	Advertise the default route to neighbors on an interface.
	<b>redistribute</b>	Redistributes routes and advertising external routes to neighbors.
Setting Route Filtering Rules	⚠ Optional.	
	<b>distribute-list in</b>	Filters the received RIPng routing information.
	<b>distribute-list out</b>	Filters the sent RIPng routing information.
Modifying Route Selection Parameters	⚠ Optional.	
	<b>distance</b>	Modifies the administrative distance of a RIPng route.
	<b>ipv6 rip metric-offset</b>	Modifies the metric offset on an interface.
	<b>default-metric</b>	Configure the default metric for route redistribution.
Modifying Timers	⚠ Optional.	
	<b>timers</b>	Modifies the update timer, invalid timer, and flush timer of RIPng.

### 8.4.1 Configuring RIPng Basic Functions

#### Configuration Effect

- Build a RIPng routing domain on the network.
- Routers in the domain obtain routes to a remote network through RIPng.

#### Notes

- IPv6 addresses must be configured.
- IPv6 unicast routes must be enabled.

#### Configuration Steps

##### ▾ Enabling a RIPng Routing Process

- Mandatory.
- Unless otherwise required, perform this configuration on every router in the RIPng routing domain.

##### ▾ Running RIPng on an Interface

- Mandatory.
- Unless otherwise required, perform this configuration on every interconnected interface of routers in the RIPng routing domain.

##### ▾ Enabling Split Horizon or Poison Reverse

- By default, split horizon is enabled and poison reverse is disabled.

- Unless otherwise required, enable split horizon on every interface connected to the broadcast network, such as the Ethernet. (Retain the default setting.)
- Unless otherwise required, enable split horizon on every interface connected to the point-to-point (P2P) network, such as the PPP and HDLC. (Retain the default setting.)
- It is recommended that split horizon and poison reverse be disabled on an interface connected to a non-broadcast multi-access network, such as FR and X.25; otherwise, some devices cannot learn the complete routing information.
- If the secondary IP address is configured for an interface connected to a non-broadcast, it is recommended that split horizon and poison reverse be disabled.

#### ▾ Configuring a Passive Interface

- This configuration is recommended.
- Use the passive interface to set the boundary of the RIPng routing domain. The network segment of the passive interface belongs to the RIPng routing domain, but RIPng packets cannot be sent over the passive interface.
- If RIPng routes need to be exchanged on an interface (such as the router interconnect interface) in the RIPng routing domain, this interface cannot be configured as a passive interface.

#### Verification

- Check the routing table on a router to verify that the route to a remote network can be obtained through RIPng.

#### Related Commands

##### ▾ Enabling a RIPng Routing Process

<b>Command</b>	<b>ipv6 router rip</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to create a RIPng routing process and enter routing process configuration mode.

##### ▾ Running RIPng on an Interface

<b>Command</b>	<b>ipv6 rip enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The configuration for running the RIPng on an interface is different from that of RIPv2. In RIPv2, the <b>network</b> command is configured in routing process configuration mode to define an IP address range. If the IP address of an interface belongs to this IP address range, RIP automatically runs on this interface.

##### ▾ Enabling Split Horizon

<b>Command</b>	<b>split-horizon [ poisoned-reverse ]</b>
<b>Parameter</b>	<b>poisoned-reverse:</b> Indicates that the split horizon function contains the poison reverse function.
<b>Description</b>	
<b>Command</b>	Routing process configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Run the <b>show ipv6 rip</b> command to check whether split horizon is enabled. The configuration is different from that of RIPv2. In RIPv2, the split horizon function is configured in interface configuration mode.

▾ **Configuring a Passive Interface**

<b>Command</b>	<b>passive-interface</b> { <b>default</b>   <i>interface-type interface-num</i> }
<b>Parameter</b>	<b>default</b> : Indicates all interfaces.
<b>Description</b>	<b>interface-type interface-num</b> : Specifies an interface.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	First, run the <b>passive-interface default</b> command to configure all interfaces as passive interfaces. Then, run the <b>no passive-interface interface-type interface-num</b> command so that the interfaces used for interconnection between routers in the domain are not passive interface.

▾ **Displaying the IP Routing Table**

<b>Command</b>	<b>show ipv6 route</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode or global configuration mode
<b>Usage Guide</b>	Check whether the routing table contains any route to a remote network that is learned through RIPng.

**Configuration Example**

▾ **Building a RIPng Routing Domain**

```

### Common Errors

- The IPv6 address is not configured on an interface.
- The interface used for interconnection between devices is configured as a passive interface.

### 8.4.2 Advertising the Default Route or External Routes

#### Configuration Effect

- In the RIPng domain, introduce a unicast route of another AS so that the unicast routing service to this AS can be provided for users in the RIPng domain.
- In the RIPng domain, inject a default route to another AS so that the unicast routing service to this AS can be provided for users in the RIPng domain.

#### Notes

- The RIPng basic functions must be configured.

#### Configuration Steps

##### ▾ Configuring External Route Redistribution

- Optional.
- Perform this configuration if external routes of the RIPng domain should be introduced to the AS border router (ASBR).

##### ▾ Generating a Default Route

- Optional.
- Perform this configuration if the default route should be introduced to an ASBR so that other routers in the RIPng domain access other AS domains through this ASBR by default.

#### Verification

- Run the **show ipv6 route rip** command on a non-ASBR to check whether the external routes of the domain and default route have been loaded.

#### Related Commands

##### ▾ Advertising the Default Route to Neighbors on an Interface

Command	<code>ipv6 rip default-information { only originate } [ metric <i>metric-value</i> ]</code>
---------	---

<b>Parameter Description</b>	<p><b>only:</b> Advertises only IPv6 default route.</p> <p><b>originate:</b> Advertises the IPv6 default route and other routes.</p> <p><b>metric <i>metric-value</i>:</b> Indicates the metric of the default route. The value ranges from 1 to 15. The default value is 1.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After this command is configured on the interface, an IPv6 default route is advertised to the external devices through this interface, but the route itself is not added to the route forwarding table or the device and the RIPng route database.</p> <p>To prevent occurrence of a route loop, once this command is configured on an interface, RIPng refuses to receive the default route updates advertised by neighbors.</p>

↘ **Redistributing Routes and Advertising External Routes to Neighbors**

<b>Command</b>	<b>redistribute { bgp   connected   isis [ <i>area-tag</i> ]   ospf <i>process-id</i>   static } [ metric <i>metric-value</i>   route-map <i>route-map-name</i> ]</b>
<b>Parameter Description</b>	<p><b>bgp:</b> Indicates redistribution from BGP.</p> <p><b>Connected:</b> Indicates redistribution from direct routes.</p> <p><b>isis [ <i>area-tag</i> ]:</b> Indicates redistribution from IS-IS. <i>area-tag</i> indicates the IS-IS process ID.</p> <p><b>ospf <i>process-id</i>:</b> Indicates redistribution from OSPF. <i>process-id</i> indicates the OSPF process ID. The value ranges from 1 to 65535.</p> <p><b>static:</b> Indicates redistribution from static routes.</p> <p><b>metric <i>metric-value</i>:</b> Sets the metric of the route redistributed to the RIPng domain.</p> <p><b>route-map <i>route-map-name</i>:</b> Sets the redistribution filtering rules.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	During route redistribution, it is not necessary to convert the metric of one routing protocol to the metric of another routing protocol because different routing protocols use completely different metric measurement methods. RIP measures the metric based on the hop count, and OSPF measures the metric based on the bandwidth. Therefore, the computed metrics cannot be compared with each other.

**Configuration Example**

<b>Scenario</b> Figure 8- 8	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router B, configure redistribution of static routes.</li> <li>● On the GE0/1 interface of Router A, configure advertisement of the default route.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ipv6 rip default-information originate</pre>

<b>B</b>	<pre>B# configure terminal B(config)#ipv6 routerrip B(config-router)# redistribute static</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the routing tables on Router A and Router B, and confirm that Router A can learn the route 3001:10:10::/64, and Router B can learn the default route ::/0.</li> </ul>
<b>A</b>	<pre>A# show ipv6 route rip  IPv6routing table name - Default - 17 entries Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  R      3001:10:10::/64 [120/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre>
<b>B</b>	<pre>B# show ipv6 route rip  IPv6routing table name - Default - 17 entries Codes: C - Connected, L - Local, S - Static         R - RIP, O - OSPF, B - BGP, I - IS-IS         N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area  R      ::/0 [120/2] via FE80::21A:A9FF:FE41:5B06, GigabitEthernet 0/1</pre>

### 8.4.3 Setting Route Filtering Rules

#### Configuration Effect

- Routes that do not meet filtering criteria cannot be loaded to the routing table, or advertised to neighbors. In this way, users within the network can be prevented from accessing specified destination networks.

#### Notes

- The RIPng basic functions must be configured.

#### Configuration Steps

##### 📄 Filtering the Received RIP Routing Information

- To refuse receiving some specified routes, you can configure the route distribution control list to process all the received route update packets. If no interface is specified, route update packets received on all interfaces will be processed.

📌 **Filtering the Sent RIP Routing Information**

- If this command does not contain any optional parameter, route update advertisement control takes effect on all interfaces. If the command contains the interface parameter, route update advertisement control takes effect only on the specified interface. If the command contains other routing process parameters, route update advertisement control takes effect only on the specified routing process.

**Verification**

- Run the **show ipv6 route rip** command to check that the routes that have been filtered out are not loaded to the routing table.

**Related Commands**

<b>Command</b>	<b>distribute-list prefix-list</b> <i>prefix-list-name</i> { <b>in</b>   <b>out</b> } [ <i>interface-type interface-name</i> ]
<b>Parameter</b>	<b>prefix-list</b> <i>prefix-list-name</i> : Indicates the name of the prefix list, which is used to filter routes.
<b>Description</b>	<b>in</b>   <b>out</b> : Specifies update routes (received or sent routes) that are filtered. <i>interface-type interface-name</i> : Indicates that the distribution list is applied to the specified interface.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	N/A

**Configuration Example**

<b>Scenario</b> Figure 8- 9	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On router A, configure route filtering.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ipv6 prefix-list hello permit 4001::/64 A(config)# ipv6 router rip A(config-router)# distribute-list prefix-list hello in</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check that Router A can learn only the route to 4001::/64.</li> </ul>

<b>A</b>	<pre> A# show ipv6 route rip  IPv6 routing table name - Default - 17 entries  Codes: C - Connected, L - Local, S - Static          R - RIP, O - OSPF, B - BGP, I - IS-IS          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          IA - Inter area  R      4001::/64 [120/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1 </pre>
----------	--

#### 8.4.4 Modifying Route Selection Parameters

##### Configuration Effect

- Change the RIPng routes to enable the traffic pass through specified nodes or avoid passing through specified nodes.
- Change the sequence that a router selects various types of routes so as to change the priorities of RIPng routes.

##### Notes

- The RIPng basic functions must be configured.

##### Configuration Steps

##### ✚ Modifying the Administrative Distance of a RIPng Route

- Optional.
- Perform this configuration if you wish to change the priorities of RIPng routes on a router that runs multiple unicast routing protocols.

##### ✚ Modifying the Metric Offset on an Interface

- Optional.
- Unless otherwise required, perform this configuration on a router where the metrics of routes need to be adjusted.

##### ✚ Configuring the Default Metric of an External Route Redistributed to RIPng

- Optional.
- Unless otherwise required, perform this configuration on an ASBR to which external routes are introduced.

##### Verification

- Run the **show ipv6 rip** command to display the administrative distance of RIPng routes.
- Run the **show ipv6 rip data** command to display the metrics of external routes redistributed to RIPng.

##### Related Commands

##### ✚ Modifying the Administrative Distance of a RIPng Route

<b>Command</b>	<b>distance</b> <i>distance</i>
<b>Parameter Description</b>	<i>distance</i> : Sets the administrative distance of a RIPng route. The value is an integer ranging from 1 to 254.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	Run this command to set the administrative distance of a RIPng route.

#### ✚ Modifying the Metric Offset on an Interface

<b>Command</b>	<b>ipv6 rip metric-offset</b> <i>value</i>
<b>Parameter Description</b>	<i>value</i> : Indicates the interface metric offset. The value ranges from 1 to 16.
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	Before a route is added to the routing table, the metric of the route must be added with the metric offset set on the interface. You can control the use of a route by setting the interface metric offset.

#### ✚ Configuring the Default Metric of an External Route Redistributed to RIPng

<b>Command</b>	<b>default-metric</b> <i>metric</i>
<b>Parameter Description</b>	<i>metric</i> : Indicates the default metric. The valid value ranges from 1 to 16. If the value is equal to or greater than 16, the FSOS determines that this route is unreachable.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the metric is not specified during redistribution of a routing protocol process, RIPng uses the metric defined by the <b>default-metric</b> command. If the metric is specified, the metric defined by the <b>default-metric</b> command is overwritten by the specified metric. If this command is not configured, the value of <b>default-metric</b> is 1.

### Configuration Example

#### ✚ Modifying the Administrative Distance of a RIPng Route

<b>Scenario</b> Figure 8- 10	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router A, set the administrative distance of a RIPng route to 160.</li> </ul>
	<pre>A# configure terminal A(config)# ipv6 router rip A(config-router)# distance 160</pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>On Router A, check whether the administrative distance of a RIPng route is 160.</li> </ul>
	<pre>A# show ipv6 route rip   in 3001::/64 R      3001::/64 [160/2] via FE80::2D0:F8FF:FE22:334A, GigabitEthernet 0/1</pre>

### 8.4.5 Modifying Timers

#### Configuration Effect

- Change the duration of RIPng timers to accelerate or slow down the change of the protocol state or occurrence of an event.

#### Notes

- The RIPng basic functions must be configured.
- Modifying the protocol control parameters may result in protocol running failures. Therefore, you are advised not to modify the timers.

#### Configuration Steps

##### ✚ Modifying the Update Timer, Invalid Timer, and Flush Timer

- Mandatory.
- Unless otherwise required, perform this configuration on a router where RIPng timers need to be modified.

#### Verification

- Run the **show ipv6 rip** command to display settings of timers.

#### Related Commands

<b>Command</b>	<code>timers update invalid flush</code>
<b>Parameter Description</b>	<p><i>Update</i>: Indicates the route update time in second. It defines the interval at which the device sends the route update packet. Each time an update packet is received, the invalid timer and flush timer are reset. By default, a route update packet is sent every 30s.</p> <p><i>Invalid</i>: Indicates the route invalid time in second, counted from the last time when a valid update packet is received. It defines the time after which the route in the routing list becomes invalid because the route is not updated. The duration of the invalid timer must be at least three times the duration of the update timer. If no update packet is received before the invalid timer expires, the corresponding route enters the invalid state. If the update packet is received before the invalid timer expires, the timer is reset. The default duration of the invalid timer is 180s.</p> <p><i>Flush</i>: Indicates the route flushing time in second, counted from the time when the RIPng route enters the invalid state. When the flush timer expires, the route in the invalid state will be deleted from the routing table. The default duration of the flush timer is 120s.</p>
<b>Command Mode</b>	Routing process configuration mode
<b>Usage Guide</b>	By default, the update timer is 30s, the invalid timer is 180s, and the flush timer is 120s.

#### Configuration Example

<p><b>Scenario</b> Figure 8- 11</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the interface IPv6 addresses on all routers. (Omitted)</li> <li>● Configure the RIPng basic functions on all routers. (Omitted)</li> <li>● On Router A, configure the update timer, invalid timer, and flush timer.</li> </ul>
<p><b>B</b></p>	<pre>B# configure terminal B(config)#ipv6routerrip B(config-router)# timers 10 30 90</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● On Router B, check the settings of RIPng timers.</li> </ul>
<p><b>B</b></p>	<pre>B# show ipv6 rip  Routing Protocol is "RIPng"    Sending updates every 10 seconds with +/-50%, next due in 12 seconds   Timeout after 30 seconds, garbage collect after 90 seconds   Outgoing update filter list for all interface is: not set   Incoming update filter list for all interface is: not set   Default redistribution metric is 1   Default distance is 120   Redistribution:     Redistributing protocol connected   Defaultversion control: send version 1, receive version 1  Interface                Send  Recv -----                - GigabitEthernet0/1      1     1  Routing Information Sources:    Gateway: fe80::2d0:f8ff:fe22:334a Distance: 120    Last Update: 00:00:02  Bad Packets:0  Bad Routes:0</pre>

**Common Errors**

- Settings of RIPng timers on devices connected to the same network are inconsistent. Consequently, routes cannot be learned properly.

## 8.5 Monitoring

### Displaying

Description	Command
Displays information about the RIPng process.	<b>show ipv6 rip</b>
Displays the RIPng routing table.	<b>show ipv6 rip database</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs RIPng.	<b>debug ipv6 rip</b> [interface <i>interface-type interface-num</i>   nsm   restart ]

## 9 Configuring PBR

### 9.1 Overview

Policy-based routing (PBR) is implemented by applying a route map including policies to interfaces and devices.

Similar to static routing, PBR is also manually configured and cannot automatically update with network changes. In addition, PBR is effective only for packets sent from local interfaces and devices. As compared with static and dynamic routing, PBR is more flexible. Static and dynamic routing can forward packets only based on destination addresses. PBR can forward packets based on source and destination addresses, packet length and input interface.

### 9.2 Applications

Application	Description
Selecting an ISP by Using PBR	Specify preferential output interfaces for packets from different subnets.
Implementing Traffic Classification by Using PBR	Specify QoS values for packets from different subnets.

#### 9.2.1 Selecting an ISP by Using PBR

An existing user network often uses resources of multiple internet server providers (ISPs). PBR needs to be used since different bandwidths may be requested from different ISPs or the network resources for key users need to be protected. By controlling forwarding of certain data packets, you can make full use of ISP resources as well as meet the requirements of flexible and diversified applications.

#### Scenario

Figure 9- 1

ALAN has two output interfaces for connecting the Internet. PBR is configured on the layer-3 device DEV1 to enable the two output interfaces to implement load sharing and mutual backup.

The specific requirements are as follows:

- Data streams from subnet 1 are sent from GE 0/1.
- Data streams from subnet 2 are sent from GE 0/2.
- If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.

### Deployment

- Configure two different ACLs on the layer-3 device DEV1:  
ACL1: source addresses belong to subnet 1.  
ACL2: source addresses belong to subnet 2.
- Configure two policies in the route map on the layer-3 device DEV1:  
Policy 1: sets the next hops for packets matching ACL1 to GE0/1 and GE0/2 (Based on the configuration sequence, GE0/1 takes effect first and GE0/2 works in the backup mode).  
Policy 2: sets the next hops for packets matching ACL2 to GE0/2 and GE0/1 (Based on the configuration sequence, GE0/2 takes effect first and GE0/1 works in the backup mode).
- Configure PBR on GE0/3 (by using a route map). Then, packets received on this interface are forwarded based on the policies.

## 9.2.2 Implementing Traffic Classification by Using PBR

### Scenario

Networks of medium- and small-sized enterprises have simple structures. Different branch nodes are interconnected to the central nodes through carrier dedicated lines or the Internet VPN mode. Enterprise networks often need to implement three-in-one integration (of audio, video and data) to maximize the utilization of existing IP networks and save costs. Since all traffic is output from a single output interface, it is necessary to adjust the QoS policies for the output interface, in order to provide preferential communication quality for bandwidth- and delay-sensitive applications.

Figure 9- 2

ALAN has an output interface for connecting the Internet. PBR is configured on the layer-3 device DEV1 to change the QoS values for packets from different networks.

The specific requirements are as follows:

- For data streams from subnet 1, representing audio streams, set the DSCP value to 56.
- For data streams from subnet 2, representing video streams, set the DSCP value to 40.
- For data streams from subnet 3, representing data streams, set the DSCP value to 24.

### Deployment

- Configure three different ACLs on the layer-3 device DEV1:
  - ACL1: source addresses belong to subnet 1.
  - ACL2: source addresses belong to subnet 2.
  - ACL3: source addresses belong to subnet 3.
- Configure three policies in the route map on the layer-3 device DEV1:
  - Policy 1: sets the DSCP value for packets matching ACL1 to 56.
  - Policy 2: sets the DSCP value for packets matching ACL2 to 40.
  - Policy 3: sets the DSCP value for packets matching ACL3 to 24.
- Configure PBR on GE0/3 (by using a route map). Then, the DSCP values for packets received on this interface are changed based on the policies.

## 9.3 Features

Feature	Description
Configuring a Policy	Before configuring PBR, configure policies in a route map.
Configuring PBR	Apply a route map including policies to interfaces and devices to implement PBR.

### 9.3.1 Configuring a Policy

A policy is a "match ..., set..." statement, which indicates that "if certain conditions are matched, perform certain processing actions".

-  For detailed introduction to the policies, see the section "Route Map".

## Executing Policies

In the global configuration mode, you can run the **route-map** *route-map-name* [**permit** | **deny**][*sequence-number*] command to create a policy in a route map.

A route map may contain multiple policies. Each policy has a corresponding sequence number. A smaller sequence number means a higher priority. Policies are executed based on their sequence numbers. Once the matching condition of a policy is met, the processing action for this policy needs to be executed and the route map exits. If no matching condition of any policy is met, no processing action will be performed.

Policies have two working modes:

- **permit**: When the matching condition of a policy is met, perform the processing action for this policy and exit the route map.
- **deny**: When the matching condition of a policy is met, do not perform the processing action for this policy and exit the route map.

## Matching conditions of policies

The matching conditions of a policy may contain 0, 1 or more matching rules.

- If 0 matching rule is contained, no packet will be matched.
- If one or more match rules are contained, all match rules must be matched at the same time to meet the matching conditions of the policy.

In the route map mode, run the **match** command to configure match rules. One **match** command is mapped to one match rule.

PBR supports the following **match** commands:

	Command	Description
	<b>match ip address</b>	The source IPv4 address (and the destination IPv4 address) is used as the matching condition.   Multiple <b>match ip address</b> commands can be configured in a policy.
IPv6 PBR	<b>match ipv6 address</b>	The source IPv6 address (and the destination IPv6 address) is used as the matching condition.   Only one <b>match ipv6 policy</b> command can be configured in a policy.

-  IPv4 PBR defines the source IP address (and destination IP address) ranges of packets by using the IP standard or extended ACLs. IPv6 PBR defines the source IPv6 address (and destination IPv6 address) ranges of packets by using the IPv6 extended ACLs.
-  Packet forwarding based on policies of IPv4 PBR interfaces supports expert-level and MAC name ACLs. Packet forwarding based on local policies does not support expert-level and MAC name ACLs.
-  When PBR uses an ACL that is unavailable, the route sub-map will not be matched and the next route sub-map will be matched instead. If no route sub-map is matched, a common route will be selected for forwarding. If only ACLs are configured but no ACE is configured, the PBR forwarding behavior is the same as that in a scenario where an ACL is unavailable
-  On a switch, if a route sub-map uses multiple ACLs in PBR, only the first ACL is matched.

## Processing action for a policy

The processing action of a policy may contain 0, 1 or more set rules.

- If 0 set rule is contained, no processing action will be performed and the route map will directly exit.

- If one or more set rules are contained, all processing actions will be performed and the route map will exit.

If set rules have different priorities, the set rule with the highest priority will take effect.

In the route map mode, run the **set** command to configure set rules. One **set** command is mapped to one set rule.

PBR supports the following **set** commands:

	Command	Description
IPv4 PBR	<b>set ip tos</b>	<p>Modifies the <b>tos</b> field of an IPv4 packet.</p> <p> Command <b>set ip and dscp</b> cannot work with each other.</p>
	<b>set ip precedence</b>	<p>Modifies the <b>precedence</b> field of an IPv4 packet.</p> <p> Command <b>set ip and dscp</b> cannot work with each other.</p>
	<b>set ip dscp</b>	<p>Modifies the <b>dscp</b> field of an IPv4 packet.</p> <p> Command <b>set ip tos and precedence</b> cannot work with each other.</p>
	<b>set ip next-hop</b>	<p>Configures the next hop of IPv4 packet forwarding. The next hop must be directly connected; otherwise, this command is invalid.</p> <p>A packet matching the match rules will be forwarded to the next hop specified by <b>set ip next-hop first</b>, no matter whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p> On a switch, the output interfaces for next hops supported by PBR include the SVI, routing and layer-3 AP interfaces.</p>
	<b>set ip next-hop recursive</b>	<p>Configures the recursive next hop of IPv4 packet forwarding. The next hop can be directly connected or not directly connected. A non-directly-connected next hop will recur to a static or dynamic route in the routing table.</p> <p>This command supports recursion to multiple ECMP next hops of a static or dynamic route. A maximum of 32 next hops are supported. If a recursive route is a static route, only one next hop is supported for the static recursive route.</p> <p>The redundant backup or load balancing mode of multiple recursive next hops is also determined by the <b>ip policy { redundancy   load-balance }</b> command.</p> <p>A packet matching the match rules will be forwarded to the recursive next hop specified by <b>set ip next-hop recursive first</b>, no matter whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p> Only when a static or dynamic route has an output interface and a next-hop IP address, the policy-based recursive next hop can take effect.</p>
	<b>set ip default next-hop</b>	<p>Configures the default next hop of IPv4 packet forwarding.</p> <p>A packet matching the match rules will be forwarded to the default next hop specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table.</p>
IPv6 PBR	<b>set ipv6 precedence</b>	<p>Modifies the <b>precedence</b> field of an IPv6 packet.</p> <p> IPv6 PBR does not support <b>set ipv6 tos</b> or <b>set ipv6 dscp</b>.</p>
	<b>set ipv6 next-hop</b>	<p>Configures the next hop of IPv6 packet forwarding.</p> <p>An IPv6 packet matching the match rules will be forwarded to the next hop</p>

	Command	Description
		<p>specified by <b>set ipv6 next-hop</b> first, no matter whether the route selected for the IPv6 packet in the routing table is consistent with the next hop specified by PBR. The next hop must be directly connected; otherwise, this command is invalid.</p>
	<b>set ipv6 next-hop recursive</b>	<p>Configures the recursive next hop for IPv6 packet forwarding. The next hop can be directly or indirectly connected. An indirectly connected next hop will be recursed to a static or dynamic route in the routing table.</p> <p>This command supports recursion to multiple ECMP next hops of a static or dynamic route, and a maximum of 32 next hops are supported.</p> <p>The redundancy or load balancing mode of multiple recursive next hops is determined by the <b>ipv6 policy { redundance   load-balance }</b> command.</p> <p>A packet matching the match rules will be first forwarded to the next hop specified by the <b>set ipv6 next-hop recursive</b> command, regardless of whether the route selected for the packet in the routing table is consistent with the next hop specified by PBR.</p> <p>The recursive next hop takes effect only upon recursion to a static or dynamic route that has an egress and next-hop IPv6 address.</p>
	<b>set ipv6 default next-hop</b>	<p>Configures the default next hop of IPv6 packet forwarding.</p> <p>An IPv6 packet matching the match rules will be forwarded to the default next hop specified by this command if a route fails to be selected or the default route is selected for this packet in the routing table.</p> <p>The next hop must be directly connected; otherwise, this command is invalid.</p>

**i** The priority sequence is as follows: **set vrf>set ip next-hop>set ip next-hop>set ip next-hop recursive>common route>set ip default next-hop>** default route. The preceding **set** commands can be configured at the same time but only the command with the highest priority takes effect.

**i** The priority sequence is as follows: **set ipv6 next-hop>set ipv6 next-hop recursive>common route>set ipv6 default next-hop>** default route. The preceding **set** commands can be configured at the same time but only the command with the highest priority takes effect.

For switches, the **set ipv6 default next-hop** command does not take effect for IPv6 addresses whose mask length exceeds 64.

### 9.3.2 Configuring PBR

#### PBR

Apply a route map including policies to interfaces or devices to implement PBR.

- Apply a route map to an interface so that packets received by the interface are routed based on the policy. The PBR is often used to control user packets received by a device. This command is effective only for forwarded packets, but not for locally initiated packets.
- Apply a route map to a device so that packets locally initiated are routed based on the policy. The PBR is often used to control protocol packets exchanged between devices (such as ping packets sent locally). This command is effective only for locally initiated packets, but not for forwarded packets.

**i** By default, PBR is not unavailable on a device and packets are forwarded based on a routing table.

**i** On a switch, the interfaces which support PBR are L3 Ethernet interface, SVI interface and L3 AP interface.

## Redundant backup or load balancing

You can set multiple next hops in a policy. Either redundant backup or load balancing can be implemented among multiple next hops. Redundant backup is implemented by default.

**i** Redundant backup or load balancing is only effective for next hops configured in the **set ip next-hop**, **set ip next-hop recursive**, **set ip default next-hop**, **set ipv6 next-hop**, **set ipv6 next-hop recursive** and **set ipv6 default next-hop** commands, and only effective among multiple next hops in the same set rule.

- Redundant backup

Based on the configuration sequence, the first accessible next hop takes effect. When the currently effective next hop (R1) is faulty, the traffic automatically switches to the next accessible next hop (R2). When R1 becomes accessible again, the traffic automatically switches back to R1.

A newly added next hop is arranged at the last of the sequence. Assume that the original sequence of multiple next hops is R1 > R2 > R3. After R1 is deleted and added again, the sequence changes to R2 > R3 > R1.

If no next hop is accessible, packets will be discarded.

## Correlation with BFD

Correlation between PBR and BFD is effective only for next hops configured by the **set ip next-hop** or **set ipv6 next-hop** command.

The **set ip next-hop** and **set ipv6 next-hop** commands carry the **verify-availability** and **bfd [ vrf vrf-name ] interface-type interface-number gateway** parameters, which can establish correlation between PBR and a BFD session and monitor the accessibility of next hops.

Correlation between PBR and BFD helps enhance the PBR's perception about network environment changes. When BFD detects that the current next hop is not accessible, the BFD will immediately notify the PBR to switch the traffic to another accessible next hop (to implement redundant backup) or all the other accessible next hops (to implement load balancing).

**i** For the configuration and related commands for correlation between PBR and BFD, see the "BFD" section.

## Correlation with Track

Correlation between PBR and Track is effective only for next hops configured by the **set ip next-hop** command.

The **set ip next-hop** command carries the **verify-availability** and **track track-obj-number** parameters, which can establish correlation between PBR and a Track session and monitor the accessibility of next hops.

Correlation between PBR and Track helps enhance the PBR's perception about network environment changes. When Track detects that the current next hop is not accessible, the Track will immediately notify the PBR to switch the traffic to another accessible next hop (to implement redundant backup) or all the other accessible next hops (to implement load balancing).

**i** Only IPv4 PBR supports correlation with Track.

**i** For the configuration and related commands for correlation between PBR and Track, see the "RNS" section.

## Source-addressed-based PBR

Run the global configuration commands **ip policy-source in-interface** and **ipv6 policy-source in-interface** to directly generate source-address-based PBR. You do not need to configure a route map.

- If only source IPv4 or Ipv6 addresses need to be matched for packets forwarded by an interface, you can apply the command for source-address-based PBR. The procedure for configuring this command is simpler than that for interface-based PBR.
- If source-address-based PBR is applied to a specified interface, packets received on this interface will be routed based on policies according to the source addresses.

The PBR is often used to control user packets received by a device. This command is effective only for forwarded packets, but not for locally initiated packets.

- Source-address-based PBR has a higher priority than interface-based PBR. If source-address-based PBR and interface-based PBR are applied to the same interface, only interface-based PBR takes effect.
- By default, source-address-based routing is not available on devices and packets are forwarded based on the routing table.

### 9.4 Limitations

- If PBR refers ACL which does not exist, the route submap is not matched but match the next route submap. When all route submaps do not match, it is forwarded through common route. It is the same if only ACL is configured but the ACE is not.
- On a switch, if a route submap of PBR refers to multiple ACLs, it matches only the first ACL and does not match the subsequent ACL.

### 9.5 Configuration

Configuration	Description and Command	
Configuring Basic Functions of PBR	(Mandatory) It is used to apply PBR to forward packets.	
	<b>ip policy route-map</b>	Applies PBR for IPv4 packets received by an interface.
	<b>ipv6 policy route-map</b>	Applies PBR for IPv6 packets received by an interface.
	<b>ip local policy route-map</b>	Applies PBR for IPv4 packets locally initiated.
	<b>ipv6 local policy route-map</b>	Applies PBR for IPv6 packets locally initiated.
Setting Redundant Backup or Load Balancing	(Optional) It is used to set whether PBR implements redundant backup or load balancing among multiple next hops.	
	<b>ip policy { redundancy   load-balance }</b>	Sets whether IPv4 PBR implements redundant backup or load balancing among multiple next hops. The default setting is redundant backup.
	<b>ipv6 policy { redundancy   load-balance }</b>	Sets whether IPv6 PBR implements redundant backup or load balancing among multiple next hops. The default setting is redundant backup.
Configuring Source-Address-Based PBR	(Optional) It is used to apply source-address-based PBR to forward packets.	
	<b>ip policy-source in-interface</b>	Applies source-address-based PBR for IPv4 packets received by an interface.
	<b>ipv6 policy-source in-interface</b>	Applies source-address-based PBR for IPv6 packets received by an interface.

### 9.5.1 Configuring Basic Functions of PBR

#### Configuration Effect

Perform personalized routing management for user data streams by preparing flexible policies.

Perform personalized management for protocol interaction and network topologies by preparing flexible policies.

#### Notes

- A route map must be used when PBR is configured; therefore, you must configure a route map on a device.
- If an ACL is used when the route map is configured, you must configure the ACL on the device.

#### Configuration Steps

##### ▾ Applying PBR for IPv4 packets received by an interface

- To perform personalized routing management for IPv4 user data streams passing a device, you should perform this configuration.
- Perform this configuration on the input interface for user data streams.
- Run the **ip policy route-map** command to apply a route map to an interface. Then, PBR is executed for IPv4 packets received on this interface.

<b>Command</b>	<b>ip policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Only one <b>ip policy route-map</b> command can be configured for an interface. If multiple <b>ip policy route-map</b> commands are configured for an interface, only the last configuration takes effect. If the route map used in PBR is unavailable, the PBR does not take effect. It will not take effect, if the PBR is configured on DAILER, loopback or tunnel interface.

##### ▾ Applying PBR for IPv6 packets received by an interface

- To perform personalized routing management for IPv6 user data streams passing a device, you should perform this configuration.
- Perform this configuration on the input interface for user data streams.
- Run the **ipv6 policy route-map** command to apply a route map to an interface. Then, PBR is executed for IPv6 packets received on this interface.

<b>Command</b>	<b>ipv6 policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Only one <b>ipv6 policy route-map</b> command can be configured for an interface. If multiple <b>ipv6 policy route-map</b>

	<p>commands are configured for an interface, only the last configuration takes effect.</p> <p>If the route map used in PBR is unavailable, the PBR does not take effect.</p> <p>It will not take effect, if the PBR is configured on DAILER, loopback or tunnel interface.</p>
--	--

#### ▾ Applying PBR for IPv4 packets locally initiated

- To perform personalized management for IPv4 protocol interaction and IPv4 network topologies, you should perform this configuration.
- Run the **ip local policy route-map** command to apply a route map to a device. Then, PBR is executed for IPv4 packets locally initiated.

<b>Command</b>	<b>ip local policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Only one <b>ip local policy route-map</b> command can be configured for a device. If the route map used in PBR is unavailable, the PBR does not take effect.

#### ▾ Applying PBR for IPv6 packets locally initiated

- To perform personalized management for IPv6 protocol interaction and IPv6 network topologies, you should perform this configuration.
- Run the **ipv6 local policy route-map** command to apply a route map to a device. Then, PBR is executed for IPv6 packets locally initiated.

<b>Command</b>	<b>ipv6 local policy route-map</b> <i>route-map-name</i>
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Defaults</b>	By default, PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Only one <b>ipv6 local policy route-map</b> command can be configured for a device. If the route map used in PBR is unavailable, the PBR does not take effect.

#### Verification

- Check the configurations of PBR.
- Check the configurations of the route map used by PBR.
- If an ACL is used when the route map is configured, you should check the configurations of the ACL.

#### ▾ Checking the configurations of IPv4 PBR

<b>Command</b>	<b>show ip policy</b> [ <i>route-map-name</i> ]
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Command</b>	Privilege, global and interface configuration modes

<b>Mode</b>	
<b>Usage Guide</b>	<p>Check the interfaces configured with IPv4 PBR according to the output information and the name of the used route map.</p> <pre>FS# show ip policy  Banalance mode: redundance  Interface          Route map local              RM_for_PBR_1 GigabitEthernet0/1  RM_for_PBR_2</pre> <p><b>Local</b> indicates applying policy-based routing for IPv4 packets locally initiated.</p>

### ↘ Checking the configurations of IPv6 PBR

<b>Command</b>	<b>show ipv6 policy</b> [ <i>route-map-name</i> ]
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Check the interfaces configured with IPv6 PBR according to the output information and the name of the used route map.</p> <pre>FS#show ipv6 policy  Banalance mode: redundance  Interface          Route map local              RM_for_PBR_1 VLAN 1             RM_for_PBR_2</pre> <p><b>Local</b> indicates applying policy-based routing for IPv6 packets locally initiated.</p>

### ↘ Checking the configurations of a route map

<b>Command</b>	<b>show route-map</b> [ <i>route-map-name</i> ]
<b>Parameter Description</b>	<i>route-map-name</i> : Indicates the name of a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Multiple route maps may be available on a device. Focus on the route map used in PBR and check its policy settings.</p> <pre>FS# show route-map  route-map RM_FOR_PBR, permit, sequence 10    Match clauses:     ip address acl1    Set clauses:     ip next-hop 200.24.18.1</pre>

	<pre>route-map RM_FOR_PBR, permit, sequence 20    Match clauses:      ip address acl2    Set clauses:  ip next-hop 200.24.19.1</pre>
--	--

### ▾ Checking the configurations of an ACL

<b>Command</b>	<b>show access-lists [ <i>acl-id</i>   <i>acl-name</i> ]</b>
<b>Parameter</b>	<i>acl-id</i> : Indicates the ACL ID.
<b>Description</b>	<i>acl-name</i> : Indicates the ACL name.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Multiple ACLs may be available on a device. Focus on the ACL used by a route map and check its configurations.</p> <pre>FS# show access-lists 1  ip access-list standard 1    10 permit 200.24.16.0 0.0.0.255  ip access-list standard 2    10 permit 200.24.17.0 0.0.0.255</pre>

### ▾ Checking the routing information of IPv4 PBR

<b>Command</b>	<b>show ip pbr route [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a local interface or device and check the routing information of IPv4 PBR.</p> <pre>FS# show ip pbr route  PBR IPv4 Route Summay : 1  Interface      : GigabitEthernet0/1    Sequence      10    Min Length    : None    Max Length    : None    VRF ID        0    Route Flags   :    Route Type    : PBR    Direct        : Permit    Priority       : High</pre>

	<pre> Tos_Dscp      : None Precedence    : None  Tos_Dscp      : 0 Precedence    : 0  Mode          : redundance  NextHop Count : 1  NextHop[0]    : 192.168.8.100  Weight[0]     : 1  Ifindex[0]    : 2                 </pre>
--	---

↘ **Checking the routing information of IPv6 PBR**

<b>Command</b>	<b>show ipv6 pbr route [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a local interface or device and check the routing information of IPv6 PBR.</p> <pre> FS# show ipv6 pbr route  PBR IPv6 Route Summary : 1  Interface      : GigabitEthernet 0/1  Sequence      : 10  ACL[0]         : 2900  ACL_CLS[0]    : 5  Min Length    : None  Max Length    : None  VRF ID        : 0  Route Flags    :  Route Type     : PBR  Direct        : Permit  Priority       : High  Tos_Dscp      : None  Precedence    : None  Tos_Dscp      : 0  Precedence    : 0  Mode          : redundance  NextHop Count : 1                 </pre>

	Nexthop[0] : 10::2 Weight[0] : 1 Ifindex[0] : 2
--	---

#### ▾ Checking a route map used by IPv4 PBR

<b>Command</b>	<b>show ip pbr route-map <i>rmap-name</i></b>
<b>Parameter Description</b>	<i>rmap-name</i> : Indicates the route map name.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a route map and check the route map used by IPv4 PBR.</p> <pre>FS# show ip pbr route-map rm PBR VRF: GLOBAL, ID: 0 Forward Mode: redundance Forwarding: On  Route-map rm Route-map index: Sequence 10, permit Match rule: ACL ID: 2900, CLS: 1, Name: acl1 Set rule: IPv4nexthop: 192.168.8.100, (VRF name: , ID: 0), Weight: 0 PBRstateinfoifx: 2, Connected: True, Trackstate: Up</pre>

#### ▾ Checking a route map used by IPv6 PBR

<b>Command</b>	<b>show ipv6 pbr route-map <i>rmap-name</i></b>
<b>Parameter Description</b>	<i>rmap-name</i> : Indicates the route map name.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify a route map and check the route map used by IPv6 PBR.</p> <pre>FS# show ipv6 pbr route-map rm6 PBR VRF: GLOBAL, ID: 0 Forward Mode: redundance Forwarding: On  Route-map rm6</pre>

	Route-map index: Sequence 10, permit  Match rule:  ACLID: 2901, CLS: 5, Name: acl6  Set rule:  IPv6 nexthop: 10::2, (VRF name: , ID: 0), Weight: 0  PBR state info ifx: 2, Connected: True, Track state: Up
--	---

#### ↘ Checking the statistics about packets forwarded by IPv4 PBR

<b>Command</b>	<b>show ip pbr statistics [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	FS# show ip pbr statistics  IPv4 Policy-based route statistic  gigabitEthernet 0/1  statistics : 10

#### ↘ Checking the statistics about packets forwarded by IPv6 PBR

<b>Command</b>	<b>show ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	<b>local</b> : Indicates local.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	FS# show ipv6 pbr statistics  IPv6 Policy-based route statistic  gigabitEthernet 0/1  statistics : 20

#### Configuration Example

## Configuring IPv4 PBR and selecting an output link based on source addresses of packets

<p><b>Scenario</b></p> <p><b>Figure 9- 3</b></p>	
	<p>The layer-3 device DEV1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24. DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on the GE 0/1 interface are switched to the GE 0/2 interface. Vice versa.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure two ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Set a policy to set the next hops for packets from subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)</li> <li>● Set a policy to set the next hops for packets from subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)</li> <li>● Apply the policy to GE 0/3.</li> <li>● Set PBR to implement redundant backup among multiple next hops. (The default setting is redundant backup.)</li> </ul> <p><b>i</b> During redundant backup, based on the configuration sequence, the first next hop takes effect first.</p>
	<pre>DEV1(config)# access-list 1 permit 200.24.16.0 0.0.0.255 DEV1(config)# access-list 2 permit 200.24.17.0 0.0.0.255 DEV1(config)# route-map RM_FOR_PBR 10 DEV1(config-route-map)# match ip address 1 DEV1(config-route-map)# set ip next-hop 200.24.18.1 DEV1(config-route-map)# set ip next-hop 200.24.19.1 DEV1(config-route-map)# exit</pre>

	<pre> DEV1(config)# route-map RM_FOR_PBR 20 DEV1(config-route-map)# match ip address 2 DEV1(config-route-map)# set ip next-hop 200.24.19.1 DEV1(config-route-map)# set ip next-hop 200.24.18.1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet0/3)#ip policy route-map RM_FOR_PBR DEV1(config-if-GigabitEthernet 0/3)#exit DEV1(config)# ip policy redundance </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the configurations of IPv4 PBR.</li> <li>● Check the configurations of the route map.</li> <li>● Check the configurations of an ACL.</li> </ul>
	<pre> DEV1# show ip policy Interface                Route map GigabitEthernet0/3      RM_FOR_PBR </pre>
	<pre> DEV1# show route-map route-map RM_FOR_PBR, permit, sequence 10   Match clauses:     ip address 1   Set clauses: ip next-hop 200.24.18.1 200.24.19.1 route-map RM_FOR_PBR, permit, sequence 20   Match clauses:     ip address 2   Set clauses:     ip next-hop 200.24.19.1 200.24.18.1 </pre>
	<pre> DEV1# show access-lists ip access-list standard 1   10 permit 200.24.16.0 0.0.0.255 ip access-list standard 2   10 permit 200.24.17.0 0.0.0.255 </pre>

## 📌 Configuring IPv6 PBR and selecting an output link based on source addresses of packets

<p><b>Scenario</b> <b>Figure 9- 4</b></p>	
	<p>DEV1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 2003::/64 whereas the network segment where subnet 2 resides is 2004::/64.</p> <p>DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 2001::1/64 and 2002::1/64.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on the GE 0/1 interface are switched to the GE 0/2 interface. Vice versa.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure two ACLs to match packets from subnets 1 and 2 respectively.</li> <li>● Set a policy to set the next hops for packets from subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)</li> <li>● Set a policy to set the next hops for packets from subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)</li> <li>● Apply the policy to GE 0/3.</li> <li>● Set PBR to implement redundant backup among multiple next hops.</li> </ul> <p><b>i</b> During redundant backup, based on the configuration sequence, the first next hop takes effect first.</p>
	<pre> DEV1(config)# ipv6 access-list net1 DEV1(config-ipv6-acl)# permit ipv6 2003::/64 any DEV1(config-ipv6-acl)# exit DEV1(config)# ipv6 access-list net2 DEV1(config-ipv6-acl)# permit ipv6 2004::/64 any DEV1(config-ipv6-acl)# exit DEV1(config)# route-map RM_FOR_PBR 30 DEV1(config-route-map)# match ipv6 address net1 DEV1(config-route-map)# set ipv6 next-hop 2001::1                     </pre>

	<pre> DEV1(config-route-map)# set ipv6 next-hop 2002::1 DEV1(config-route-map)# exit DEV1(config)# route-map RM_FOR_PBR 40 DEV1(config-route-map)# match ipv6 address net2 DEV1(config-route-map)# set ipv6 next-hop 2002::1 DEV1(config-route-map)# set ipv6 next-hop 2001::1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet0/3)# ipv6 policy route-map RM_FOR_PBR DEV1(config-if-GigabitEthernet 0/3)# exit DEV1(config)# ipv6 policy redundancy                     </pre>

---

▾ **Configuring correlation between IPv4 PBR and Track**

<p><b>Scenario</b> Figure 9- 5</p>	
	<p>The layer-3 device DEV1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24. DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p> <ul style="list-style-type: none"> <li>● DEV1 can fast detect a faulty output link and switch to a backup link.</li> </ul>
<p><b>Configuration Steps</b></p>	<p>When configuring IPv4 PBR and selecting an output link based on source addresses of the packets, add or modify the following configurations (red fields):</p> <ul style="list-style-type: none"> <li>● Set two Track objects and track the accessibility of the next hops of the two output interfaces.</li> <li>● When configuring a policy, set the correlation between the next hops and the Track objects.</li> </ul>
<p><b>DEV1</b></p>	<pre> DEV1(config)# ip access-list extended 101 DEV1(config-ip-acl)# permit ip 200.24.16.0.0.255 any DEV1(config-ip-acl)# exit DEV1(config)# ip access-list extended 102 DEV1(config-ip-acl)# permit ip 200.24.17.0.0.255 any DEV1(config-ip-acl)# exit DEV1(config)# ip rns 1 DEV1(config-ip-rns)# icmp-echo 200.24.18.1 DEV1(config)# ip rns schedule 1 start-time now life forever DEV1(config)# track 1 rns 1 DEV1(config)# ip rns 2 DEV1(config-ip-rns)# icmp-echo 200.24.19.1                     </pre>

	<pre> DEV1(config)#ip rns schedule 2 start-time now life forever  DEV1(config)#track 2 rns 2  DEV1(config)# route-map RM_FOR_PBR 10  DEV1(config-route-map)# match ip address 101  DEV1(config-route-map)# set ip next-hop verify-availability 200.24.18.1 track 1  DEV1(config-route-map)# set ip next-hop verify-availability 200.24.19.1 track 2  DEV1(config-route-map)# exit  DEV1(config)# route-map RM_FOR_PBR 20  DEV1(config-route-map)# match ip address 102  DEV1(config-route-map)# set ip next-hop verify-availability 200.24.19.1 track 2  DEV1(config-route-map)# set ip next-hop verify-availability 200.24.18.1 track 1  DEV1(config-route-map)# exit  DEV1(config)# interface GigabitEthernet 0/3  DEV1(config-if-GigabitEthernet0/3)#ip policy route-map RM_FOR_PBR  DEV1(config-if-GigabitEthernet 0/3)#exit  DEV1(config)# ip policy redundance </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check whether the Track objects are up.</li> </ul>
<b>DEV1</b>	<pre> FS#show track  Track 1    Reliable Network Service 1    The state is Up      1 change, current state last: 120 secs    Delay up 30 secs, down 50 secs  Track 2    Reliable Network Service 2    The state is Up      1 change, current state last: 130 secs    Delay up 30 secs, down 50 secs </pre>

-  **Configuring IPv4 recursive PBR, selecting an output link based on source addresses of the packets, and recurring to the output link of a dynamic route**

<p><b>Scenario</b> <b>Figure 9- 6</b></p>	
	<p>The layer-3 device DEV 1 is connected to subnet 1 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24.</p> <p>DEV 1 is connected to subnet 2 through GE0/1 and GE0/2 and their next hops are 200.24. 18. 1 and 200.24. 19. 1.</p>
	<p>Subnet 1 is connected to subnet 2 through two output interfaces of DEV1. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Configure static or dynamic routes in advance to ensure that static or dynamic routes in the network segment 200.24.20.0 are available in the routing table of DEV1.</li> <li>● Data streams from subnet 1 for accessing the Internet can recur to a dynamic route whose IP address is 200.24.20.1.</li> <li>● If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure an ACL to match packets from subnet 1.</li> <li>● Set a policy to set the recursive next hop for packets from subnet 1 to 200.24.20.1.</li> <li>● Apply the policy to GE 0/3.</li> <li>● Set PBR to implement redundant backup among multiple next hops. (The default setting is redundant backup.)</li> </ul> <p><b>i</b> During redundant backup, the sequence for the next hops to take effect is related to the sequence for the static or dynamic routes to take effect.</p>
	<pre>DEV1(config)# access-list 1 permit 200.24.16.0 0.0.0.255 DEV1(config)# route-map RM_FOR_PBR 10 DEV1(config-route-map)# match ip address 1 DEV1(config-route-map)# set ip next-hop recursive 200.24.20.1 DEV1(config-route-map)# exit DEV1(config)# interface GigabitEthernet 0/3 DEV1(config-if-GigabitEthernet0/3)# ip policy route-map RM_FOR_PBR DEV1(config-if-GigabitEthernet 0/3)# exit DEV1(config)# ip policy redundancy</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Check the configurations of IPv4 PBR.</li> <li>● Check the configurations of the route map.</li> <li>● Check the configurations of the ACLs.</li> </ul>
	<pre>DEV1# show ip policy</pre>

	Interface	Route map
	GigabitEthernet0/3	RM_FOR_PBR
	<pre>DEV1# show route-map route-map RM_FOR_PBR, permit, sequence 10  Match clauses:  ip address 1  Set clauses:  ip next-hop recursive 200.24.20.1</pre>	
	<pre>DEV1# show access-lists ip access-list standard 1  10 permit 200.24.16.0 0.0.0.255</pre>	

### Common Errors

- A route map is used when PBR is configured but the route map does not exist.
- An ACL is used when a route map is configured but the ACL does not exist.

### 9.5.2 Setting Redundant Backup or Load Balancing

#### Configuration Effect

- Using multiple next hops in the mutual backup mode can enhance the network reliability.
- Implementing load balancing among multiple next hops can expand the network bandwidth.

#### Notes

- The basic functions of PBR must be configured.
- Redundant backup and load balancing are effective only for the next hops set by the following **set** commands.

Command	Description
<b>set ip next-hop</b>	Configures the next hop of IPv4 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ip default next-hop</b>	Configures the default next hop of IPv4 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ipv6 next-hop</b>	Configures the next hop of IPv6 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ipv6 default next-hop</b>	Configures the default next hop of IPv6 packets. This command carries the <i>weight</i> parameter, which is used to set the weight of the WCMP. The default value is 1.
<b>set ip next-hop recursive</b>	Configures the recursive next hop of IPv4 packets. Only one command can be configured for a route map and packets can recur to multiple next hops (up to 32 next hops) of a static or dynamic ECMP route. The redundant backup or load balancing mode for recurring to multiple next hops is also determined by the <b>ip policy { redundancy   load-balance }</b> command.
<b>set ip next-hop recursive</b>	Configures the recursive next hop of IPv4 packets. Only one command can be configured for a route

map and packets can recur to multiple next hops (up to 32 next hops) of a static or dynamic ECMP route. The redundant backup or load balancing mode for recurring to multiple next hops is also determined by the **ip policy { redundance | load-balance }** command.

**i** Up to eight next hops can be set for WCMP whereas up to 32 next hops can be set for ECMP.

### Configuration Steps

#### ➤ Setting whether IPv4 PBR implements redundant backup or load balancing among multiple next hops

- If load balancing needs to be implemented among multiple next hops, this configuration needs to be performed.
- If load balancing is configured at present, you also need to perform this configuration to reset redundant backup.
- This configuration is effective for all PBRs configured on a device.

<b>Command</b>	<b>ip policy { redundance   load-balance }</b>
<b>Parameter</b>	redundance: Indicates redundant backup.
<b>Description</b>	load-balance: Indicates load balancing.
<b>Defaults</b>	Redundant backup is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If redundant backup is selected, the first next hop takes effect based on the configuration sequence. If load balancing is selected, all next hops take effect at the same time and share traffic by weight.

#### ➤ Setting whether Ipv6 PBR implements redundant backup or load balancing among multiple next hops

- If load balancing needs to be implemented among multiple next hops, this configuration needs to be performed.
- If load balancing is configured at present, you also need to perform this configuration to reset redundant backup.
- This configuration is effective for all PBRs configured on a device.

<b>Command</b>	<b>ipv6 policy { redundance   load-balance }</b>
<b>Parameter</b>	redundance: Indicates redundant backup.
<b>Description</b>	load-balance: Indicates load balancing.
<b>Defaults</b>	Redundant backup is configured by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If redundant backup is selected, the first next hop takes effect based on the configuration sequence. If load balancing is selected, all next hops take effect at the same time and share traffic by weight.

### Verification

- Check whether redundant backup or load balancing is implemented among multiple next hops.

#### ➤ Checking whether IPv4 PBR implements redundant backup or load balancing among multiple next hops

<b>Command</b>	<b>show ip policy [ route-map-name ]</b>
<b>Parameter Description</b>	<b>route-map-name: Specifies a route map.</b>
<b>Command Mode</b>	Privilege, global and interface configuration modes

<b>Usage Guide</b>	<p>See the following example and focus on the red field.</p> <pre> FS# show ip policy  Banlance mode: redundance  Interface          Route map local              test GigabitEthernet0/3  test                     </pre>
--------------------	--

↘ **Checking whether IPv6 PBR implements redundant backup or load balancing among multiple next hops**

<b>Command</b>	<code>show ipv6 policy [ route-map-name ]</code>
<b>Parameter Description</b>	<i>route-map-name</i> : Specifies a route map.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>See the following example and focus on the red field.</p> <pre> PE#show ipv6 policy  Banlance mode: redundance  Interface          Route map VLAN 1             RM_for_Vlan_1 VLAN2              RM_for_Vlan_2                     </pre>

**Configuration Example**

↘ **Configuring IPv4 PBR to implement redundant backup among multiple next hops**

See the preceding example: Configuring IPv4 PBR and selecting an output link based on source addresses of packets

↘ **Configuring IPv6 PBR to implement redundant backup among multiple next hops**

See the preceding example: Configuring IPv6 PBR and selecting an output link based on source addresses of packets

↘ **Configuring IPv4 PBR to implement load balancing among multiple next hops**

<p><b>Scenario</b> <b>Figure 9-7</b></p>	
	<p>The layer-3 device DEV1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24. DEV1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows: The traffic is equally shared by GE0/1 and GE0/2.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of PBR. Specify multiple next hops.</li> <li>● Set the load balancing mode.</li> </ul>

### 9.5.3 Configuring Source-Address-Based PBR

#### Configuration Effect

Perform personalized routing management for IPv4 or IPv6 addresses of user data streams by preparing flexible policies.

#### Notes

- Source-address-based PBR has a higher priority than interface-based PBR. When they are applied to an interface at the same time, interface-based PBR takes effect whereas source-address-based PBR does not take effect.

#### Configuration Steps

##### 📌 Applying source-address-based PBR for IPv4 packets received by an interface

- To perform personalized routing management based on source IPv4 addresses for IPv4 user data streams passing a device, you should perform this configuration.
- The global configuration takes effect on the input interface of specified user data streams.
- Run the **ip policy-source in-interface** command to perform source-address-based PBR for IPv4 packets received by a specified interface.

<b>Command</b>	<b>ip policy-source in-interface</b> <i>interface-type</i> <i>sequence</i> { <i>source-address mask</i>   <i>source-address/mask</i> } <b>[default]</b> <b>next-hop</b> <i>ip-address</i> [ <i>weight</i> ]   <b>[default]</b> <b>interface</b> <i>out-interface-type</i>   <b>vrf</b> <i>vrf-name</i> }
<b>Parameter Description</b>	<i>interface-type</i> : Specifies the type of an interface to which source-address PBR is applied. <i>sequence</i> : Indicates the sequence number of a policy. A smaller sequence number means a higher priority. <i>source-address</i> : Indicates the source IPv4 address. <i>mask</i> : Indicates the mask of the source IPv4 address. <i>ip-address</i> : Indicates the next-hop IPv4 address. <i>weight</i> : Indicates the weight of a next hop. <i>out-interface-type</i> : Indicates the type of the next hop output interface. <i>vrf-name</i> : Indicates the name of a VRF instance.
<b>Defaults</b>	By default, source-address-based PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>Configure multiple <b>ip policy-source in-interface</b> commands for the same interface. The sequence numbers of different source addresses are different. A smaller sequence number means a higher priority of the source-address-based PBR.</p> <p>When the sequence number is the same, the priorities of next hops are as follows: <b>vrf vrf-name &gt; next-hop ip-address &gt; interface out-interface-type &gt; default next-hop ip-address &gt; default interface out-interface-type</b>.</p> <p>Source-address-based PBR has a higher priority than interface-based PBR. When they are applied to an interface at the same time, interface-based PBR takes effect whereas source-address-based PBR does not take effect.</p>

#### ▾ Applying source-address-based PBR for IPv6 packets received by an interface

- To perform personalized routing management based on source IPv6 addresses for IPv6 user data streams passing a device, you should perform this configuration.
- The global configuration takes effect on the input interface of specified user data streams.
- Run the **ipv6 policy-source in-interface** command to perform source-address-based PBR for IPv6 packets received by a specified interface.

<b>Command</b>	<b>ipv6 policy-source in-interface</b> <i>interface-type</i> <i>sequence</i> { <i>source-address/prefix-length</i> } <b>[default]</b> <b>next-hop</b> <i>ipv6-address</i> [ <i>weight</i> ]   <b>[default]</b> <b>interface</b> <i>out-interface-type</i>   <b>vrf</b> <i>vrf-name</i> }
<b>Parameter Description</b>	<p><i>interface-type</i>: Specifies the type of an interface to which source-address PBR is applied.</p> <p><i>sequence</i>: Indicates the sequence number of a policy. A smaller sequence number means a higher priority.</p> <p><i>source-address</i>: Indicates the source IPv6 address.</p> <p><i>prefix-length</i>: Indicates the prefix length of a source IPv6 address.</p> <p><i>ipv6-address</i>: Indicates the next-hop IPv6 address.</p> <p><i>weight</i>: Indicates the weight of a next hop.</p> <p><i>out-interface-type</i>: Indicates the type of the next hop output interface.</p> <p><i>vrf-name</i>: Indicates the name of a VRF instance.</p>
<b>Defaults</b>	By default, source-address-based PBR is unavailable on a device and packets are forwarded based on a routing table.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Configure multiple <b>ipv6 policy-source in-interface</b> commands for the same interface. The sequence numbers of different source addresses are different. A smaller sequence number means a higher priority of the source-address-based PBR.</p> <p>When the sequence number is the same, the priorities of next hops are as follows: <b>vrf vrf-name &gt; next-hop ipv6-address &gt; interface out-interface-type &gt; default next-hop ipv6-address &gt; default interface out-interface-type</b>.</p> <p>Source-address-based PBR has a higher priority than interface-based PBR. When they are applied to an interface at the same time, interface-based PBR takes effect whereas source-address-based PBR does not take effect.</p>

#### Verification

##### ▾ Checking the routing information of source-address-based IPv4 PBR

<b>Command</b>	<b>show ip pbr source-route</b> [ <b>interface</b> <i>if-name</i> ]
<b>Parameter Description</b>	<i>if-name</i> : Indicates an interface name.
<b>Command Mode</b>	Privilege, global and interface configuration modes

<b>Usage Guide</b>	<p>Specify an interface and check the routing information of IPv4 source-address-based PBR.</p> <pre> FS# show ip pbr source-route  PBR IPv4 Source Route  Interface      : GigabitEthernet 0/1  Sequence      : 10  Source address : 10.1.1.1/24  VRF ID        : 0  Route Flags   :  RouteType     : PBR  Direct        : Permit  Priority       : High  Match_ipaddr  : Exist  Mode           : redundance  Nexthop Count : 1  Nexthop[0]    : 192.168.8.100  Weight[0]     : 1  Ifindex[0]    : 2                     </pre>
--------------------	--

📌 **Checking the routing information of IPv6 PBR**

<b>Command</b>	<b>show ipv6 pbr source-route [ interface <i>if-name</i> ]</b>
<b>Parameter</b>	<i>if-name</i> : Indicates an interface name.
<b>Description</b>	
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>Specify an interface and check the routing information of IPv6 PBR.</p> <pre> FS# show ipv6 pbr source-route  PBR IPv6 Source Route  Interface      : GigabitEthernet 0/1  Sequence      : 10  Source address : 1000::1/64  VRF ID        : 0  Route Flags   :  RouteType     : PBR  Direct        : Permit  Priority       : High  Match_ipaddr  : Exist                     </pre>

<p>Mode : redundance</p> <p>NextHop Count : 1</p> <p>NextHop[0] : 1001::2</p> <p>Weight[0] : 1</p> <p>Ifindex[0] 3</p>
--

**Configuration Example**

📌 **Configuring IPv4 source-address-based PBR and selecting an output link based on source addresses of packets**

<p><b>Scenario</b></p> <p><b>Figure 9- 9</b></p>	
	<p>The layer-3 device DEV 1 is connected to subnet 1 and subnet 2 through GE0/3. The network segment where subnet 1 resides is 200.24.16.0/24 whereas the network segment where subnet 2 resides is 200.24.17.0/24. DEV 1 is connected to the Internet through GE0/1 and GE0/2 and their next hops are 200.24.18.1 and 200.24.19.1.</p>
	<p>This LAN has two output interfaces for connecting the Internet. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● Data streams from subnet 1 for accessing the Internet should pass GE 0/1.</li> <li>● Data streams from subnet 2 for accessing the Internet should pass GE 0/2.</li> <li>● If the GE 0/1 link is disconnected, the data streams on GE 0/1 are switched to GE 0/2. Vice versa.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Set source-address-based PBR and set the next hops for packets from the GE0/3 subnet 1 to GE0/1 and GE0/2. (Pay attention to the configuration sequence.)</li> <li>● Set source-address-based PBR and set the next hops for packets from the GE0/3 subnet 2 to GE0/2 and GE0/1. (Pay attention to the configuration sequence.)</li> <li>● Set PBR to implement redundant backup among multiple next hops. (The default setting is redundant backup.)</li> </ul> <p><b>i</b> During redundant backup, based on the configuration sequence, the first next hop takes effect first.</p>

## 9.6 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the statistics about packets forwarded by IPv4 PBR.	<b>clear ip pbr statistics [ interface <i>if-name</i>   local ]</b>
Clears the statistics about packets forwarded by IPv6 PBR.	<b>clear ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>

### Displaying

Description	Command
Displays the configurations of IPv4 PBR.	<b>show ip policy</b>
Displays the configurations of IPv6 PBR.	<b>show ipv6 policy</b>
Displays the configurations of a route map.	<b>show route-map [ name ]</b>
Displays the configurations of an ACL.	<b>show access-list</b>
Displays the correlation between IPv4 PBR and BFD.	<b>show ip pbr bfd</b>
Displays the correlation between IPv6 PBR and BFD.	<b>show ipv6 pbr bfd</b>
Displays the routing information of IPv4 PBR.	<b>show ip pbr route [ interface <i>if-name</i>   local ]</b>
Displays the routing information of IPv6 PBR.	<b>show ipv6 pbr route [ interface <i>if-name</i>   local ]</b>
Displays a route map used by IPv4 PBR.	<b>show ip pbr route-map <i>rmap-name</i></b>
Displays a route map used by IPv6 PBR.	<b>show ipv6 pbr route-map <i>rmap-name</i></b>
Displays the routing information of IPv4 source-address-based PBR.	<b>show ip pbr source-route [ interface <i>if-name</i> ]</b>
Displays the routing information of IPv6 source-address-based PBR.	<b>show ipv6 pbr source-route [ interface <i>if-name</i> ]</b>
Displays the statistics about IPv4 PBR.	<b>show ip pbr statistics [ interface <i>if-name</i>   local ]</b>
Displays the statistics about IPv6 PBR.	<b>show ipv6 pbr statistics [ interface <i>if-name</i>   local ]</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs PBR errors.	<b>debug pbr error</b>
Debugs PBR events.	<b>debug pbr events</b>
Debugs multiple service cards supported by PBR.	<b>debug pbr ms</b>

Description	Command
Debugs PBR message communication.	<b>debug pbr msg</b>
Debugs interaction between PBR and NSM.	<b>debug pbr nsm</b>
Debugs packet forwarding of PBR.	<b>debug pbr packet</b>
Debugs PBR GR.	<b>debug pbr restart</b>

## 10 Managing Routes

### 10.1 Overview

The network service module (NSM) manages the routing table, consolidates routes sent by various routing protocols, and selects and sends preferred routes to the routing table. Routes discovered by various routing protocols are stored in the routing table. These routes are generally classified by source into three types:

- Direct route: It is the route discovered by a link-layer protocol and is also called interface route.
- Static route: It is manually configured by the network administrator. A static route is easy to configure and less demanding on the system, and therefore applicable to a small-sized network that is stable and has a simple topology. However, when the network topology changes, the static route must be manually reconfigured and cannot automatically adapt to the topological changes.
- Dynamic route: It is the route discovered by a dynamic routing protocol.

### 10.2 Applications

Application	Description
Basic Functions of the Static Route	Manually configure a route.
Floating Static Route	Configure a standby route in the multipath scenario.
Load Balancing Static Route	Configure load balancing static routes in the multipath scenario.
Correlation of Static Routes with BFD	Use the Bidirectional Forwarding Detection (BFD) function to test whether the next hop of a static route is reachable.
Fast Reroute of Static Routes	Use the fast reroute function to improve the switching performance in the multipath scenario.
ARP-to-host Conversion	Use the ARP-to-host conversion to not transmit ARP packets sent by hosts across the whole network.
ND-to-route Conversion	Use the ND-to-route conversion to not transmit ND across the whole network
ND-to-route Delayed Release	Specify the time of delayed release to not immediately release the ND-to-route route

#### 10.2.1 Basic Functions of the Static Route

##### Scenario

On a network with a simple topology, you can configure only static routes to implement network interworking. Appropriate configuration and use of static routes can improve the network performance and guarantee the bandwidth for important network applications.

As shown in Figure 10- 1, to implement interworking between PC 1, PC 2, and PC 3, you can configure static routes on R 1, R 2, and R 3.

- On R 1, configure a route to the network segment of PC 2 through R 2, and a route to the network segment of PC 3 through R 3.
- On R 2, configure a route to the network segment of PC 1 through R 1, and a route to the network segment of PC 3 through R 3.

- On R3, configure a route to the network segment of PC 1 through R1, and a route to the network segment of PC 2 through R2.

Figure 10- 1

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R1, R2, and R3.

### 10.2.2 Floating StaticRoute

#### Scenario

If no dynamic routing protocol is configured, you can configure floating static routes to implement dynamic switching of routes to prevent communication interruption caused by the network connection failures.

As shown in Figure 10-2, to prevent communication interruption caused by a line failure between R1 and R3, you can configure a floating static route respectively on R1 and R3. Normally, packets are forwarded on a path with a small administrative distance. If a link on this path is down, the route is automatically switched to the path with a large administrative distance.

- On R1, configure two routes to the network segment of PC3, including a route through R3 (default distance = 1) and a route through R2 (default distance = 2).
- On R3, configure two routes to the network segment of PC1, including a route through R1 (default distance = 1) and a route through R2 (default distance = 2).

Figure 10- 2

**Deployment**

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.

**10.2.3 Load Balancing Static Route**

**Scenario**

If there are multiple paths to the same destination, you can configure load balancing routes. Unlike floating routes, the administrative distances of load balancing routes are the same. Packets are distributed among these routes based on the balanced forwarding policy.

As shown in Figure 10-3, load balancing routes are configured respectively on R1 and R3 so that packets sent to the network segment of PC3 or PC1 are balanced between two routes, including a route through R2 and a route through R4.

- On R1, configure two routes to the network segment of PC3, including a route through R2 and a route through R4.
- On R3, configure two routes to the network segment of PC1, including a route through R2 and a route through R4.

Figure 10- 3

<b>Remarks</b>	On the switch, the load is balanced based on the destination IP address by default.
----------------	---

**Deployment**

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, R 3, and R 4.
- Configure the load balancing policy on R 1 and R 3.

**10.2.4 Correlation of Static Routes with Track, BFD or ARP**

**Scenario**

When the floating static routes or load balancing static routes are configured, the static routes may fail to sense the route failures if the line is faulty but the interface status is normal. To resolve this problem, the device needs to check whether the next hop of a static route is reachable. If the next hop is not reachable, the device can switch the traffic to the standby route.

You can use the Track, BFD or ARP function to check whether the next hop of a static route is reachable. The following scenario takes BFD as an example.

Three modes can all check whether the next hop of a static route is reachable. If more than one mode is configured, when one mode checks the next hop of a static route is unreachable, then the static route is invalid. Therefore, it is recommend to take only one mode.

As shown in Figure 10-4, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure a floating static route respectively on R 1 and R 3, and correlate static routes with BFD.

- On R 1, configure two routes to the network segment of PC 3, including a route through R 3 (default distance = 1) and a route through R 2 (default distance = 2). BFD is enabled on the first route to check whether the next hop 1.1.13.3 is reachable, and on the second route to check whether the next hop 1.1.12.2 is reachable.
- On R 3, configure two routes to the network segment of PC 1, including a route through R 1 (default distance = 1) and a route through R 2 (default distance = 2). BFD is enabled on the first route to check whether the next hop 1.1.13.1 is reachable, and on the second route to check whether the next hop 1.1.23.2 is reachable.

Figure 100- 4

**Deployment**

- Configure the address and subnet mask of each interface.
- Configure the BFD parameters on each interface.
- Configure static routes and correlate these static routes with BFD on R 1, R 2, and R 3.

## 10.2.5 Fast Reroute of Static Routes

### Scenario

To accelerate route switching and shorten the communication interruption time when no dynamic routing protocol is configured, you can either correlate static routes with Track, BFD or ARP to check whether the next hop is reachable. In addition, you can or configure fast reroute to further improve the convergence performance.

As shown in Figure 10-5, to prevent communication interruption caused by a line failure between R 1 and R 3, you can configure static fast reroute respectively on R 1 and R 3. Normally, packets are forwarded on the path between R 1 and R 3. When the link on this route is down, packets are automatically rerouted to R 2.

- On R 1, configure a route with the exit interface set to Gi0/3 and the next hop set to 1.1.13.3, and a standby route with the exit interface set to Gi0/2 and the next hop set to 1.1.12.2.
- On R 3, configure a route with the exit interface set to Gi0/1 and the next hop set to 1.1.13.1, and a standby route with the exit interface set to Gi0/2 and the next hop set to 1.1.23.2.

Figure 10- 5

### Deployment

- Configure the address and subnet mask of each interface.
- Configure static routes on R 1, R 2, and R 3.
- Configure static fast reroute on R 1, R 2, and R 3.

## 10.2.6 ARP-to-host Conversion

### Scenario

In special requirement scenarios, communication is required between hosts, but ARP packets sent by hosts are not desired to transmit across the whole network. In this case, you can run the arp-to-host command on the devices connected to hosts to convert ARP entries to host routes, so that the remote devices learn the host routes through BGP redistribution to meet the scenario requirement.

As shown in the following figure, PC1 and PC2 are two hosts in the same network segment. PC1 and PC2 are required to communicate with each other, but ARP packets are not desired to transmit across the whole network. Run the arp-to-host command on R1 and R2 to generate ARP host routes, establish a BGP neighbor relationship between R1 and R2, and enable ARP host route redistribution. In this case, both R1 and R2 can obtain routes to PC1 and PC2 to implement network interconnection.

Figure 10- 6

### Deployment

- Configure IP addresses and masks for interfaces.
- Enable ARP-to-host conversion on interfaces of R1 and R2.
- Establish a BGP neighbor relationship between R1 and R2, and redistribute ARP host routes.

## 10.2.7 nd-to-route Conversion

### Scenario

In special requirement scenarios, interconnection is required among hosts, but ND packets sent by hosts are not desired to transmit across the whole network. In this case, you can run the `nd-to-route` command on the devices connected to hosts to convert ND entries to routes, so that the remote devices learn the nd-route route through BGP redistribution to meet the scenario requirement.

As shown in the following figure, PC1 and PC2 are two hosts in the same network segment. PC1 and PC2 are required to communicate with each other, but ND packets are not desired to transmit across the whole network. Run the `nd-to-route` command on R1 and R2 to generate nd-route routes, establish a BGP neighbor relationship between R1 and R2, and enable nd-route route redistribution. In this case, both R1 and R2 can obtain routes to PC1 and PC2 to implement network interconnection.

The hardware delivery performance of remote route is better than that of local device, so the time to release nd-route route should be controlled to avoid premature traffic diversion to the local device. By configuring the `nd-route delayed redistribution` function, you can configure the time to redistribute the nd-route route based on the actual scenario.

By default, the route converted by ND is a static route with a mask of 128 bits. If there are too many ND entries, a large number of nd-route routes are generated, which greatly increases the memory overhead and reduces the computational performance of the route, so you need to aggregate nd-route on the same network segment. You can convert nd-route routes to routes with fixed-length masks to aggregate nd-route routes on the same network segment.

Figure 100-7

### Deployment

- Configure IP addresses and masks for interfaces.
- Enable `nd-to-route` conversion on interfaces of R1 and R2.
- Establish a BGP neighbor relationship between R1 and R2, and redistribute nd-route routes.

## 10.3 Features

Feature	Description
Route Computation	Generate a valid route on a device.
Optimal Route Selection	Select an optimal route to forward packets.
Default Route	Forward all packets and help reduce the size of a routing table.
Route Reliability	Quickly detect a route failure and recover communication.

### 10.3.1 Route Computation

#### Routing Function

Routing functions are classified into IPv4 and IPv6 routing functions. If the routing functions are disabled, a device is equivalent to a host and cannot forward routes.

#### Dynamic Route

A dynamic routing protocol learns remote routes and dynamically updates routes by exchanging routes with neighbors. If a neighbor is the next hop of a route and this neighbor fails, the route fails as well.

#### Static Route

On a network with a simple topology, you can configure only static routes to implement network interworking. Appropriate configuration and use of static routes can improve the network performance and guarantee the bandwidth for important network applications.

Whether a static route is active is computed based on the status of the local interface. When the exit interface of a static route is located at layer 3 (L3) and is in Up status (the link status is Up and the IP address is configured), this route is active and can be used for packet forwarding.

A static route can go across VPN routing & forwarding (VRF) instances. The next hop or exit interface of a static route of VRF 1 can be configured on VRF 2.

#### ARP-to-host Conversion

Enable ARP-to-host conversion on a specified interface. If the interface is a Layer-3 interface in up status, ARP entries will be converted into 32-bit host routes on the interface.

#### ND-to-route Conversion

Enable nd-to-route conversion on a specified interface. If the interface is a Layer-3 interface in up status, ND entries will be converted into routes with fixed-length masks on the interface. By configuring the delayed redistribution of nd-to-route, the nd-to-route is redistributed according to the configured time.

### 10.3.2 Optimal Route Selection

#### Administrative Distance

When multiple routing protocols generate routes to the same destination, the priorities of these routes can be determined based on the administrative distance. A smaller administrative distance indicates a higher priority.

#### Equal-Cost Route

If multiple routes to the same destination have different next hops but the same administrative distance, these routes are mutually equal-cost routes. Packets are distributed among these routes to implement load balancing based on the balanced forwarding policy.

On a specific device, the total number of equal-cost routes is limited. Routes beyond the limit do not participate in packet forwarding.

### Floating Route

If multiple routes to the same destination have different next hops and different administrative distances, these routes are mutually floating routes. The route with the smallest administrative distance will be first selected for packet forwarding. If this route fails, a route with a larger administrative distance is further selected for forwarding, thus preventing communication interruption caused by a network line failure.

### 10.3.3 Default Route

In the forwarding routing table, the route with the destination network segment 0.0.0.0 and the subnet mask 0.0.0.0 is the default route. Packets that cannot be forwarded by other routes will be forwarded by the default route. The default route can be statically configured or generated by a dynamic routing protocol.

#### Static Default Route

On a L3 switch, a static route with the network segment 0.0.0.0 and the subnet mask 0.0.0.0 is configured to generate the default route.

#### Default Network

The default network is configured to generate a default route. If the **ip default-network** command is configured to specify a network (a classful network, such as a Class A, B, or C network), and this network exists in the routing table, the router will use this network as the default network and the next hop of this network is the default gateway. As the network specified by the **ip default-network** command is a classful one, if this command is used to identify a subnet in a classful network, the router automatically generates a static route of the classful network instead of any default route.

### 10.3.4 Route Reliability

When a device on a network is faulty, some routes become unreachable, resulting in traffic interruption. If connectivity of the next hop can be detected in real time, the route can be re-computed when a fault occurs, or traffic can be switched over to the standby route.

#### Correlation with Track

A track object is an abstract concept. It can be used to trace whether an IP address is reachable or whether an interface is up. If a dynamic routing protocol or a static route is correlated with the Track function, the dynamic routing protocol or the static route can quickly learn whether the next hop is reachable so as to respond quickly.

#### Correlation with BFD

The BFD protocol provides a light-load and fast method for detecting the connectivity of the forwarding path between two adjacent routers. If a dynamic routing protocol or a static route is correlated with the BFD function, the dynamic routing protocol or the static route can quickly learn whether the next hop is reachable so as to respond quickly.

 The detection performance of BFD is better than that of Track.

#### Correlation with ARP

If a static route is correlated with the ARP function, when the ARP does not exist, the static route can quickly learn that the next hop is unreachable so as to respond quickly.

### Fast Reroute

Fastreroute provides a standby route. When a dynamic routing protocol or a static route detects that the next hop is unreachable, it immediately switches traffic over to the standby route to recovery communication.

## 10.4 Limitations

Support 64 groups of ECMP, and each group supports a maximum of 32 entries. A group refers to multiple equivalent next hops of a prefix.

## 10.5 Configuration

Configuration Item	Description and Command	
Configuring a Static Route	 (Mandatory) It is used to configure a static route entry.	
	<b>ip route</b>	Configures an IPv4 static route.
	<b>ipv6 route</b>	Configures an IPv6 static route.
Configuring a Default Route	 (Optional) It is used to configure the default gateway.	
	<b>ip route 0.0.0.0 0.0.0.0 gateway</b>	Configures an IPv4 default gateway on a L3 device.
	<b>ipv6 route ::/0 ipv6-gateway</b>	Configures an IPv6 default gateway on a L3 device.
Configuring Route Limitations	 (Optional) It is used to limit the number of equal-cost routes and number of static routes, or disable routing.	
	<b>maximum-paths</b>	Configures the maximum number of equal-cost routes.
	<b>ip static route-limit</b>	Configures the maximum number of IPv4 static routes.
	<b>ipv6 static route-limit</b>	Configures the maximum number of IPv6 static routes.
	<b>no ip routing</b>	Disables IPv4 routing.
	<b>noipv6 unicast-routing</b>	Disables IPv6 routing.
	<b>no ip route static inter-vrf</b>	Prohibits static routing across VRFs.
Correlating a Static Route with BFD	 (Optional) It is used to correlate a static route with BFD.	
	<b>ip route static bfd</b>	Correlates an IPv4 static route with BFD.
	<b>ipv6 route static bfd</b>	Correlates an IPv6 static route with BFD.
Configure Static Fast Reroute	 (Optional) It is used to configure static fast reroute.	
	<b>route-map</b>	Configures a route map.

Configuration Item	Description and Command	
	<b>set fast-reroute backup-nexthop</b>	Configures the standby interface and standby next hop for fast reroute.
	<b>ip fast-reroute</b>	Configures static fast reroute.
Configure ARP-to-host Conversion	<b>ip route arp-to-host interface <i>interface-name</i></b>	Configures ARP-to-host conversion on a specified interface.
	<b>ip route arp-to-host tag <i>tag-number</i></b>	Configures the tag of ARP-to-host
	<b>ip route arp-to-host delay-time <i>time-number</i></b>	Configures the delayed redistribution of ARP-to-host route
	<b>redistribute arp-host[ route-map <i>map-tag</i> ] [ metric <i>metric-value</i> ]</b>	Configures BGP redistribution of ARP host route.
Configure nd-to-route Conversion	<b>ipv6 route nd-to-route delay-time <i>time-number</i></b>	Configures the delayed redistribution of nd-to-route
	<b>ipv6 route nd-to-route interface <i>interface-name</i> [ipv6-prefix <i>X:X:X::X/&lt;0-128&gt;</i>] [prefix-len <i>masklen</i>]</b>	Enables nd-to-route on a specific interface
	<b>ipv6 route nd-to-route tag <i>tag-number</i></b>	Configures the tag of nd-to-route
	<b>ipv6 route nd-to-route warning-ignore</b>	Ignores the alarm log of nd-to-route conversion
	<b>redistribute nd-route[ route-map <i>map-tag</i> ] [ metric <i>metric-value</i> ]</b>	Configures BGP redistribution of nd-route route

### 10.5.1 Configuring a Static Route

#### Configuration Effect

- Generate a static route in the routing table. Use the static route to forward packets to a remote network.

#### Notes

- If the **no ip routing** command is configured on a L3 switch, you cannot configure IPv4 static routes on this switch, and existing IPv4 static routes will also be deleted. Before the device is restarted, reconfiguring the **ip routing** command can recover the deleted IPv4 static routes. After the device is restarted, deleted IPv4 static routes cannot be recovered.
- If the **no ipv6 unicast-routing** command is configured on a L3 switch, you cannot configure IPv6 static routes on this switch, and existing IPv6 static routes will also be deleted. Before the device is restarted, reconfiguring the **ipv6 unicast-routing** command can recover the deleted IPv6 static routes. After the device is restarted, deleted IPv6 static routes cannot be recovered.
- To correlate a static route with the Track function, you must run the **track** command to configure a track object.

#### Configuration Steps

##### 📌 Configuring a Static IPv4 Route

Configure the following command on an IPv4-enabled router.

<b>Command</b>	<b>ip route</b> [vrf <i>vrf_name</i> ] <i>network</i> <i>net-mask</i> { <i>ip-address</i>   <i>interface</i> [ <i>ip-address</i> ]} [ <i>distance</i> ] [ <b>tag</b> <i>tag</i> ] [ <b>permanent</b>   <b>track</b> <i>object-number</i> ] <b>arp</b> ] [ <b>weight</b> <i>number</i> ] [ <b>description</b> <i>description-text</i> ] [ <b>disabled</b>   <b>enabled</b> ] [ <b>global</b> ]	
<b>Parameter Description</b>	<i>vrf</i> <i>vrf_name</i>	(Optional) Indicates the routing VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF of a configured IPv4 address family. The VRF is a global VRF by default.
	<i>network</i>	Indicates the address of the destination network.
	<i>net-mask</i>	Indicates the mask of the destination network.
	<i>ip-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>ip-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<i>tag</i>	(Optional) Indicates the tag of the static route. The tag is 0 by default.
	<b>permanent</b>	(Optional) Indicates the flag of the permanent route. The static route is not a permanent route by default.
	<b>track</b> <i>object-number</i>	(Optional) Indicates correlation with Track. <i>object-number</i> indicates the ID of the track object. By default, the static route is not correlated with the Track function.
	<b>weight</b> <i>number</i>	(Optional) Indicates the weight of the static route. The weight is 1 by default.
	<b>description</b> <i>description-text</i>	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.
	<b>disabled/enabled</b>	(Optional) Indicates the enable flag of the static route. The flag is enabled by default.
	<b>global</b>	(Optional) Indicates that the next hop belongs to a global VRF. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> .
<b>arp</b>	(Optional) Correlate the static route with ARP function. By default, it is not correlated.	
<b>Defaults</b>	By default, no static route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	<p>The simplest configuration of this command is <b>ip route network net-mask ip-address</b>.</p> <p>If the static route is correlated with Track and the down status of the trace object is detected, the static route is not active and does not participate in packet forwarding.</p> <p>If the static route is correlated with ARP, but no ARP information is detected, the static route is not active and does not participate in packet forwarding.</p>	

### 📌 Configuring an IPv6 Static Route

Configure the following command on an IPv6-enabled router.

<b>Command</b>	<b>ipv6 route</b> [vrf <i>vrf-name</i> ] <i>ipv6-prefix</i> / <i>prefix-length</i> { <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name</i> 1  <b>default</b> }]   <i>interface</i> [ <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name</i> 1  <b>default</b> }] ] } [ <i>distance</i> ] [ <b>weight</b> <i>number</i> ] [ <b>description</b> <i>description-text</i> ]	
<b>Parameter Description</b>	<i>vrf</i> <i>vrf-name</i>	(Optional) Indicates the routing VRF, which must be a multi-protocol VRF of a configured IPv6 address family. The VRF is a global VRF by default.
	<i>ipv6-prefix</i>	Indicates the IPv6 prefix, which must comply with the address expression specified in RFC4291.

	<i>prefix-length</i>	Indicates the length of the IPv6 prefix. Note that a slash (/) must be added in front of the length.
	<i>ipv6-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>ipv6-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<b>nexthop-vrf</b> <i>vrf-name 1</i>	(Optional) Indicates the routing VRF of the next hop, which must be a multi-protocol VRF of a configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by the VRF name. <b>nexthop-vrf default</b> indicates that the VRF of the next hop is a global VRF.
	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<b>weight number</b>	(Optional) Indicates the weight of the static route, which must be specified when you configure equal-cost routes. The weight ranges from 1 to 8. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The weight is 1 by default.
	<b>description</b> <i>description-text</i>	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.
<b>Defaults</b>	By default, no static route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	The simplest configuration of this command is <b>ipv6 route</b> <i>ipv6-prefix / prefix-length ipv6-address</i> .	

### Verification

- Run the **show ip route** command to display the IPv4 routing table and check whether the configured IPv4 static route takes effect.
- Run the **show ipv6 route** command to display the IPv6 routing table and check whether the configured IPv6 static route takes effect.

### Configuration Example

#### ▾ Configuring Static Routes to Implement Interworking of the IPv4 Network

<b>Scenario</b> <b>Figure 10- 7</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure interface addresses on each device.</li> </ul>
<b>R1</b>	<pre>R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/2)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#interface gigabitEthernet 0/0 R2(config-if-GigabitEthernet 0/0)# ip address 1.1.2.1 255.255.255.0 R2(config-if-GigabitEthernet 0/0)# exit R2(config)#interface gigabitEthernet 0/1 R2(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R2(config-if-GigabitEthernet 0/1)# exit R2(config)#interface gigabitEthernet 0/3 R2(config-if-GigabitEthernet 0/3)# ip address 1.1.23.2 255.255.255.0</pre>
<b>R3</b>	<pre>R3#configure terminal R3(config)#interface gigabitEthernet 0/0 R3(config-if-GigabitEthernet 0/0)# ip address 1.1.3.1 255.255.255.0 R3(config-if-GigabitEthernet 0/0)# exit</pre>

	<pre>R3(config)#interface gigabitEthernet 0/1 R3(config-if-GigabitEthernet 0/1)# ip address 1.1.13.3 255.255.255.0 R3(config-if-GigabitEthernet 0/0)# exit R3(config)#interface gigabitEthernet 0/2 R3(config-if-GigabitEthernet 0/2)# ip address 1.1.23.3 255.255.255.0</pre>
	<ul style="list-style-type: none"> <li>● Configure static routes on each device.</li> </ul>
<b>R1</b>	<pre>R1#configure terminal R1(config)#ip route 1.1.2.0 255.255.255.0 GigabitEthernet 0/2 1.1.12.2 R1(config)#ip route 1.1.3.0 255.255.255.0 GigabitEthernet 0/3 1.1.13.3</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#ip route 1.1.1.0 255.255.255.0 GigabitEthernet 0/1 1.1.12.1 R2(config)#ip route 1.1.3.0 255.255.255.0 GigabitEthernet 0/3 1.1.23.3</pre>
<b>R3</b>	<pre>R3#configure terminal R3(config)#ip route 1.1.2.0 255.255.255.0 GigabitEthernet 0/2 1.1.23.2 R3(config)#ip route 1.1.1.0 255.255.255.0 GigabitEthernet 0/1 1.1.13.1</pre>

<b>R2</b>	<p>R2# show ipv6 route</p> <p>IPv6 routing table name - Default - 10 entries</p> <p>Codes: C - Connected, L - Local, S - Static</p> <p>R - RIP, O - OSPF, B - BGP, I - IS-IS</p> <p>N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2</p> <p>E1 - OSPF external type 1, E2 - OSPF external type 2</p> <p>SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2</p> <p>IA - Inter area</p> <p>C 1111:2323::/64 via GigabitEthernet 0/0, directly connected</p> <p>L 1111:2323::1/128 via GigabitEthernet 0/0, local host</p> <p>C 1111:1212::/64 via GigabitEthernet 0/1, directly connected</p> <p>L 1111:1212::1/128 via GigabitEthernet 0/1, local host</p> <p>S 1111:1111::/64 [1/0] via GigabitEthernet 0/1, directly connected</p> <p>C FE80::/10 via ::1, Null0</p> <p>C FE80::/64 via GigabitEthernet 0/0, directly connected</p> <p>L FE80::2D0:F8FF:FEFB:C092/128 via GigabitEthernet 0/0, local host</p> <p>C FE80::/64 via GigabitEthernet 0/1, directly connected</p> <p>L FE80::2D0:F8FF:FEFB:C092/128 via GigabitEthernet 0/1, local host</p>

### Common Errors

- The link on the interface is not up.
- No IP address is configured for the interface.
- The static route is correlated with Track, but the track object is not configured.

## 10.5.2 Configuring a DefaultRoute

### Configuration Effect

- Generate a default route in the routing table. The default route is used to forward packets that cannot be forwarded by other routes.

### Notes

- On a L3 switch, run the **ip route 0.0.0.0 0.0.0.0 gateway** or **ipv6 route ::/0 ipv6-gateway** command to configure the default gateway.
- If the **no ip routing** or **no ipv6 unicast-routing** command is configured on a L3 switch, you can run the **ip default gateway** or **ipv6 default gateway** command to configure the default gateway.

### Configuration Steps

#### ▾ Configuring the IPv4 Gateway on a L2 Switch

<b>Command</b>	<b>ip default-gateway gateway</b>	
<b>Parameter Description</b>	<i>gateway</i>	indicates the IPv4 gateway address.
<b>Defaults</b>	By default, no static default route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	N/A	

#### ▾ Configuring the IPv6 Gateway on a L2 Switch

<b>Command</b>	<b>ipv6 default-gateway gateway</b>	
<b>Parameter Description</b>	<i>gateway</i>	indicates the IPv6 gateway address.
<b>Defaults</b>	By default, no static default route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	N/A	

#### ▾ Configuring the IPv4 Default Gateway on a L3 Switch

<b>Command</b>	<b>ip route [vrf vrf_name]0.0.0.0 0.0.0.0 {ip-address   interface [ip-address]} [distance] [tag tag] [permanent ] [weight number] [description description-text] [disabled   enabled] [global]</b>	
<b>Parameter Description</b>	<i>vrf vrf_name</i>	(Optional) Indicates the routing VRF, which can be a single-protocol IPv4 VRF or a multi-protocol VRF of a configured IPv4 address family. The VRF is a global VRF by default.
	<b>0.0.0.0</b>	Indicates the address of the destination network.
	<b>0.0.0.0</b>	Indicates the mask of the destination network.

	<i>ip-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>ip-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ip-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<i>tag</i>	(Optional) Indicates the tag of the static route. The tag is 0 by default.
	<b>permanent</b>	(Optional) Indicates the flag of the permanent route. The static route is not a permanent route by default.
	<b>weight number</b>	(Optional) Indicates the weight of the static route. The weight is 1 by default.
	<b>description</b> <i>description</i> <i>-text</i>	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.
	<b>disabled /enabled</b>	(Optional) Indicates the enable flag of the static route. The flag is enabled by default.
	<b>global</b>	(Optional) Indicates that the next hop belongs to a global VRF. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> .
<b>Defaults</b>	By default, no static default route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	The simplest configuration of this command is <b>ip route 0.0.0.0 0.0.0.0 <i>ip-address</i></b> .	

### ✎ Configuring the IPv6 Default Gateway on a L3 Switch

<b>Command</b>	<b>ipv6 route [vrf <i>vrf-name</i>] ::/0 { <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name 1</i>   <b>default</b> } ] } <i>interface</i> [ <i>ipv6-address</i> [ <b>nexthop-vrf</b> { <i>vrf-name 1</i>   <b>default</b> } ] ] [ <i>distance</i> ] [ <b>weight number</b> ] [ <b>description</b> <i>description-text</i> ]</b>	
<b>Parameter Description</b>	<b>vrf <i>vrf-name</i></b>	(Optional) Indicates the routing VRF, which must be a multi-protocol VRF of a configured IPv6 address family. The VRF is a global VRF by default.
	<b>::</b>	Indicates the IPv6 prefix, which must comply with the address expression specified in RFC4291.
	<b>0</b>	Indicates the length of the IPv6 prefix. Note that a slash (/) must be added in front of the length.
	<i>ipv6-address</i>	(Optional) Indicates the next-hop address of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>ipv6-address</i> is not specified, a static direct route is configured.
	<i>interface</i>	(Optional) Indicates the next-hop exit interface of the static route. You must specify at least one of <i>ipv6-address</i> and <i>interface</i> , or both of them. If <i>interface</i> is not specified, a recursive static direct route is configured. The exit interface is obtained by the next hop in the routing table.
	<b>nexthop-vrf</b> <i>vrf-name 1</i>	(Optional) Indicates the routing VRF of the next hop, which must be a multi-protocol VRF of a configured IPv6 address family. By default, the VRF of the next hop is the same as the VRF specified by <i>vrf name</i> . <b>nexthop-vrf default</b> indicates that the VRF of the next shop is a global VRF.
	<i>distance</i>	(Optional) Indicates the administrative distance of the static route. The administrative distance is 1 by default.
	<b>weight number</b>	(Optional) Indicates the weight of the static route, which must be specified when you configure equal-cost routes. The weight ranges from 1 to 8. When the weights of all equal-cost routes of a route are summed up, the sum cannot exceed the maximum number of equal-cost routes that

		can be configured for the route. Weighting of equal-cost routes of a route indicates the traffic ratio of these routes. The weight is 1 by default.
	<b>description</b> <i>description</i> -text	(Optional) Indicates the description of the static route. By default, no description is configured. <i>description-text</i> is a string of one to 60 characters.
<b>Defaults</b>	By default, no static default route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	The simplest configuration of this command is <b>ipv6 route ::/0 ipv6-gateway</b> .	

▾ **Configuring the IPv4 Default Network on a L3 Switch**

<b>Command</b>	<b>ip default-network network</b>	
<b>Parameter Description</b>	<i>network</i>	Indicates the address of the network. (The network must be a Class A, B, or C network.)
<b>Defaults</b>	By default, no default network is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	If the network specified by the <b>ip default-network</b> command exists, a default route is generated and the next hop to this network is the default gateway. If the network specified by the <b>ip default-network</b> command does not exist, the default route is not generated.	

**Verification**

- On a L2 switch (or a L3 switch where routing is disabled), run the **show ip redirects** or **show ipv6 redirects** command to display the default gateway.
- On a L3 switch where routing is enabled, run the **show ip route** or **show ipv6 route** command to display the default route.

**Configuration Example**

▾ **Configuring IPv4 Default Routes on L3 Switches to Implement Network Interworking**

<b>Scenario</b> Figure 10- 10	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IP addresses on L3 devices.</li> </ul>
<b>R1</b>	<pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/1                     </pre>

	<pre>R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#interface gigabitEthernet 0/0 R2(config-if-GigabitEthernet 0/0)# ip address 1.1.2.1 255.255.255.0 R2(config-if-GigabitEthernet 0/0)# exit R2(config)#interface gigabitEthernet 0/1 R2(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R2(config-if-GigabitEthernet 0/0)# exit</pre>
<b>R1</b>	<ul style="list-style-type: none"> <li>● Configure an IPv6 default gateway on R 1.</li> </ul> <pre>R1#configure terminal R1(config)#ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/1 1.1.12.2</pre>
<b>R2</b>	<pre>R2#configure terminal R2(config)#ip route 0.0.0.0 0.0.0.0 GigabitEthernet 0/1 1.1.12.1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Display the routing table.</li> </ul>
<b>R1</b>	<pre>R1# show ip route  Codes: C-Connected, L-Local, S-Static         R-RIP,O-OSPF,B-BGP,I-IS-IS         N1-OSPFNSSA external type 1, N2-OSPFNSSA external type 2         E1 - OSPF external type 1, E2 - OSPF external type 2         SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2         IA - Inter area, * - candidate default  Gateway of last resort is 1.1.12.2  S*   0.0.0.0/0 [1/0] via 1.1.12.2, GigabitEthernet 0/1 C    1.1.1.0/24 is directly connected, GigabitEthernet 0/0 C    1.1.1.1/32 is local host. C    1.1.12.0/24 is directly connected, GigabitEthernet 0/1 C    1.1.12.1/32 is local host.</pre>

### 10.5.3 Configuring Route Limitations

#### Configuration Effect

- Limit the number of equal-cost routes and number of static routes, or disable routing.

## Notes

Route limitations cannot be configured on a L2 switch.

## Configuration Steps

### ▾ Configuring the Maximum Number of Equal-Cost Routes

<b>Command</b>	<b>maximum-paths</b> <i>number</i>	
<b>Parameter Description</b>	<i>number</i>	Indicates the maximum number of equal-cost routes. The value ranges from 1 to 64.
<b>Defaults</b>	The default value varies from products.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to configure the maximum number of next hops in the equal-cost route. In load balancing mode, the number of routes on which traffic is balanced does not exceed the configured number of equal-cost routes.	

### ▾ Configuring the Maximum Number of IPv4 Static Routes

<b>Command</b>	<b>ip static route-limit</b> <i>number</i>	
<b>Parameter Description</b>	<i>number</i>	Indicates the upper limit of routes. The value ranges from 1 to 10,000.
<b>Defaults</b>	By default, a maximum of 1,024 IP static routes can be configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to configure the maximum number of IPv4 static routes. If the maximum number of IPv4 static routes is reached, no more IPv4 static route can be configured.	

### ▾ Configuring the Maximum Number of IPv6 Static Routes

<b>Command</b>	<b>ipv6 static route-limit</b> <i>number</i>	
<b>Parameter Description</b>	<i>number</i>	Indicates the upper limit of routes. The value ranges from 1 to 10,000.
<b>Defaults</b>	By default, a maximum of 1,000 IPv6 static routes can be configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to configure the maximum number of IPv6 static routes. If the maximum number of IPv6 static routes is reached, no more IPv6 static route can be configured.	

### ▾ Disabling IPv4 Routing

<b>Command</b>	<b>no ip routing</b>	
<b>Parameter Description</b>	N/A	
<b>Defaults</b>	By default, IPv4 routing is enabled.	
<b>Command Mode</b>	Global configuration mode	

<b>Usage Guide</b>	Run this command to disable IPv4 routing. If the device functions only as a bridge or a voice over IP (VoIP) gateway, the device does not need to use the IPv4 routing function of the FSOS software. In this case, you can disable the IPv4 routing function of the FSOS software.
--------------------	---

▾ **Disabling IPv6 Routing**

<b>Command</b>	<b>no ipv6 unicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, IPv6 routing is enabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to disable IPv6 routing. If the device functions only as a bridge or a VoIP gateway, the device does not need to use the IPv6 routing function of the FSOS software. In this case, you can disable the IPv6 routing function of the FSOS software.

▾ **Prohibiting Static Routing Across VRFs**

<b>Command</b>	<b>no ip route static inter-vrf</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Defaults</b>	By default, static IP or IPv6 routing across VRFs is allowed.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to prohibit static IP routing across VRFs. After this command is configured, the static IP route across VRFs is not active and cannot participate in packet forwarding.

**Verification**

Run the **show run** command to display the configuration file and verify that the preceding configuration commands exist.

**Configuration Example**

▾ **Configuring at Most Two Static Routing Limitations**

<b>Configuration Steps</b>	On R 1, configure the IP addresses, static routes, and maximum number of static routes.
	<pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/2)# exit R1(config)#interface gigabitEthernet 0/3 R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0 R1(config-if-GigabitEthernet 0/3)# exit R1(config)#ip route 1.1.3.0 255.255.255.0 1.1.13.3 R1(config)#ip route 1.1.4.0 255.255.255.0 1.1.12.2 R1(config)#ip route 1.1.5.0 255.255.255.0 1.1.12.2 R1(config)#ip static route-limit 2 % Exceeding maximum static routes limit. </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Check the static routes that really take effect in the routing table.</li> </ul> <pre> R1(config)# show ip route Codes: C-Connected, L-Local, S-Static        R-RIP, O-OSPF, B-BGP, I-IS-IS        N1-OSPFNSSA external type 1, N2-OSPFNSSA external type 2        E1-OSPF external type 1, E2-OSPF external type 2        SU-IS-IS summary, L1-IS-IS level-1, L2-IS-IS level-2        IA-Inter area, * - candidate default  Gatewayoflastresortis no set C    1.1.1.0/24 is directly connected, GigabitEthernet 0/0 C    1.1.1.1/32 is local host. S    1.1.3.0/24 [1/0] via 1.1.13.3 S    1.1.4.0/24 [1/0] via 1.1.12.2 </pre>

C	1.1.12.0/24 is directly connected, GigabitEthernet 0/2
C	1.1.12.1/32 is local host.
C	1.1.13.0/24 is directly connected, GigabitEthernet 0/3
C	1.1.13.1/32 is local host.

#### 10.5.4 Correlating a Static Route with BFD

##### Configuration Effect

- A static route can quickly detect a route failure with the help of BFD.

##### Notes

- BFD correlation cannot be configured on a L2 switch.
- You must configure a static route.
- You must configure the BFD session parameters by running the **bfd interval xmin\_rx xmultiplier x** command.

##### Configuration Steps

###### ✚ Correlating an IPv4 Static Route with BFD

Command	<b>ip route static bfd</b> [ <b>vrf vrf-name</b> ] <i>interface-type interface-number gateway</i> [ <b>source ip-address</b> ]	
<b>Parameter Description</b>	<i>vrf vrf-name</i>	(Optional) Indicates the name of the VRF to which the static route belongs. The VRF is a global VRF by default.
	<i>interface-type</i>	Indicates the interface type.
	<i>interface-number</i>	Indicates the interface number.
	<i>gateway</i>	Indicates the IP address of the gateway, that is, the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.
	<b>source ip-address</b>	(Optional) Indicates the source IP address used for the BFD session. This parameter must be configured if the neighbor IP address involves multiple hops. By default, the source IP address is not specified.
<b>Defaults</b>	By default, a static route is not correlated with BFD.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to correlate an IPv4 static route with BFD. If the down status of the BFD session is detected, the IPv4 static route is not active and does not participate in packet forwarding.	

###### ✚ Correlating an IPv6 Static Route with BFD

Command	<b>ipv6 route static bfd</b> [ <b>vrf vrf-name</b> ] <i>interface-type interface-number gateway</i> [ <b>source ipv6-address</b> ]	
<b>Parameter Description</b>	<i>vrf vrf-name</i>	(Optional) Indicates the name of the VRF to which the static route belongs. The VRF is a global VRF by default.
	<i>interface-type</i>	Indicates the interface type.
	<i>interface-number</i>	Indicates the interface number.
	<i>gateway</i>	Indicates the IP address of the gateway, that is, the neighbor IP address of BFD. If the next hop of the static route is this neighbor, BFD is used to check the connectivity of the forwarding path.

	<b>sourceip-address</b>	(Optional) Indicates the source IP address used for the BFD session. This parameter must be configured if the neighbor IP address involves multiple hops. By default, the neighbor IP address of the BFD session is a single hop, and the source IP address is not used.
<b>Defaults</b>	By default, a static route is not correlated with BFD.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to correlate an IPv6 static route with BFD. If the down status of the BFD session is detected, the IPv6 static route is not active and does not participate in packet forwarding.	

**Verification**

- Run the **show bfd neighbors** command to display information about BFD neighbors.
- Run the **show ip route static bfd** or **show ipv6 route static bfd** command to display information about correlation of static routes with BFD.

**Configuration Example**

▾ **Correlating an IPv4 Static Route with BFD**

<b>Scenario</b> Figure 10- 7	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a BFD session on the interconnect interface between R 1 and R 2.</li> <li>● Configure static routes on R 1 and R 2, and specify the exit interface or next hop as the interworking interface.</li> <li>● Correlate static routes with BFD on R 1 and R 2, and check the connectivity of the next hops of static routes.</li> </ul>
<b>R1</b>	<pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# no switchport R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.1 255.255.255.0 R1(config-if-GigabitEthernet 0/1)#bfd interval 50 min_rx 50 multiplier 3 R1(config-if-GigabitEthernet 0/1)#exit R1(config)# ip route 1.1.2.0 255.0.0.0 FastEthernet 0/1 1.1.12.2 R1(config)#ip route static bfd gigabitEthernet 0/1 1.1.12.2                     </pre>
<b>R2</b>	<pre> R2#configure terminal R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)# no switchport R1(config-if-GigabitEthernet 0/1)# ip address 1.1.12.2 255.255.255.0 R1(config-if-GigabitEthernet 0/1)#bfd interval 50 min_rx 50 multiplier 3                     </pre>

	<pre>R1(config-if-GigabitEthernet 0/1)# exit R1(config)#iproute 1.1.1.0255.0.0.0FastEthernet0/1 1.1.12.1 R1(config)#iproute staticbfd gigabitEthernet 0/1 1.1.12.1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Display the status of BFD neighbors.</li> <li>● Display the static routes correlated with BFD.</li> </ul>
<b>R1</b>	<pre>R1#show bfd neighbors  OurAddr      NeighAddr    LD/RD  RH/RS  Holdown(mult) State Int 1.1.12.1     1.1.12.2     8192/0 Up      0(3  )      Up GigabitEthernet0/1  R1#show ip route static bfd  S      1.1.2.0/24 via 1.1.12.2, GigabitEthernet 0/1, BFD state is Up</pre>

#### Common Errors

- The link on the interface is not up.
- No IP address is configured for the interface.
- No BFD session parameters are configured.
- No static route is configured.

#### 10.5.5 Configure Static Fast Reroute

##### Configuration Effect

- Configure and enable static fast reroute.

##### Notes

- Static fast reroute cannot be configured on a L2 switch.
- You must configure a static route.
- You must configure a route map.

##### Configuration Steps

##### ▾ Defining a Standby Route in the Route Map

<b>Command</b>	<b>set fast-reroute backup-nexthop</b> <i>interface ip-address</i>	
<b>Parameter</b>	<i>interface</i>	Indicates the standby exit interface.
<b>Description</b>	<i>ip-address</i>	Indicates the standby next hop.
<b>Defaults</b>	N/A	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run the <b>route-map</b> <i>name</i> [ <b>permit</b>   <b>deny</b> ] <i>sequence</i> command to create a road map.	

	<p>Run the <b>match</b> command to define matching conditions.</p> <p>Run the <b>set fast-reroute backup-nexthop interface ip-address</b> command to define the standby exit interface and standby next hop.</p> <p>If a route meets matching conditions, a standby route is generated for this route. If the <b>match</b> command is not configured, standby routes are generated for any static route with the exit interface and next hop.</p>
--	---

▾ **Enabling Fast Reroute and Referencing the Route Map**

<b>Command</b>	<b>ip fast-reroute [ vrf vrf-name] static route-map route-map-name</b>	
<b>Parameter</b>	<i>vrf-name</i>	(Optional) Specifies a VRF. If the VRF is not specified, the command is executed on all VRFs.
<b>Description</b>	<i>route-map-name</i>	Indicates the name of the road map for the standby route.
<b>Defaults</b>	By default, static fast reroute is not configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	Run this command to enable fast reroute and reference the route map.	

**Verification**

Run the **show ip route fast-reroute** command to display the active and standby routes that take effect.

**Configuration Example**

▾ **Configuring Fast Re-Routing**

<b>Scenario</b> Figure 10- 8	
<b>Configuration Steps</b>	<p>On R 1, configure a static route to the network segment of PC 3, and the next hop of the exit interface is R 3.</p> <p>On R 1, configure static fast reroute. The next hop of the exit interface of the standby route is R2.</p> <pre> R1#configure terminal R1(config)#interface gigabitEthernet 0/0 R1(config-if-GigabitEthernet 0/0)# ip address 1.1.1.1 255.255.255.0 R1(config-if-GigabitEthernet 0/0)# exit R1(config)#interface gigabitEthernet 0/2                     </pre>

	<pre> R1(config-if-GigabitEthernet 0/2)# ip address 1.1.12.1 255.255.255.0  R1(config-if-GigabitEthernet 0/0)# exit  R1(config)#interface gigabitEthernet 0/3  R1(config-if-GigabitEthernet 0/3)# ip address 1.1.13.1 255.255.255.0  R1(config-if-GigabitEthernet 0/3)# exit  R1(config)#ip route 1.1.3.0 255.255.255.0 GigabitEthernet0/3 1.1.13.3  R1(config)#route-map fast-reroute  R1(config-route-map)# set fast-reroute backup-interface GigabitEthernet 0/2 backup-nextthop 1.1.12.2  R1(config-route-map)# exit  R1(config)#ip fast-reroute static route-map fast-reroute </pre>
<b>Verification</b>	<p>Display the active and standby routes on R1.</p> <pre> R1#show ip route fast-reroute  Codes: C - connected, S - static, R - RIP, B - BGP          O - OSPF, IA - OSPF inter area          N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2          E1 - OSPF external type 1, E2 - OSPF external type 2          i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2          ia - IS-IS inter area, * - candidate default          Status codes: m - main entry, b - backup entry, a - active entry  Gateway of last resort is no set  S    1.1.3.0/24 [ma] via 1.1.13.3, GigabitEthernet 0/3                  [b] via 1.1.12.2, GigabitEthernet 0/2 </pre>

### Common Errors

- The link on the interface is not up.
- No static route is configured.
- The matching conditions are not configured or are not properly configured in the road map.

### 10.5.6 Configuring ARP-to-host Conversion

#### Configuration Effect

- Enable ARP-to-host conversion on a specified interface.

#### Notes

- This configuration cannot be performed on a Layer-2 switch.
- The interface must be a Layer-3 interface in up status.

### Configuration Steps

#### ▾ Enabling ARP-to-host Conversion on a Specified Interface

<b>Command</b>	<b>ip route arp-to-host interface</b> <i>interface-name</i>
<b>Parameter Description</b>	<i>interface-name</i> : Indicates an interface name.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to convert ARP entries into 32-bit host routes on a specified interface.

#### ▾ Enabling ARP Proxy

<b>Command</b>	<b>local-proxy-arp</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After receiving an ARP request, the device uses a proxy to send an ARP response with its own Ethernet MAC address. In this case, hosts communicate with each other through Layer-3 routes.

#### ▾ Configuring BGP Redistribution of ARP Host Routes

<b>Command</b>	<b>redistribute arp-host</b> [ <b>route-map</b> <i>map-tag</i> ] [ <b>metric</b> <i>metric-value</i> ]
<b>Parameter Description</b>	<b>route-map</b> <i>map-tag</i> : Indicates the name of an associated route map. No route map is associated by default. <b>metric</b> <i>metric-value</i> : Indicates the default metric value for redistributing routes, in the range from <b>0</b> to <b>4,294,967,295</b> . The value is not set by default.
<b>Defaults</b>	N/A
<b>Command Mode</b>	BGP configuration mode
<b>Usage Guide</b>	This command is used to configure BGP redistribution of ARP host routes.

### Verification

Run the **show ip route arphost** command to display the generated host routes.

### Configuration

#### Example

#### ▾ Configuring ARP-to-host Conversion

<b>Scenario</b> <b>Figure 10- 9</b>	
<b>Configuration Steps</b>	Configure interface addresses on R1 and R2. Enable ARP-to-host conversion on specified interfaces of R1 and R2, configure a BGP neighbor relationship, and redistribute ARP host routes.
<b>R1</b>	<pre> R1#configure terminal R1(config)#interface vlan 40 R1(config-if-VLAN 40)#ip address 1.1.1.3 24 R1(config-if-VLAN 40)#local-proxy-arp R1(config-if-VLAN 40)#exit R1(config)#interface gigabitEthernet 0/1 R1(config-if-GigabitEthernet 0/1)#switchport R1(config-if-GigabitEthernet 0/1)#switchport mode trunk R1(config-if-GigabitEthernet 0/1)#switchport trunk allowed vlan only 40 R1(config-if-GigabitEthernet 0/1)#exit R1(config)#interface gigabitEthernet 0/2 R1(config-if-GigabitEthernet 0/2)# ip address 10.10.10.1 255.255.255.0 R1(config-if-GigabitEthernet 0/2)# exit R1(config)#router bgp 1 R1(config-router)#neighbor 10.10.10.2 remote-as 1 R1(config-router)#redistribute arp-host R1(config-router)#address-family ipv4 R1(onfig-router-af)#neighbor 10.10.10.2 next-hop-self R1(onfig-router-af)#exit R1(config-router)#exit R1(config)#ip route arp-to-host vlan 40 R1(config)#ip route arp-to-host delay-time 1 </pre>
<b>R2</b>	<pre> R2#configure terminal R2(config)#interface vlan 40 R2(config-if-VLAN 40)#ip address 1.1.1.4 24 R2(config-if-VLAN 40)#local-proxy-arp R2(config-if-VLAN 40)#exit R2(config)#interface gigabitEthernet 0/1 R2(config-if-GigabitEthernet 0/1)# switchport R2(config-if-GigabitEthernet 0/1)#switchport mode trunk R2(config-if-GigabitEthernet 0/1)# switchport trunk allowed vlan only 40 R2(config-if-GigabitEthernet 0/1)#exit R2(config)#interface gigabitEthernet 0/2 R2(config-if-GigabitEthernet 0/2)# ip address 10.10.10.2 255.255.255.0 </pre>

	<pre>R2(config-if-GigabitEthernet 0/2)# exit R2(config)#router bgp 1 R2(config-router)#neighbor 10.10.10.1 remote-as 1 R2(config-router)#redistribute arp-host R2(config-router)#address-family ipv4 R2(onfig-router-af)#neighbor 10.10.10.1 next-hop-self R2(onfig-router-af)#exit R2(config-router)#exit R2(config)#ip route arp-to-host vlan 40 R2(config)#ip route arp-to-host delay-time 1</pre>
<b>Verification</b>	<p>Display the ARP host routes of R1 to check that PC1 can ping PC2.</p> <pre>R1(config)#show ip route arphost A    1.1.1.1/32 [1/0] via 1.1.1.1, gigabitEthernet 0/1 R1#show ip route Codes: C - Connected, L - Local, S - Static        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route        N1 - OSPFNSSA external type 1, N2 - OSPFNSSA external type 2        E1 - OSPF external type 1, E2 - OSPF external type 2        SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2        IA - Inter area, EV - BGP EVPN, A - Arp to host        * - candidate default  Gateway of last resort is 0.0.0.0 to network 0.0.0.0 S*    0.0.0.0/0 is directly connected, Null 0 C     10.10.10.0/24 is directly connected, GigabitEthernet 0/2 C     10.10.10.1/32 is local host. C     1.1.1.0/24 is directly connected, VLAN 40 A     1.1.1.1/32 [1/0] via 1.1.1.1, VLAN 40 C     1.1.1.3/32 is local host. B     1.1.1.2/32 [200/0] via 10.10.10.2, 00:57:12</pre>

### Common Errors

- The ARP proxy function is not enabled on specified interfaces.

### 10.5.7 Configuring nd-to-route Conversion

#### Configuration Effect

- Enable nd-to-route on a specified interface

#### Notes

- This configuration cannot be performed on a Layer-2 switch.
- The interface must be a Layer-3 interface in up status.

#### Configuration Steps

## ▾ Enabling nd-to-route on a Specified Interface

**Command** `ipv6 route nd-to-route interface interface-name [ipv6-prefix X:X:X:X/<0-128>] [prefix-len masklen]`

**Parameter** *interface-name*: the interface name.

**Description** *X:X:X:X/<0-128>*: Ipv6 network segment. If the nd entries match this network segment, the route is converted according to the mask specified by this network segment. If the network segment does not specify a mask, the default mask is 128.

*masklen*: the mask length of the nd-to-route. The range is 0 to 128, and the default value is 128. If an IPv6 network segment is specified, it is longer than the mask length of configured network segment. If no IPv6 network segment is specified, it is longer than the mask length of IPv6 address on the interface. Otherwise, the configuration fails.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** If the IPv6 network segment and prefix-len are not specified, the ND learned on the default interface generates a 128-bit route. If no IPv6 network segment is specified but prefix-len is specified, ND on the interface generate the specified prefix-len. If IPv6 network segment is specified but prefix-len is not specified, the network segment generates a 128-bit route by default. If the network segment and the prefix-len are specified, the network segment is verified to match with the prefix when the ND is learned, and then the prefix-len is generated. If the network segment and prefix-len are specified, and the prefix-len of an unspecified network segment is configured, the specified interface generates the route according to its prefix-len, while the unspecified interface generates the route according to the unspecified prefix-len.

If you configure the IPv6 address of an interface before configuring the prefix-len of the interface address to generate a route with fixed-length mask, a configuration error occurs when the prefix-len is shorter than or equal to the mask of the IPv6 address. The prefix-len command fails. For example, first configure IPv6 address 10::1/64 on the interface of vlan 40, and then configure `ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60` in the global configuration mode, the configuration fails.

If you configure the IPv6 address of an interface before configuring the prefix-len of an unspecified network segment, a configuration error occurs when the prefix-len is shorter than or equal to the mask of any of the IPv6 addresses on the interface. The prefix-len configuration command for the unspecified network segment fails. For example, first configure IPv6 address 10::1/64 on the interface of vlan 40, and then configure `ipv6 route nd-to-route interface vlan 40 prefix-len 60` in the global configuration mode, the configuration fails.

If you configure the prefix-len of an unspecified network segment before configuring the IPv6 address of this interface, syslog is displayed and the prefix-len configuration of unspecified network segment is canceled when one of the IPv6 addresses is longer than or equal to the prefix-len of the unspecified network segment. For example, first configure `ipv6 route nd-to-route interface vlan 40 prefix-len 60` in the global configuration mode, and then configure address 10::1/64 on the interface of vlan 40, syslog alarm is displayed and the configuration `ipv6 route nd -to-route interface vlan 40 prefix-len 60` is deleted.

If you configure the prefix-len of the specified network segment and then configure the IPv6 address of the corresponding network segment, syslog is displayed and the prefix-len configuration of the specified network segment is canceled when the IPv6 address mask of the corresponding network segment is longer than or equal to the prefix-len of the specified network segment. For example, first configure `ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60` in the global configuration mode, and then configure the address 10::1/64 on the interface of vlan 40, the

syslog alarm is displayed and the configuration `ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60` is deleted.

If you configure the prefix-len of unspecified network segment and the prefix-len of the specified network segment, and then configure the IPv6 address of the interface, please check whether the mask of each IPv6 address is longer than or equal to the prefix-len of the specified/unspecified network segment. Syslog is displayed and the prefix-len configuration of specified network segment is canceled when the mask of each IPv6 address is longer than or equal to the prefix-len of the corresponding network segment. Syslog is displayed and the prefix-len configuration of unspecified network segment is canceled when the mask of each IPv6 address is longer than or equal to the prefix-len of unspecified network segment. For example, first configure `ipv6 route nd-to-route interface vlan 40 prefix-len 62` and `ipv6 route nd-to-route interface vlan 40 ipv6-prefix 10::1/58 prefix-len 60`, and then configure address `10::1/64` on the interface of vlan 40, the syslog alarm is displayed and two configurations are deleted.

### ✎ Configuring Delayed Redistribution of nd-to-route

**Command** `ipv6 route nd-to-route delay-time time-number`

**Parameter** *time-number*: time of the delayed redistribution of nd-to-route. The unit is second, the range is 1-1000, and the default value is 0

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide** This command is used to delay the redistribution of nd-to-route

### ✎ Configuring Tag of nd-to-route

**Command** `ipv6 route nd-to-route tag tag-number`

**Parameter** *time-number*: tag attribute value of nd-to-route. The range is 1-4294967295, and the default value is 0.

**Defaults** N/A

**Command Mode** Global configuration mode

**Usage Guide**

### ✎ Ignoring Warning Log of nd-to-route

**Command** `ipv6 route nd-to-route warning-ignore`

**Parameter** -

**Description**

**Defaults** N/A

**Command** Global configuration mode

**Mode**

**Usage Guide** After you configure to ignore the warning of nd-to-route, the alarm that the same PORT ND generates the same network segment route is ignored. If this command is not configured, the warning log that the same PORT ND generates the same network segment route is printed (only once). The alarm that different ports generate the same network segment route is not controlled by this command.

### ▾ Enabling ndProxy

**Command** **local-proxy-nd enable**

**Parameter** -

**Description**

**Defaults** N/A

**Command** SVI interface mode

**Mode**

**Usage Guide** When the device receives an ND request, it will send an ND response. The MAC address of the response is the local Ethernet MAC address, so that the interconnection among different hosts is implemented by Layer 3 routing.

### ▾ Configuring BGP Redistributed nd-route Route

**Command** **redistribute nd-route [ route-map *map-tag* ] [ metric *metric-value* ]**

**Parameter** **route-map** *map-tag*: name of the associated route-map. There is no associated route-map by default. **metric**  
**Description** *metric-value*: configured the metric value of redistributed route by default, the range is 0-4294967295. There is no default value.

**Defaults** N/A

**Command** BGP mode

**Mode**

**Usage Guide** Configure BGP to redistribute nd-route route

#### Verification

Run the **show ipv6 route ndroute** command to display the generated host routes.

#### Configuration Example

### ▾ Configuring nd-to-route

## Scenario

Figure 10- 16

**Configuration** Configure interface addresses on R1 and R2.

### Steps

Enable nd-to-route conversion on the specified interface of R1 and R2, configure BGP and redistribute nd-route routes.

### R1

```

R1#configure terminal

R1(config)#interface vlan 40

R1(config-if-VLAN 40)#ipv6 address 10::1/64

R1(config-if-VLAN 40)# local-proxy-nd enable

R1(config-if-VLAN 40)#exit

R1(config)#interface gigabitEthernet 0/1

R1(config-if-GigabitEthernet 0/1)#switchport

R1(config-if-GigabitEthernet 0/1)#switchport mode trunk

R1(config-if-GigabitEthernet 0/1)#switchport trunk allowed vlan only 40

R1(config-if-GigabitEthernet 0/1)#exit

R1(config)#interface gigabitEthernet 0/2

R1(config-if-GigabitEthernet 0/2)# ipv6 address 11::1/64

R1(config-if-GigabitEthernet 0/2)# exit

R1(config)#router bgp 1

R1(config-router)#neighbor 11::2 remote-as 1

R1(config-router)#address-family ipv6

R1(onfig-router-af)#neighbor11::2 next-hop-self

R1(config-router-af)#redistribute nd-route

R1(config-router-af)#exit

R1(config-router)#exit

R1(config)#ipv6 route nd-to-route vlan 40

R1(config)#ipv6 route nd-to-route delay-time 1
  
```

**R2**

```
R2#configure terminal

R2(config)#interface vlan 40

R2(config-if-VLAN 40)# ipv6 address 10::2/64

R2(config-if-VLAN 40)# local-proxy-nd enable

R2(config-if-VLAN 40)#exit

R2(config)#interface gigabitEthernet 0/1

R2(config-if-GigabitEthernet 0/1)# switchport

R2(config-if-GigabitEthernet 0/1)#switchport mode trunk

R2(config-if-GigabitEthernet 0/1)# switchport trunk allowed vlan only 40

R2(config-if-GigabitEthernet 0/1)#exit

R2(config)#interface gigabitEthernet 0/2

R2(config-if-GigabitEthernet 0/2)# ipv6 address 11::2/64

R2(config-if-GigabitEthernet 0/2)# exit

R2(config)#router bgp 1

R2(config-router)#neighbor 11::1 remote-as 1

R2(config-router)#address-family ipv6

R2(config-router-af)#neighbor 11::1 next-hop-self

R2(onfig-router-a)#redistributend-route

R2(onfig-router-af)#exit

R2(config-router)#exit

R2(config)# ipv6 route nd-to-route vlan 40

R2(config)# ipv6 route nd-to-route delay-time 1
```

**Verification**

Display the nd-route routes of R1 to check that PC1 can ping PC2.

```
R1(config)#show ipv6 route ndroute

N      1111::1/128[1/0]via 1111::1,VLAN40

R1#show ipv6 route

IPv6routing table name - Default - 18 entries

Codes: C - Connected, L - Local, S - Static

        R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route
```

```

N1 - OSPFNSSAexternal type 1, N2 - OSPFNSSAexternal type 2

E1 - OSPFexternal type 1, E2 - OSPFexternal type 2

SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2

IA - Inter area, N - Nd to host

C    10::/64 via VLAN 1, directly connected
L    10::1/128 via VLAN 1, local host
C    101::/64 via VLAN 101, directly connected
L    101::2/128 via VLAN 101, local host
C    102::/64 via VLAN 102, directly connected
L    102::2/128 via VLAN 102, local host
C    103::/64 via VLAN 103, directly connected
L    103::2/128 via VLAN 103, local host
N    1111::1/128 [1/0] via 1111::1, VLAN 40
B    1111::2/128 [200/0] via 11::2, 00:57:12
    
```

**Common Error**

- The nd proxy function is not enabled on the specified interface.

**10.5.8 Configuring an Aggregate Route**

**Configuration Effect**

- Generate an aggregate route in the routing table.

**Notes**

- Cannot be configured on a L2 switch.

**Configuration Steps**

📄 **Configuring an Aggregate Route**

<b>Command</b>	<b>ip route aggregate [ vrf vrf_name ] network netmask Null 0 [ tag tag ]</b>	
<b>Parameter Description</b>	<i>vrf vrf_name</i>	(Optional) Route VRF which can be the single protocol IPv4 VRF or configured IPv4 address family multi-protocol VRF. Global VRF by default.
	<i>network</i>	Indicates the address of the destination network.
	<i>netmask</i>	Indicates the mask of the destination network.

	<b>Null 0</b>	Not configure the next hop IP address and egress of the aggregate route
	<i>tag</i>	(Optional) The tag of the aggregate route, 0 by default
<b>Defaults</b>	By default, no aggregate route is configured.	
<b>Command Mode</b>	Global configuration mode	
<b>Usage Guide</b>	The command takes effect in OPENCONF YANG to record the configuration of aggregate routes. The actual effect is like black hole route.	

### Verification

- Run the **show ip route** command to display the host route.

### Configuration Example

#### ▾ Configuring an Aggregate Route

<b>Configuration Steps</b>	Add an aggregate route to the destination network of 1.1.1.0/24 whose TAG is 32.
	<pre>FS(config)#ip route aggregate 1.1.1.0 255.255.255.0 Null 0 tag 32</pre>
<b>Verification</b>	Run the <b>show ip route</b> command to display the aggregate route.
<b>R1</b>	<pre>FS(config)# show ip route</pre> <p>Codes: C - Connected, L - Local, S - Static</p> <p>R - RIP, O - OSPF, B - BGP, I - IS-IS, V - Overflow route</p> <p>N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2</p> <p>E1 - OSPF external type 1, E2 - OSPF external type 2</p> <p>SU - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2</p> <p>IA - Inter area, EV - BGP EVPN, A - Arp to host</p> <p>LA - Local aggregate route</p> <p>* - candidate default</p> <p>Gateway of last resort is not set</p> <pre>LA    1.1.1.0/24 [1/0] via 0.0.0.0, Null 0</pre>

### 10.5.9 Configuring Real-time Statistic of Active Routes

#### Configuration Effect

- Enable the real-time statistic of active routes

#### Notes

- Cannot be configured on a L2 switch.

#### Configuration Steps

##### ▾ Configuring an Aggregate Route

<b>Command</b>	<b>ip active-route real-time summary</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	By default, the function is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The real-time statistic of active routes mainly applies to the scenario when GRPC periodic samples or gets active routes, or run the <b>show ip route summary</b> command frequently, so as to reduce the statistic time of displaying active routes in large volume.</p> <p>It is not recommended to enable the function in normal scenario, especially with high demand of routing convergence.</p>

#### Verification

- Run the **show run** command to display the host route.

#### Configuration Example

##### ▾ Configuring Real-time Statistic of Active Routes

<b>Configuration Steps</b>	Enable the real-time statistic of active routes
	FS(config)#ip active-route real-time summary
<b>Verification</b>	Run the <b>show run</b> command to display the aggregate route.
<b>R1</b>	<pre>FS(config)# sh run   in active-route ip active-route real-time summary</pre>

## 10.6 Monitoring

### Displaying

Description	Command
Displays the IPv4 routing table.	<b>show ip route</b>
Displays the IPv6 routing table.	<b>show ipv6route</b>

## Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs IPv4 route management.	<b>debug nsm kernel ucast- v4</b>
Debugs IPv6 route management.	<b>debug nsm kernel ucast-v6</b>
Debugs fast reroute management.	<b>debug nsm kernel frr</b>
Debugs default network management.	<b>debug nsm kernel default-network</b>
Debugs internal events of route management.	<b>debug nsm events</b>
Debugs sending of route management and routing protocol messages.	<b>debug nsm packet send</b>
Debugs receiving of route management and routing protocol messages.	<b>debug nsm packet recv</b>

## 11 Configuring VRF

### 11.1 Overview

A Virtual Private Network (VPN) Routing and Forwarding (VRF) table is used for the forwarding of VPN packets. Each VPN corresponds to a VRF table.

A device that provides the VPN service has multiple routing tables, including a public network routing table and one or multiple VRF tables. The public-network routing table is used for the forwarding of public network packets, and the VRF tables are used for the forwarding of VPN packets. These routing tables are created to separate routes in the public network from those in VPNs and separate routes in different VPNs.

A VPN is a private dedicated network built in the public network. "Virtual" means that the VPN is logically exclusive, instead of physically exclusive.

### 11.2 Applications

Application	Description
Local Inter-VPN Access	Provide the VPN service on a routing device and enable VPNs to access each other.
VRF only on Provider Edges (PEs)	Provide the VPN service in an IP network and connect one Customer Edge (CE) to one VPN.
VRF on CEs and PEs	Provide the VPN service in an IP network and connect one CE to multiple VPNs.

CE: An edge device in a customer network

PE: An edge device in a Service Provider (SP) network

#### 11.2.1 Local Inter-VPN Access

##### Scenario

Provide the VPN service on a routing device and enable VPNs to access each other.

In Figure 11-1, Sub a runs the Routing Information Protocol (RIP), Sub b runs the Open Shortest Path First (OSPF) protocol, and Servers is a network segment directly connected to C. Provide the VPN service on C to Sub a, Sub b, and Servers, and enable Sub a and Sub b to access Servers.

Figure 11-1

**Related Configuration**

- On C, create a VRF table for Sub a, bind the interface directly connected to A, and associate the VRF table with A by using RIP.
- On C, create a VRF table for Sub b, bind the interface directly connected to B, and associate the VRF table with B by using OSPF.
- On C, create a VRF table for Servers and bind the interface directly connected to Servers.
- On C, configure the route targets (RTs) of the VRF tables for Sub a, Sub b, and Servers. Import the routes in the VRF tables for Sub a and Sub b to the VRF table for Servers, and import the routes in the VRF table for Servers to the VRF tables for Sub a and Sub b.
- Configure the Border Gateway Protocol (BGP) on C. Introduce the RIP routes to the VRF table for Sub a, introduce the OSPF routes to the VRF table for Sub b, and introduce the direct routes to the VRF table for Servers.

**11.2.2 VRF Only on PEs**

**Scenario**

An Internet Service Provider (ISP) provides the VPN service in an IP backbone network.

In Figure 11-2, VPN1 runs RIP, and VPN2 runs OSPF.

- One CE is connected to one VPN, and all routes on the CE are exclusively used by the connected VPN. Therefore, no VRF table needs to be created to separate the routes.
- On each PE, VRF tables must be created to separate the routes in VPN1, those in VPN2, and those in the public network from each other.

Figure 11-2

**Deployment**

- On PE1, create a VRF table for VPN1 and bind the interface directly connected to CE1. On PE2, create a VRF table for VPN1 and bind the interface directly connected to CE3.
- On PE1, create a VRF table for VPN2 and bind the interface directly connected to CE2. On PE2, create a VRF table for VPN2 and bind the interface directly connected to CE4.
- On PE1, associate the VRF table for VPN1 with CE1 by using RIP. On PE2, associate the VRF table for VPN1 with CE3 by using RIP.
- On PE1, associate the VRF table for VPN2 with CE2 by using OSPF. On PE2, associate the VRF table for VPN2 with CE4 by using OSPF.
- In the VRF instance for VPN1 on PE1, redistribute RIP routes to BGP, and redistribute BGP routes to RIP. The configuration on PE2 is similar.
- In the VRF instance for VPN2 on PE1, redistribute OSPF routes to BGP, and redistribute BGP routes to OSPF. The configuration on PE2 is similar.

### 11.2.3 VRF on CEs and PEs (MCE Application)

#### Scenario

An ISP provides the VPN service in an IP backbone network.

In Figure 11-3, VPN a runs RIP, VPN b runs OSPF, and PE1 and PE2 are connected to BGP.

- One Multi-VPN-Instance CE (MCE) is connected to multiple VPNs. VRF tables must be created to separate the routes in VPN a from those in VPN b.
- On each PE, VRF tables must be created to separate the routes in VPN a, those in VPN b, and those in the public network from each other.

Figure 11-3

#### Deployment

- On MCE1, create VRF tables for VPN a and VPN b respectively, bind the interfaces directly connected to VPN a and VPN b, and bind the VLAN interface connected to PE1. The configuration on MCE2 is similar.
- On PE1, create VRF tables for VPN a and VPN b respectively, and bind the VLAN interface connected to MCE1. The configuration on PE2 is similar.
- On MCE1, associate the VRF table for VPN a with VPN a by using RIP. The configuration on MCE2 is similar.
- On MCE1, associate the VRF table for VPN b with VPN b by using OSPF. The configuration on MCE2 is similar.
- In the VRF instance for VPN a on MCE1, redistribute RIP routes to BGP, and redistribute BGP routes to RIP. The configuration on MCE2 is similar.
- In the VRF instance for VPN b on MCE1, redistribute OSPF routes to BGP, and redistribute BGP routes to OSPF. The configuration on MCE2 is similar.

## 11.3 Features

### Overview

Feature	Description
VPN Instance	A VPN instance is used to provide the VPN service. It is typically represented by a VRF table.
VPN Route	A VPN route is used to forward VPN packets.
VPN Route Attribute	Route distinguisher (RD): Identifies the VPN to which a route belongs. RT: Indicates the route trade-off mode of VRF.
Global VRF	Global default VPN instance

### 11.3.1 VPN Instance

A VPN instance is used to provide the VPN service. On a device that provides the VPN service, a VPN instance consists of the VRF table, interfaces, routing protocol processes, and configuration that belong to the same VPN. A VPN instance is typically represented by a VRF table.

#### Working Principle

A PE exchanges routes with a CE by using the related routing protocol in the corresponding VPN instance. A VRF table is bound to a specific interface to generate its interface set. Packets received on these interfaces will be associated with the VRF table and forwarded along corresponding routes.

#### Related Configuration

Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. Single-protocol VRF tables only support IPv4, whereas multiprotocol VRF tables support IPv4 and IPv6.

#### 📄 Configuring a Single-Protocol VRF Table

By default, a device has no VRF table.

Run the **ip vrf** command to create a single-protocol VRF table.

Run the **ip vrf forwarding** command to bind an interface.

Currently, single-protocol VRF tables only support IPv4.

#### 📄 Configuring a Multiprotocol VRF Table

By default, a device has no VRF table.

Run the **vrf definition** command to create a multiprotocol VRF table.

Run the **address-family ipv4** command to enable the IPv4 address family.

Run the **address-family ipv6** command to enable the IPv6 address family.

Run the **vrf forwarding** command to bind an interface.

Multiprotocol VRF tables support IPv4 and IPv6.

### 11.3.2 VPN Route

A VPN route is only used to forward VPN packets. It comes from:

- Direct route and host route on the bound interface
- Direct route and host route on the configured import interface (not bound)
- Static and dynamic routes (RIP, RIPng, OSPFv2, OSPFv3, ISIS, and BGP) in the configured VPN instance
-  For details about the static routes in a VPN instance, see "Configuration Guide > IP Route".
-  For details about RIP in a VPN instance, see "Configuration Guide > IP Route > RIP".
-  For details about RIPng in a VPN instance, see "Configuration Guide > IP Route > RIPng".
-  For details about OSPFv2 in a VPN instance, see "Configuration Guide > IP Route > OSPFv2".
-  For details about OSPFv3 in a VPN instance, see "Configuration Guide > IP Route > OSPFv3".
-  For details about ISIS in a VPN instance, see "Configuration Guide > IP Route > ISIS".
-  For details about BGP in a VPN instance, see "Configuration Guide > IP Route > BGP".

### 11.3.3 VPN Route Attribute

The BGP extended attributes include two attributes specific to VPN routes: RD and RT.

#### Working Principle

##### ↘ RD

Two routes with the same address but different RDs in two VRF tables can be advertised separately between PEs, because the routes are sent together with their RDs through multiprotocol BGP (MP-BGP).

##### ↘ RT

RT in essence indicates each VRF table's route trade-off and preferences. It is mainly used to control the advertising and installation policies for VPN routes. RT is divided into the import attribute and export attribute. The import attribute indicates the route of interest, and the export attribute indicates the advertised route. A PE advertises a route to other PEs based on the RT export rule in the corresponding VRF table. The peer PE checks all received routes against the RT import rule in each VRF table. If a route matches an RT export rule (the export rule contains the import rule), it will be added to the corresponding VRF table.

#### Related Configuration

##### ↘ RD

By default, no RD is configured in VRF mode.

Run the **rd** command to configure an RD.

##### ↘ RTFS

By default, no RT is configured in VRF mode or address family mode.

Run the **route-taet { import | export | both }** command to configure an RT.

### 11.3.4 Global VRF

DefaultVPNinstance.

#### Working Principle

## Global VRF

Configure VPN routing and attributes in the default VPN configuration mode,

### Related Configuration

#### Enter Global VRF Mode

By default, global VRF exists.

Run the **vrf global-vrf** command to enter the global VRF mode.

## 11.4 Configuration

Configuration	Description and Command	
Configuring a Single-Protocol VRF Table	 Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. If IPv6 is supported, configure a multiprotocol VRF table; otherwise, you can configure a single-protocol VRF table or a multiprotocol VRF table. This configuration item creates a VRF table in an IPv4 network. IPv6 is not supported.	
	<b>ip vrf vrf-name</b>	Creates a VRF table.
	<b>rd rd_value</b>	Configures an RD.
	<b>route-target { import   export   both } rt_value</b>	Configures an RT.
	<b>ip vrf forwarding vrf-name</b>	Binds an interface and adds the direct route and host route on the interface to a VRF table.
	<b>ip vrf receive vrf_name</b>	Adds the direct route and host route on an interface to a VRF table without binding the interface.
Configuring a Multiprotocol VRF Table	 Single-protocol VRF tables and multiprotocol VRF tables cannot be created at the same time. If IPv6 is supported, configure a multiprotocol VRF table. otherwise, you can configure a single-protocol VRF table or a multiprotocol VRF table. This configuration item creates a VRF table in an IPv4 or IPv6 network.	
	<b>vrf definition vrf-name</b>	Creates a VRF table.
	<b>description string</b>	Configures a VRF descriptor.
	<b>rd rd_value</b>	Configures an RD.
	<b>route-target { import   export   both } rt_value</b>	Configures an RT.
	<b>address-family ipv4</b>	Enables the IPv4 address family.
	<b>address-family ipv6</b>	Enables the IPv6 address family.
	<b>vrf forwarding vrf-name</b>	Binds an interface and adds the direct route and host route on the interface to a VRF table.
	<b>vrf receive vrf-name</b>	Adds the direct route and host route on an interface to a VRF table without binding the interface.

### 11.4.1 Configuring a Single-Protocol VRF Table

#### Configuration Effect

- Provide the VPN service on a device.
- With BGP assistance, flexibly control the separation and access between VPNs.
- With BGP assistance, provide the VPN service in an IP backbone network.
- Only IPv4 is supported.

#### Notes

- No VRF table needs to be created if the device only forwards packets from one VPN or from the public network.
- If the device needs to forward public network packets and VPN packets or forward packets from multiple VPNs, VRF tables must be created to separate routes.
- In many cases, static or dynamic routes (RIP, OSPF, ISIS, and BGP) need to be added to VRF tables.

#### Configuration Steps

##### ↘ Creating a VRF Table

- Mandatory.
- Create a VRF table for each VPN.

##### ↘ Configuring an RD

- Optional.
- When routing information needs to be advertised through BGP in the backbone network, BGP may select the best route for advertising if overlapping network addresses exist in different VPNs, which will make some VPNs fail to obtain corresponding routing information. To solve this problem, you can configure RDs for routes to enable BGP to make routing decisions based on these RDs, thus ensuring that each VPN can obtain corresponding routing information.
- Run the **rd** command in single-protocol VRF mode.

##### ↘ Configuring an RT

- Optional.
- You can run the **route-target export** command to specify the attributes of the route to be advertised, and run the **route-target import** command to specify the attributes of the route to be received. You can also run the **route-target both** command to specify the export and import attributes.
- Run the **route-target** command in single-protocol VRF mode.

##### ↘ Binding an Interface and Adding the Direct Route and Host Route on the Interface to a VRF Table

- Mandatory.
- If the physical link for transmitting VPN packets is exclusively occupied by a VPN, bind the physical interface to the corresponding VRF table.

- If the physical link for transmitting VPN packets is shared by multiple VPNs, you need to create an independent logical link for each VPN, and bind the logical interface to the corresponding VRF table. A logical interface can be a subinterface or a VLAN interface.
- You must bind an interface to the corresponding single-protocol VRF table before you configure the IPv4 address of the interface. If you bind the interface after its IPv4 address is configured, the IPv4 address will be invalid (the IPv6 address of the interface is retained).
- If you bind an interface to the corresponding single-protocol VRF table and enable IPv6 on the interface, the device cannot forward the IPv6 packets received on the interface.

#### ✚ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

- Optional.
- If policy-based routing (PBR) is required for VRF table selection, run the **ip vrf receive** command on the interface to which PBR is applied, and import the direct route and host route on the interface to each VRF table available for choice.

#### Verification

- Check whether VRF tables are created correctly on the router.

#### Related Commands

##### ✚ Creating a VRF Table

<b>Command</b>	<b>ip vrf vrf-name</b>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of the VRF table to be created. It cannot exceed 31 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF mode.

##### ✚ Configuring an RD

<b>Command</b>	<b>rd rd_value</b>
<b>Parameter Description</b>	<p><i>rd_value</i> has the following three different parameter forms:</p> <p>(1) <i>rd_value</i> = <b>as_num: nn</b>  <b>as_num</b> indicates the 2-byte number that identifies a public autonomous system (AS). <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rd_value</i> = <b>ip_addr: nn</b>  <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rd_value</i> = <b>as4_num: nn</b>  <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p>
<b>Command Mode</b>	VRF configuration mode
<b>Usage Guide</b>	<p>You cannot directly change the RD of an existing VRF table. You need to delete the VRF table first and then configure a new RD.</p> <p>A VRF table has only one RD. You cannot configure multiple RDs for one VRF table.</p>

##### ✚ Configuring an RT

<b>Command</b>	<b>route-target { import   export   both } <i>rt_value</i></b>
<b>Parameter</b>	<i>rt_value</i> has the following three different parameter forms:
<b>Description</b>	<p>(1) <i>rt_value</i> = <b>as_num:nn</b></p> <p><b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rt_value</i> = <b>ip_addr:nn</b></p> <p><b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rt_value</i> = <b>as4_num: nn</b></p> <p><b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p>
<b>Command</b>	VRF configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	A VRF table can be configured with multiple import and export RT attributes.

### ↘ Binding an Interface

<b>Command</b>	<b>ip vrf forwarding <i>vrf-name</i></b>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<p>By default, an interface does not belong to any VRF table.</p> <p>After an interface is bound to the corresponding VRF table, the direct route and host route on the interface will be automatically added to the VRF table.</p> <p>You must bind an interface to the corresponding single-protocol VRF table before you configure the IPv4 address of the interface. If you bind the interface after its IPv4 address is configured, the IPv4 address will be invalid (the IPv6 address of the interface is retained).</p>

### ↘ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

<b>Command</b>	<b>ip vrf receive <i>vrf-name</i></b>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<p>This command is used to add the host route and direct route on an interface to a VRF table. If you need to add the host route and direct route on an interface to multiple VRF tables, run the command multiple times.</p> <p>Different from the <b>ip vrf forwarding</b> command, the <b>ip vrf receive</b> command does not bind an interface to the corresponding VRF table. The interface is still a global interface and does not belong to any VRF table.</p> <p>The <b>ip vrf forwarding</b> and <b>ip vrf receive</b> commands are mutually exclusive on the same interface.</p>

### ↘ Displaying the VRF Information on a Device

<b>Command</b>	<b>show ip vrf [ brief   detail   interfaces ] [ <i>vrf-name</i> ]</b>
<b>Parameter</b>	<b>brief</b> : Displays brief information.
<b>Description</b>	<p><b>detail</b>: Displays detailed information.</p> <p><b>interfaces</b>: Displays the interface binding information.</p> <p><i>vrf-name</i>: Indicates the name of a VRF table.</p>
<b>Command</b>	Privilege, global and interface configuration modes

<b>Mode</b>	
<b>Usage Guide</b>	This command is used to display the information of a specified VRF table to check whether the VRF table is bound with the correct interface.

▾ **Displaying the Routes in a VRF Table**

<b>Command</b>	<code>show ip route vrf vrf-name</code>
<b>Parameter</b>	<i>vrf-name</i> : Indicates the name of a VRF table.
<b>Description</b>	
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to check whether a specified VRF table contains corresponding routes.

**Configuration Example**

▾ **Local Inter-VPN Access**

<b>Scenario</b> Figure 11-4																							
	Sub a, Sub b, and Servers are three VPNs that have separate address spaces. Sub a runs RIP, Sub b runs OSPF, and Servers is a network segment directly connected to C.																						
<b>Configuration Requirements</b>	Routes in Sub a are separated from those in Sub b, but both Sub a and Sub b can access Servers.																						
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>On C, create a VRF table for Sub a, bind the interface directly connected to A, and associate the VRF table with A by using RIP.</li> <li>On C, create a VRF table for Sub b, bind the interface directly connected to B, and associate the VRF table with B by using OSPF.</li> <li>On C, create a VRF table for Servers and bind the interface directly connected to Servers.</li> <li>On C, configure the RTs of the VRF tables for Sub a, Sub b, and Servers. Import the routes in the VRF tables for Sub a and Sub b to the VRF table for Servers, and import the routes in the VRF table for Servers to the VRF tables for Sub a and Sub b.</li> <li>Configure the Border Gateway Protocol (BGP) on C. Introduce the RIP routes to the VRF table for Sub a, introduce the OSPF routes to the VRF table for Sub b (enabled with an address family), and introduce the direct routes to the VRF table for Servers (enabled with an address family).</li> </ul> <p><b>i</b> Planning of interfaces and addresses:</p> <table border="1"> <thead> <tr> <th>Interface Description</th> <th>Interface Name</th> <th>IP Address/Mask</th> <th>VRF Table</th> </tr> </thead> <tbody> <tr> <td>Interface on C connected to A</td> <td>GE0/1</td> <td>10.10.1.1/24</td> <td>VRF table for Sub a</td> </tr> <tr> <td>Interface on C connected to B</td> <td>GE0/2</td> <td>10.10.2.1/24</td> <td>VRF table for Sub b</td> </tr> <tr> <td>Interface on C connected to Servers</td> <td>GE0/3</td> <td>10.10.3.1/24</td> <td>VRF table for Servers</td> </tr> <tr> <td>Interface on A connected to C</td> <td>GE0/1</td> <td>10.10.1.2/24</td> <td>-</td> </tr> </tbody> </table>			Interface Description	Interface Name	IP Address/Mask	VRF Table	Interface on C connected to A	GE0/1	10.10.1.1/24	VRF table for Sub a	Interface on C connected to B	GE0/2	10.10.2.1/24	VRF table for Sub b	Interface on C connected to Servers	GE0/3	10.10.3.1/24	VRF table for Servers	Interface on A connected to C	GE0/1	10.10.1.2/24	-

GigabitEthernet0/2	10.10.2.1	Subb	up
GigabitEthernet0/3	10.10.3.1	Servers	up

```

C#show ip route vrf Subb

Routing Table: Subb

Codes: C - connected, S - static, R - RIP, B - BGP

        O - OSPF, IA - OSPF inter area

        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2

        E1 - OSPF external type 1, E2 - OSPF external type 2

        i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2

        ia - IS-IS inter area, * - candidate default

Gateway of last resort is no set

O    10.2.0.0/16 [20/0] via 0.0.0.0, 00:10:46, GigabitEthernet 0/2
O    10.10.2.0/24 [20/0] via 0.0.0.0, 00:10:46, GigabitEthernet 0/2
C    10.10.2.1/32 is local host.
C    10.10.3.0/24 is directly connected, GigabitEthernet 0/3
C    10.10.3.1/32 is local host.

```

### Common Errors

- An interface is bound to a VRF table after the IP interface of the interface is configured.
- When a physical link is used to forward packets from multiple VPNs, the corresponding physical interface is bound to a VRF table.
- VPN routes are not introduced to BGP.

### 11.4.2 Configuring a Multiprotocol VRF Table

#### Configuration Effect

- Provide the VPN service on a device.
- With BGP assistance, flexibly control the separation and access between VPNs.
- With BGP assistance, provide the VPN service in an IP backbone network.
- Support IPv4 and IPv6 through address family configuration.

#### Notes

- No VRF table needs to be created if the device only forwards packets from one VPN or from the public network.

- If the device needs to forward public network packets and VPN packets or forward packets from multiple VPNs, VRF tables must be created to separate routes.
- In many cases, static or dynamic routes (RIP, OSPF, ISIS, and BGP) need to be added to VRF tables.

### Configuration Steps

#### ↘ Creating a VRF Table

- Mandatory.
- Create a VRF table for each VPN.

#### ↘ Configuring an Address Family

- Mandatory.
- Enable the corresponding address family for each created VRF table.

#### ↘ Configuring an RD

- Optional.
- When routing information needs to be advertised through BGP in the backbone network, BGP may select the best route for advertising if overlapping network addresses exist in different VPNs, which will make some VPNs fail to obtain corresponding routing information. To solve this problem, you can configure RDs for routes to enable BGP to make routing decisions based on these RDs, thus ensuring that each VPN can obtain corresponding routing information.

#### ↘ Configuring an RT

- Optional.
- You can run the **route-target export** command to specify the attributes of the route to be advertised, and run the **route-target import** command to specify the attributes of the route to be received. You can also run the **route-target both** command to specify the export and import attributes.
- Run the **route-target** command in multiprotocol VRF mode or multiprotocol VRF address family mode.

#### ↘ Binding an Interface and Adding the Direct Route and Host Route on the Interface to a VRF Table

- Mandatory.
- If the physical link for transmitting VPN packets is exclusively occupied by a VPN, bind the physical interface to the corresponding VRF table.
- If the physical link for transmitting VPN packets is shared by multiple VPNs, you need to create an independent logical link for each VPN, and bind the logical interface to the corresponding VRF table. A logical interface can be a subinterface or a VLAN interface.
- Before you bind an interface to a multiprotocol VRF table, enable an address family for the table. If you do not enable the IPv4 address family in advance, you cannot configure the IPv4 address and VRRP IPv4 address of the bound interface. If you do not enable the IPv6 address family in advance, you cannot configure the IPv6 address and VRRP IPv6 address of the bound interface.
- You must bind an interface to the corresponding multiprotocol VRF table before you configure the IPv4 or IPv6 address of the interface. If you bind the interface after its IPv4 or IPv6 address is configured, the address will be invalid.

#### ↘ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

- Optional.
- If PBR is required for VRF table selection, run the **ip vrf receive** command on the interface to which PBR is applied, and import the direct route and host route on the interface to each VRF table available for choice.

### Verification

- Check whether multiprotocol VRF tables are created correctly on the router and corresponding address families are enabled.

### Related Commands

#### ↘ Creating a VRF Table

<b>Command</b>	<b>vrf definition</b> <i>vrf-name</i>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the name of the VRF table to be created. It cannot exceed 31 characters.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF mode.

#### ↘ Enabling the IPv4 Address Family

<b>Command</b>	<b>address-family ipv4</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	VRF mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF IPv4 address family submode.

#### ↘ Enabling the IPv6 Address Family

<b>Command</b>	<b>address-family ipv6</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	VRF mode
<b>Usage Guide</b>	After you run the command, the system will enter VRF IPv6 address family submode.

#### ↘ Configuring an RD

<b>Command</b>	<b>rd</b> <i>rd_value</i>
<b>Parameter Description</b>	<p><i>rd_value</i> has the following three different parameter forms:</p> <p>(1) <i>rd_value</i> = <b>as_num: nn</b>  <b>as_num</b> indicates the 2-byte number that identifies a public AS. <b>nn</b> is configurable in the range 0..4294967295.</p> <p>(2) <i>rd_value</i> = <b>ip_addr:nn</b>  <b>ip_addr</b> must be a global IP address. <b>nn</b> is configurable in the range 0..65535.</p> <p>(3) <i>rd_value</i> = <b>as4_num: nn</b>  <b>as4_num</b> indicates the 4-byte number that identifies a public AS. <b>nn</b> is configurable in the range 1..65535.</p>
<b>Command Mode</b>	VRF configuration mode

<b>Usage Guide</b>	<p>You cannot directly change the RD of an existing VRF table. You need to delete the VRF table first and then configure a new RD.</p> <p>A VRF table has only one RD. You cannot configure multiple RDs for one VRF table.</p>
--------------------	---

### ↘ Configuring an RT

<b>Command</b>	<code>route-target { import   export   both } rt_value</code>
<b>Parameter Description</b>	<p><code>rt_value</code> has the following three different parameter forms:</p> <p>(1) <code>rt_value = as_num:nn</code>  <code>as_num</code> indicates the 2-byte number that identifies a public AS. <code>nn</code> is configurable in the range 0..4294967295.</p> <p>(2) <code>rt_value = ip_addr:nn</code>  <code>ip_addr</code> must be a global IP address. <code>nn</code> is configurable in the range 0..65535.</p> <p>(3) <code>rt_value = as4_num:nn</code>  <code>as4_num</code> indicates the 4-byte number that identifies a public AS. <code>nn</code> is configurable in the range 1..65535.</p>
<b>Command Mode</b>	VRF configuration mode or VRF address family submode
<b>Usage Guide</b>	One VRF table can be configured with multiple import and export RT attributes.

### ↘ Binding an Interface

<b>Command</b>	<code>vrf forwarding vrf-name</code>
<b>Parameter Description</b>	<code>vrf-name</code> : Indicates the name of a VRF table.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>By default, an interface does not belong to any VRF table.</p> <p>After an interface is bound to the corresponding VRF table, the direct route and host route on the interface will be automatically added to the VRF table.</p> <p>Before you bind an interface to a multiprotocol VRF table, enable an address family for the table. If you do not enable the IPv4 address family in advance, you cannot configure the IPv4 address and VRRP IPv4 address of the bound interface. If you do not enable the IPv6 address family in advance, you cannot configure the IPv6 address and VRRP IPv6 address of the bound interface.</p> <p>You must bind an interface to a multiprotocol VRF table before you configure the IPv4, IPv6, VRRP IPv4, and VRRP IPv6 addresses of the interface; otherwise, these addresses will be invalid and the IPv6 protocol on the interface will be disabled.</p> <p>If the IPv4 address family is deleted from the multiprotocol VRF table, the IPv4 and VRRP IPv4 addresses of all interfaces bound to the VRF table will be deleted, and the IPv4 static routes in the VRF table or next-hop routes are also deleted. If the IPv6 address family is deleted from the multiprotocol VRF table, the IPv6 and VRRP IPv6 addresses of all interfaces bound to the VRF table will be deleted, the IPv6 protocol on the interfaces will be disabled, and the IPv6 static routes in the VRF table or next-hop routes are also deleted.</p>

### ↘ Adding the Direct Route and Host Route on an Interface to a VRF Table Without Binding the Interface

<b>Command</b>	<code>vrf receive vrf-name</code>
<b>Parameter Description</b>	<code>vrf-name</code> : Indicates the name of a VRF table.
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>This command is used to add the host route and direct route on an interface to a VRF table. If you need to add the host route and direct route on an interface to multiple VRF tables, run the command multiple times.</p> <p>Different from the <b>vrf forwarding</b> command, the <b>vrf receive</b> command does not bind an interface to the corresponding VRF table. The interface is still a global interface and does not belong to any VRF table.</p> <p>The <b>vrf forwarding</b> and <b>vrf receive</b> commands are mutually exclusive on the same interface.</p>

▾ **Displaying the VRF Information on a Device**

<b>Command</b>	<b>show vrf [ brief   detail   ipv4   ipv6] [ vrf-name ]</b>
<b>Parameter</b>	<b>brief:</b> Displays brief information.
<b>Description</b>	<p><b>detail:</b> Displays detailed information.</p> <p><b>ipv4:</b> Displays the brief information of an IPv4 VRF table.</p> <p><b>ipv6:</b> Displays the brief information of an IPv6 VRF table.</p> <p><b>vrf-name:</b> Indicates the name of a VRF table.</p>
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to display the information of a specified VRF table to check whether the VRF table is bound with the correct interface.

▾ **Displaying the Routes in a VRF Table**

<b>Command</b>	<b>show ip route vrf vrf-name</b>
<b>Parameter</b>	<b>vrf-name:</b> Indicates the name of a VRF table.
<b>Description</b>	
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	This command is used to check whether a specified VRF table contains corresponding routes.

**Configuration Example**

**i** The following example only describes VRF-related configuration on A1, B1, MCE1, and PE1. The configuration on A2, B2, MCE2, and PE2 is similar.

▾ **VRF on CEs and PEs (MCE Application)**

<b>Scenario</b> Figure 11-5	
	<p>VPN a and VPN b have independent address spaces.</p> <p>VPN a runs RIP and VPN b runs OSPF.</p>
<b>Configuration Requirements</b>	The routes in VPN a are separated from those in VPN b. A1 and A2 can access each other, and B1 and B2 can access each other.

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Connect MCE1 and A1 through RIP. Extend RIP routes on A1. On MCE1, create a VRF table for VPN a, bind the directly connected interface, and configure RIP routes.</li> <li>● Connect MCE1 and B1 through OSPF. Extend OSPF routes on B1. On MCE1, create a VRF table for VPN b, bind the directly connected interface, and configure OSPF routes.</li> <li>● Connect MCE1 and PE1 through BGP. On MCE1 and PE1, create a VRF table for each VPN, bind the VLAN interface, and configure BGP routes.</li> <li>● Configure the physical link between MCE1 and PE1 in Trunk mode.</li> <li>● In the VRF instance for VPN a on MCE1, redistribute the RIP routes to BGP, and redistribute the BGP routes to RIP.</li> <li>● In the VRF instance for VPN b on MCE1, redistribute the OSPF routes to BGP, and redistribute the BGP routes to OSPF.</li> </ul> <p> Planning of interfaces and addresses:</p>

	<pre>-</pre>

## Common Errors

- A multiprotocol VRF table is configured, but no address family is enabled.
- An interface is bound to a VRF table after the IP interface of the interface is configured.
- When a physical link is used to forward packets from multiple VPNs, the corresponding physical interface is bound to a VRF table.
- VPN routes are not introduced to BGP.

## 11.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the routes in a specified VRF table.	<b>clear ip route vrf <i>vrf-name</i></b>

### Displaying

Description	Command
Displays the information of a single-protocol VRF table.	<b>show ip vrf [ <i>brief</i>   <i>detail</i>   <i>interfaces</i> ] [ <i>vrf-name</i> ]</b>
Displays the information of a multiprotocol VRF table.	<b>show vrf [ <i>ipv4</i>   <i>ipv6</i>   <i>brief</i>   <i>detail</i> ] [ <i>vrf-name</i> ]</b>
Displays the global VRF information.	<b>show global-vrf [ <i>ipv4</i>   <i>ipv6</i>   <i>brief</i>   <i>detail</i> ]</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Displays the debugging information during the processes where a VRF table is created, an address family is enabled, and an interface is bound to the VRF table.	<b>debug vrf</b>
Prints the information of interface-related VRF operation debugging.	<b>debug vrf interface</b>

## 12 Configuring L3MAC

### 12.1 Overview

A layer-3 MAC address for forwarding can be configured for a device so that packets whose destination MAC addresses match the configured layer-3 MAC address are forwarded at layer 3. In data center scenarios, this MAC address can be configured in static ARP entries of neighbors so that routing can be triggered on any neighbor device.

## 12.2 Applications

Application	Description
Data Center Scenario	Layer-3 routing can be triggered on any neighbor without perceiving the layer-3 MAC address of the device.

### 12.2.1 Data Center Scenario

#### Scenario

A data center adopting the topology shown in the figure below is used as an example:

- A global layer-3 MAC address is configured on SW2 and SW3.
- A static ARP entry is configured on SW1.
- The MAC address in the static ARP entry configured on SW1 is the global layer-3 MAC address of its neighbors, that is, SW2 and SW3.

Figure 1-1

#### Deployment

- Packets from SW1 can be routed at layer 3 through its neighbors: SW2 and SW3.

## 12.3 Configuration

Configuration	Description and Command
Adding a Layer-3 MAC Address	Mandatory.
	<code>l3intf-mac-add</code> Adds a layer-3 MAC address.

### 12.3.1 Adding a Layer-3 MAC Address

#### Configuration Effect

- Add a global layer-3 MAC address so that layer-3 routing can be triggered when packets matching this layer-3 MAC address are received.

#### Notes

- Up to two layer-3 MAC addresses can be added.

## Configuration Steps

### ▾ Adding a Layer-3 MAC Address

<b>Command</b>	<b>I3intf-mac-add mac</b>
<b>Parameter Description</b>	<i>mac</i> : Indicates the layer-3 MAC address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Deleting a Layer-3 MAC Address

<b>Command</b>	<b>no I3intf-mac-add mac</b>
<b>Parameter Description</b>	<i>mac</i> : Indicates the layer-3 MAC address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Verification

1. Run the **show run** command to check whether the current configuration is correct.
2. Run the **show I3intf-mac-add** command to check whether the current configuration is correct.

## Configuration Example

### ▾ Adding a Layer-3 MAC Address

<b>Scenario</b> Figure 1-2	
<b>Configuration Steps</b>	Configure a static ARP entry on SW1, and a global layer-3 MAC address on SW2 and SW3.
<b>SW2</b>	SW2FS# configure terminal SW2#(FS(config)#I3intf-mac-add 0000.0001.2233
<b>SW3</b>	SW3FS# configure terminal SW3#(FS(config)#I3intf-mac-add 0000.0001.2233
<b>SW1</b>	SW1FS# configure terminal

	SW1FS(config)# arp 192.168.22.20 0000.0001.2233 arpa
<b>Verification</b>	<ol style="list-style-type: none"> <li>1. Run the <b>show l3intf-mac-add</b> command to display the global MAC address configured on SW2 and SW3.</li> <li>2. Pump traffic and verify that packets from SW1 are routed at layer 3 regardless of whether the next hop of SW1 is SW2 or SW3.</li> </ol>
<b>SW2</b>	<pre>SW2(config)#FS#show l3intf-mac-add l3intf mac address: 0000.0001.2235</pre>
<b>SW3</b>	<pre>SW3(config)#FS#show l3intf-mac-add l3intf mac address: 0000.0001.2235</pre>

## 12.4 Monitoring

### Displaying

Description	Command
Displays the configured global layer-3 MAC address of the device.	<b>show l3intf-mac-add</b>

## 13 Configuring Hardware Capacity Query

### 13.1 Overview

The FSOS provides the function of querying the hardware capacity and usage of the route forward information database (FIB).

#### Protocols and Standards

N/A

### 13.2 Features

#### Basic Concepts

Route hardware resources are classified into IPv4 and IPv6 route resources by protocol, and are classified into host and network route resources by route prefix.

Route resource allocation varies with the chip hardware type.

- **N5860 series, N8560 series and NC8200 series**

Products of these series use XGS chips. Their route hardware resources consist of the L3\_ENTRY, L3\_DEFIP, L3\_DEFIP\_128, and ALPM tables. The L3\_ENTRY table can store IPv4/IPv6 host routes. The L3\_DEFIP table can store IPv4 and IPv6\_64 routes. The L3\_DEFIP\_128 table can store IPv6 routes with a mask of 65 to 128 bits. The ALPM table can store IPv4/IPv6 routes. IPv4 and IPv6 routes occupy different quantities of hardware entries, and can be converted in the following ways:

Calculation rules for the L3\_ENTRY table:

- One IPV4\_HOST route occupies one L3\_ENTRY entry.

- One IPV4\_HOSTFULL route occupies two L3\_ENTRY entries.
- One IPV6\_HOST route occupies two L3\_ENTRY entries.
- One IPV6\_HOSTFULL route occupies four L3\_ENTRY entries.

Calculation rules for the L3\_DEFIP table: (If ALPM is enabled, conversion is not required and the L3\_DEFIP entry usage is not displayed.)

- Two IPv4 routes occupy one L3\_DEFIP entry. (If there is only one IPv4 route, the IPv4 route also occupies one L3\_DEFIP entry.)
- One IPV6\_64 route occupies one L3\_DEFIP entry.

Calculation rules for the L3\_DEFIP\_128 table: (If ALPM is enabled, conversion is not required and the L3\_DEFIP\_128 entry usage is not displayed.)

- One IPV6\_128 route occupies one L3\_DEFIP\_128 entry.

Calculation rules for the ALPM table: (If ALPM is disabled, related ALPM entries are set to 0 and the ALPM entry usage is not displayed.)

- One IPV4 route occupies one ALPM entry.
- One IPv6 route occupies 1.5 ALPM entries when IPV6\_128 is disabled.
- One IPv6 route occupies three ALPM entries when IPV6\_128 is enabled.

- N18000-X CB series

Fixed capacities are allocated to manage host and network route resources, respectively. IPv4 and IPv6 host routes share host route resources. IPv4 and IPv6 network routes share network route resources. An IPv6 route occupies four times of resources over an IPv4 route. For example, when the total host route resource capacity is 200 K, 200 K IPv4 host routes, 50 K IPv6 host routes, or 100 K IPv4 host routes and 25 K IPv6 host routes are supported.

The network route resource capacity of the N18000-X CB series is determined by the prefix length of installed routes, to provide references for the guarantee capacity (minimum) and theoretical capacity (maximum).

Route tables are hash tables, and hash collisions easily occur. Some hardware resources may be incompletely used.

### Verification

#### ▾ Displaying Resource Usage in Standalone Mode

- Run the **show route-res usage slot slot\_num** command to display the resource usage.

<b>Command</b>	<b>show route-res usage slot slot_num</b>
<b>Parameter Description</b>	slot_num: Specifies the ID of the slot in which the line card of the chassis-type device resides, where 0 indicates a box-type device.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A
<b>Command Presentation</b>	<pre>FS#show route-res usage slot 0 Switch Mode Current:default Switch Mode Next   :default ----- L3 Software Statistics:</pre>

Switch	Slot	Chip	Name	Used	Description
1	0	0	IPV4_LPM	0	ipv4 route in lpm table
1	0	0	IPV4_HOST	0	ipv4 route in l3_entry table
1	0	0	IPV4_HOSTFULL	0	ipv4 route in l3_entry_double table
1	0	0	IPV6_64_LPM	0	ipv6-64 route in lpm table
1	0	0	IPV6_128_LPM	0	ipv6-65~128 route in lpm table
1	0	0	IPV6_HOST	0	ipv6 route in l3_entry_double
1	0	0	IPV6_HOST_FULL	0	ipv6 route in l3_entry_qual

Switch	Slot	Chip	Name	Used	Max	Description
1	0	0	NEXTHOP	0	49152	nexthop number
1	0	0	ECMP_GROUP	0	4096	ecmp group number

L3 Forwarding Resources:

Switch	Slot	Chip	Resource	Service	Max	Used[ %]	Remain

### 13.3 Monitoring

#### Clearing

N/A

#### Displaying

Description	Command
Displays the FIB hardware capacity and usage of a specified switch line card in standalone mode.	<b>show route-res usage slot <i>slot_num</i></b>
Displays the FIB hardware capacity and usage of a specified switch line card in VSU mode.	<b>show route-res usage switch <i>switch_num</i> slot <i>slot_num</i></b>
Displays the FIB hardware capacities and usage of all line cards.	<b>show route-res usage all</b>

#### Debugging

N/A

The preceding **show** commands apply to chassis- and box-type devices in standalone and VSU modes.

## Multicast Configuration

1. Configuring IP Multicasting
2. Configuring IPv6 Multicast
3. Configuring IGMP
4. Configuring MLD
5. Configuring PIM-DM
6. Configuring PIM-SM
7. Configuring PIM-SMv6
8. Configuring MSDP
9. Configuring IGMP Snooping
10. Configuration MLD Snooping

## 14 Configuring IP Multicasting

### 14.1 Overview

IP multicasting is abstracted hardware multicasting and an extended multicast routing protocol on the standard IP network layer.

In traditional IP transmission, only one host can send packets to a single host (unicast communication) or all hosts (broadcast communication). However, the multicast technology provides the third choice: a host can send packets to certain specified hosts.

IP multicasting is applicable to one-to-many multimedia applications.

### 14.2 Applications

Application	Description
PIM-DM Applications	The PIM-DM multicast service is provided on the same network.
PIM-SM Applications	The PIM-SM multicast service is provided on the same network.

#### 14.2.1 PIM-DM Applications

##### Scenario

The PIM-DM multicast service is provided on the same network.

As shown in Figure 1- 1:

- A multicast source sends a multicast packet, and receiver A and receiver B on the same network receive the multicast packet.

Figure 1- 1

<b>Remarks</b>	<p>A and B are layer-3 devices and C is a layer-2 access device.</p> <p>Source is connected to the Gi 0/1 interface of A, and receiver A and receiver B are connected to the Gi 0/2 and Gi 0/3 interfaces of C.</p>
----------------	---

##### Deployment

- Run the Open Shortest Path First (OSPF) protocol on the same network to implement unicast routing.
- Run PIM-DM on the same network to implement multicast routing.

- Run the Internet Group Membership Protocol (IGMP) in a user host network segment to implement group member management.

## 14.2.2 PIM-SM Applications

### Scenario

The PIM-SM multicast service is provided on the same network.

As shown in Figure 1- 2:

- A multicast source sends a multicast packet, and receiver A and receiver B on the same network receive the multicast packet.

Figure 1- 2

### Remarks

A, B, and C are layer-3 routers.

The multicast source is connected to the Gi 0/1 interface of A, receiver B is connected to the Gi 0/1 interface of B, and receiver B is connected to the Gi 0/1 interface of C.

### Deployment

- Run OSPF on the same network to implement unicast routing.
- Run PIM-SM on the same network to implement multicast routing.
- Run IGMP in a user host network segment to implement group member management.

## 14.3 Features

### Basic Concepts

#### ▾ PIM Routers and PIM Interfaces

Routers enabled with PIM are called PIM routers. Interfaces enabled with PIM protocol are called PIM interfaces.

Multicast packets are forwarded on PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for sending multicast packets are called downstream interfaces.

The network segments where upstream interfaces are located are called upstream network segments. The network segments where downstream interfaces are located are called downstream network segments.

#### ▾ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On certain PIM interfaces, borders are configured to divide a large PIM network into multiple PIM domains. Borders may reject specified multicast packets or limit transmission of PIM messages.

### ✚ Multicast Distribution Tree, DR and RP

Multicast packets are transmitted from one point to multiple points. The forwarding path is in a tree structure. This forwarding path is called a multicast distribution tree (MDT) and has the following types:

- Rendezvous Point Tree (RPT): The RP is regarded as the root and the designated router (DR) that connects group members is regarded as a leaf.
- Shortest Path Tree (SPT): The DR that connects multicast sources is regarded as the root, and RP or DR that connects group members is regarded as a leaf.

The DR and RP are functional roles for a PIM router.

- The RP collects multicast sources and group member information on the network.
- The DR that connects multicast sources reports multicast source information to the RP. The DR that connects group members reports group member information to the RP.

### ✚ (\*,G) and (S,G)

- (\*,G): Packets sent from any source to group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Packets sent from source S to group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

### ✚ ASM and SSM

PIM-SM supports the following multicast models that are applicable to different multicast address segments:

- Any-Source Multicast (ASM): In the ASM model, user hosts cannot select multicast sources. User hosts join a group and receive packets sent from all sources to the group.
- Source-Specific Multicast (SSM): In the SSM model, user hosts can select multicast sources. User hosts specify source addresses when joining a group and receive only packets sent from specified sources to the group.

SSM model requirements: User hosts must know the multicast source address in advance using other network services so that the hosts can select multicast sources.

## Overview

Feature	Description
Configuring Basic Functions of IP Multicasting	Creates a PIM network and provides data sources and user terminals on the network with the IPv4 multicast service.
Configuring a TTL Threshold	Configures a TTL threshold for an interface, that is, the minimum TTL value of multicast packets allowed on an interface.
Configuring the Number of Entries That Can Be Added to the Multicast Routing Table	Limits the number of entries that can be added to the multicast routing table.
Configuring an IP	Configures an interface as a multicast border for a specified group.

Feature	Description
Multicasting Border	
Configuring an IP Multicasting Static Route	Allows the multicast forwarding path to be different from the unicast path.
Configuring Layer-2 Direction Control for Multicast Streams	Allows a specified multicast stream to be configured with multiple commands, that is, to be configured with multiple ports that can forward the stream. Once direction control is configured for a multicast stream, the stream can be forwarded only by these configured interfaces. Other interfaces are not permitted to forward the stream.
Configuring RPF Route Selection Based on the Longest Match Rule	Selects an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules. Among these three routes, the one with the longest match mask is selected as the RPF route.
Configuring Multicast Non-Stop Forwarding Parameters	During normal running, SSP synchronizes the hardware multicast forwarding table to the management board in real time. After the management board is switched, the command for configuring the multicast control plane of the original slave management board is loaded, and the multicast protocol (such as PIM-SM or IGMP Snooping) re-converges. The multicast non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of the multicast protocol.
Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries	Deletes the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

### 14.3.1 Configuring Basic Functions of IP Multicasting

Create a PIM network and provide data sources and user terminals on the network with the IPv4 multicast service.

#### Working Principle

A device maintains the routing table for forwarding multicast packets through multicast routing protocols (such as PIM-DM or PIM-SM) and learns the states of group members in the directly connected network segment through IGMP. A host sends IGMP Report messages to join a specified IGMP group.

#### Related Configuration

##### ▾ Enabling IPv4 Multicast Routing

By default, IPv4 multicast routing is disabled.

Run **ip multicast-routing** to enable IPv4 multicast routing.

##### ▾ Configuring IP Multicasting on an Interface

By default, IP multicasting is disabled on an interface.

Run **ip pim sparse-mode** or **ip pim dense-mode** to enable IP multicasting on an interface.

### 14.3.2 Configuring a TTL Threshold

Configure a TTL threshold for an interface, that is, the minimum TTL value of multicast packets allowed on an interface.

#### Working Principle

Configure a TTL threshold for an interface and check the TTL values of multicast packets. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded.

#### Related Configuration

##### ▾ Configuring a TTL Threshold

By default, the TTL threshold of an interface is 0.

Run `ip multicast ttl-threshold ttl-value` to change the TTL threshold of an interface. The value ranges from 0 to 255.

A larger value of *ttl-value* means a larger TTL value of multicast packets to be forwarded.

### 14.3.3 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

Each multicast data packet received on the device maintains a corresponding IP multicast route forwarding entry. However, excess multicast routing entries may exhaust device memory and deteriorate device performance. You can limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

#### Working Principle

The number of entries in the IP multicasting routing table is limited based on the actual network and service performance requirements to ensure device performance.

#### Related Configuration

##### ▾ Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

By default, a maximum of 1024 entries can be added to an IP multicast routing table.

Run `ip multicast route-limit limit [threshold]` to change the number of entries that can be added to the IP multicasting routing table. The value ranges from 1 to 65536.

A larger value of *limit* means a larger number of entries that can be added to the IP multicasting routing table.

### 14.3.4 Configuring an IP Multicasting Border

Configure an IP multicasting border to specify the transmission range of multicast packets.

#### Working Principle

An IP multicasting border is configured to specify the transmission range of multicast packets. When an IP multicasting border is configured on an interface, this interface cannot forward or receive multicast packets, including those sent from the local host.

#### Related Configuration

##### ▾ Configuring an IP Multicasting Border

By default, no IP multicasting border is configured.

Run `ip multicast boundary access-list [ in | out ]` to configure an IP multicasting border.

### 14.3.5 Configuring an IP Multicasting Static Route

Configure an IP multicasting static route to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

#### Working Principle

An RPF check is performed once multicast packets are forwarded. An IP multicasting static route can be configured to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

#### Related Configuration

##### ▾ Configuring an IP Multicasting Static Route

By default, no IP multicasting static route is configured.

Run `ip mroute source-address mask {[bgp|isis|ospf|rip|static]} {v4rpf-address|interface-type interface-number} [distance]` to configure an IP multicasting static route.

### 14.3.6 Configuring Layer-2 Direction Control for Multicast Streams

Configure layer-2 direction control for multicast streams to control the forwarding of multicast streams on an interface.

#### Working Principle

Configure layer-2 direction control for multicast streams and a forwarding interface so that multicast streams can be forwarded only through configured interfaces. In this case, layer-2 forwarding of multicast streams can be controlled.

#### Related Configuration

##### ▾ Configuring Layer-2 Direction Control for Multicast Streams

By default, layer-2 direction control for multicast streams is disabled.

Run `ip multicast static source-address group-address interface-type interface-number` to configure layer-2 direction control for multicast streams.

### 14.3.7 Configuring RPF Route Selection Based on the Longest Match Rule

Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table and select the one with the longest match mask as the RPF route from the three optimal routes.

#### Working Principle

A multicast static route, an MBGP route, and a unicast route that can be used for RPF check are selected respectively from the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules.

- If the longest match rule is used, the route with the longest match mask is selected as the RPF route. If the three routes have the same mask, the one with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.
- Otherwise, the one with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.

#### Related Configuration

### ▾ Configuring RPF Route Selection Based on the Longest Match Rule

By default, the route with the highest priority is selected as the RPF route. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.

Run **ip multicast rpf longest-match** to configure RPF route selection based on the longest match rule.

### 14.3.8 Configuring Multicast Non-Stop Forwarding Parameters

The non-stop forwarding function ensures continuous forwarding of multicast data streams during the re-convergence of multicast protocols.

#### Working Principle

During normal running, SSP synchronizes the hardware multicast forwarding table to the management board in real time. After the management board is switched, the command for configuring the multicast control plane of the original slave management board is loaded, and the multicast protocol (such as PIM-SM or IGMP Snooping) re-converges. The multicast non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of multicast protocols.

After the configured protocol convergence period times out, all multicast forwarding table entries that are not updated during the convergence period are deleted.

#### Related Configuration

### ▾ Configuring the Maximum Period for Multicast Protocol Convergence

By default, the maximum period for multicast protocol convergence is 20s.

Run **msfnsf convergence-time *time*** to configure the maximum period for multicast protocol convergence. The value ranges from 0 to 3600s.

A larger value of *time* means a longer maximum period for multicast protocol convergence.

### ▾ Configuring the Multicast Packet Leakage Period

By default, the multicast packet leakage period is 30s.

Run **msfnsfleak *interval*** to configure the multicast packet leakage period. The value ranges from 0 to 3600s.

A larger value of *interval* means a longer leakage period.

### 14.3.9 Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

#### Working Principle

Delete the earliest hardware entries and adds new entries if the hardware forwarding table overflows when you create multicast forwarding entries.

#### Related Configuration

### ▾ Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries

By default, the overwriting mechanism upon the overflow of multicast hardware forwarding entries is disabled.

Run **msf ipmc-overflow override** to configure the overwriting mechanism upon overflow of multicast hardware forwarding entries.

## 14.4 Configuration

Configuration	Description and Command	
Configuring Basic Functions of IP Multicasting	 (Mandatory) It is used to configure the multicast service.	
	<b>ip multicast-routing</b>	Enables the IPv4 multicast routing function.
Configuring a TTL Threshold	 Optional.	
	<b>ip multicast ttl-threshold</b> <i>ttl-value</i>	Configures a TTL threshold for an interface.
Configuring the Number of Entries That Can Be Added to the Multicast Routing Table	<b>ip multicast route-limit</b> <i>limit</i> [ <i>threshold</i> ]	Limits the number of entries that can be added to the multicast routing table.
Configuring an IP Multicasting Border	<b>ip multicast boundary</b> <i>access-list</i> [ <i>in</i>   <i>out</i> ]	Configures an interface as a multicast border for a specified group.
Configuring an IP Multicasting Static Route	<b>ip mroute</b> <i>source-address</i> <i>mask</i> { [ <i>bgp</i>   <i>isis</i>   <i>ospf</i>   <i>rip</i>   <i>static</i> ] { <i>v4rpf-address</i>   <i>interface-type</i> <i>interface-number</i> } } [ <i>distance</i> ]	Configures an IP multicasting static route.
Configuring Layer-2 Direction Control for Multicast Streams	<b>ip multicast static</b> <i>source-address</i> <i>group-address</i> <i>interface-type</i> <i>interface-number</i>	Controls the direction of data streams on layer-2 interfaces.
Configuring RPF Route Selection Based on the Longest Match Rule	<b>ip multicast rpf longest-match</b>	Configures RPF route selection based on the longest match rule.
Configuring Multicast Non-Stop Forwarding Parameters	<b>msf nsf convergence-time</b> <i>time</i>	Configures the maximum period for multicast protocol convergence.
	<b>msf nsf leak</b> <i>time</i>	Configures the multicast packet leakage period.
Configuring an Overwriting Mechanism Upon Overflow of Multicast Hardware Forwarding Entries	<b>msf ipmc-overflow override</b>	Configures the overwriting mechanism upon overflow of multicast hardware forwarding entries.

### 14.4.1 Configuring Basic Functions of IP Multicasting

#### Configuration Effect

- Create a PIM network and provide data sources and user terminals on the network with the IPv4 multicast service.

#### Notes

- A PIM network needs to use existing unicast routes on the network. Therefore, IPv4 routes must be configured on the network.

#### Configuration Steps

##### ▾ Enabling IPv4 Multicast Routing

- Mandatory.
- IPv4 multicast routing should be enabled on each router unless otherwise specified.

### ✚ Enabling IP Multicasting for an Interface

- Mandatory.
- IP multicasting protocol should be enabled on interfaces unless otherwise specified:

#### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups.

- Check whether the user hosts can successfully receive packets from each group.

#### Related Commands

### ✚ Enabling IPv4 Multicast Routing

<b>Command</b>	<b>ip multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

### ✚ Configuring IP Multicasting

 For IGMP configuration, see the IGMP section.

 For PIM-DM configuration, see the PIM-DM section.

 For PIM-SM configuration, see the PIM-SM section.

 After layer-3 multicasting is enabled in the private VLAN and super VLAN and a multicast source exists in the sub-VLAN, an extra entry whose ingress is the sub-VLAN into which the multicast stream enters needs to be copied due to the validity check during multicast forwarding. This results in occupation of one more multicast hardware entry and one less in the multicast capacity.

### ✚ Displaying Information About the Multicast Forwarding Table

<b>Command</b>	<b>show ip mroute [ group-or-source-address [ group-or-source-address ] ] [ dense   sparse ] [ summary   count ]</b>
<b>Parameter Description</b>	<p><i>group-or-source-address</i>: Specifies a group address or source address.</p> <p><i>group-or-source-address</i>: Specifies a group address or source address.</p> <p><b>dense</b>: Displays the core entry of PIM-DM multicast.</p> <p><b>sparse</b>: Displays the core entry of PIM-SM multicast.</p> <p><b>summary</b>: Displays summary information about multicast routing entries.</p> <p><b>count</b>: Displays counting information about multicast routing entries.</p>
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	<p>The three parameters are optional, and the source address and group address must be specified simultaneously.</p> <p>When no source address or group address is specified, all MFC entries are displayed.</p> <p>When only the source address and group address are specified, MFC entries of the source address and group address are displayed.</p>

## Configuration Example

### Creating the IP Multicast Service on the IPv4 Network and Supporting PIM-DM

<b>Scenario</b> <b>Figure 1- 3</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on a router.</li> <li>● Enable IPv4 multicast routing on all routers.</li> <li>● Enable PIM-DM on device interconnection interfaces and interfaces for connecting user hosts and multicast sources.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim dense-mode A(config-if)# exit A(config)# interface GigabitEthernet 0/2 A(config-if)# ip pim dense-mode A(config-if)# exit</pre>
<b>B</b>	<pre>B# configure terminal B(config)# ip multicast-routing B(config)# interface GigabitEthernet 0/1 B(config-if)# ip pim dense-mode B(config-if)# exit B(config)# interface GigabitEthernet 0/2 B(config-if)# ip pim dense-mode B(config-if)# exit</pre>
<b>Verification</b>	<p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G.</p> <ul style="list-style-type: none"> <li>● Check multicast packets received by receiver A. Receiver A should be able to receive multicast packets from G.</li> <li>● Check multicast forwarding tables on A and B.</li> </ul>

A	<pre>A# show ip mroute  IP Multicast Routing Table  Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group  Timers: Uptime/Stat Expiry  Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:01:55, stat expires 00:02:19  Owner PIMDM, Flags: TFS    Incoming interface: GigabitEthernet 0/1    Outgoing interface list:      GigabitEthernet 0/2 (1)</pre>
B	<pre>B# show ip mroute  IP Multicast Routing Table  Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group  Timers: Uptime/Stat Expiry  Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:00:35, stat expires 00:02:55  Owner PIMDM, Flags: TFS    Incoming interface: GigabitEthernet 0/2    Outgoing interface list:      GigabitEthernet 0/1 (1)</pre>

### Common Errors

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a router.
- IP multicasting is not enabled on an interface.

### 14.4.2 Configuring a TTL Threshold

#### Configuration Effect

- Configure a TTL threshold for an interface and check the TTL values of multicast packets. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded.

**Notes**

- The basic functions of IP multicasting must be configured.

**Configuration Steps**

- Set a TTL threshold on PIM router interfaces unless otherwise specified.

**Verification**

Enable multicast sources to send multicast packets and user hosts to join the groups.

- Set a TTL threshold to a value that is larger than the TTL value of the multicast packet on the PIM router interface directly connected to the user host and check whether the user can receive the multicast packet.

**Related Commands**

▾ **Configuring a TTL Threshold**

<b>Command</b>	<code>ip multicast ttl-threshold <i>ttl-value</i></code>
<b>Parameter Description</b>	<i>ttl-value</i> : Specifies a TTL threshold for an interface. The value ranges from 0 to 255. The default value is 0.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	A multicast-enabled device can retain a TTL threshold for each interface. Multicast packets whose TTL values are larger than the TTL threshold of the interface are forwarded and those whose TTL values are smaller are discarded. A TTL threshold takes effect only for multicast frames and must be configured on layer-3 interfaces.

**Configuration Example**

▾ **Creating the IP Multicast Service on the IPv4 Network and Configuring a TTL Threshold**

<b>Scenario</b> Figure 1- 4	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure the TTL threshold as 100 on the Gi 0/2 interface of device A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)#int gigabitEthernet 0/2</pre>

	<pre>A(config-if-GigabitEthernet 0/2)#ip multicast ttl-threshold 100 A(config-if-GigabitEthernet 0/2)# exit</pre>
<p><b>Verification</b></p>	<p>Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G.</p> <ul style="list-style-type: none"> <li>● Configure the TTL threshold as 100 on the Gi0/2 interface of device A, which is larger than the TTL value of the multicast packet.</li> <li>● Check the difference between the route forwarding entries before and after the TTL threshold is configured.</li> </ul>
<p><b>Before Configuring the TTL Threshold</b></p>	<pre>A# show ip mroute IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:00:08, stat expires 00:03:29 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (1)</pre>
<p><b>After Configuring the TTL Threshold</b></p>	<pre>A# show ip mroute IP Multicast Routing Table Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed,       R - RPT, S - SPT, s - SSM Group Timers: Uptime/Stat Expiry Interface State: Interface (TTL)  (192.168.1.100, 233.3.3.3), uptime 00:00:01, stat expires 00:03:29 Owner PIMDM, Flags: TFS   Incoming interface: GigabitEthernet 0/1   Outgoing interface list:     GigabitEthernet 0/2 (100)</pre>

### 14.4.3 Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

#### Configuration Effect

- Each multicast data packet received on the device maintains a corresponding IP multicast route forwarding entry. However, excess multicast routing entries may exhaust device memory and deteriorate device performance. You can limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

#### Notes

- The basic functions of IP multicasting must be configured.

#### Configuration Steps

- Limit the number of entries in the IP multicast routing table based on the actual network and service performance requirements.

#### Verification

Send N groups of multicast packets from the multicast source on the network, configure user hosts to join the groups, configure the number of entries that can be added to the IP multicast routing table as N-1, and check whether the multicast packet received by the user host is that of the N-1 group.

#### Related Commands

##### ✚ Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

<b>Command</b>	<code>ip multicast route-limit <i>limit</i> [ <i>threshold</i> ]</code>
<b>Parameter Description</b>	<p><i>limit</i>: Specifies the number of entries in the multicast routing table. The value ranges from 1 to 65536. The default value is 1024.</p> <p><i>threshold</i>: Specifies the number of entries in the multicast routing table that triggers the warning message. The default value is 65536.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Due to limitations on hardware resources, routing entries that exceed the range permitted by hardware can be forwarded only by software, deteriorating the performance.

#### Configuration Example

##### ✚ Creating the IP Multicast Service on the IPv4 Network and Configuring the Number of Entries That Can Be Added to the Multicast Routing Table

<p><b>Scenario</b></p> <p><b>Figure 1- 5</b></p>	 <pre> graph LR     MS[Multicast Source] --- Gi0/1  A((A))     A --- Gi0/2  B((B))     B --- Gi0/1  RA[Receiver A]           </pre>
--	--

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic the functions of IP multicasting. (Omitted)</li> <li>● Configure the number of entries that can be added to the multicast routing table on device B as 2.</li> </ul>
<b>B</b>	<pre>B# configure terminal B(config)# ip multicast route-limit 2</pre>
<b>Verification</b>	<p>Enable the multicast source (192.168.1.100) to send packets to G1 (233.3.3.1), G2 (233.3.3.2), and G3 (233.3.3.3). Enable receiver A to join G1, G2, and G3.</p> <ul style="list-style-type: none"> <li>● Check multicast packets received by receiver A. Receiver A should be able to receive multicast packets from two groups among G1, G2, and G3.</li> <li>● Check multicast routing entries on A and B.</li> <li>● When the number of entries in the IP multicasting routing table reaches the upper threshold, a prompt message is displayed.</li> </ul>
<b>A</b>	<pre>A# show ip mroute</pre> <p>IP Multicast Routing Table</p> <p>Flags: I – Immediate Stat, T – Timed Stat, F – Forwarder installed, R – RPT, S – SPT, s – SSM Group</p> <p>Timers: Uptime/Stat Expiry</p> <p>Interface State: Interface (TTL)</p> <p>(192.168.1.100, 233.3.3.1), uptime 00:00:06, stat expires 00:03:24</p> <p>Owner PIMDM, Flags: TFS</p> <p>Incoming interface: GigabitEthernet 0/1</p> <p>Outgoing interface list:</p> <p>GigabitEthernet 0/2 (1)</p> <p>(192.168.1.100, 233.3.3.2), uptime 00:00:05, stat expires 00:03:25</p> <p>Owner PIMDM, Flags: TFS</p> <p>Incoming interface: GigabitEthernet 0/1</p> <p>Outgoing interface list:</p> <p>GigabitEthernet 0/2 (1)</p> <p>(192.168.1.100, 233.3.3.3), uptime 00:00:00, stat expires 00:03:30</p> <p>Owner PIMDM, Flags: TFS</p> <p>Incoming interface: GigabitEthernet 0/1</p>

	<p>Outgoing interface list:</p> <p>GigabitEthernet 0/2 (1)</p>

### Common Errors

- An IPv4 unicast route is incorrectly configured.

### 14.4.4 Configuring an IP Multicasting Border

#### Configuration Effect

- Configure an IP multicasting border to specify the transmission range of multicast packets.

#### Notes

- The basic functions of IP multicasting must be configured.

#### Configuration Steps

- Configure an IP multicasting border on PIM router interfaces unless otherwise specified.

### Verification

Enable multicast sources to send multicast packets and user hosts to join the groups. Configure an IP multicasting border on the PIM router interface connected to the user host and check whether the user can receive the multicast packet.

### Related Commands

#### ▾ Enabling IPv4 Multicast Routing

<b>Command</b>	<b>ip multicast boundary</b> <i>access-list</i> [ in   out ]
<b>Parameter</b>	<i>access-list</i> : Indicates the group address range defined by ACL.
<b>Description</b>	<i>in</i> : Indicates that the IP multicasting border takes effect in the incoming direction of the multicast stream. <i>out</i> : Indicates that the IP multicasting border takes effect in the outgoing direction of the multicast stream.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After this command is executed, IGMP and PIM-SM packets in the group range are filtered on this interface and multicast data streams are not going in and out through this interface. The ACL associated with this command can be a standard ACL or an extended ACL. For extended ACLs, only the destination address is matched and the source address is matched.

### Configuration Example

#### ▾ Creating the IP Multicast Service on the IPv4 Network and Configuring an IP Multicasting Border

<b>Scenario</b> Figure 1- 6	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure an ACL on device A.</li> <li>● Configure an IP multicasting border on the Gi 0/1 interface of device A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)#ip access-list standard ip_multicast A(config-std-nacl)#deny any A(config-std-nacl)#exit A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)#ip multicast boundary ip_multicast A A(config-if-GigabitEthernet 0/1)# exit</pre>

<b>Verification</b>	Enable the multicast source (192.168.1.100) to send packets to G (233.3.3.3). Enable receiver A to join G. <ul style="list-style-type: none"> <li>● Run <b>debug ip pim sparse-mode events</b>.</li> </ul>
<b>A</b>	<pre>A# debug ip pim sparse-mode events Jan 1 20:58:34: %7: VRF(0): No cache message: src 192.168.1.100 for 233.3.3.3 vif 2 *Jan 1 20:58:34: %7: VRF(0): Ignore No cache message: src 192.168.1.100 for 233.3.3.3 vif 2 in PIM_BOUNDARY_FLT_BOTH range</pre>

### Common Errors

- An IPv4 unicast route is incorrectly configured.

### 14.4.5 Configuring an IP Multicasting Static Route

#### Configuration Effect

- Configure an IP multicasting static route to specify an RPF interface or RPF neighbor for multicast packets from specified multicast sources.

#### Notes

- The basic functions of IP multicasting must be configured.

#### Configuration Steps

- An IP multicasting static route can be configured on each device unless otherwise specified.

#### Verification

Run **show ip rpf source-address** to check the RPF information of a specified source.

#### Related Commands

#### 📄 Configuring Basic Functions of IP Multicasting

<b>Command</b>	<b>ip mroute</b> <i>source-address mask</i> { [ <b>bgp</b>   <b>isis</b>   <b>ospf</b>   <b>rip</b>   <b>static</b> ] { <i>v4rpf-address</i>   <i>interface-type interface-number</i> } } [ <i>distance</i> ]
<b>Parameter Description</b>	<p><i>source-address</i>: Specifies the multicast source address.</p> <p><i>mask</i>: Specifies the mask of the multicast source address.</p> <p><i>protocol</i>: Indicates the unicast routing protocol currently used.</p> <p><i>rpf-address</i>: Specifies the address of the RPF neighbor (next hop of the multicast source).</p> <p><i>interface-type interface-number</i>: Indicates the RPF interface (outgoing interface of the multicast source).</p> <p><i>distance</i>: Specifies the route management distance. The value ranges from 0 to 255. The default value is 0.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Multicast static routes are applicable only to RPF check.</p> <p>If the IP address of the outgoing interface, but not the next hop, of the static multicast route needs to be specified, the</p>

outgoing interface must be a point-to-point type.

▾ **Displaying the RFP Information of a Specified Source Address**

<b>Command</b>	<b>show ip rpf source-address</b>
<b>Parameter Description</b>	<i>source-address</i> : Specifies the source IP address.
<b>Command Mode</b>	Privilege, global and interface configuration modes
<b>Usage Guide</b>	The three parameters are optional, and the source address and group address must be specified simultaneously. When no source address or group address is specified, all MFC entries are displayed. When only the source address and group address are specified, MFC entries of the source address and group address are displayed.

**Configuration Example**

▾ **Creating the IP Multicast Service on the IPv4 Network and Supporting PIM-DM**

<b>Scenario</b> Figure 1- 7	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure a static route to the receiver on device B.</li> </ul>
<b>A</b>	<pre>B# configure terminal B(config)# ip mroute 10.10.10.10 255.255.255.255 ospf 192.168.1.1 1</pre>
<b>Verification</b>	Run <b>show ip rpf</b> to view the RPF information to the receiver before and after the configuration.
<b>Before Configuration</b>	<pre>B# show ip rpf 10.10.10.10</pre> <p>RPF information for 10.10.10.10</p> <p>RPF interface: GigabitEthernet 0/2</p> <p>RPF neighbor: 192.168.2.1</p> <p>RPF route: 10.10.10.10/32</p> <p>RPF type: unicast (ospf)</p> <p>RPF recursion count: 0</p> <p>Doing distance-preferred lookups across tables</p> <p>Distance: 110</p> <p>Metric: 1</p>
<b>After Configuration</b>	<pre>B# show ip rpf 10.10.10.10</pre>

	<p>RPF information for 10.10.10.10</p> <p>RPF interface: GigabitEthernet 0/0</p> <p>RPF neighbor: 192.168.1.1</p> <p>RPF route: 10.10.10.10/32</p> <p>RPF type: static</p> <p>RPF recursion count: 0</p> <p>Doing distance-preferred lookups across tables</p> <p>Distance: 1</p> <p>Metric: 0</p>
--	--

### Common Errors

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a device.

### 14.4.6 Configuring Layer-2 Direction Control for Multicast Streams

#### Configuration Effect

Configure layer-2 direction control for multicast streams to control the forwarding of multicast streams on an interface.

#### Notes

- The basic functions of IP multicasting must be configured.

#### Configuration Steps

- Layer-2 direction control for multicast streams can be configured on layer-2 devices unless otherwise specified.

#### Verification

Send multicast packets on the network containing layer-2 device A, connect multiple user hosts to VLAN 1 of layer-2 device A to receive the group, configure layer-2 direction control for multicast streams on device A, and check whether multicast packets are sent to the configured layer-2 interface.

#### Related Commands

#### ▾ Configuring Layer-2 Direction Control for Multicast Streams

<b>Command</b>	<code>ip multicast static source-address group-address interface-type interface-number</code>
<b>Parameter Description</b>	<p><i>source -address</i>: Specifies the multicast source address.</p> <p><i>group-address</i>: Specifies the multicast group address.</p> <p><i>interface-type interface-number</i>: Specifies a layer-2 interface that is allowed to forward the multicast flow.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Allow a specified multicast flow to be configured with multiple commands, that is, to be configured with multiple interfaces. Once direction control is configured for a multicast stream, the stream can be forwarded only by these configured interfaces. Other interfaces are not permitted to forward the stream.

This command controls only the forwarding of multicast streams on the interface, but does not directly affect the processing of multicast protocols on the protocol packets. However, since certain features of the multicast protocol are driven by multicast data streams, behaviors of the multicast routing protocols may also be affected.

**Configuration Example**

📌 **Creating the IP Multicast Service on the IPv4 Network and Configuring Layer-2 Direction Control for Multicast Streams**

<p><b>Scenario</b> Figure 1- 8</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure layer-2 direction control for multicast streams on device B so that the streams are sent only to the Gi0/2 interface.</li> </ul>
<p><b>B</b></p>	<pre>A# configure terminal A(config)# ip multicast static 192.168.1.100 233.3.3.3 gigabitEthernet0/2</pre>
<p><b>Verification</b></p>	<p>Enable the multicastsource(192.168.1.100) to send packets to G(233.3.3.1). Enable receivers A and B to join G.</p> <ul style="list-style-type: none"> <li>● Check multicast packets received by receiver A. Receiver B should not be able to receive multicast packets from G.</li> </ul>

**Common Errors**

- An IPv4 unicast route is incorrectly configured.

**14.4.7 Configuring RPF Route Selection Based on the Longest Match Rule**

**Configuration Effect**

- Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table and select the one with the longest match mask as the RPF route from the three optimal routes.

**Notes**

- The basic functions of IP multicasting must be configured.

**Configuration Steps**

- Configure RPF route selection based on the longest match rule on each device unless otherwise specified.

**Verification**

Configure a multicast static route and a unicast static route to have the same priority and configure the unicast static route to have a longer mask length.

- Run **show ip rpf source-address** to check the RPF information of a specified source.

**Related Commands**

<b>Command</b>	<b>ip multicast rpf longest-match</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The steps for selecting RFP routes are as follows:</p> <ol style="list-style-type: none"> <li>1, Select an optimal route respectively from the multicast static routing table, MBGP routing table, and unicast routing table for RPF check.</li> <li>2, Select one from the three routes as the RPF route.</li> </ol> <p>If the longest match rule is used, the route with the longest match mask is selected. If the three routes have the same mask, the one with the highest priority is selected. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.</p> <p>If the longest match rule is not used, the route with the longest match mask is selected. If they have the same priority, the RPF routes are selected in the sequence of multicast static route, MBGP route, and unicast route.</p>

**Configuration Example**

▾ **Creating the IP Multicast Service on the IPv4 Network and Configuring RPF Route Selection Based on the Longest Match Rule**

<b>Scenario</b> Figure 1-9	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● On device B, configure an IP multicast static route whose mask length is smaller than that of the unicast static route.</li> <li>● Configure RPF route selection based on the longest match rule on device B.</li> </ul>
<b>B</b>	<pre> B# configure terminal B(config)# ip multicast-routing B(config)# ip mroute 10.10.10.10 255.255.0.0 ospf 192.168.1.1 B(config)# ip multicast rpf longest-match                     </pre>
<b>Verification</b>	Run <b>show ip rpf</b> to check the RFP information of the multicast source before and after configuring RPF route selection based on the longest match rule.

<b>Before configuration</b>	<pre> B#show ip rpf 10.10.10.10 RPF information for 10.10.10.10  RPF interface: GigabitEthernet 0/0  RPF neighbor: 192.168.1.1  RPF route: 10.10.0.0/16  RPF type: static  RPF recursion count: 0  Doing distance-preferred lookups across tables  Distance: 0  Metric: 0 </pre>
<b>After configuration</b>	<pre> B# show ip rpf 10.10.10.10 RPF information for 10.10.10.10  RPF interface: GigabitEthernet 0/2  RPF neighbor: 192.168.2.1  RPF route: 10.10.10.10/32  RPF type: unicast (ospf)  RPF recursion count: 0  Doing prefix-length-preferred lookups across tables  Distance: 110  Metric: 1 </pre>

### Common Errors

- An IPv4 unicast route is incorrectly configured.
- IPv4 multicast routing is not enabled on a router.

### 14.4.8 Configuring Multicast Non-Stop Forwarding Parameters

#### Configuration Effect

- The non-stop forwarding function ensures continuous forwarding of multicast data streams during re-convergence of multicast protocols.

#### Notes

- The basic functions of IP multicasting must be configured.

#### Configuration Steps

##### 📌 Configuring the Maximum Period for Multicast Protocol Convergence

- The maximum period for multicast protocol convergence can be specified on each device unless otherwise specified.

### ↘ Configuring the Multicast Packet Leakage Period

- The multicast leakage period can be configured on each device unless otherwise specified.

#### Verification

Run **show msf nsf** to check the configured multicast non-stop forwarding parameters.

#### Related Commands

### ↘ Configuring the Maximum Period for Multicast Protocol Convergence

<b>Command</b>	<b>msf nsf convergence-time <i>time</i></b>
<b>Parameter Description</b>	<b>convergence-time <i>time</i></b> : Specifies the maximum period for multicast protocol convergence. The value ranges from 0 to 3600s. The default value is 20s.

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IP multicasting. (Omitted)</li> <li>● Configure the overwriting mechanism upon overflow of multicast hardware forwarding entries.</li> </ul>

A	<pre>A# configure terminal A(config)#msf ipmc-overflow override</pre>
Verification	Run <b>show running-config</b> to check whether the overwriting mechanism upon overflow of multicast hardware forwarding entries is configured.
A	<pre>A# show running-config ... msf ipmc-overflow override ...</pre>

## 14.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and interrupt services.

Description	Command
Clears the IPv4 multicast forwarding table.	<b>clear ip mroute</b> { *   <i>v4group-address</i> [ <i>v4source-address</i> ] }
Resets statistics in the IPv4 multicast forwarding table.	<b>clear ip mroute statistics</b> { *   <i>v4group-address</i> [ <i>v4source-address</i> ] }

### Displaying

Description	Command
Displays help guidance information of each multicast module.	<b>multicast help</b>
Displays status of the IPv4 multicast modules.	<b>view multicast</b>
Displays the IPv4 multicast forwarding table.	<b>show ip mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>dense</b>   <b>sparse</b> ] [ <b>summary</b>   <b>count</b> ]
Displays IPv4 static multicast route information.	<b>show ip mroute static</b>
Displays the RFP Information of a specified IPv4 source address.	<b>show ip rpf</b> { <i>source-address</i> [ <i>group-address</i> ] [ <b>rd route-distinguisher</b> ] } [ <b>metric</b> ]
Displays information about IPv4 multicast interfaces.	<b>show ip mvif</b> [ <i>interface-type interface-number</i> ]
Displays the IPv4 layer-3 multicast forwarding table.	<b>show ip mrf mfc</b>
Displays the IPv4 multi-layer multicast forwarding table.	<b>show msf msc</b>
Displays IPv4 multicast non-stop forwarding configurations.	<b>show msf nsf</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs running of the multicast core.	<b>debug nsm mcast all</b>
Debugs communication between the IPv4 multicast core and the protocol module.	<b>debug nsm mcast fib-msg</b>
Debugs the interface running of the IPv4 multicast core.	<b>debug nsm mcast vif</b>
Debugs the interface and entry statistics processing of the IPv4 multicast core.	<b>debug nsm mcast stats</b>
Debugs the processing of IPv4 layer-3 multicast packet forwarding.	<b>debug ip mrf forwarding</b>
Debugs the operation on layer-3 multicast forwarding entries on an IPv4 network.	<b>debug ip mrf mfc</b>
Debugs the processing of layer-3 multicast forwarding events on an IPv4 network.	<b>debug ip mrf event</b>
Debugs the processing of IPv4 multi-layer multicast packet forwarding.	<b>debug msf forwarding</b>
Debugs the operation on multi-layer multicast forwarding entries on an IPv4 network.	<b>debug msf mfc</b>
Debugs the bottom-layer hardware processing of IPv4 multi-layer multicast packet forwarding.	<b>debug msf ssp</b>
Debugs the invocation of API interfaces provided by IPv4 multi-layer multicast forwarding.	<b>debug msf api</b>
Debugs the processing of multi-layer multicast forwarding events on an IPv4 network.	<b>debug msf events</b>

## 15 Configuring IPv6 Multicast

### 15.1 Overview

IPv6 multicast is enrichment and enhancement of IPv4 multicast. In comparison with IPv4 multicast, the IPv6 multicast address mechanism is greatly enriched.

In traditional IP transmission, a host is allowed to send packets only to a single host (unicast communication) or all hosts (broadcast communication). The multicast technology provides a third choice: A host is allowed to send packets to certain hosts.

The IP multicast technology is applicable to one-to-many multimedia applications.

#### Protocols and Standards

IPv6 multicast covers the following protocols:

- Multicast Listener Discovery (MLD): Runs between a multicast device and a host, and tracks and learns relationships of group members.
- Protocol Independent Multicast – Sparse Mode for IPv6 (PIM-SMv6): Runs between devices and implements multicast packet forwarding by establishing a multicast routing table.

## 15.2 Applications

Application	Description
Typical Application of PIM-SMv6	The PIM-SMv6 multicast service is provided in the same network.

### 15.2.1 Typical Application of PIM-SMv6

#### Scenario

The PIM-SMv6 multicast service is provided in the same network.

As shown in the following figure:

- R1 and the multicast source are in the same network, R2 is configured as a rendezvous point (RP), R3 is in the same network as Receiver A, and R4 is in the same network as Receiver B. Assume that devices and hosts are correctly connected, IPv6 is enabled on each interface, and IPv6 unicast is enabled on each device.

Figure 2- 1

#### Remarks

R1, R2, R3, and R4 are Layer-3 devices and R2 functions as an RP.

The multicast source is directly connected to R1, Receiver A is directly connected to R3, and Receiver B is directly connected to R4.

#### Deployment

- Run the Open Shortest Path First for IPv6 (OSPFv6) protocol in the same network to implement unicast routing.
- Run the PIM-SMv6 protocol in the same network to implement multicast routing.

## 15.3 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded by PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for transmitting multicast packets are called downstream interfaces.

Network segments where upstream interfaces are located are called upstream network segments. Network segments where downstream interfaces are located are called downstream network segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network. On some PIM interfaces, borders are set to divide a large PIM network into multiple PIM domains. The borders may reject specific multicast packets or limit transmission of PIM messages.

#### ↘ Multicast Distribution Tree, DR, RP

Multicast packets are transmitted from one point to multiple points. The forwarding path presents a tree structure. This forwarding path is called a multicast distribution tree (MDT). MDTs are classified into two types:

- Rendezvous point tree (RPT): Uses the rendezvous point (RP) as the root and designated routers (DRs) connected to group members as leaves.
- Shortest path tree (SPT): Use the DR connected to a multicast source as the root and the RPs or DRs connected to group members as leaves.

DRs and RPs are function roles of PIM routers.

- RPs collect information about multicast sources and group members in the network.
- The DR connected to a multicast source reports multicast source information to the RP and the DRs connected to group members report the group member information to the RP.

#### ↘ (\*,G), (S,G)

- (\*,G): Indicates the packets transmitted from any source to Group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Indicates the packets transmitted from Source S to Group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

#### ↘ ASM, SSM

PIM-SM supports two multicast service models: any-source multicast (ASM) and source-specific multicast (SSM), which are applicable to different multicast address segments.

- ASM: In the ASM model, a user host cannot select a multicast source. The user host joins a multicast group and receives all packets sent from all sources to the multicast group.

- SSM: In the SSM model, a user host can select a multicast source. The user host specifies the source address when joining a multicast group, and then receives packets only from the specified source to the multicast group.
- **i** SSM model requirement: Other network services must be used to enable a user host to know the position of a multicast source in advance so that the user host selects the multicast source.

## Overview

Feature	Description
Configuring IPv6 Multicast Basic Functions	Creates a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.
Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table	Restricts the number of entries that can be added to the multicast routing table.
Configuring the IPv6 Multicast Border	Sets an interface as the multicast border of a specific group range.
Configuring IPv6 Multicast Static Routing	Configures multicast static routing to adopt multicast forwarding paths different from unicast forwarding paths.
Configuring Layer-2 Flow Direction Control for Multicast Streams	Multiple commands can be configured for a multicast stream, that is, multiple ports can be allowed to forward the multicast stream. If flow direction control is configured for a multicast stream, the multicast stream can be forwarded only by the configured ports. Other ports are not allowed to forward the multicast stream.
Configuring RPF Route Selection According to the Longest Matching Principle	One optimal route is selected from each of the multicast static routing table, MBGP routing table, and unicast routing table according to RPF rules. Among the three optimal routes, the route with the longest subnet mask matching is selected as the RPF route.

### 15.3.1 Configuring IPv6 Multicast Basic Functions

Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.

#### Working Principle

A device maintains the routing table used for multicast packet forwarding over an IPv6 multicast routing protocol (such as PIM-SMv6), and learns information about the status of group members in the directly-connected network segments over the MLDv1/v2 protocol. A host joins a specific IPv6 multicast group by transmitting the MLD REPORT message.

#### Related Configuration

##### ▾ Enabling the IPv6 Multicast Routing Function

The IPv6 multicast routing function is disabled by default.

Run the **ipv6 multicast-routing** command to enable the IPv6 multicast routing function.

##### ▾ Configuring an IP Multicast Protocol on an Interface

The IPv6 multicast protocol is disabled on an interface by default.

Run the **ipv6 pim dense-mode** command to enable the IPv6 multicast protocol on an interface.

### 15.3.2 Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

Every multicast data packet received by the device is used to maintain relevant IPv6 multicast routing entries. Excessive multicast routing entries, however, may deplete the device memory and degrade the device performance. Users can restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

#### Working Principle

Restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements, so as to sustain the device performance.

#### Related Configuration

##### ↘ Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

By default, 1,024 entries can be added to the IP multicast routing table.

Run the **ipv6 multicast route-limit** *limit* [ *threshold* ] command to adjust the number of entries that can be added to the IPv6 multicast routing table. The value ranges from 1 to 65,536.

A larger value of *limit* means that more entries can be added to the IPv6 multicast routing table, and a smaller value of *limit* means that fewer entries can be added to the IPv6 multicast routing table.

### 15.3.3 Configuring the IPv6 Multicast Border

Configure the IPv6 multicast border to restrict the transmission scope of multicast packets.

#### Working Principle

Configure the multicast border to specify the transmission scope of multicast packets. When the multicast forwarding border is configured on an interface, multicast packets including multicast packets sent by the local device cannot be forwarded or received by this interface.

#### Related Configuration

##### ↘ Configuring the IPv6 Multicast Border

No multicast border is configured by default.

Run the **ipv6 multicast boundary** *access-list-name* [ *in* | *out* ] command to configure the multicast border.

### 15.3.4 Configuring IPv6 Multicast Static Routing

Configure IPv6 multicast static routing to specify a reverse path forwarding (RPF) interface or RPF neighbor for multicast packets from a specific multicast source.

#### Working Principle

The RPF check is conducted during forwarding of multicast packets. IPv6 multicast static routing can be configured to specify an RPF interface or RPF neighbor for multicast packets from a specific multicast source.

#### Related Configuration

## ▾ Configuring IPv6 Multicast Static Routing

No multicast static routing is configured by default.

Run the **ipv6 mroute** *ipv6-prefix/prefix-length* [ **bgp** | **isis** | **ospfv3** | **ripng** | **static** ] { *ipv6-prefix* | *interface-type interface-number* } [ *distance* ] command to configure IPv6 multicast static routing.

### 15.3.5 Configuring Layer-2 Flow Direction Control for Multicast Streams

Configure Layer-2 flow direction control for multicast streams to control the forwarding behavior of multicast streams on ports.

#### Working Principle

Configure Layer-2 flow direction control for multicast streams to configure the ports that are allowed to forward multicast streams. Then, multicast streams are forwarded only by the configured ports, thereby controlling Layer-2 forwarding of multicast streams.

#### Related Configuration

## ▾ Configuring Layer-2 Flow Direction Control for Multicast Streams

Layer-2 flow direction control is disabled for multicast streams by default.

Run the **ipv6 multicast static** *source-address group-address interface-type interface-number* command to configure the Layer-2 flow direction control for multicast streams.

### 15.3.6 Configuring RPF Route Selection According to the Longest Matching Principle

Among the three optimal routes selected from the multicast static routing table, Multiprotocol Border Gateway Protocol (MBGP) routing table, and unicast routing table, select the optimal route with the longest subnet mask matching as the RPF route.

#### Working Principle

According to RPF rules, select a multicast static route, MBGP route, and unicast route used for the RPF check respectively from the multicast static routing table, MBGP routing table, and unicast routing table.

- If route selection according to the longest matching principle is configured, the route with the longest subnet mask matching is selected out of the three routes as the RPF route. If the three routes share the same subnet mask, the route with the highest priority is selected. If the three routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.
- If route selection according to the longest matching principle is not configured, the route with the highest priority is selected. If the three routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.

#### Related Configuration

## ▾ Configuring RPF Route Selection According to the Longest Matching Principle

A route with the highest priority is selected as the RPF route by default. If the routes have the same priority, the RPF route is selected according to the sequence of multicast static route, MBGP route, and unicast route.

Run the **ipv6 multicast rpf longest-match** command to configure RPF route selection according to the longest matching principle.

## 15.4 Configuration

Configuration	Description and Command	
Configuring IPv6 Multicast Basic Functions	 (Mandatory) It is used to create a multicast service.	
	<b>ipv6 multicast-routing</b>	Enables the IPv6 multicast routing function.
Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table	 Optional.	
	<b>ipv6 multicast route-limit</b> <i>limit</i> [ <i>threshold</i> ]	Restricts the number of entries that can be added to the multicast routing table.
Configuring the IPv6 Multicast Border	<b>ipv6 multicast boundary</b> <i>access-list-name</i> [ <i>in</i>   <i>out</i> ]	Sets an interface as the multicast border of a specific group range.
Configuring IPv6 Multicast Static Routing	<b>ipv6 mroute</b> <i>ipv6-prefix/prefix-length</i> [ <i>protocol</i> ] { <i>v6rpf-address</i>   <i>interface-type interface-number</i> } [ <i>distance</i> ]	Configures IPv6 multicast static routing.
Configuring Layer-2 Flow Direction Control for Multicast Streams	<b>ipv6 multicast static</b> <i>source-address group-address interface-type interface-number</i>	Controls the flow direction of data streams on Layer-2 ports.
Configuring RPF Route Selection According to the Longest Matching Principle	<b>ipv6 multicast rpf longest-match</b>	Configures RPF route selection according to the longest matching principle.

### 15.4.1 Configuring IPv6 Multicast Basic Functions

#### Configuration Effect

- Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.

#### Notes

- The PIM network needs to use existing unicast routing in the network. Therefore, IPv6 unicast routing must be configured in the network.

#### Configuration Steps

##### ▾ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- Enable the IPv6 multicast routing function on each router unless otherwise specified.

##### ▾ Enabling an IP Multicast Protocol on Interfaces

- Mandatory.
- Enable the IPv6 multicast protocol function on interfaces unless otherwise specified.

#### Verification

Make multicast sources in the network send multicast packets and make a user host join the groups.

- Check whether the user host can successfully receive packets from each group.

**Related Commands**

▾ **Enabling the IPv6 Multicast Routing Function**

<b>Command</b>	<b>ipv6 multicast-routing</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The IPv6 multicast routing function must be enabled before various IPv6 multicast protocols are enabled. The IPv6 multicast routing function and the MLD snooping function are mutually exclusive.

▾ **Configuring IPv6 Multicast Protocols**

- i For details about the MLD configuration method, see the *Configuring MLD*.
- i For details about the PIM-SMv6 configuration method, see the *Configuring PIM-SMv6*.
- i After the Layer-3 multicast function is enabled on a private VLAN and Super VLAN, if there is a multicast source in the sub-VLAN, an entry needs to be additionally copied, with the inlet of the sub-VLAN where multicast streams enter because the validity check needs to be conducted at the inlet during multicast packet forwarding. As a result, one more multicast hardware entry is occupied, and the multicast capacity needs to be decreased by one.

▾ **Displaying Multicast Forwarding Table Information**

<b>Command</b>	<b>show ipv6 mroute [ group-or-source-address [ group-or-source-address ] ] [ sparse ] [ summary   count ]</b>
<b>Parameter Description</b>	<p><i>group-or-source-address</i>: Indicates the group address or source address.</p> <p><i>group-or-source-address</i>: Indicates the group address or source address.</p> <p><b>sparse</b>: Displays the core entry of the PIM-SMv6 multicast routing table.</p> <p><b>summary</b>: Displays the summary of IPv6 multicast routing entries.</p> <p><b>count</b>: Displays the count information about IPv6 multicast routing entries.</p>
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

### Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.
- No IPv6 multicast protocol is enabled on an interface.

### 15.4.2 Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table

#### Configuration Effect

- Every multicast data packet received by the device is used to maintain relevant IPv6 multicast routing entries. Excessive multicast routing entries, however, may deplete the device memory and degrade the device performance. Users can restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

#### Notes

- The IPv6 multicast basic functions must be configured.

#### Configuration Steps

- Restrict the number of entries in the IPv6 multicast routing table based on the actual networking conditions and service performance requirements.

#### Verification

Make multicast sources in the network send multicast packets to N different multicast groups and make a user host join these groups. Set the number of entries that can be added to the IPv6 multicast routing table to N-1 on the device and check that multicast packets received by the user host are from N-1 groups.

**Related Commands**

▾ **Configuring the Number of Entries That Can Be Added to the IP Multicast Routing Table**

<b>Command</b>	<code>ipv6 multicast route-limit limit [ threshold ]</code>
<b>Parameter Description</b>	<p><i>limit</i>: Indicates the number of multicast routing entries. The value ranges from 1 to 65,536 and the default value is 1,024.</p> <p><i>threshold</i>: Indicates the multicast routing entry quantity for triggering an alarm. The default value is 65,536.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Routing entries that are beyond the allowable range of hardware can be forwarded only by software due to hardware resource restrictions, making the performance deteriorate.

**Configuration Example**

▾ **Creating the IPv6 Multicast Service on an IPv6 Network and Configuring the Number of Entries That Can Be Added to the IPv6 Multicast Routing Table**

<b>Scenario</b> Figure 2- 3	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IP multicast basic functions (omitted).</li> <li>● Set the number of entries that can be added to the IP multicast routing table to 2 on Device B.</li> </ul>

### Common Errors

- IPv6 unicast routing is incorrectly configured.

### 15.4.3 Configuring the IPv6 Multicast Border

#### Configuration Effect

- Configure the IPv6 multicast border to restrict the transmission scope of multicast packets.

#### Notes

- The IPv6 multicast basic functions must be configured.

#### Configuration Steps

- Configure the IPv6 multicast border on each PIM router interface unless otherwise specified.

#### Verification

Make multicast sources send multicast packets to multicast groups and make a user host join these multicast groups. Configure the IPv6 multicast border on the PIM router interface connected to the user host and check whether the user host can receive multicast packets.

#### Related Commands

##### ▾ Enabling the IPv6 Multicast Routing Function

<b>Command</b>	<b>ipv6 multicast boundary <i>access-list-name</i> [ in   out ]</b>
<b>Parameter Description</b>	<p><i>access-list-name</i>: Uses the group address range defined by an access control list (ACL).</p> <p><b>in</b>: Indicates that the multicast border takes effect in the incoming direction of multicast streams.</p> <p><b>out</b>: Indicates that the multicast border takes effect in the outgoing direction of multicast streams.</p>
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>The ACL referenced in this command can be a standard ACL or an extended ACL. If an extended ACL is used, only destination addresses need to be matched.</p> <p>This command can be used to filter MLD and PIM-SMv6 protocol packets relevant to the IPv6 multicast group range. Multicast data streams are not transmitted or received by multicast border interfaces.</p>

### Configuration Example

#### Creating the IPv6 Multicast Service on an IPv6 Network and Configuring the IPv6 Multicast Border

<b>Scenario</b> <b>Figure 2- 4</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IP multicast basic functions (omitted).</li> <li>● Configure an ACL on Device A.</li> <li>● Configure the IP multicast border on Interface Gi0/1 of Device A.</li> </ul>

### Common Errors

- IPv6 unicast routing is incorrectly configured.

#### 15.4.4 Configuring IPv6 Multicast Static Routing

##### Configuration Effect

- Configure IPv6 multicast static routing to specify an RPF interface or RPF neighbor for multicast packets from a specific multicast source.

##### Notes

- The IPv6 multicast basic functions must be configured.

##### Configuration Steps

- Configure IPv6 multicast static routing on each device unless otherwise specified.

##### Verification

Configure IPv6 multicast static routing and then run the **show ipv6 rpf v6source-address** command to check RPF information about a specific multicast source.

##### Related Commands

##### ▾ Configuring IPv6 Multicast Static Routing

<b>Command</b>	<b>ipv6 mroute <i>ipv6-prefix/prefix-length</i> [ <i>protocol</i> ] { <i>v6rpf-address</i>   <i>interface-type interface-number</i> } [ <i>distance</i> ]</b>
<b>Parameter Description</b>	<p><i>ipv6-prefix</i>: Indicates the IPv6 address of a multicast source.</p> <p><i>prefix-length</i>: Indicates the subnet mask of the IPv6 address of the multicast source.</p> <p><i>protocol</i>: Indicates the unicast routing protocol that is being used currently.</p> <p><i>v6rpf-address</i>: Indicates the IPv6 address of the RPF neighbor (next hop to the multicast source).</p> <p><i>interface-type interface-number</i>: Indicates the RPF interface (outbound interface to the multicast source).</p> <p><i>distance</i>: Indicates the route management distance. The value ranges from 0 to 255 and the default value is 0.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>IPv6 multicast static routing is used only for the RPF check.</p> <p>To specify the outbound interface rather than the next-hop IP address of IPv6 static multicast routing, the outbound interface must be of the point-to-point type.</p>

##### ▾ Displaying RPF Information About a Specific Source Address

<b>Command</b>	<b>show ipv6 rpf <i>v6source-address</i></b>
<b>Parameter Description</b>	<i>v6source-address</i> : Indicates the IPv6 source address.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

##### Configuration Example

📌 **Creating the IPv6 Multicast Service on an IPv6 Network and Configuring IPv6 Multicast Static Routing**

<p><b>Scenario</b> Figure 2- 5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure IPv6 multicast basic functions (omitted).</li> <li>● Configure a static route to the receiver on Device B.</li> </ul>
<p><b>A</b></p>	<pre>B# configure terminal B(config)# ipv6 mroute 2005::/64 ospfv3 2002::2</pre>
<p><b>Verification</b></p>	<p>Run the <b>show ipv6 rpf</b> command to display the RPF information received by the receiver before and after configuration.</p>
<p><b>Before Configuration</b></p>	<pre>B# show ipv6 rpf 2005::1 RPF information for 2005::1 RPF interface: GigabitEthernet 0/1 RPF neighbor: fe80::2d0:f8ff:fe22:341b RPF route:2005::1/128 RPF type: unicast (ospf) RPF recursion count: 0 Doing distance-preferred lookups across tables Distance: 110 Metric: 1</pre>
<p><b>After Configuration</b></p>	<pre>B# show ipv6 rpf 2005::1 RPF information for 2005::1 RPF interface: GigabitEthernet 0/2 RPF neighbor: 2002::2 RPF route: 2005::/64 RPF type: unicast (ospf) RPF recursion count: 0 Doing distance-preferred lookups across tables Distance: 110 Metric: 1</pre>

**Common Errors**

- IPv6 unicast routing is incorrectly configured.

- IPv6 multicast routing is not enabled on a router.

#### 15.4.5 Configuring Layer-2 Flow Direction Control for Multicast Streams

##### Configuration Effect

Configure Layer-2 flow direction control for multicast streams to control the forwarding behavior of multicast streams on ports.

##### Notes

- The IPv6 multicast basic functions must be configured.

##### Configuration Steps

- Configure Layer-2 flow direction control for multicast streams on devices unless otherwise specified.

##### Verification

Make Device A send multicast packets to multicast groups in the network. Multiple user hosts connected to VLAN 1 of Device A receive multicast packets from these multicast groups. Configure Layer-2 flow direction control for multicast streams on Device A so that multicast packets are sent to configured ports.

##### Related Commands

#### ▾ Configuring Layer-2 Flow Direction Control for Multicast Streams

<b>Command</b>	<b>ipv6 multicast static</b> <i>source-address group-address interface-type interface-number</i>
<b>Parameter Description</b>	<i>source -address</i> : Indicates the multicast source address. <i>group-address</i> : Indicates the multicast group address. <i>interface-type interface-number</i> : Indicates a Layer-2 port that is allowed to forward multicast streams.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Multiple commands can be configured for a multicast stream, that is, multiple ports can be allowed to forward the multicast stream. If flow direction control is configured for a multicast stream, the multicast stream can be forwarded only by the configured ports. Other ports are not allowed to forward the multicast stream.  This command controls only the forwarding behavior of multicast streams on ports. It does not directly affect processing of protocol packets by multicast protocols. Some features of multicast protocols (such as PIM-SMv6) are driven by multicast data streams, and therefore, the behavior of the multicast routing protocols may still be affected.

##### Configuration Example

#### ▾ Creating the IPv6 Multicast Service on an IPv6 Network and Configuring Layer-2 Flow Direction Control for Multicast Streams

<b>Scenario</b> <b>Figure 2- 6</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure IP multicast basic functions (omitted).</li> <li>Configure Layer-2 flow direction control for multicast streams on Device B so that multicast streams are transmitted only to Interface Gi0/2.</li> </ul>
<b>B</b>	<pre>A# configure terminal A(config)# ipv6 multicast static 2001::1 ff16::16 gigabitEthernet 0/2</pre>
<b>Verification</b>	<p>Make Multicast Source (2001: : 1) send packets to G (ff16::16) and make Receiver A and Receive B join G.</p> <ul style="list-style-type: none"> <li>Receiver A should be able to receive multicast packets from G but Receiver B cannot receive multicast packets from G.</li> </ul>

#### Common Errors

- IPv6 unicast routing is incorrectly configured.

#### 15.4.6 Configuring RPF Route Selection According to the Longest Matching Principle

##### Configuration Effect

Among the three optimal routes selected from the multicast static routing table, MBGP routing table, and unicast routing table, select the optimal route with the longest subnet mask matching as the RPF route.

##### Notes

- The IP multicast basic functions must be configured.

##### Configuration Steps

- Configure RPF route selection according to the longest matching principle on each device unless otherwise specified.

##### Verification

Configure a multicast static route and a unicast static route with the same priority and configure the unicast static route to have the longest subnet mask matching.

- Run the **show ipv6 rpf v6source-address** command to check RPF information about a specific source.

##### Related Commands

#### 📄 Configuring RPF Route Selection According to the Longest Matching Principle

<b>Command</b>	<b>ipv6 multicast rpf longest-match</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The steps of selecting an RPF route are as follows:</p> <p>Select one optimal route used for the RPF check from each of the IPv6 multicast static routing table, IPv6 MBGP routing table, and IPv6 unicast routing table.</p> <p>Select one route out of the three optimal routes as the RPF route.</p> <p>If the command for selecting the RPF route according to the longest matching principle is configured, the route with the longest subnet mask matching is selected out of the three optimal routes as the RPF route. If the three routes share the same subnet mask, the route with the highest priority is selected. If the routes have the same priority, the RPF route is selected according to the sequence of IPv6 multicast static route, IPv6 MBGP route, and IPv6 unicast route.</p> <p>If the command for selecting the RPF route according to the longest matching principle is not configured, the route with the highest priority is selected out of the three optimal routes as the RPF route. If the routes have the same priority, the RPF route is selected according to the sequence of IPv6 multicast static route, IPv6 MBGP route, and IPv6 unicast route.</p>

**Configuration Example**

➤ **Creating the IPv6 Multicast Service on the IPv6 Network and Configuring the RPF Route Selection According to the Longest Matching Principle**

<b>Scenario</b> Figure 2- 7	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IP multicast basic functions (omitted).</li> <li>● Configure an IPv6 multicast static route with the subnet mask length smaller than that of the unicast route on Device B.</li> <li>● Configure the RPF route selection according to the longest matching principle on Device B.</li> </ul>
<b>B</b>	<pre> B# configure terminal B(config)# ipv6 multicast-routing B(config)# ipv6 mroute 2005::/64 ospfv3 2002::2 B(config)# ipv6 multicast rpf longest-match                     </pre>
<b>Verification</b>	Run the <b>show ipv6 rpf</b> command to display the RPF information about the multicast source before and after RPF route selection according to the longest matching principle is configured.
<b>Before Configuration</b>	<pre> B# show ipv6 rpf 2005::1                     </pre>

	<p>RPF information for 2005::1</p> <p>RPF interface: GigabitEthernet 0/2</p> <p>RPF neighbor: 2002::2</p> <p>RPF route: 2005::/64</p> <p>RPF type: unicast (ospf)</p> <p>RPF recursion count: 0</p> <p>Doing distance-preferred lookups across tables</p> <p>Distance: 110</p> <p>Metric: 1</p>
<b>After Configuration</b>	<p>B# show ipv6 rpf 2005::1</p> <p>RPF information for 2005::1</p> <p>RPF interface: GigabitEthernet 0/1</p> <p>RPF neighbor: fe80::2d0:f8ff:fe22:341b</p> <p>RPF route: 2005::1/128</p> <p>RPF type: unicast (ospf)</p> <p>RPF recursion count: 0</p> <p>Doing distance-preferred lookups across tables</p> <p>Distance: 110</p> <p>Metric: 1</p>

### Common Errors

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.

## 15.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the IPv6 multicast forwarding table.	<b>clear ipv6 mroute</b> { *   <i>v6group-address</i> [ <i>v6source-address</i> ] }
Clears the statistics in the IPv6 multicast forwarding table.	<b>clear ipv6 mroute statistics</b> { *   <i>v6group-address</i> [ <i>v6source-address</i> ] }

### Displaying

Description	Command

## 16 Configuring IGMP

### 16.1 Overview

The Internet Group Management Protocol (IGMP) is a member of TCP/IP protocol family. It manages IP multicast members and is used to establish and maintain multicast group membership between hosts and directly neighboring multicast routers. IGMP behaviors are classified into host behaviors and device behaviors.

- At present, three IGMP versions are available, which are IGMPv1, IGMPv2 and IGMPv3.
- All IGMP versions support the Any-Source Multicast (ASM) model.
- IGMPv3 can be directly used for the Source-Specific Multicast (SSM) model.
- IGMPv1 and IGMPv2 can be used for the SSM model only when the IGMP SSM Mapping technology is supported.

#### Protocols and Standards

- RFC 1112: Host Extensions for IP Multicasting
- RFC 2236: Internet Group Management Protocol, Version 2
- RFC 3376: Internet Group Management Protocol, Version 3
- RFC 4605: Internet Group Management Protocol (IGMP) / Multicast Listener Discovery (MLD)-Based Multicast Forwarding ("IGMP/MLD Proxying")

### 16.2 Applications

Application	Description
Local IGMP Service	Implements the IGMP service in a local network.
IGMP Proxy Service	In a simple tree network topology, use the IGMP proxy service instead of the PIM service.

#### 16.2.1 Local IGMP Service

##### Scenario

As shown in Figure 3- 1, receivers 1 and 2 and routers A and B form a local network.

Query packets sent by router A or B are valid in the LAN, whereas Report packets sent by receivers 1 and 2 are also valid locally.

Figure 3-1

<b>Remarks</b>	C is the egress gateway (EG) device.
----------------	--------------------------------------

A and B are core routers.

### Deployment

- Routers A, B and C run OSPF.
- The interfaces of A, B and C run multicast protocols (PIM-SM or PIM-DM).

## 16.2.2 IGMP Proxy Service

### Scenario

As shown in Figure 3-2, router A implements the proxy function working as a host and forms a local network group with router B. Router A forwards Report packets sent by receivers 1 and 2.

Figure 3- 2

### Remarks

Router A implements the proxy function.  
Router B provides the PIM service.

### Deployment

- Routers A and B run OSPF.
- The interfaces of A and B run multicast protocols (PIM-SM or PIM-DM).
- The multicast proxy function is implemented on the interfaces Gi0/0 and Gi0/1 of router A.

## 16.3 Features

### Basic Concepts

#### Host Behavior and Device Behavior

- Layer-3 multicast devices that run multicast management protocols are called devices and their behaviors are called device behaviors.
- PCs or simulated PCs that run multicast management protocols are called hosts and their behaviors are called host behaviors.

#### Querier

- Devices compete against each other by comparing IP addresses. Devices with lower IP addresses become queriers and send Query packets regularly.

#### IGMP Proxy-Service Interface

- This interface performs host behaviors, receives Query packets sent by upstream devices (hence also called uplink interface), and sends Report information collected by the router proxy.

#### ↘ IGMP Mroute-Proxy Interface

- This interface implements the router functions, sends packets received by the IGMP PROXY-SERVICE interface (hence also called downlink interface), and collects host information and sends the host information to the IGMP PROXY-SERVICE interface.

#### ↘ IGMP SSM Mapping

- Mapping of the SSM model. IGMPv1 and IGMPv2 do not support the SSM model, but can enable the SSM-MAP function to support the SSM model.

### Overview

Feature	Description
IGMP Router	Sends Query packets and obtains local member information.
IGMP Querier	Selects a unique querier from a network segment.
IGMP Group Filtering	Filters group members and limit the number of group members.
Static IGMP Group	Static group information is available on a router; therefore, it is unnecessary for the host to send a Report packet to obtain the static group information.
Simulating Hosts to Join IGMP Groups	Simulate the host behavior to directly join a multicast group on an interface.
IGMP Proxy	Use this function in a simple tree network topology where no complex multicast route protocols (such as PIM) need to be executed.
IGMP SSM Mapping	Provide the SSM model support for IGMPv1 and IGMPv2. When a host joins a group, you can specify a source to save bandwidth and prevent unwanted and invalid multicast data streams from occupying network bandwidth, especially in a network environment where multiple multicast sources share one multicast address.
Router Alert Option	Checks whether IGMP packets contain the Router Alert option and discards the packets without the Router Alert option.  Sends IGMP packets with the Router Alert option.

#### 16.3.1 IGMP Router

- This function is used to send Query packets and obtain local member information.

#### Working Principle

- In a multicast network running the IGMP, a multicast device periodically sends IGMP Query packets and confirms information about local members based on responses.
- Only one multicast device sends IGMP Query packets in one network segment and this device is called querier. The querier is determined by means of selection. Initially, all multicast devices are in the Querier state. When a device receives a membership query from a device with a lower IP address, the device changes from the Querier state to the Non-querier state. Therefore, only one device is in the Querier state finally. This device has the lowest IP address among all multicast devices in the network.
- The querier sends IGMP packets of different versions based on the IGMP version settings. In addition, the following querier parameters can be modified: frequency for the querier to send IGMP Query packets, query times and query interval for the last member, maximum response time of IGMP Query packets, and keepalive time of the existing querier.

## Related Configuration

### ▾ Enabling IGMP

IGMP is disabled on an interface by default.

You can run the `ip pim {sparse-mode|dense-mode}` command to enable or disable IGMP for an interface.

IGMP can be enabled only when Sparse Mode (SM) or Dense Mode (DM) is configured on the interface.

### ▾ Specifying the IGMP Version

IGMPv2 is enabled by default.

You can run the `ip igmp version { 1 | 2 | 3 }` command to set or reset the IGMP version.

### ▾ Configuring the Last-Member Query Interval

The interval for sending the last-member Query packets is 1s by default.

You can run the `ip igmp last-member-query-interval interval` command to set or reset the interval for an interface to send Query packets.

*A larger value means a larger interval; a smaller value means a smaller interval.*

### ▾ Configuring the Last-Member Query Times

The number of the last-member query times is 2 by default.

You can run the `ip igmp last-member-query-count count` command to set or reset the number of the last-member query times.

A larger value means more last-member query times; a smaller value means fewer last-member query times.

### ▾ Configuring the Common Member Query Interval

The common member query interval is 125s by default.

You can run the `ip igmp query-interval seconds` command to set or reset the common member query interval.

*A larger value means a larger common query interval; a smaller value means a smaller common query interval.*

### ▾ Configuring the Maximum Response Time

The maximum response time is 10s by default.

You can run the `ip igmp query-max-response-time seconds` command to set or reset the maximum response time.

A larger value means longer response time; a smaller value means shorter response time.

## 16.3.2 IGMP Querier

Select a unique querier from a network segment. The querier sends Query packets to obtain group information of the local network.

### Working Principle

In a multicast network running IGMP, a multicast device is specified for sending IGMP Query packets. This device is determined through selection. At the beginning, all devices are in the Querier state. When the devices receive membership queries from a device with a lower IP address, the devices change from the Querier state to the Non-querier state. Therefore, only one device is in the Querier state finally. This device has the lowest IP address among all multicast devices in the network. When the selected querier fails,

IGMPv2 also works. Non-querier devices maintain the interval timer for survival of querier. This timer is reset each time a device receives a membership Query packet. If the timer expires, a new round of querier selection starts.

#### Related Configuration

##### ↘ Configuring the Querier Timeout

The querier timeout is 255s by default.

You can run the `ip igmp query-timeout seconds` command to set the querier timeout.

A larger value means longer survival time; a smaller value means shorter survival time.

### 16.3.3 IGMP Group Filtering

Filter group members and limit the number of group members.

#### Working Principle

To prevent hosts in a network segment where an interface resides from joining a multicast group, you can configure an ACL on this interface as a filter. The interface will filter the received IGMP membership Report packets based on this ACL, maintain group membership only for multicast groups allowed by this ACL and set the maximum number of router members.

#### Related Configuration

##### ↘ Configuring the IGMP Group ACL

By default, no ACL is used and any group is allowed to join.

You can run the `ip igmp access-group access-list-name` command to set or reset the multicast group ACL.

After the ACL is configured, a router receives only packets set in the ACL.

##### ↘ Configuring the Maximum Number of IGMP Group Members

The maximum number of IGMP group members is 1,024 by default.

You can run the `ip igmp limit number` command to set or reset the maximum number of multicast group members.

A larger value means more members; a smaller value means fewer members.

### 16.3.4 Static IGMP Group

When static IGMP groups are available on a router, it is unnecessary for the host to send a Report packet to obtain the static group information. The router can directly exchange group information with a PIM router.

#### Working Principle

You need to set static group information manually.

#### Related Configuration

##### ↘ Configuring a Static Group

No static group is configured by default.

You can run the `ip igmp static-group group-address` command to configure a static group.

### 16.3.5 Simulating Hosts to Join IGMP Groups

Simulate the host behavior to directly join a multicast group on an interface.

#### Related Configuration

##### ▾ Configuring the Join-Group function

No join-group information is set by default.

You can run the **ip igmp join-group *group-address*** command to configure the address of the multicast group to be joined by the simulated host.

### 16.3.6 IGMP Proxy

Use this function in a simple tree network topology where no complex multicast route protocols (such as PIM) need to be executed. In this way, a downstream proxy host can send IGMP packets and maintain the membership.

#### Working Principle

When an upstream router is configured as an IGMP proxy-service interface, it is equal to a host that can receive Query packets sent by upstream routers or forward group information sent by downstream hosts. When a downstream router is configured as an IGMP multicast proxy interface, it is equal to a router that can forward Query packets sent by upstream routers or receive Report packets sent by downstream routers.

#### Related Configuration

##### ▾ Configuring the IGMP Proxy Service

The IGMP proxy service function is disabled by default.

You can run the **ip igmp proxy-service** command to enable the IGMP proxy service.

This function is mandatory when a proxy is to be used.

##### ▾ Configuring the IGMP Mroute Proxy

The IGMP mroute proxy function is disabled by default.

You can run the **ip igmp mroute-proxy *interfacename*** command to enable the IGMP mroute proxy.

This function is mandatory when a proxy is to be used.

### 16.3.7 IGMP SSM Mapping

Provide the SSM model support for IGMPv1 and IGMPv2. When a host joins a group, you can specify a source to save bandwidth and prevent unwanted and invalid multicast data streams from occupying network bandwidth, especially in a network environment where multiple multicast sources share one multicast address.

#### Working Principle

Based on IGMP v1/v2, IGMPv3 provides an extra function, namely, the multicast source filter function. In IGMPv1/v2, a host determines to join a group only based on the group address and then receive multicast streams sent to this group address from any source. A host using IGMPv3 advertises the multicast group that the host wants to join and the addresses of multicast sources from which this host wants to receive packets. IGMPv1 and IGMPv2 also implement "source address filtering" in some sense; however, they implement this function on the multicast receivers by enabling the SSM mapping function and configuring the static SSM mapping group.

## Related Configuration

### ▾ Enabling IGMP SSM Mapping

The SSM mapping function is disabled by default.

You can run the **ip igmp ssm-map enable** command to enable the function.

Mandatory.

### ▾ Configuring Static IGMP SSM Mapping

No static SSM mapping is set by default.

You can run the **ip igmp ssm-map static access-list-num A.B.C.D** command to configure static SSM mapping.

## 16.3.8 Router Alert Option

Check whether IGMP packets contain the Router Alert option and discard packets without the Router Alert option.

Support sending IGMP packets containing the Router Alert option.

### Working Principle

If a packet contains the Router Alert option, the device needs to check the packet in depth and updates the control data accordingly.

If the packet does not contain the option, the device does not check the packet.

After Router Alert option check is enabled, the IGMP packets not containing the Router Alert option are discarded.

After enabled with the function of sending packets with Router Alert option, the device sends IGMP packets with Router Alert option encapsulated.

## Related Configuration

### ▾ Checking Router Alert Option

Router Alert option check is disabled by default.

You can run the **ip igmp enforce-router-alert** command to enable the function.

### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

Packets are sent without the Router Alert option by default.

You can run the **ip igmp send-router-alert** command to enable the function.

## 16.4 Configuration

Configuration	Description and Command	
Configuring IGMP Basic Functions	 (Mandatory) It is used to set up the multicast service.	
	<b>ip multicast-routing</b>	Enables the IPv4 multicast routing function.
	<b>ip pim { sparse-mode   dense-mode }</b>	Enables the PIM-SM or PIM-DM function.
Configuring IGMP Routers	<b>ip igmp version { 1   2   3 }</b>	Specifies the IGMP version.
	<b>ip igmp last-member-query-interval interval</b>	Configures the last-member query interval.

	<b>ip igmp last-member-query-count</b> <i>count</i>	Configures the last-member query times.
	<b>ip igmp query-interval</b> <i>seconds</i>	Configures the membership query interval.
	<b>ip igmp query-max-response-time</b> <i>seconds</i>	Configures the maximum response time.
Configuring IGMP Querier	<b>ip igmp query-timeout</b> <i>seconds</i>	Configures the querier timeout.
Configuring IGMP Group Filtering	<b>ip igmp access-group</b> <i>access-list</i>	Configures the IGMP group ACL.
	<b>ip igmp limit</b> <i>number</i> [ <b>except</b> <i>access-list</i> ]	Configures the maximum number of IGMP group members.
Configuring IGMP Proxy	<b>ip igmp proxy-service</b>	Configures the IGMP proxy service.
	<b>ip igmp mroute-proxy</b> <i>interface-type</i> <i>interface-number</i>	Configures the IGMP mroute proxy.
Configuring IGMP SSM Mapping	<b>ip igmp ssm-map enable</b>	Enables IGMP SSM mapping.
	<b>ip igmp ssm-map static</b> <i>access-list</i> <i>source-address</i>	Configures static IGMP SSM mapping.
Configuring Alert Option	<b>ip igmp enforce-router-alert</b>	Checks the Router Alert option.
	<b>ip igmp send-router-alert</b>	Sends IGMP packets containing the Router Alert option.

#### 16.4.1 Configuring IGMP Basic Functions

##### Configuration Effect

- Enable the multicast routing function of a local network and collect group information of the local network.

##### Notes

- An interface must be enabled with the PIM-SM or PIM-DM function.

##### Configuration Steps

###### ▾ Enabling the IPv4 Multicast Routing Function

- Mandatory.
- If there is no special requirement, the IPv4 multicast routing function should be enabled on each router in the local network.

###### ▾ Enabling the PIM-SM or PIM-DM Function

- Mandatory.
- If there is no special requirement, the PIM-SM or PIM-DM function should be directly enabled on an interface of the local network.

##### Verification

Run the **show ip igmp interface** *interface-type interface-number* command to check whether IGMP is enabled on the interface.

##### Related Commands

###### ▾ Enabling the IPv4 Multicast Routing Function

<b>Command</b>	<b>ip multicast-routing</b>
----------------	-----------------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling the PIM-SM or PIM-DM Function

<b>Command</b>	<code>ip pim { sparse-mode  dense-mode }</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be layer-3 interfaces, including routing interfaces, L3AP, SVI and loopback interfaces. All PIM interfaces should be accessible to IPv4 unicast routes.

### Configuration Example

#### ▾ Enabling IGMP for a Local Network

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure an IPv4 unicast routing protocol (such as OSPF) on a router and ensure that the loopback interface is accessible to a unicast route.</li> <li>● Enable the IPv4 multicast route function on all routers.</li> <li>● Enable the PIM-SM or PIM-DM function on interfaces interconnecting devices and interfaces connecting user hosts and multicast sources.</li> </ul>
	<pre>VSU(config)#ip multicast-routing VSU(config)#int gi 0/5 VSU(config-if-GigabitEthernet 0/5)#ip add 192.168.1.90 255.255.255.0 VSU(config-if-GigabitEthernet 0/5)#ip pim sparse-mode</pre>
<b>Verification</b>	Run the <code>show ip igmp interface interface-type interface-number</code> command to check whether IGMP is enabled on the interface.
	<pre>VSU#show ip igmp interface gigabitEthernet 0/5 Interface GigabitEthernet 0/5 (Index 5) IGMP Active, Querier, Version 2 (default) Internet address is 192.168.1.90 IGMP interface limit is 1024 IGMP interface has 1 group-record states IGMP interface has 0 static-group records IGMP activity: 3 joins, 0 leaves IGMP query interval is 125 seconds IGMP querier timeout is 255 seconds</pre>

	<p>IGMP max query response time is 10 seconds</p> <p>Last member query response interval is 10</p> <p>Last member query count is 2</p> <p>Group Membership interval is 260 seconds</p> <p>Robustness Variable is 2</p>
--	--

### Common Errors

- Routers in the network are not enabled with the multicast routing function.
- No multicast interface is available in the network.

### 16.4.2 Configuring IGMP Routers

#### Configuration Effect

- Modify the IGMP router parameters will affect the type of packets to be sent and the sending method.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

##### ▾ Specifying the IGMP Version

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

##### ▾ Configuring the Last-Member Query Interval

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

##### ▾ Configuring the Last-Member Query Times

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

##### ▾ Configuring the Common Member Query Interval

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

##### ▾ Configuring the Maximum Response Time

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### Verification

Run the **show ip igmp interface** *interface-type interface-number* command to display the interface configurations.

## Related Commands

### ▾ Specifying the IGMP Version

<b>Command</b>	<b>ip igmp version { 1   2   3 }</b>
<b>Parameter Description</b>	1: Indicates IGMPv 1. 2: Indicates IGMPv 2. 3: Indicates IGMPv 3.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After this command is configured, IGMP will automatically restart.

### ▾ Configuring the Last-Member Query Interval

<b>Command</b>	<b>ip igmp last-member-query-interval <i>interval</i></b>
<b>Parameter Description</b>	<i>Interval</i> : Indicates the interval for sending the Query packets of a specific group. The value ranges from 1 to 255 in the unit of 0.1s, and the default value is 10 (namely, 1s).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to IGMPv2 or IGMPv3. When an interface receives a Leave packet, the interface sends Query packets of the group continually and waits for a response from the host. After timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the interface from the IGMP group. The timeout duration is equal to the value of <b>last-member-query-interval</b> multiplied by <b>last-member-query-count</b> plus 1/2 of <b>query-max-response-time</b> .

### ▾ Configuring the Last-Member Query Times

<b>Command</b>	<b>ip igmp last-member-query-count <i>count</i></b>
<b>Parameter Description</b>	<i>count</i> : Indicates the times for sending the Query packets of a specific group, ranging from 2 to 7. The default value is 2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command applies only to IGMPv2 or IGMPv3. When an interface receives a Leave packet, the interface sends Query packets of the group continually and waits for a response from the host. After timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the interface from the IGMP group. The timeout duration is equal to the value of <b>last-member-query-interval</b> multiplied by <b>last-member-query-count</b> plus 1/2 of <b>query-max-response-time</b> .

### ▾ Configuring the Common Member Query Interval

<b>Command</b>	<b>ip igmp query-interval <i>seconds</i></b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the common member query interval, ranging from 1 to 18,000s. The default value is 125.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Maximum Response Time

<b>Command</b>	<b>ip igmp query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the maximum response time, ranging from 1 to 25s. The default value is 10.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query packets, the interface waits for a response. If timeout occurs, the IGMP router assumes that the group member does not exist in the directly connected network segment and deletes the group information.

### Configuration Example

#### ▾ Configuring Basic Router Parameters

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Specify the IGMPv3.</li> <li>● Configure the last-member query interval to 15 (1.5s).</li> <li>● Configure the number of the last-member queries to 3.</li> <li>● Configure the common member query interval to 130s.</li> <li>● Configure the maximum response time to 15s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp version 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-count 3 VSU(config-if-GigabitEthernet 0/5)#ip igmp last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-interval 130 VSU(config-if-GigabitEthernet 0/5)#ip igmp query-max-response-time 15</pre>
<b>Verification</b>	Run the <b>show ip igmp interface</b> <i>interface-type interface-number</i> command to check the IGMP functions of the interface.
	<pre>VSU#show ip igmp interface gigabitEthernet 0/5 Interface GigabitEthernet 0/5 (Index 5)   IGMP Enabled, Active, Querier, Version 3   Internet address is 192.168.1.90   IGMP interface limit is 1024   IGMP interface has 1 group-record states   IGMP interface has 0 static-group records   IGMP activity: 3 joins, 0 leaves   IGMP query interval is 130 seconds   IGMP querier timeout is 267 seconds   IGMP max query response time is 15 seconds   Last member query response interval is 15   Last member query count is 3</pre>

	Group Membership interval is 275 seconds Robustness Variable is 2 VSU#
--	--

### Common Errors

- The basic functions of IGMP are not enabled.

### 16.4.3 Configuring IGMP Querier

#### Configuration Effect

- Select a unique querier in a local network.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

- If necessary, the querier timeout can be configured.
- If there is no special requirement, you can perform the configuration on all interfaces enabled with IGMP in the local network.

#### Verification

Run the **show ip igmp interface** *interface-type interface-number* command to display the interface configurations.

#### Related Commands

##### ↘ Configuring the Querier Timeout

<b>Command</b>	<b>ip igmp query-timeout</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the keepalive time of the querier, ranging from 60 to 300s. The default value is 255s.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query packets, an interface waits for Query packets sent by other devices. If timeout occurs, the IGMP router assumes that the querier is unique in the directly connected network segment.

#### Configuration Example

##### ↘ Configuring the Querier Timeout

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of IGMP.</li> <li>● Set the querier timeout to 280S.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp query-timeout 280</pre>
<b>Verification</b>	Run the <b>show ip igmp interface</b> <i>interface-type interface-number</i> command to check the IGMP functions of the interface.
	<pre>VSU#show ipigmp interface gigabitEthernet 0/5</pre>

	<pre> Interface GigabitEthernet 0/5 (Index 5)   IGMP Enabled, Active, Querier, Version 3   Internet address is 192.168.1.90   IGMP interface limit is 1024   IGMP interface has 1 group-record states   IGMP interface has 0 static-group records   IGMP activity: 11 joins, 0 leaves   IGMP query interval is 130 seconds   IGMP querier timeout is 280 seconds   IGMP max query response time is 15 seconds   Last member query response interval is 15   Last member query count is 3   Group Membership interval is 275 seconds   Robustness Variable is 2  VSU# </pre>
--	---

### Common Errors

- The basic functions of IGMP are not enabled.

### 16.4.4 Configuring IGMP Group Filtering

#### Configuration Effect

- A router filters IGMP group members.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

##### ▾ Configuring the IGMP Group ACL

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

##### ▾ Configuring the Maximum Number of IGMP Group Members

Optional.

If there is no special requirement, you can perform this configuration on all router interfaces directly connected to the local network.

#### Verification

##### ▾ IGMP Group ACL

- Configure an interface to allow only groups in ACL 1 to join. The access addresses of ACL 1 are 225.0.0.1~225.0.0.255.
- Configure the interface to join a group whose address is 225.0.0.5.
- Configure the interface to join a group whose address is 236.0.0.5.
- View the group information of the current interface.

#### ▾ Maximum Number of IGMP Group Members

- Set the maximum member quantity to 5 on an interface.
- Configure the interface to join a group whose address is from 225.0.0.5 to 225.0.0.10.
- View the group information of the interface.

#### Related Commands

##### ▾ Configuring the IGMP Group ACL

<b>Command</b>	<b>ip igmp access-group <i>access-list</i></b>
<b>Parameter Description</b>	<i>access-list</i> : Defines a group address range by using a standard IP ACL or an extended ACL. The value ranges from 1 to 199, 1300 to 2699 and characters.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Configure this command on an interface to control the groups that hosts in a directly connected network segment can join. Use an ACL to limit the group address range. If Report packets denied by the ACL are received, the packets will be discarded.  When IGMPv3 is enabled, this command supports an extended ACL. If the received IGMP Report information is (S1,S2,S3...Sn,G), this command will apply the corresponding ACL to the (0,G) information for matching. Therefore, you must configure a (0,G) record explicitly for the extended ACL in order to normally filter (S1,S2,S3...Sn,G).

##### ▾ Configuring the Maximum Number of IGMP Group Members

<b>Command</b>	<b>ip igmp limit <i>number</i> [ <b>except</b> <i>access-list</i> ]</b>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of IGMP group members, whose value range varies with devices. The default value is 1,024 for an interface and 65,536 globally. <b>except <i>access-list</i></b> : Indicates that the groups in the ACL are not counted. <b>access-list</b> indicates a standard IP ACL. The value ranges from 1 to 99, 1300 to 1999 and words.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Global configuration mode: Limits the maximum quantity of the IGMP group members in a system. Interface configuration mode: limits the maximum quantity of IGMP group members on an interface. If the quantity of group members exceeds the interface or global limit, the Report packets received subsequently will be ignored. If an Except ACL is configured, Report packets within a specified range can be normally processed; therefore, the generated group members are not counted. The interface and global configurations can be performed independently. If the global quantity limit is smaller than that for an interface, the global configuration shall be used.

#### Configuration Example

### ▾ Configuring IGMP Group Filtering

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IGMP.</li> <li>● Configure the access address range of ACL 1 from 225.0.0.1 to 225.0.0.255.</li> <li>● Set the address of the group to be joined to 225.0.0.5.</li> <li>● Set the address of the group to be joined to 236.0.0.5.</li> </ul>
	<pre>VSU(config)#access-list 1 permit 225.0.0.1 225.0.0.255 VSU(config-if-GigabitEthernet 0/5)#ip igmp access-group 1 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.5 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 236.0.0.5</pre>
<b>Verification</b>	Run the <b>show ip igmp groups</b> [ <i>interface-type interface-number</i> ][ <i>group-address</i> ][ <b>detail</b> ] command to display the group information of the interface.
	<pre>VSU(config-if-GigabitEthernet 0/5)#show ip igmp groups IGMP Connected Group Membership GroupAddress      Interface          Uptime    Expires    Last Reporter 225.0.0.5         GigabitEthernet0/5 00:14:00 00:02:45 192.168.1.90</pre>

### ▾ Configuring the Maximum Number of IGMP Group Members

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IGMP.</li> <li>● Configure the maximum number of IGMP group members for the interface to 5.</li> <li>● Add group information (225.0.0.5~225.0.0.12).</li> <li>● View group information.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/5)#ip igmp limit 5 VSU(config-if-GigabitEthernet 0/5)# VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.5 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.6 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.7 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.8 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.9 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.10 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.11 VSU(config-if-GigabitEthernet 0/5)#ip igmp join-group 225.0.0.12</pre>
<b>Verification</b>	Run the <b>show ip igmp groups</b> [ <i>interface-type interface-number</i> ][ <i>group-address</i> ][ <b>detail</b> ] command to display the group information of the interface.
	<pre>VSU(config-if-GigabitEthernet 0/5)#show ip igmp groups IGMP Connected Group Membership GroupAddress      Interface          Uptime    Expires    Last Reporter</pre>

225.0.0.9	GigabitEthernet 0/5	00:00:11	00:04:33	192.168.1.90

### Common Errors

- The basic functions of IGMP are not enabled.

### 16.4.5 Configuring IGMP Proxy

#### Configuration Effect

- Configure the router proxy function and collect local member information.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

##### ▾ Configuring the IGMP Proxy Service

- Optional.
- If there is no special requirement, you can perform this configuration on directly connected upstream router interfaces.

##### ▾ Configuring the IGMP Mroute Proxy

- Optional.
- If there is no special requirement, you can perform this configuration on directly connected downstream host interfaces.

#### Verification

- Set interface 7 for directly connecting to an upstream router as a multicast proxy server.
- Set interface 1 for directly connecting to a downstream host as a multicast proxy.
- Set interface 1 to be joined by groups whose addresses are 225.0.0.6 and 225.5.5.5.
- View the current group information.

### Common Errors

- The basic functions of IGMP are not enabled.

### 16.4.6 Configuring IGMP SSM Mapping

#### Configuration Effect

- IGMPv3 supports source filtering; however, IGMPv1 and IGMPv2 do not support source filtering, but provides the SSM mapping function to filter sources.

#### Notes

- The basic functions of IGMP must be configured.

#### Configuration Steps

##### ▾ Enabling SSM Mapping

(Mandatory) Enable the SSM mapping function.

Enable the SSM mapping function on a router.

##### ▾ Configuring Static SSM Mapping

Optional.

Configure this function on routers enabled with SSM mapping.

#### Verification

Run the **show ip igmp ssm-mapping [ group-address ]** command to display SSM mapping information.

#### Related Commands

##### ▾ Enabling SSM Mapping

<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp ssm-map enable</b> command to enable the SSM mapping function. Run the <b>ip igmp ssm-map static</b> command to set static mapping entries. Run IGMPv3 on the interface. When IGMPv1 or IGMPv2 Report packets are received, source addresses of static mappings can be added.

##### ▾ Configuring Static SSM Mapping

<b>Command</b>	<b>ip igmp ssm-map static</b> <i>access-list source-address</i>
<b>Parameter Description</b>	N/A <i>access-list</i> : Indicates the group address range set by a standard IP ACL. The value ranges from 1 to 99, 1300 to 1999 and words. <i>source-address</i> : Indicates the source address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp ssm-map enable</b> command to enable the SSM mapping function. Run the <b>ip igmp ssm-map static</b> command to set static mapping entries. Run IGMPv3 on the interface. When IGMPv1 or IGMPv2 Report packets are received, source addresses of static mappings can be added.

### Configuration Example

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of IGMP.</li> <li>● Enable SSM mapping.</li> <li>● Configure static SSM mapping ACL 1.</li> </ul>
	<pre>VSU(config)#ip igmp ssm-map enable VSU(config)#ip igmp ssm-map static 1 192.168.5.9</pre>
<b>Verification</b>	Run the <b>show ip igmp ssm-mapping [ group-address ]</b> command to display SSM mapping information.
	<pre>VSU#show ip igmp ssm-mapping SSM Mapping : Enabled Database    : Static mappings configured</pre>

### Common Errors

- The basic functions of IGMP are not enabled.

### 16.4.7 Configuring Alert Option

#### Configuration Effect

Check whether IGMP packets contain the Router Alert option and discards the packets without the Router Alert option.

Support sending IGMP packets with the Router Alert option.

#### Notes

The basic functions of IGMP must be configured.

#### Configuration Steps

##### Checking Router Alert Option

Optional.

##### Sending IGMP Packets with Router Alert Option Encapsulated

Optional,

## Verification

### ▾ Checking Router Alert Option

Check whether the IGMP-enabled interface discards the IGMP packets without the Router Alert option.

### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

Check whether the IGMP-enabled interface sends the IGMP packets containing the Router Alert option.

## Related Commands

### ▾ Checking Router Alert Option

<b>Command</b>	<b>ip igmp [ vrf <i>vrf-name</i> ] enforce-router-alert</b>
<b>Parameter Description</b>	<b>vrf <i>vrf-name</i></b> : Specifies a VRF.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp enforce-router-alert</b> command to enable Router Alert option check. Run the <b>no ip igmp enforce-router-alert</b> command to disable Router Alert option check.

### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

<b>Command</b>	<b>ip igmp [ vrf <i>vrf-name</i> ] send-router-alert</b>
<b>Parameter Description</b>	<b>vrf <i>vrf-name</i></b> : Specifies a VRF.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ip igmp send-router-alert</b> command to enable the function of sending IGMP packets containing Router Alert option. Run the <b>no ip igmp send-router-alert</b> command to disable the function.

## Configuration Example

### ▾ Checking Router Alert Option

<b>Scenario</b>	Configure the basic functions of IGMP. Configure Router Alert option check.
	<pre>VSU(config)#ip igmp enforce-router-alert</pre>
<b>Verification</b>	IGMP packets containing Router Alert option 225.1.1.1 are sent to the IGMP-enabled interface and these packets are processed. Run the <b>show ip igmp groups</b> command and you will see 225.1.1.1. IGMP packets not containing Router Alert option 225.1.1.1 are sent to the IGMP-enabled interface and these packets

are discarded. Run the **show ip igmp groups** command and you will not see 225.1.1.1

### ▾ Sending IGMP Packets with Router Alert Option Encapsulated

<b>Scenario</b>	Configure the basic functions of IGMP. Configure the function of sending IGMP packets containing router alert option.
	<code>VSU(config)#ip igmp send-router-alert</code>
<b>Verification</b>	Check whether the IGMP-enabled interface sends the IGMP packets containing the Router Alert option.

## 16.5 Monitoring

### Clearing

Description	Command
Clears dynamic group membership from the IGMP buffer.	<b>clear ip igmp group</b>
Clears interface information from the IGMP buffer.	<b>clear ip igmp interface</b> <i>interface-type interface-number</i>

### Displaying

Description	Command
Displays all groups in a directly connected subnet.	<b>show ip igmp groups</b>
Displays details about all groups in a directly connected subnet.	<b>show ip igmp groups detail</b>
Displays specified groups in a directly connected subnet.	<b>show ip igmp groups</b> <i>A.B.C.D</i>
Displays details about specified groups in a directly connected subnet.	<b>show ip igmp groups</b> <i>A.B.C.D detail</i>
Displays IGMP configurations of a specified interface in a directly connected subnet.	<b>show ip igmp interface</b> <i>interface-type interface-number</i>
Displays details about all groups of a specified interface in a directly connected subnet.	<b>show ip igmp groups</b> <i>interface-type interface-number detail</i>
Displays information about a specified group of a specified interface in a directly connected subnet.	<b>show ip igmp groups</b> <i>interface-type interface-number A.B.C.D</i>
Displays details about a specified group of a specified interface in a directly connected subnet.	<b>show ip igmp groups</b> <i>interface-type interface-number A.B.C.D detail</i>
Displays configurations of an IGMP interface.	<b>show ip igmp interface</b> [ <i>interface-type interface-number</i> ]

Displays configurations of all IGMP interfaces.	<b>show ip igmp interface</b>
Displays configurations of IGMP SSM mapping.	<b>show ip igmp ssm-mapping</b>
Displays the information of IGMP SSM mapping to <i>A.B.C.D</i> .	<b>show ip igmp ssm-mapping <i>A.B.C.D</i></b>

## Debugging

Description	Command
Displays whether IGMP debugging is enabled.	<b>show debugging</b>
Debugs all IGMP information.	<b>debug ip igmp all</b>
Debugs IGMP packet decoding.	<b>debug ip igmp decode</b>
Debugs IGMP packet encoding.	<b>debug ip igmp encode</b>

Debugs IGMP FSM.	<b>debug ip igmp fsm</b>
Debugs IGMP state machine.	<b>debug ip igmp tib</b>
Debugs IGMP warning.	<b>debug ip igmp warning</b>

## 17 Configuring MLD

### 17.1 Overview

Multicast Listener Discovery (MLD) is a protocol used in the multicast technology.

This protocol receives the multicast member relationship between hosts and routers to determine multicast flow forwarding. Using information obtained from MLD, a device maintains an interface-based multicast listener status table. The multicast listener status table is activated only when at least one host in the link of the interface is a group member.

Currently, MLD has two versions: MLDv1 and MLDv2.

- MLD of both versions supports the Any-Source Multicast (ASM) model.
- MLDv2 can be directly applied to the Source-Specific Multicast (SSM) model.
- MLDv1 can be applied to the SSM model only when MLD SSM mapping is configured.

### Protocols and Standards

- RFC2710: Multicast Listener Discovery (MLDv1) for IPv6
- RFC3810: Multicast Listener Discovery Version 2 (MLDv2) for IPv6

### 17.2 Applications

Application	Description
Configuring the MLD Service on the Local Network	Implements the MLD service on the local network.
Configuring the MLD Proxy Service	In the simple tree topology, the MLD proxy service, instead of the PIM service, is used.

### 17.2.1 Configuring the MLD Service on the Local Network

#### Scenario

As shown in Figure 4- 1, the local network consists of receiver 1, receiver 2, router A, and router B.

Query messages sent by router A or router B are valid on the local network, and Report messages sent by receiver A and receiver B are also valid on the local network.

Figure 4- 1

<b>Remarks</b>	Router C is the egress gateway. Routers A and B are local routers.
----------------	---

#### Deployment

- Routers A, B, and C run the OSPFv6 protocol.
- Interfaces on routers A, B, and C run the multicast protocol (PIM SMv6).

### 17.2.2 Configuring the MLD Proxy Service

#### Scenario

As shown Figure 4-2, the proxy function is enabled on router A. Router A functions as a host and forms a local management group with router B. Router A forwards Report messages from receivers 1 and 2.

Figure 4- 2

<b>Remarks</b>	Router A functions as the proxy. Router B provides the PIM service.
----------------	--

## Deployment

- Routers A and B run the OSPFv6 protocol.
- Interfaces on routers A and B run the multicast protocol (PIM SMv6).
- The multicast proxy service is enabled on Gi 0/0 and Gi 0/1 of router A.

## 17.3 Features

### Basic Concepts

#### ↘ Host Behaviors and Device Behaviors

Layer-3 multicast devices running multicast management protocols are referred to as devices and their behaviors are device behaviors.

PCs or simulated PCs running multicast management protocols are referred to as hosts and their behaviors are host behaviors.

#### ↘ Querier

Devices interact and compete with each other. After IP address comparison, the device with a lower IP address becomes the querier and periodically sends Query messages.

#### ↘ MLD PROXY-SERVICE Interface

This interface, also called uplink interface, implements host behaviors. It receives Query messages sent by upstream devices and sends Report messages collected by the router proxy.

#### ↘ MLD MROUTE-PROXY Interface

This interface, also called downlink interface, implements router functions. It sends messages received by the proxy service interface and collects and sends host information to the proxy service interface.

#### ↘ MLD SSM-MAP

SSM mapping refers to mapping of source-specific multicast. MLDv1 does not support the SSM model until the SSM-MAP function is enabled.

### Overview

Feature	Description
Setting MLD Router Parameters	Sends Query messages to obtain local member information.
Querier Selection Process or Timeout Mechanism	Selects the unique querier in the current network segment.
Filtering MLD Groups	Filters group members and limits the number of group members.
Supporting Static MLD Groups	Stores static group information on the local router instead of obtaining group information by sending Report messages.
Configuring Simulated Host Group Information	Simulates host behaviors to directly configure group joining information.

Feature	Description
Supporting MLD Proxy	Uses this function in the simple tree topology instead of complex multicast routing protocols, such as the PIM.
Supporting SSM-MAP	Provides the SSM model for MLDv1. When a host is added to a group, a specific source can be specified to avoid network bandwidth occupation by unnecessary and invalid multicast data streams. This function is especially useful on a network where multiple multicast sources share the same multicast address.

### 17.3.1 Setting MLD Router Parameters

Sends Query messages to obtain local member information.

#### Working Principle

A device periodically sends Query messages to ensure that a group has at least one host. If no host is available in a group, the group will be deleted.

#### Related Configuration

##### ✚ Enabling MLD

By default, MLD is disabled on an interface.

Run the `ipv6 pim {sparse-mode}` command to enable or disable MLD on an interface.

MLD can be enabled only after PIM SM is enabled on the interface.

##### ✚ Configuring MLD Version

By default, the MLD version is 2.

Run the `ipv6 mld version { 1 | 2 }` command to configure or restore the MLD version of an interface.

##### ✚ Configuring the Query Interval of the Last Member

By default, the interval for sending Query messages is 1s.

Run the `ipv6 mld last-member-query-interval interval` command to configure or restore the interval for sending Query messages.

A larger value means a longer interval for sending Query messages.

##### ✚ Configuring the Number of Times for Querying the Last Member

By default, the number of times for querying the last member is 2.

Run the `ipv6 mld last-member-query-count count` command to configure or restore the number of times for querying the last member.

A larger value means a larger number of times for querying the last member.

##### ✚ Configuring the Interval for Querying a Common Member

By default, the interval for querying a common member is 125s.

Run the `ipv6 mld query-interval seconds` command to configure or restore the interval for querying a common member.

A larger value means a longer interval for querying a common member.

##### ✚ Configuring the Maximum Response Time

By default, the maximum response time is 10s.

Run the **ipv6 mld query-max-response-time** *seconds* command to configure or restore the maximum response time.

A larger value means a longer maximum response time.

### 17.3.2 Querier Selection Process or Timeout Mechanism

Selects the unique querier in the current network segment. The querier sends a Query message to obtain group information on the local network.

#### Working Principle

On a multicast network running MLD, a multicast device dedicated to query sends MLD Query messages. The device is determined by election. Initially, all devices are in the querier state. When receiving member relationship Query messages from devices with lower IP addresses, the devices switch from the receiver state to non-querier state. Therefore, there is only one device in the query state in the end. This device has the lowest IP address among all multicast devices on the network. When the querier device does not work, MLD also works. Non-querier devices maintain the keepalive interval timer for other queriers. The timer is reset once the device receives a member relationship query message. If the timer times out, the device starts to send Query messages and a new querier election starts.

#### Related Configuration

##### ✎ Configuring the Keepalive Interval of the Querier

By default, the keepalive interval of the querier is 255s.

Run the **ipv6 mld querier-timeout** *seconds* command to configure or restore the keepalive interval of the querier.

A larger value means a longer keepalive interval of the querier.

### 17.3.3 Filtering MLD Groups

Filters group members and limits the number of group members.

#### Working Principle

If you do not want hosts in the network segment where an interface resides to be added to certain multicast groups, you can configure ACL rules on the interface as a filter. The interface will filter received MLD member relationship Report messages based on the ACL rules and maintain member relationships only for multicast groups permitted by the rules. The largest number of router members can also be set.

#### Related Configuration

##### ✎ Configuring Access Control for Multicast Groups

By default, no access control is configured and hosts can be added to any groups.

Run the **ipv6 mld access-group** *access-list-name* command to configure or restore access control for multicast groups.

After the configuration, the router can receive messages only from hosts in groups specified in the access list.

##### ✎ Configuring the Maximum Number of MLD Group Members

By default, an MLD group has a maximum of 1024 members.

Run the **ipv6 mld limit** *number* command to configure or restore the maximum number of MLD group members.

A larger value means a larger number of group members.

### 17.3.4 Supporting Static MLD Groups

Stores static group information on a local router instead of obtaining group information by sending Report messages. The local router can directly exchange group information with the PIM router.

#### Working Principle

Manually configure static group information.

#### Related Configuration

##### ▾ Configuring Static-Group

By default, no static group information is configured.

Run the **ipv6 mld static-group** *group-address* command to configure or cancel static group information.

### 17.3.5 Configuring Simulated Host Group Information

Simulates host behaviors to directly configure group joining information.

#### Related Configuration

##### ▾ Configuring Join-Group

By default, no join-group information is configured.

Run the **ipv6 mld join-group** *group-address* command to configure or cancel join-group information.

### 17.3.6 Supporting MLD Proxy

In the simply tree topology, it is not necessary to run complex multicast routing protocols (such as PIM). In this case, MLD proxy can be used to send MLD messages for downstream hosts and maintain member relationships.

#### Working Principle

When an upstream router is configured as an MLD proxy service interface, it functions as a host and can receive Query messages from upstream routers as well as forward group information of downstream hosts. When a downstream router is configured as an MLD multicast proxy interface, it functions as a router and can forward Query messages of upstream routers as well as receive Report messages from downstream routers.

#### Related Configuration

##### ▾ Configuring MLDPROXY-SERVICE

By default, the MLD proxy service is disabled on an interface.

Run the **ipv6 mld proxy-service** command to configure or cancel the MLD proxy function on an interface.

This function must be configured when proxy is used.

##### ▾ Configuring MLDROUTE-PROXY

By default, the multicast proxy service is disabled on an interface.

Run the **ipv6 mld mroute-proxy** interfacename command to configure or cancel the multicast proxy function on an interface.

This function must be configured when proxy is used.

### 17.3.7 Supporting SSM-MAP

This function provides the SSM model for MLDv1. When a host is added to a group, a specific source can be specified to avoid network bandwidth occupation by unnecessary and invalid multicast data streams. This function is especially useful on a network where multiple multicast sources share the same multicast address.

#### Working Principle

Based on MLDv1, MLDv2 provides an extra function, that is, source filtering multicast. In MLDv1, a host determines to join a group only based on the group address and receives multicast streams sent to the group address from any source. However, an MLDv2 host advertises the multicast group that the host wants to join and the address of the multicast source that it wants to receive. In MLDv1, source address filtering can be implemented to some extent, but filtering is implemented by enabling SSM-MAP and configuring SSM-MAP static groups on multicast flow receivers.

#### Related Configuration

##### ▾ Enabling MLD SSM-MAP

By default, SSM-MAP is disabled.

Run the **ipv6 mld ssm-map enable** command to enable or disable the SSM-MAP function.

This function must be enabled when SSM-MAP is used.

##### ▾ Configuring MLD SSM-MAP STATIC

By default, no SSM-MAP static link table is configured.

Run the **ipv6 mld ssm-map static access-list-num A.B.C.D** command to enable or disable the SSM-MAP static link table.

## 17.4 Configuration

Configuration	Description and Command	
Configuring Basic Functions of MLD	 (Mandatory) It is used to configure the multicast service.	
	<b>ipv6 multicast-routing</b>	Enables the IPv6 multicast routing function.
	<b>ipv6 pim sparse-mode</b>	Enables the PIM-SM function.
Configuring MLD Router Parameters	<b>ipv6 mld version { 1   2 }</b>	Configures the MLD version.
	<b>ipv6 mld last-member-query-interval interval</b>	Configures the interval for querying the last member.
	<b>ipv6 mld last-member-query-count count</b>	Configures the number of times for querying the last member.
	<b>ipv6 mld query-interval seconds</b>	Configures the interval for querying a common member.
Querier Selection Process or	<b>ipv6 mld query-max-response-time seconds</b>	Configures the maximum response interval.
	<b>ipv6 mld querier-timeout seconds</b>	Configures the keepalive interval of the querier.

Timeout Mechanism		
Filtering MLD Groups	<b>ipv6 mld access-group</b> <i>access-list</i>	Filters MLD group members.
MLD Proxy	<b>ipv6 mld proxy-service</b>	Configures the MLD PROXY-SERVICE.
	<b>ipv6 mld mroute-proxy</b> <i>interface-type interface-number</i>	Configures the MLD MROUTE-PROXY.
Supporting SSM-MAP	<b>ipv6 mld ssm-map enable</b>	Enables the SSM-MAP function.
	<b>ipv6 mld ssm-map static</b> <i>access-list</i> <i>source-address</i>	Configures the SSM-MAP static link table.

### 17.4.1 Configuring Basic Functions of MLD

#### Configuration Effect

- Enable the multicast routing function and collect group information on the local network.

#### Notes

- The PIM SM function must be enabled on an interface.

#### Configuration Steps

##### ▾ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- The IPv6 multicast routing function should be enabled on all routers on the local network unless otherwise specified.

##### ▾ Enabling the PIM SM Function

- Mandatory.
- The PIM SM function should be directly enabled on an interface on the local network unless otherwise specified.

#### Verification

Run the **show ipv6 mld interface** *interface-type interface-number* command to check whether MLD is enabled on the interface.

#### Related Commands

##### ▾ Enabling the IPv6 Multicast Routing Function

<b>Command</b>	<b>ipv6 multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	-

##### ▾ Enabling the PIM SM Function

<b>Command</b>	<b>ipv6 pim { sparse-mode }</b>
<b>Parameter</b>	-
<b>Description</b>	

<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be layer-3 interfaces, including: routing, L3AP, SVI, and loopback interfaces. IPv6 unicast routes should be accessible to all PIM interfaces.

### Configuration Example

#### ↳ Enabling MLD on the Local Network

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure an IPv6 unicast routing protocol (such as OSPF) on a router and ensure that unicast routes are accessible to the loopback interface. (Omitted)</li> <li>● Enable the IPv6 multicast routing function on all routers.</li> <li>● Enable the PIM SM function on device interconnection interfaces and interfaces for connecting user hosts and multicast sources.</li> </ul>
	<pre>VSU(config)#ipv6 multicast-routing VSU(config)#int gi 0/1 VSU(config-if-GigabitEthernet 0/1)# ipv6 address 2001::1/64 VSU(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode</pre>
<b>Verification</b>	Run the <b>show ipv6 mld interface <i>interface-type</i> <i>interface-number</i></b> command to check whether MLD is enabled on the interface.
	<pre>VSU#show ipv6 mld interface gigabitEthernet 0/1 Interface GigabitEthernet 0/1 (Index 1)   MLDActive, Querier, Version2(default)   Internetaddressisfe80::2d0:f8ff:fe22:33b1   MLD interface limit is 1024   MLD interface has 0 group-record states   MLD interface has 0 join-group records   MLD interface has 0 static-group records   MLD activity: 0 joins, 0 leaves   MLD query interval is 125 seconds   MLD querier timeout is 255 seconds   MLD max query response time is 10 seconds   Last member query response interval is 10 (1/10s)   Last member query count is 2   Group Membership interval is 260   Robustness Variable is 2</pre>

### Common Errors

- Multicast routing is disabled on routers on the network.

- No multicast interface is available on the network.

## 17.4.2 Configuring MLD Router Parameters

### Configuration Effect

- Modify MLD router parameters to change the message type or sending mode.

### Notes

- The basic functions of MLD must be configured.

### Configuration Steps

#### ▾ Configuring MLD Version

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### ▾ Configuring the Interval for Querying the Last Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### ▾ Configuring the Number of Times for Querying the Last Member

Optional.

This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### ▾ Configuring the Interval for Querying a Common Member

Optional.

**This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.**

#### ▾ Configuring the Maximum Response Interval

Optional.

**This parameter can be configured on all router interfaces directly connected to the local network unless otherwise specified.**

### Verification

Run the **show ipv6 mld interface** *interface-type interface-number* command to view the configuration information.

### Related Commands

#### ▾ Configuring the MLD Version

<b>Command</b>	<code>ipv6 mld version { 1   2 }</code>
<b>Parameter Description</b>	1: Indicates version 1. 2: Indicates version 2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After this command is executed, MLD will automatically restart.

### ▾ Configuring the Interval for Querying the Last Member

<b>Command</b>	<b>ipv6 mld last-member-query-interval</b> <i>interval</i>
<b>Parameter Description</b>	<i>Interval</i> : Specifies the interval for sending Query messages of a specified group. The unit is 0.1s, the value ranges from 1 to 255, and the default value is 10 (1s).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After receiving the Done message, the interface will continuously send Query messages of a specified group and wait for responses from the host. After timeout, it is considered that the no group member exists in the directly-connected network segment and the interface is deleted from the MLD group member record. The timeout interval is calculated as follows:  Timeout interval = last-member-query-interval x last-member-query-count + query-max-response-time/2.

### ▾ Configuring the Number of Times for Querying the Last Member

<b>Command</b>	<b>ipv6 mld last-member-query-count</b> <i>count</i>
<b>Parameter Description</b>	<i>count</i> : Specifies the number of times for sending Query messages of a specified group. The value ranges from 2 to 7. The default value is 2.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After receiving the Done message, the interface will continuously send Query messages of a specified group and wait for responses from the host. After timeout, it is considered that the no group member exists in the directly-connected network segment and the interface is deleted from the MLD group member record. The timeout interval is calculated as follows:  Timeout interval = last-member-query-interval x last-member-query-count + query-max-response-time/2

### ▾ Configuring the Interval for Querying a Common Member

<b>Command</b>	<b>ipv6 mld query-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Specifies the interval for querying a common member. The unit is s, the value ranges from 1 to 18000, and the default value is 125.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	-

### ▾ Configuring the Maximum Response Interval

<b>Command</b>	<b>ipv6 mld query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Specifies the maximum response time. The unit is s, the value ranges from 1 to 25, and the default value is 10.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query messages, the interface waits for responses. After timeout, it is considered that no group member exists in the directly-connected network segment and group information is deleted.

## Configuration Example

### ▾ Configuring Basic Router Parameters

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of MLD. (Omitted)</li> <li>● Configure MLD version 2.</li> <li>● Configure the interval for querying the last member as 15 (1.5s).</li> <li>● Configure the number of times for querying the last member as 3.</li> <li>● Configure the interval for querying the common member as 130s.</li> <li>● Configure the maximum response time as 15s.</li> </ul>
	<pre> VSU(config-if-GigabitEthernet 0/1)#ipv6 mld version 2 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld last-member-query-count 3 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld last-member-query-interval 15 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld query-interval 130 VSU(config-if-GigabitEthernet 0/1)#ipv6 mld query-max-response-time 15 </pre>
<b>Verification</b>	<p>Run the <b>show ipv6 mld interface <i>interface-type interface-number</i></b> command to check whether MLD is enabled on the interface.</p>
	<pre> VSU(config-if-GigabitEthernet 0/1)# show ipv6 mld interface gi 0/1 Interface GigabitEthernet 0/1 (Index 1)   MLD Enabled, Active, Querier, Version 2 (default)   Internet address is fe80::2d0:f8ff:fe22:33b1   MLD interface limit is 1024   MLD interface has 0 group-record states   MLD interface has 0 join-group records   MLD interface has 0 static-group records   MLD activity: 0 joins, 0 leaves   MLD query interval is 130 seconds   MLD querier timeout is 267 seconds   MLD max query response time is 15 seconds   Last member query response interval is 15 (1/10s)   Last member query count is 3   Group Membership interval is 275   Robustness Variable is 2 </pre>

#### Common Errors

- Basic functions of MLD are not enabled.

#### 17.4.3 Querier Selection Process or Timeout Mechanism

##### Configuration Effect

- Select the unique querier on the local network.

## Notes

- The basic functions of MLD must be configured.

## Configuration Steps

- This function must be configured if the querier keepalive interval needs to be configured.
- This function can be configured on all MLD-enabled interfaces on the local network.

## Verification

Run the **show ipv6 mld interface *interface-type interface-number*** command to view the configuration information of the interface.

## Related Commands

### ▾ Configuring the Keepalive Interval of Other Queriers

<b>Command</b>	<b>ipv6 mld querier-timeout <i>seconds</i></b>
<b>Parameter</b>	<i>seconds</i> : Specifies the keepalive interval for other queriers. The unit is s, the value ranges from 60 to 300, and the
<b>Description</b>	default value is 255.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After sending Query messages, the interface waits for Query messages from other devices. After timeout, it is considered that it is the unique querier in the directly-connected network segment.

## Configuration Example

### ▾ Configuring the Keepalive Interval of Other Queriers

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of MLD. (Omitted)</li> <li>● Configure the keepalive interval of a querier as 280s.</li> </ul>
	<pre>VSU(config-if-GigabitEthernet 0/1)#ipv6 mld querier-timeout 280</pre>
<b>Verification</b>	Run the <b>show ipv6 mld interface <i>interface-type interface-number</i></b> command to check whether MLD is enabled on the interface.
	<pre>VSU#show ipv6 mld interface gigabitEthernet 0/1 Interface GigabitEthernet 0/1 (Index 1)   MLD Enabled, Active, Querier, Version 2 (default)   Internet address is fe80::2d0:f8ff:fe22:33b1   MLD interface limit is 1024   MLD interface has 0 group-record states   MLD interface has 0 join-group records   MLD interface has 0 static-group records   MLD activity: 0 joins, 0 leaves   MLD query interval is 130 seconds   MLD querier timeout is 280 seconds</pre>

	<p>MLD max query response time is 15 seconds</p> <p>Last member query response interval is 15 (1/10s)</p> <p>Last member query count is 3</p> <p>Group Membership interval is 275</p> <p>Robustness Variable is 2</p>
--	---

### Common Errors

- The basic functions of MLD are not enabled.

### 17.4.4 Filtering MLD Groups

#### Configuration Effect

- A router filters MLD group information.

#### Notes

- The basic functions of MLD must be configured.

#### Configuration Steps

##### ▾ Configuring Access Control for Multicast Groups

Optional.

This function can be configured on all router interfaces directly connected to the local network unless otherwise specified.

##### ▾ Configuring the Maximum Number of MLD Group Members

Optional.

This function can be configured on all router interfaces directly connected to the local network unless otherwise specified.

#### Verification

##### ▾ Filtering MLD Groups

Configure the interface to allow for only groups in link table 1. The access address of link table 1 is (FF66::100/64).

Configure the interface to add a group FF66::05.

Configure the interface to add a group FF65::05.

Check group information on the interface.

##### ▾ Configuring the Maximum Number of MLD Group Members

Configure the number of group members as 5 on the interface.

Configure the interface to add a group (FF66::05 ~ FF65::0B).

Check group information on the interface.

#### Related Commands

##### ▾ Configuring Access Control for Multicast Groups

<b>Command</b>	<b>ipv6 mld access-group</b> <i>access-list</i>
<b>Parameter Description</b>	<i>access-list</i> : Specifies the group address range by using IP standard ACLs or IP extended ACLs. The value ranges from 1 to 199, 1300 to 2699, and WORD.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>After running this command on the interface, you can control the groups that hosts in the directly-connected network segment can join. Use ACLs to limit the group address range. Report messages denied by the ACLs will be discarded.</p> <p>When MLDv2 is enabled, this command supports extended ACLs to precisely filter source record information in MLDv2 messages. When the received MLD Report message is (S1,S2,S3...Sn,G), this command will match (0,G) using the corresponding ACLs. Therefore, to normally use this command, you must explicitly configure a (0, G) in the extended ACLs to filter (S1,S2,S3...Sn,G).</p>

### ↘ Configuring the Maximum Number of MLD Group Members

<b>Command</b>	<b>ipv6 mld limit</b> <i>number</i> [ <b>except</b> <i>access-list</i> ]
<b>Parameter Description</b>	<p><i>number</i>: Specifies the maximum number of MLD group members. The value range depends on the specific device. The interface default value is 1024 and the global one is 65536.</p> <p><b>except</b> <i>access-list</i>: Groups in the access list are not counted. The access list is an IP standard ACL. The value ranges from 1 to 99, 1300 to 1999, and WORD.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Global configuration mode: Limits the number of MLD group members on the whole device.</p> <p>Interface configuration mode: Limits the number of MLD group members of the interface.</p> <p>If the number of group members exceeds the interface limit or global limit, subsequent Report messages will be ignored.</p> <p>If an except list is configured, Report messages in a specified range can be normally processed. Therefore, the group members are not counted.</p> <p>Interface and global limits can be configured separately. If the global limit is smaller than the interface limit, use the global limit.</p>

### Configuration Example

#### ↘ Configuring Group Filtering

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of MLD. (Omitted)</li> <li>● Configure the access address of link table 1 as (FF66::100/64).</li> <li>● Configure the group to join as FF66::05.</li> <li>● Configure the group to join as FF65::05.</li> </ul>
	<pre>VSU(config)#ipv6 access-list acl VSU(config-ipv6-acl)#permit ipv6 ::/64 ff66::100/64 VSU(config-ipv6-acl)#permit ipv6 2222::3333/64 ff66::100/64 VSU(config-ipv6-acl)#exit VSU(config)#</pre>

**Common Errors**

- The basic functions of MLD are not enabled.

### 17.4.5 MLD Proxy

#### Configuration Effect

- Configure the router proxy function and collect local member information.

#### Notes

- The basic functions of MLD must be configured.

#### Configuration Steps

##### ▾ Configuring MLDPROXY-SERVICE

Optional.

This function can be configured on the interface of routers directly connected to the upstream devices unless otherwise specified.

##### ▾ Configuring MLDMROUTE-PROXY

Optional

This function can be configured on the interface of hosts directly connected to the downstream devices unless otherwise specified.

#### Verification

- Configure the interface that directly connects interface 7 and upstream router as the multicast proxy service.
- Configure the interface that directly connects interface 1 and downstream host as the multicast proxy.
- Configure groups FF66::05 and FF66::06 to be added to interface 1.
- Check information of the current group.

#### Related Commands

### Common Errors

- The basic functions of MLD are not enabled.

### 17.4.6 Supporting SSM-MAP

#### Configuration Effect

- MLDv2 supports source filtering while MLDv1 does not. However, MLDv1 provides the SSM-MAP function to implement source filtering.

## Notes

- The basic functions of MLD must be configured.

## Configuration Steps

### ▾ Enabling SSM-MAP

This function must be configured if SSM-MAP.

This function must be enabled on a router where SSM-MAP is enabled.

### ▾ Configuring an SSM-MAP Static Link Table

Optional.

This function must be enabled on a router where SSM-MAP is enabled.

## Verification

Run the **show ipv6 mld ssm-mapping** [ *group-address* ] command to display SSM-MAP information.

## Related Commands

### ▾ Enabling SSM-MAP

<b>Command</b>	<b>ipv6 mld ssm-map enable</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ipv6 mld ssm-map enable</b> command to enable the SSM-MAP function. Run the <b>ipv6 mld ssm-map static</b> command to configure static mapping table items. The interface runs MLDv2. When receiving Report messages from MLDv1, the interface adds the static mapping source address.

### ▾ Configuring an SSM-MAP Static Link Table

<b>Command</b>	<b>ipv6 mld ssm-map static</b> access-list source-address
<b>Parameter Description</b>	access-list: Specifies the group address range configured by the ACL. source-address: Source address
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>ipv6 mld ssm-map enable</b> command to enable the SSM-MAP function. Run the <b>ipv6 mld ssm-map static</b> command to configure static mapping table items. The interface runs MLDv2. When receiving Report messages from MLDv1, the interface adds the static mapping source address.

## Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the basic functions of MLD. (Omitted)</li> <li>● Enable SSM-MAP.</li> <li>● Configure SSM-MAP static link table 3.</li> </ul>

## 18 Configuring PIM-DM

### 18.1 Overview

Protocol Independent Multicast (PIM) is an intra-domain multicast routing protocol.

A multicast source sends a packet to a group address. The packet is forwarded by network devices hop by hop and finally reaches the group members. On layer-3 network devices, PIM is used to create and maintain multicast routing entries, so as to support multicast forwarding.

PIM works in two modes: Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Dense Mode (PIM-DM).

- PIM-SM is applicable to large-scale networks where group members are sparsely distributed in a wide scope.
- PIM-DM is applicable to small networks where group members are densely distributed.

#### Protocols and Standards

- RFC3973: Protocol Independent Multicast - Dense Mode (PIM-DM)
- RFC2715: Interoperability Rules for Multicast Routing Protocols

### 18.2 Applications

Application	Description
Providing the Multicast Service in the Same Network	The multicast service is provided in the same network.

#### 18.2.1 Providing the Multicast Service in the Same Network

##### Scenario

The multicast service is provided in the same network.

The following figure is taken as an example:

- A multicast source sends a multicast packet, and Receiver A and Receiver B in the same network receive the multicast packet.

Figure 5- 1

<b>Remarks</b>	A, B, and C are Layer-3 routers. The multicast source is connected to the Gi0/1 interface of A, Receiver A is connected to the Gi0/1 interface of B, and
----------------	---

Receiver B is connected to Gi0/1 of C.

### Deployment

- Run the Open Shortest Path First (OSPF) protocol in the same network to implement unicast routing.
- Run the PIM-DM protocol in the same network to implement multicast routing.
- Run the Internet Group Management Protocol (IGMP) in a user host network segment to implement group member management.

### 18.3 PIM-DM Application in a Hot Backup Environment

#### Scenario

In a hot backup environment, run PIM-DM. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 5-2

**Remarks** R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode. A Layer-3 multicast protocol runs on R1 and R2.

### Deployment

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-DM on R1 and R2 to implement multicast routing.
- Make R2 run in a hot backup environment.

**Remarks** R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets (the default value is 30 seconds) needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired (the default value is 3.5 times the query interval, that is, 105 seconds). The multicast function relies on the unicast function currently, and the multicast function starts conveyance after the unicast function conveyance is complete. For example, the default graceful restart (GR) conveyance time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the

neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR convergence time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be larger than the GR convergence time of the unicast function. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be larger than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching.

## 18.4 Features

### Basic Concepts

#### ↘ PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM Routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded on PIM routers. The PIM interfaces where multicast packets are received are called Upstream Interfaces, and the PIM interfaces where multicast packets are sent are called Downstream Interfaces.

The network segments where upstream interfaces are located are called Upstream Network Segments. The network segments where downstream interfaces are located are called Downstream Network Segments.

#### ↘ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders can be set to divide a large PIM network into multiple PIM domains. The borders are able to reject specified multicast packets or limit the transmission of PIM messages.

#### ↘ Multicast Distribution Tree

Multicast packets are packets transmitted from one point to multiple points. The forwarding path is in a tree structure. This forwarding path is called the Multicast Distribution Tree (MDT).

#### ↘ (\*,G), (S,G)

- (\*,G): Packets sent from any source to Group G, the corresponding routing entries, and the forwarding path called Rendezvous Point Tree (RPT).
- (S,G): Packets sent from Source S to Group G, the corresponding routing entries, and the forwarding path called Shortest Path Tree (SPT).

### Overview

Feature	Description
PIM-DM Neighbor	Neighbor relationships are established between PIM routers to form a PIM network.
PIM-DM MDT	PIM-DM creates the MDT by using flooding, pruning, and grafting.
PIM-DM SRM	PIM-DM uses a State Refresh Message (SRM) to update the network state.
MIB	The Simple Network Management Protocol (SNMP) manager uses information in the Management Information Base (MIB) to directly manage the PIM-DM function.

### 18.4.1 PIM-DM Neighbor

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before PIM control messages can be exchanged or multicast packets can be forwarded.

#### Working Principle

A Hello message is sent from a PIM interface. For the IPv4 multicast packet with the Hello message encapsulated, the destination address is 224.0.0.13 (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the Time To Live (TTL) value is 1. For the IPv6 multicast packet with the Hello message encapsulated, the destination address is ff02::d.

Function of a Hello message: It is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.

#### ✎ Discovering Neighbors

PIM routers in the same network segment receive multicast packets from the destination address 224.0.0.13 or ff02::d. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, a Triggered-Hello-Delay message is used to generate a random time. Within the time, the interface sends Hello packets.

#### ✎ Coordinating Protocol Parameters

A Hello message includes multiple protocol parameters, which are described as follows:

- DR\_Priority: Router interfaces contend for the designated router (DR) based on their DR priorities. A higher priority means a higher chance of winning.
- Holdtime: Time in which a neighbor is held in the reachable state
- LAN\_Delay: LAN delay for transmitting a Prune message in a shared network segment
- Override-Interval: Prune override time carried in a Hello message.

When a PIM router receives a Prune message from an upstream interface, it indicates that downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, the PIM router must send a Prune Override message to the upstream interface within the Override-Interval.

$\text{LAN\_Delay} + \text{Override-Interval} = \text{PPT}$  (Prune-Pending Timer). After a PIM router receives a Prune message from a downstream interface, the PIM router will not immediately perform pruning until PPT times out. Within the time of PPT, if the PIM router receives a Prune rejection message from the downstream interface, the PIM router cancels pruning.

#### ✎ Maintaining Neighbor Relationships

A Hello message is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any change of PIM neighbors will cause change of the multicast topology in the network. If an upstream or downstream neighbor in an MDT is unreachable, multicast routes converge again and the MDT is reshaped.

#### Related Configuration

##### ✎ Enabling PIM-DM on an Interface

By default, PIM-DM is disabled on an interface.

Use the `ip pim dense-mode` command to enable or disable PIM-DM on an interface.

PIM-DM must be enabled on an interface to involve the interface in the PIM protocol.

### 📌 Setting the Interval of Hello Messages on an Interface

By default, a Hello message is sent at an interval of 30 seconds.

The `ip pim query-interval interval-seconds` command is used to adjust the interval of Hello messages. The value of the interval ranges from 1 to 65,535.

A Hello message is transmitted less frequently when the value of *interval-seconds* is larger.

## 18.4.2 PIM-DM MDT

PIM-DM creates the MDT by using flooding, pruning, and grafting.

### Working Principle

When a multicast source sends multicast packets, the system may forward them to the outgoing interfaces of multicast neighbors and local members, depending on the results of the Reverse Path Forwarding (RPF) check. The packets not passing the RPF check are discarded. If an outgoing interface exists, the packets that have passed the RPF check are accepted for forwarding; if no outgoing interface exist, a prune packet is sent to upstream devices. After the upstream interface receives the prune packet, the upstream interface transmits the source interface of the prune packet as the Pruned state and sets the Prune Timer (PT). In this way, the MDT based on the multicast source is created.

When the system receives a Join message from a local member, if a downstream device in the Pruned state sends a Graft message to an upstream device, the upstream device returns a Graft Ack message and resume multicast forwarding to the interfaces of the downstream device after receiving the Graft message.

 In network deployment, when multiple PIM-DM neighbors are created through multiple links between devices and downstream devices have no or less need in receiving, the CPU usage may be high. In this scenario, PIM-SM is recommended to deploy the environment.

### Related Configuration

#### 📌 Configuring the Prune Override Interval on an Interface

By default, the prune override interval is 500 ms.

The `ip pim override-interval interval-milliseconds` command is used to modify the prune override interval.

## 18.4.3 PIM-DM SRM

PIM-DM uses an SRM to refresh the network state.

### Working Principle

Devices connected to a multicast source periodically send SRMs to downstream devices to notify changes of the network topology. After receiving the SRMs, the adjacent devices receiving the SRMs add the local topology state information to the messages by modifying some fields in SRMs, and send the messages to downstream devices. When the messages reach leaf devices, the state information of the entire network is updated.

### Related Configuration

#### 📌 Disabling the Processing and Forwarding of SRMs

By default, the processing and forwarding of SRMs are enabled.

The **ip pim state-refresh disable** command is used to disable the processing and forwarding of SRMs.

-  Disabling the SRM function may cause the converged PIM-DM MDT to re-converge, which leads to unnecessary bandwidth waste and multicast routing table flapping. Therefore, it is recommended not to disable SRM in general conditions.

#### 📌 Setting the Interval of SRMs

By default, an SRM is sent at an interval of 60 seconds.

The **ip pim state-refresh origination-interval *interval-seconds*** command is used to adjust the interval of SRMs. The value of the interval ranges from 1 to 100.

SRMs are transmitted less frequently when the value of *interval-seconds* is larger.

-  Only devices that are directly connected to a multicast source will periodically send a PIM SRM to downstream interfaces. For a device not directly connected to the multicast source, the interval of SRMs on its downstream interfaces is invalid.

### 18.4.4 MIB

Connected to other agents, the Simple Network Management Protocol (SNMP) manager uses information in the Management Information Base (MIB) to directly manage the PIM-DM function.

#### Working Principle

The MIB specifies variables (namely information that can be queried and set by the management process) maintained by network elements and directly manages the PIM-DM function.

#### Related Configuration

##### 📌 Enabling PIM-DM MIB

By default, the PIM-DM MIB function is enabled.

The **ip pim mib dense-mode** command is used to enable the PIM-DM MIB function.

## 18.5 Configuration

Configuration	Description and Command
Configuring PIM-DM Basic Functions	 (Mandatory) It is used to create the multicast service.
	<b>ip multicast-routing</b> Enables IPv4 multicast routing.
	<b>ip pim dense-mode</b> Enables PIM-DM.
Configuring PIM-DM Neighbors	 (Optional) It is used to limit the (S,G) pairs of legitimate multicast packets in Any Source Multicast (ASM) model.
	<b>ip pim query-interval <i>interval-seconds</i></b> Sets the Interval of Hello messages on an interface.
	<b>ip pim propagation-delay <i>interval-milliseconds</i></b> Sets the prune propagation delay on an interface.
	<b>ip pim override-interval <i>interval-milliseconds</i></b> Sets the prune override interval on an interface.
	<b>ip pim neighbor-filter <i>access-list</i></b> Configures neighbor filtering on an interface.

Configuration	Description and Command	
Configuring PIM-DM SRMs	<b>ip pim state-refresh disable</b>	Disables the processing and forwarding of SRMs.
	<b>ip pim state-refresh origination-interval</b> <i>interval-seconds</i>	Sets the Interval of SRMs on an interface.
Configuring PIM-DM MIB	<b>ip pim mib dense-mode</b>	Enables PIM-DM MIB.

### 18.5.1 Configuring PIM-DM Basic Functions

#### Configuration Effect

- Create a PIM-DM network and provide data sources and user terminals in the network with the IPv4 multicast service.

#### Notes

- PIM-DM needs to use the unicast routes existing in the network. Therefore, IPv4 unicast routing must be configured in the network.

#### Configuration Steps

##### ▾ Enabling IPv4 Multicast Routing

- Mandatory
- IPv4 multicast routing should be enabled on each router unless otherwise specified.

##### ▾ Enabling PIM-DM

- Mandatory
- PIM-DM should be enabled on the following interfaces unless otherwise specified: interconnected interfaces on routers and interfaces connecting multicast sources and user hosts.

#### Verification

Make multicast sources send multicast packets and make user hosts join the groups.

- Check whether the user hosts can successfully receive packets from each group.
- Check whether correct PIM-DM routing entries are created on routers.

#### Related Commands

##### ▾ Enabling IPv4 Multicast Routing

Command	<b>ip multicast-routing</b>
Parameter	N/A
Description	
Command Mode	Global configuration mode
Usage Guide	N/A

##### ▾ Enabling PIM-DM

Command	<b>ip pim dense-mode</b>
---------	--------------------------

<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be at Layer-3, including: routing interfaces, aggregate ports(APs), switch virtual interfaces (SVIs), and loopback interfaces. For all PIM interfaces, IPv4 unicast routes should be reachable.

▾ **Displaying the PIM-SM Routing Table**

<b>Command</b>	<b>show ip pim dense-mode mroute [ group-or-source-address [ group-or-source-address ] ] [ summary ]</b>
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates a group address or source address. <i>group-or-source-address</i> : Indicates a group address or source address (The two addresses cannot be group addresses or source addresses at the same time). <b>summary</b> : Displays the routing table summary.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	Check whether sufficient routing entries are provided. Check the upstream and downstream interface lists and ensure that a correct SPT tree is created.

**Configuration Example**

▾ **Enabling IPv4 Multicast Routing on the IPv4 Network**

<b>Scenario</b> Figure 5- 3	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure IPv4 unicast routing protocols (for example, OSPF) on all the routers.</li> <li>● Enable the IPv4 multicast routing function on all the routers.</li> <li>● Enable the PIM-DM function on all the interconnected interfaces of the routers, Source, and Receiver..</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim dense-mode A(config-if)# exit A(config)# interface GigabitEthernet 0/2 A(config-if)# ip pim dense-mode A(config-if)# exit</pre>

<p><b>B</b></p>	<pre> B# configure terminal  B(config)# ip multicast-routing  B(config)# interface GigabitEthernet 0/1  B(config-if)# ip pim dense-mode  B(config-if)# exit  B(config)# interface GigabitEthernet 0/2  B(config-if)# ip pim dense-mode  B(config-if)# exit                     </pre>

--	---

### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

### 18.5.2 Configuring PIM-DM Neighbors

#### Configuration Effect

- Coordinate protocol parameters and adjust parameters in the Hello packet.
- Enable neighbor filtering to improve network security.

#### Notes

- Basic functions of PIM-DM must be configured.

#### Configuration Steps

- Set parameters on PIM router interfaces unless otherwise specified.

#### Verification

- Set parameters in a Hello packet on an interface and run the **debug ip pim dense-mode encode** command to check parameters.
- Enable neighbor filtering and run the **show ip pim dense-mode decode** command to display neighbor filtering information.
- Run the **show running-config interface** [*interface-type interface-number*] command to display configurations on an interface.

#### Related Commands

##### ⌵ Setting the Interval of Hello Messages

<b>Command</b>	<b>ip pim query-interval</b> <i>interval-seconds</i>
<b>Parameter</b>	<i>interval-seconds</i> : The value ranges from 1 to 65,535 in the unit of seconds.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When the Hello interval is set, the holdtime value will be updated as its 3.5 times.

- i** Every time when the interval of Hello messages is updated, the holdtime value is automatically updated as 3.5 times of the interval. If the result of the interval of Hello messages multiplied by 3.5 is greater than 65,535, the holdtime value is updated as 65,535.

##### ⌵ Setting the Prune Propagation Delay

<b>Command</b>	<b>ip pim propagation-delay</b> <i>interval-milliseconds</i>
<b>Parameter Description</b>	<i>interval-milliseconds</i> : The value ranges from 1 to 32,767 in the unit of milliseconds.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Set <b>propagation-delay</b> of an interface, that is, configure the prune propagation delay of an interface.

📌 **Setting the Prune Override Interval**

<b>Command</b>	<b>ip pim override-interval</b> <i>interval-milliseconds</i>
<b>Parameter Description</b>	<i>interval-milliseconds</i> : The value ranges from 1 to 32,767 in the unit of milliseconds.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Set <b>override-interval</b> of an interface, that is, configure the prune override time of an interface.

📌 **Configuring PIM-DM Neighbor Filtering**

<b>Command</b>	<b>ip pim neighbor-filter</b> <i>access-list</i>
<b>Parameter Description</b>	<i>access-list</i> : The supported ACL ranges from 1 to 99. Naming an ACL is also supported.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Only addresses that meet ACL filtering conditions can be used as PIM neighbors of the current interface. Otherwise, the addresses filtered out cannot be neighbors.  Peering refers to exchange of protocol packets between PIM neighbors. If peering with a PIM device is suspended, the neighbor relationship with it cannot be formed so that PIM protocol packets will not be received from the device.

**Configuration Example**

📌 **Configuring PIM-DM Neighbors on the IPv4 Network**

<b>Scenario</b> Figure 5- 4	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-DM (omitted).</li> <li>● Set protocol parameters in a Hello packet on the Gi0/1 interface of device A.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim query-interval 60 A(config-if)# ip pim propagation-delay 800 A(config-if)# ip pim override-interval 1000</pre>

	A(config-if)# exit
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show running-config interface</b> [ <i>interface-type interface-number</i> ] command to display configurations on an interface.</li> <li>● Run the <b>debug ip pim dense-mode encode</b> command to debug parameters in a Hello packet.</li> </ul>

### Common Errors

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- PIM-DM is not enabled on a certain interface.

### 18.5.3 Configuring PIM-DM SRMs

#### Configuration Effect

- Enable or disable the PIM-DM SRM function.
- Adjust the interval of SRMs.

#### Notes

- Basic functions of PIM-DM must be configured.

#### Configuration Steps

- The interval of SRMs is only applicable only to the PIM router interfaces that are directly connected to the multicast source.

#### Verification

- Configure the PIM-DM SRMs and run the **show running-config** command to display the SRM status.
- Run the **show ip pim dense-mode track** command to display the SRM number.
- Run the **show running-config interface** [ *interface-type interface-number* ] command to display interface configurations.

**Related Commands**

▾ **Disabling the Processing and Forwarding of SRMs**

<b>Command</b>	<b>ip pim state-refresh disable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	When the processing and forwarding of SRMs are disabled, the State Refresh Capable option is not included in a Hello packet, and is not processed when the Hello packet is received.  Disabling the SRM function may cause the converged PIM-DM MDT to re-converge, which leads to unnecessary bandwidth waste and multicast routing table flapping. Therefore, it is recommended not to disable this function in general conditions.

▾ **Setting the Interval of SRMs**

<b>Command</b>	<b>ip pim state-refresh origination-interval <i>interval-seconds</i></b>
<b>Parameter Description</b>	<i>interval-seconds</i> : The value ranges from 1 to 100 in the unit of second.

## 19 Configuring PIM-SM

### 19.1 Overview

Protocol Independent Multicast (PIM) is an intra-domain multicast routing protocol.

A multicast source sends a packet to a group address. The packet is forwarded by network devices hop by hop and finally reaches the group members. On Layer-3 network devices, PIM is used to create and maintain multicast routing entries, so as to support multicast forwarding.

PIM works in two modes: Protocol Independent Multicast - Sparse Mode (PIM-SM) and Protocol Independent Multicast - Dense Mode (PIM-DM).

- PIM-SM is applicable to large-scale networks where group members are sparsely distributed in a wide scope.

- PIM-DM is applicable to small networks where group members are densely distributed.

### Protocols and Standards

- RFC4601: Protocol Independent Multicast -Sparse Mode (PIM-SM)
- RFC5059: Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)
- RFC3962: Protocol Independent Multicast - Dense Mode protocol
- RFC4607: Source-Specific Multicast for IP

## 19.2 Applications

Application	Description
Enabling ASM for PIM-SM	The receiver receives any multicast source.
Enabling SSM for PIM-SM	The receiver receives only a specific multicast source.

### 19.2.1 Enabling ASM for PIM-SM

#### Scenario

Provide multicast services within only one domain.

For example, in the following figure, the receiver receives any multicast source.

Figure 6-1

Remarks
R 1 is connected directly to the multicast source.
R 2 serves as the rendezvous point (RP).
R 3 is connected directly to Receiver A.
R 4 is connected directly to Receiver B.

#### Deployment

- Run the Open Shortest Path First (OSPF) protocol to realize unicast routing.
- Run PIM-SM to realize multicast routing.
- Run the Internet Group Management Protocol (IGMP) in the network segment of the user host to manage group members.

## 19.2.2 Enabling SSM for PIM-SM

### Scenario

Provide multicast services within only one domain.

For example, in the following figure, the receiver receives a specific multicast source.

Figure 6-2

### Remarks

R1 is connected directly to the multicast source.  
 R2 serves as the RP.  
 R2 is connected directly to Receiver A.  
 R2 is connected directly to Receiver B.

### Deployment

- Run the OSPF protocol to realize unicast routing.
- Run PIM-SM to realize multicast routing.
- Run the source-specific multicast (SSM) of PIM-SM within the domain.
- Run IGMPv3 in the network segment of the user host to manage group members.

## 19.3 PIM-SM Application in a Hot Backup Environment

### Scenario

In a hot backup environment, run PIM-SM. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 6-3

**Remarks** R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode. A Layer-3 multicast protocol runs on R1 and R2.

#### Deployment

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-SM on R1 and R2 to implement multicast routing.
- Make R2 run in a hot backup environment.

**Remarks** R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets (the default value is 30 seconds) needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired (the default value is 3.5 times the query interval, that is, 105 seconds). The multicast function relies on the unicast function currently, and the multicast function starts convergeFSence after the unicast function convergeFSence is complete. For example, the default graceful restart (GR) convergeFSence time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR convergeFSence time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be laFSer than the GR convergeFSence time of the unicast function. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be laFSer than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching.

## 19.4 Features

### Basic Concepts

#### ▾ PIM Router and PIM Interface

A router running PIM is called a PIM router. An interfaces running PIM is called a PIM interface.

Multicast packets are forwarded on PIM routers. The PIM interfaces where multicast packets are received are called upstream interfaces, and the PIM interfaces where multicast packets are sent are called downstream interfaces.

The network segments where upstream interfaces are located are called upstream network segments, and the network segments where downstream interfaces are located are called downstream network segments.

### ✚ PIM Network and PIM Domain

PIM routers are connected through PIM interfaces to form a PIM network.

On some PIM interfaces, borders can be set to divide a large PIM network into multiple PIM domains. The borders can reject the passage of specific multicast packets or limit the transmission of PIM packets.

### ✚ Multicast Distribution Tree, DR, and RP

Multicast packets are transmitted from one point to multiple points, forming a tree-shaped forwarding path. Such forwarding path is called the multicast distribution tree (MDT), which includes the following two types:

- RPTree (RPT): It is rooted at an RP, and uses the designated router (DR) of the member groups connected to it as its leaves.
- Shortest path tree (SPT): It is rooted at a DR that is connected to the multicast source, and uses the RP or the DR of the member groups connected to it as its leaves.

Both the DR and RP are the functions of a PIM router.

- An RP collects the information of a multicast source or multicast member on the network.
- The DR connected to the multicast source advertises the multicast source information to the RP; the DR connected to multicast group members advertises the information of multicast group members to the RP.

### ✚ (\*, G), (S, G)

- (\*, G): Indicates the packets sent from any source to a group (G), the corresponding route entries, and the RPT.
- (S, G): Indicates the packets sent from the source (S) to a group (G), the corresponding routing entries, and the SPT.

### ✚ ASM, SSM

PIM-SM supports both any-source multicast (ASM) and SSM, and it is applicable to different multicast group address segments.

- ASM: In this model, a user is not allowed to select a multicast source. The user host joins a group, and receives the packets sent from all sources.
- SSM: In this model, a user can select a multicast source. The user host joins a group and specifies the source address. Then only the packets sent from this source address is received.

Requirements for using an SSM model: Before selecting a multicast source, you need to learn the address of the multicast source using other network services.

### Overview

Feature	Description
PIM-SM Neighbor	Establishes neighbor relationships between PIM routers to form a PIM network.
DR Election	In the network segment where group member hosts are located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the group members. In the network segment where the multicast source is located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the multicast source.

Feature	Description
BSR Mechanism	On a PIM network, the BSR generates periodic candidate RPs and bootstrap packets of corresponding group addresses.
RP Mechanism	On a PIM network, through static RP configuration or dynamic RP election, the location of the RP can be learned by each PIM router.
Register Information of the Multicast Source	When the multicast source is detected on the network, the source DR sends a register packet to the RP, which obtains the source information and multicast packet.
Creating an RPT	When a group member is detected on the network, the DR connecting to the group members send packets toward the RP to form an RPT. If the multicast source already exists on the network, the packets arrived at the RP can be sent to the group members along the RPT.
Creating an SPT	When data packets arrive at the DR connecting to group members, the DR sends these packets toward the multicast source to form an SPT, and multicast packets are sent to group members along the SPT.
ASM and SSM	A PIM router can provide multicast services of both ASM model and SSM model at the same time. SSM model applies to the groups whose addresses are within the range of the SSM addresses. For other groups, use ASM model.

#### 19.4.1 PIM-SM Neighbor

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before PIM control packets can be exchanged or multicast packets can be forwarded.

##### Working Principle

A PIM interface sends a Hello packet. For the IPv4 multicast packet whose Hello packet is encapsulated, the destination address is 224.0.0.13 (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the Time To Live (TTL) value is 1. For the IPv6 multicast packet whose Hello packet is encapsulated, the destination address is ff02::d.

A Hello packet is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.

##### 📄 Discovering Neighbors

PIM routers in the same network segment receive multicast packets from the destination address 224.0.0.13. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, a triggered-hello-delay packet is used to generate a random time. Within the time, the interface sends Hello packets.

##### 📄 Coordinating Protocol Parameters

A Hello packet includes multiple protocol parameters, which are described as follows:

- DR\_Priority: indicates the priority of a router interface for competing for the DR. A higher priority means a higher chance of winning.
- Holdtime: Indicates the time in which a neighbor is held in the reachable state
- LAN\_Delay: Indicates the LAN delay for transmitting a Prune packet in a shared network segment.
- Override-Interval: Indicates the prune override time carried in a Hello packet.

When a PIM router receives a Prune packet from an upstream interface, it indicates that downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, the PIM router must sent a Prune Override packet to the upstream interface within the override interval.

$LAN\_Delay + Override\ Interval = PPT$  (Prune-Pending Timer). After a PIM router receives a Prune packet from a downstream interface, the PIM router will not immediately perform pruning until PPT times out. Within the time of PPT, if the PIM router receives a Prune rejection packet from the downstream interface, the PIM router cancels pruning.

### ✚ Maintaining Neighbor Relationships

A Hello packet is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any change of PIM neighbors will cause change of the multicast topology in the network. If an upstream or downstream neighbor in an MDT is unreachable, multicast routes converge again and the MDT is reshaped.

#### Related Configuration

### ✚ Enabling PIM-SM on an Interface

By default, PIM-SM is disabled on an interface.

Run **ip pim sparse-mode** to enable or disable PIM-SM on an interface.

PIM-SM must be enabled on an interface to involve the interface in the PIM protocol. If PIM-SM is not enabled for the interface of a DR, static RP, candidate RP (C-RP), or candidate BSR (C-BSR), corresponding roles of the PIM protocol cannot be run.

### ✚ Setting the Interval of Hello Packets on an Interface

By default, a Hello packet is sent every 30s.

Run **ip pim query-interval *interval-seconds*** to adjust the interval of Hello packets. The value ranges from 1 to 65,535.

A Hello packet is transmitted less frequently when the value of *interval-seconds* is greater.

## 19.4.2 DR Election

In the network segment where group member hosts are located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the group members.

In the network segment where the multicast source is located, PIM neighbors compete for the DR, and the one wins the election becomes the DR for connecting to the multicast source.

The DR sends Join/Prune packets toward the MDT, or sends the multicast source data to the MDT.

#### Working Principle

When creating a PIM neighbor, you can send a Hello packet to obtain the IP address and DR priority of the neighbor to elect a DR.

Two parameters play a key role in winning the DR election: the DR priority of an interface and the IP address of the interface.

### ✚ DR Priority of an Interface

During the DR election, the PIM router with the highest DR priority will be elected as the DR.

### ✚ Interface IP Address

During the DR election, if the priority of interfaces is the same, then interface IP addresses will be compared. The interface with the maximum IP address will be elected as the DR.

#### Related Configuration

### ▾ Enabling PIM-SM on an Interface

By default, PIM-SM is disabled on an interface.

Run **ip pim sparse-mode** to enable or disable PIM-SM on an interface.

PIM-SM must be enabled on an interface to involve the interface in the PIM protocol. If PIM-SM is not enabled for the interface of a DR, static RP, C-RP, or C-BSR, corresponding protocols cannot be run.

### ▾ Adjusting the DR Priority of an Interface

By default, the DR priority is 1.

Run **ip pim dr-priority *priority-value*** to adjust the DR priority of the interface. The value ranges from 0 to 4,294,967,294.

The DR priority is used in the DR election in the network segment directly connected the interface. A greater value indicates a higher priority.

## 19.4.3 BSR Mechanism

On a PIM network, the BSR generates periodic candidate RPs and bootstrap packets of corresponding group addresses. These bootstrap packets are sent hop by hop in the domain. All the routers on the entire network will receive these bootstrap packets, and record these candidate RPs and their corresponding group addresses.

### Working Principle

One or multiple candidate BSRs are configured in a PIM-SM domain. You need to apply a certain algorithm to select the BSR from these candidate BSRs.

### Related Configuration

#### ▾ Configuring Candidate BSRs

By default, candidate BSRs are not configured.

Run **ip pim bsr-candidate *interface-type interface-number* [ *hash-mask-length* [ *priority-value* ] ]** to configure or cancel the configuration of candidate BSRs.

Through bootstrap packet (BSM) learning and competition of candidate BSRs, a unique BSR is generated for the PIM-SM domain.

#### ▾ Configuring BSR Borders

By default, BSR borders are not configured.

Run **ip pim bsr-border** to configure or cancel the configuration of BSR borders.

After this command is configured, BSMs received by the interface will be discarded and will not be forwarded by this interface, preventing BSM flooding.

#### ▾ Filtering BSMs

By default, BSMs from the BSR are not filtered.

Run **ip pim accept-bsr list { <1-99> | <1300-1999> | *WORD* }** to configure whether to filter BSMs.

If this function is enabled, only legible BSMs are received by the interface; if this function is disabled, all the external BSMs will be received by the device running PIM-SM.

### ↘ **Configuring Legible C-RP Addresses and the Multicast Groups They Serve for a Candidate BSR**

By default, Candidate-RP-Advertisement (C-RP-Adv) packets are not filtered by a candidate BSR.

Run **ip pim accept-crp list { <100-199> | <2000-2699> | WORD }** to configure whether to filter C-RP-Adv packets.

If this function is enabled, C-RP addresses and corresponding multicast groups are filtered by a candidate BSR. If this function is disabled, all external C-RP-Adv packets are received by a candidate BSR.

### ↘ **Allowing a C-BSR to Receive a C-RP-ADV Packet Whose Prefix-Count Is 0**

By default, a candidate BSR cannot receive a C-RP-ADV packet whose prefix-count is 0.

Run **ip pim accept-crp-with-null-group** to configure whether to receive a C-RP-ADV packet whose prefix-count is 0.

If this function is enabled, a C-RP-ADV packet whose prefix-count is 0 can be received by a candidate BSR. If this function is disabled, a C-RP-ADV packet whose prefix-count is 0 cannot be received by a candidate BSR.

## 19.4.4 RP Mechanism

On a PIM network, through static RP configuration or dynamic RP election, the location of the RP can be learned by each PIM router. The RP as the root of the RPT, is the point where the RPT is rooted at and RPT data traffic is forwarded from.

### Working Principle

All PIM routers in the same PIM domain must be mapped to the same RP as a specific multicast group address. On a PIM network, an RP can be configured as static or dynamic.

#### ↘ **Static RP**

In static RP configuration, RP addresses are configured directly on PIM routers and these addresses are learnt by the entire PIM network.

#### ↘ **Dynamic RP**

In a PIM-SM domain, there are candidate RPs that send unicast packets (including RP addresses and the multicast groups they serve) to the BSR, which generates periodic candidate RPs and bootstrap packets of corresponding group addresses. These bootstrap packets are sent hop by hop in the domain, and received and saved by PIM routers, which apply a hash function to map the group addresses to the candidate RP that can provide services. Then the RP corresponds to these multicast group addresses can be confirmed.

### Related Configuration

#### ↘ **Configuring Static RP Addresses**

By default, no RP address is configured.

Run **ip pim rp-address rp-address [ access-list ]** to configure a static RP address for a PIM router.

To use static RP addresses, the static RP address of all routers in the PIM-SM domain must be the same, so that the PIM SM multicast routing remains consistent.

#### ↘ **Configuring Candidate C-RP Addresses**

By default, no C-RP address is configured.

Run **ip pim rp-candidate** *interface-type interface-number* [ **priority** *priority-value* ] [ **interval** *interval-seconds* ] [ **group-list** *access-list* ] to configure or cancel a PIM router as a candidate C-RP.

After a candidate RP is configured, it can send periodic C-RP-Adv packets to the BSR, and the information carried by these C-RP-Adv packets will be advertised to all PIM-SMs in the domain, ensuring the uniqueness of RP mapping.

#### ✎ Ignoring the RP Priority in RP-Set

By default, C-RP of the highest priority is configured.

Run **ip pim ignore-rp-set-priority** to select or deselect the RP priority when selecting the corresponding RP of a multicast group.

If you want to select an RP from multiples RPs that serve the same multicast group address, you can run this command to ignore the RP priority. If this command is not configured, RP priority will be considered when two RPs are compared.

### 19.4.5 Register Information of the Multicast Source

When the multicast source is detected on the network, the source DR sends a register packet to the RP, which obtains the source information and multicast packet.

#### Working Principle

When a source DR receives a multicast packet from the host directly connected to it, the source DR encapsulates the multicast packet into the register packet, and sends the unicast packet to RP to form an (S, G) entry.

If the RP has an outgoing interface for the forwarding entry, it encapsulates the data packet and forwards the packet to the outgoing interface.

If the RP does not have the forwarding entry of the present group, it generates the (S, G) entry and enables the timer. If the timer times out, the RP sends a Register-Stop packet to the DR to delete the entry. The source DR sends an inspection packet before timeout after it receives the Register-Stop packet.

If no Register-Stop packet is received by the DR, the DR on the timeout data source will encapsulate the multicast data in the register packet and send the unicast packet to the RP.

If a Register-Stop packet is received by the DR, time-delay will be performed once again, and an inspection packet will be sent before time delay.

#### Related Configuration

#### ✎ Detecting the Reachability of a Register Packet

By default, the reachability of an RP is not detected.

Run **ip pim register-rp-reachability** to configure or cancel the detection of the reachability of an RP.

You can enable this function if you want to detect whether an RP is reachable for a register packet sent from a DR. After this function is enabled, the DR will detect the reachability of a register packet before it is sent to an RP, namely, the DR will check whether a route to the RP exists in the unicast routing entry and static multicast routing entry. If the route does not exist, the register packet will not be sent.

#### ✎ Configuring an RP to Filter the Addresses of Register Packets

By default, all register packets are received an RP.

Run **ip pim accept-register** { **list access-list** [ **route-map map-name** ] | **route-map map-name** [ **list access-list** ] } to configure an RP to filter or cancel the filtering of the source addresses of received register packets.

You can run this command if you want to filter the source addresses of received register packets. If this function is not enabled, all register packets will be received by the RP. If this function is disabled, only the register packets whose source addresses and multicast group addresses included in access control lists (ACLs) are processed; otherwise, the packets will be filtered.

#### ↘ Limiting the Speed for Sending a Register Packet

By default, the speed for sending a register packet is not limited.

Run **ip pim register-rate-limit rate** to limit or cancel the limitation of the speed for sending a register packet.

If the **no** form of this command is configured, the speed is not limited. This command takes effect for only the register packet of each (S, G) packet, but not all the register packets in the entire system.

#### ↘ Calculating the Checksum of the Entire Register Packet Length

By default, the checksum of a register packet is calculated as stipulated by the protocol.

Run **ip pim register-checksum-wholepkt [ group-list access-list ]** to configure the checksum of the register packet length.

You can enable this function if you want to include the length of encapsulated multicast packets into the checksum of the register packet length. If this function is disabled, the checksum of a register packet is calculated as stipulated by the protocol.

#### ↘ Configuring an RP to Forward Multicast Data Packets to Downstream Interfaces After Decapsulating Register Packets

By default, register packets are not decapsulated and multicast packet are not forwarded to interfaces.

Run **ip pim register-decapsulate-forward** to forward or cancel the forwarding of data packets to downstream interfaces.

You can run this command if you want to decapsulate a register packet and forward the multicast packet. If this function is disabled, the multicast packet will not be forwarded.

#### ↘ Configuring the Source IP Address of a Register Packet

By default, the source IP address of a register packet is the same as the interface address of the DR connected to the multicast source.

Run **ip pim register-source** { *local\_address* | *Interface-type interface-number* } to configure the source IP address.

You can run this command if you want to configure the source IP address of the register packet sent by a DR. If this function is disabled or the **no** form of this command is used, the source address of the register packet will be the same as the interface address of the DR connected to the multicast source. If you want to configure *local\_address*, the configured address must be reachable for a unicast route. *Interface-type interface-number* can be a typical a loopback interface or an interface of other types. The interface address must have been advertised by a unicast route.

#### ↘ Configuring the Suppression Time of a Register Packet

By default, the suppression time of a register packet is 60s.

Run **ip pim register-suppression seconds** to configure the suppression time.

If you run this command on a DR, you can change the suppression time of the register packets sent from the DR. If you run this command but does not run **ip pim rp-register-kat** on an RP, the keepalive period of the RP will be changed.

#### ↘ Configuring the Inspection Time of a Null Register Packet

By default, the inspection time is 5s.

Run **ip pim probe-interval** *interval-seconds* to configure the inspection time.

In the time interval before the timeout of register packet suppression, the source DR can send a null register packet to an RP. This time interval is called the inspection time, which is 5s by default.

### 📌 **Configuring the Time of a RP KAT**

By default, the default value of a keepalive timer (KAT) is used. The default value is calculated as follows: Suppression time of a register packet x 3 + Inspection time of a null register packet.

Run **ip pim rp-register-kat** *seconds* to configure the KAT time.

You can run this command if you want to configure the keepalive time of (S, G) of a register packet sent from an RP.

## **19.4.6 Creating an RPT**

When a group member is detected on the network, the DR connecting to the group members send packets toward the RP to form an RPT. If the multicast source already exists on the network, the packets arrived at the RP can be sent to the group members along the RPT.

### **Working Principle**

To create an RPT, perform the following steps:

A receiver DR receives an IGMP (\*, G) include report packet from the receiving end.

If the DR is not the RP of this group (G), the DR will send a (\*, G) Join packet toward the RP. The router receiving this (\*, G) Join packet will send the packet hop by hop until it is received by the RP, which means that the RP has joined the RPT.

When the data source host sends the multicast data to a group, the source data is encapsulated in the register packet, and sent from the source DR to the RP in unicast mode. Then the RP decapsulates the register packet, takes the data packets out, and forwards these packets to each group member along the RPT.

The RP sends the (S, G) Join packets along the data source to join the SPT of this source.

After the SPT between the RPs to the source DR is created, the data packets from the data source will be sent decapsulated to the RPs along the SPT.

When the first multicast data packet arrives at an RP along the SPT, the RP sends a Register-Stop packet to the source DR to stop sending a register packet. After the source DR receives the Register-Stop packet, it stops encapsulating a register packet and sends the packet along the SPT to the RP, which will forwards the packet to each group member.

### **Related Configuration**

#### 📌 **Configuring the Interval for Sending a Join/Prune Packet**

By default, the interval for sending a Join/Prune packet is 60s.

Run **ip pim jp-timer** *seconds* to configure the interval for sending a Join/Prune packet.

You can run this command to configure the interval for sending a Join/Prune packet. If not configured, the value will be a default 60s.

### 19.4.7 Creating an SPT

When data packets arrive at the DR connecting to group members, the DR sends these packets toward the multicast source to form an SPT, and multicast packets are sent to group members along the SPT. In this way, the burden on RP in the RPT is reduced, and the source DR will arrive at the receiver DR with less hops.

#### Working Principle

To create an SPT, perform the following steps:

The receiver DR sends (\*, G) Join packets toward the source DR along the SPT, and (\*, G) Join packets are then sent hop by hop until they are received by the source DR, forming an SPT.

#### Related Configuration

By default, SPT switchover is not enabled.

Run **ip pim spt-threshold [ group-list access-list ]** to configure whether to switch to an SPT.

If this function is enabled, upon the reception of the first (S, G) packet, a PIM Join packet is triggered, and an SPT is created. If **group-list** is specified, all the specified groups will be switched to the SPT. If the **no** form of this command is used and **group-list** is not specified, an RPT will not be switched to an SPT, and the DR will remain in the RPT and send a Prune packet toward the source DR; if the **no** form of this command is used and **group-list** is specified, and that the ACLs have been configured, it means that the association between **group-list** and the ACLs is canceled, and all the groups are allowed to switch from an RPT to an SPT.

### 19.4.8 ASM and SSM

A PIM router can provide multicast services of both ASM model and SSM model at the same time. SSM model applies to the groups whose addresses are within the range of the SSM addresses. For other groups, use ASM model. In an ASM model, only the multicast group (G) is specified for a multicast receiver, and the multicast source (S) is not specified. In an SSM model, both the multicast source (S) and multicast group (G) can be specified for a multicast receiver.

#### Working Principle

To realize SSM in an IPv4 router, IGMPv3 needs to be applied for managing membership between the host and devices, and PIM-SM needs to be applied to connect to devices.

In an SSM model, as a multicast receiver has learnt the (S, G) of the multicast source through a certain channel (for example, by visiting the server or receiving an advertisement), when a multicast receiver needs to request a multicast service, the multicast receiver can send the IGMP (S, G) Join packet toward the router of last hop. For example, as shown in Figure 6-3, the multicast receiver 1 sends the IGMP (S, G) Join packet to request the multicast service (S, G). After the router of last hop receives the IGMP (S, G) Join packet, it sends the PIM (S, G) Join packet to the multicast source hop by hop. As shown in Figure 6-4, when R 1 receives the IGMP (S, G) Join packet sent from multicast Receiver 1, R 1 sends the PIM (S, G) Join packet to R 3, which then sends the packet to R 4, thereby forming an SPT connecting the multicast receiver and multicast source.

Figure 6- 4 SSM Model

To create an SSM model, the following requirements need to be met:

- A multicast receiver needs to learn the (S, G) of the multicast source in advance, and an IGMP (S, G) Join packet needs to be sent if the receiver needs to request a multicast service.
- IGMPv3 must be run on the interface of the last hop router connecting to the multicast receiver. IGMPv1 and IGMPv2 does not support SSM.
- PIM-SM and SSM must be run on the devices connecting the multicast receiver and multicast source.

The default range of SSM groups is 232/8. You can run a command to change the value.

An SSM has the following features:

- A multicast receiver can learn the information of the multicast source through a certain channel (for example, by visiting the server or receiving an advertisement) in advance.
- An SSM model is a specific subnet of PIM-SM. It handles only the PIM (S, G) Join and PIM (S, G) Prune packets and discards the RPT-related packets, for example, PIM (\*, G) Join/Prune packets, that are within the scope the SSM. If the SSM detects a register packet within the scope, it will respond immediately with a Register-Stop packet.
- If an RP is not required, the election and distribution of RP information are not performed. The MDTs in an SSM are all SPTs.

**Related Configuration**

ASM is enabled by default.

Run `ip pim ssm { default | range access-list }` to configure whether to switch to SSM.

In SSM, multicast packets can be received by the multicast source directly but not along the RP tree.

**19.5 Configuration**

Configuration	Description and Command
Configuring Basic PIM-SM Functions	(Mandatory) It is used to configure the multicast service.
	<code>ip multicast-routing</code> Enables IPv4 multicast routing.
	<code>ip pim sparse-mode</code> Enables PIM-SM.

Configuration	Description and Command
	<b>ip pim rp-address</b> Configures a static RP.
	<b>ip pim rp-candidate</b> Configures a C-RP.
	<b>ip pim bsr-candidate</b> Configures a C-BSR.
	<b>ip pim ssm</b> Enables SSM.
Configuring PIM-SM Neighbors	 (Optional) It is used to configure the parameters for sending and receiving the Hello packets between neighbors.
	<b>ip pim query-interval</b> <i>interval-seconds</i> Configures the interval for sending Hello packets.
	<b>ip pim propagation-delay</b> <i>milliseconds</i> Configures the prune propagation delay.
	<b>ip pim override-interval</b> <i>milliseconds</i> Configures the prune override interval.
	<b>ip pim neighbor-tracking</b> Enables the suppression capability of an interface for sending Join packets.
	<b>ip pim triggered-hello-delay</b> <i>interval-seconds</i> Configures the delay for sending Hello packets.
	<b>ip pim dr-priority</b> <i>priority-value</i> Configures the DR priority of a Hello packet.
<b>ip pim neighbor-filter</b> <i>access_list</i> Configures neighbor filtering.	
Configuring BSR Parameters	 (Optional) It is used to configure a BSR.
	<b>ip pim bsr-border</b> Configures BSR borders.
	<b>ip pim accept-bsr list</b> { <1-99>   <1300-1999>   <i>WORD</i> } Configures BSM packets limit on a PIM router.
	<b>ip pim accept-crpf list</b> <i>access-list</i> Configures a C-BSR to inspect the address range of a C-PR.
Configuring RP and DR Parameters	 (Optional) It is used to configure the parameters of an RP or a DR.
	<b>ip pim ignore-rp-set-priority</b> Ignores the C-RP priority.
	<b>ip pim register-rp-reachability</b> Enables the source DR to detect the RP reachability.
	<b>ip pim accept-register list</b> <i>access-list</i> Configures the range of source register (S, G) addresses.
	<b>ip pim register-rate-limit</b> <i>rate</i> Limits the speed for sending register packets.
	<b>ip pim register-checksum-wholepkt</b> [ <b>group-list</b> <i>access-list</i> ] Calculates the checksum of the entire register packet.
	<b>ip pim register-decapsulate-forward</b> Enables an RP to decapsulate a register packet and forwards the multicast packet to interfaces.
	<b>ip pim register-source</b> { <i>local_address</i>   <i>Interface-type interface-number</i> } Configures the source IP address of a register packet.
	<b>ip pim register-suppression</b> <i>seconds</i> Configures the suppression time of a register packet.
	<b>ip pim probe-interval</b> <i>seconds</i> Configures the inspection time of a null register packet.
<b>ip pim rp-register-kat</b> <i>seconds</i> Configures the interval of KATs on an RP.	

Configuration	Description and Command	
Configuring the Interval for Sending a Join/Prune Packet	 (Optional) It is used to specify the interval for sending a Join/Prune packet.	
	<code>ip pim jp-timer seconds</code>	Configures the interval for sending a Join/Prune packet.
Configuring the Router of Last Hop to Switch from an RPT to SPT	 (Optional) It is used to switch from SPT to RPT.	
	<code>ip pim spt-threshold [ group-list access-list ]</code>	Enables SPT switchover.

### 19.5.1 Configuring Basic PIM-SM Functions

#### Configuration Effect

- Create a PIM-SM network and provide data sources and user terminals on the network with the IPv4 multicast service.
- Any of ASM or SSM or both models can be configured.

#### Notes

- PIM-SM needs to use existing unicast routes on the network. Therefore, IPv4 unicast routes must be configured on the network.
- If the PIM network needs to support SSM multicast services, IGMPv3 or SSM mapping must be configured.

#### Configuration Steps

##### ▾ Enabling IPv4 Multicast Routing

- Mandatory.
- If not specified, IPv4 multicast routing must be enabled on each router.

##### ▾ Enabling PIM-SM

- Mandatory.
- If not specified, PIM-SM must be enabled on the following interfaces: interconnecting router interfaces, interfaces of static RPs, C-RPs, and C-BSRs, and the interfaces connecting to the multicast source and user hosts.

##### ▾ Configuring an RP

- An RP must be configured if ASM multicast services need to be provided on a PIM network.
- An RP can be configured in three models: configuring only a static RP, configuring only a dynamic RP, and configuring both a static RP and dynamic RP. If both a static RP and dynamic RP are configured, the dynamic RP takes precedence over the static RP.
- Configuring a static RP: If not specified, a static RP should be configured on each router.
- Configuring a dynamic RP: If not specified, a C-RP and C-BSR should be configured on one or multiple routers.

##### ▾ Enabling SSM

- SSM must be enabled if SSM multicast services need to be provided on a PIM network.
- If not specified, SSM must be enabled on every router.

#### Verification

Send multicast packets from the multicast source to the groups within the address range of ASM and SSM, and join user hosts to these groups.

- Check whether the user hosts can successfully receive packets from each group.
- Check whether PIM-SM routing entries are created on routers correctly.

## Related Commands

### ▾ Enabling IPv4 Multicast Routing

<b>Command</b>	<b>ip multicast-routing</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling PIM-SM

<b>Command</b>	<b>ip pim sparse-mode</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	PIM interfaces must be at Layer-3, including: routing interfaces, aggregate ports (APs), switch virtual interfaces (SVIs), and loopback interfaces. For all PIM interfaces, IPv4 unicast routes should be reachable.

### ▾ Configuring a Static RP

<b>Command</b>	<b>ip pim rp-address <i>rp-address</i> [ <i>access_list</i> ]</b>
<b>Parameter</b>	
<b>Description</b>	<i>rp-address</i> : Indicates the address of an RP. <i>access_list</i> : Specifies the range of multicast group addresses served by a static RP using an ACL. By default, an RP services all groups.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to locate a static RP. A static RP should be one with good routing performance. It is recommended that the address of the loopback interface be used as the static RP address. The static RP of all routers must be the same (including the RP address and the range of multicast group addresses it serves). It is recommended that the address of the loopback interface be used as the static RP address. The load can be shared if you configure multiple static RPs to serve different multicast group addresses. It is recommended that the address of the loopback interface be used as the static RP address.

### ▾ Configuring a C-RP

<b>Command</b>	<b>ip pim rp-candidate <i>interface-type interface-number</i> [ <i>priority priority-value</i> ] [ <i>interval seconds</i> ] [ <i>group-list access_list</i> ]</b>
----------------	--

<b>Parameter Description</b>	<p><i>interface-type interface-number</i>: Uses the address of this interface as the address of the C-RP.</p> <p><b>priority</b> <i>priority-value</i>: Competes for the RP priority. A greater value indicates a higher priority. The value ranges from 0 to 255 (192 by default).</p> <p><b>interval</b> <i>seconds</i>: Indicates the interval for sending a C-RP packet to a BSR. The value ranges from 1 to 16,383 (60 by default).</p> <p><b>group-list</b> <i>access_list</i>: Specifies the range of multicast group addresses served by a C-RP using an ACL. By default, a C-RP services all multicast groups.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure a router as a C-RP.</p> <p>A C-RP should be one with good routing performance. A C-RP and C-BSR can be on the same router or different routers.</p> <p>It is recommended that the address of the loopback interface be used as the C-RP address.</p> <p>If multiple C-RPs serve the same group, redundancy can be realized.</p> <p>If multiple C-RPs serve the different groups, load can be shared.</p>

### ↘ Configuring a C-BSR

<b>Command</b>	<b>ip pim bsr-candidate</b> <i>interface-type interface-number</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ]
<b>Parameter Description</b>	<p><i>interface-type interface-number</i>: Uses the address of this interface as the address of the C-BSR.</p> <p><i>hash-mask-length</i>: Indicates the length of hash mask used to competing for the RP. The value ranges from 0 to 32 (10 by default).</p> <p><i>priority-value</i>: Indicates the priority for competing for the BSR. A greater value indicates a higher priority. The value ranges from 0 to 255 (64 by default).</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure a router as a C-BSR.</p> <p>A C-BSR should be one with good routing performance. A C-RP and C-BSR can be on the same router or different routers.</p> <p>It is recommended that the address of the loopback interface be used as the C-BSR address.</p> <p>Configuring multiple C-BSRs can realize redundancy.</p>

### ↘ Enabling SSM

<b>Command</b>	<b>ip pim ssm</b> { <b>default</b>   <b>range</b> <i>access_list</i> }
<b>Parameter Description</b>	<p><b>default</b>: Indicates the default range of SSM group addresses, which is 232.0.0.0/8.</p> <p><b>range</b> <i>access_list</i>: Specifies the range of SSM group addresses using an ACL.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The SSM group addresses configured on all routers must be the same.

### ↘ Displaying the PIM-SM Routing Entry

<b>Command</b>	<b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]
<b>Parameter Description</b>	<p><i>group-or-source-address</i>: Indicates a multicast group address or source address (the two addresses cannot be multicast group addresses or source addresses at the same time).</p> <p><b>proxy</b>: Indicates the RPF vector carried by an entry.</p>

<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	Check whether sufficient routing entries are provided. Check the upstream and downstream interface lists and ensure that a correct SPT tree is created.

### Configuration Example

#### ▾ Enabling IPv4 Multicast Routing to Support ASM and SSM

<b>Scenario</b> <b>Figure 6- 5</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a IPv4 unicast routing protocol (such as OSPF) on a router, and the router is reachable for the unicast route of a loopback interface. (Omitted)</li> <li>● Enable IPv4 multicast routing on all the routers.</li> <li>● Enable PIM-SM on all the interconnected interfaces of the routers, Source, and Receiver.</li> <li>● Configure C-RP and C-BSR on the loopback interfaces of Router A and Router B, and enable PIM-SM on the loopback interfaces.</li> <li>● Enable SSM on all routers.</li> <li>● Enable IGMPv3 on the router interfaces connecting to user terminals. (Omitted)</li> </ul>
<b>A</b>	<pre> A# configure terminal A(config)# ip multicast-routing A(config)# ip pim ssm default A(config)# interface GigabitEthernet 0/1 A(config-if)# ip pim sparse-mode A(config-if)# exit A(config)# interface GigabitEthernet 0/2 A(config-if)# ip pim sparse-mode A(config-if)# exit A(config)# interface loopback 0 A(config-if)# ip pim sparse-mode A(config-if)# exit A(config)# ip pim rp-candidate loopback 0 </pre>

<p><b>B</b></p>	<pre> B# configure terminal  B(config)# ip multicast-routing  B(config)# ip pim ssm default  B(config)# interface GigabitEthernet0/1  B(config-if)# ip pim sparse-mode  B(config-if)# exit  B(config)# interface GigabitEthernet0/2  B(config-if)# ip pim sparse-mode  B(config-if)# exit  B(config)#interface loopback 0  B(config-if)# ip pim sparse-mode  B(config-if)# exit  B(config)# ip pim bsr-candidate loopback 0                 </pre>
<p><b>Verification</b></p>	<p>Send packets from S (192.168.1.10) to G 1 (229.1.1.1) and G2 (232.1.1.1). Add the user to G 1 and G 2, and specify the source when the user joins G 2.</p> <ul style="list-style-type: none"> <li>● Check that multicast packets from S (192.168.1.10) to G 1 and G 2 are received by the user.</li> <li>● Check the PIM-SM routing entries on Router A and Router B. Entries (*, 229.1.1.1), (192.168.1.10, 229.1.1.1), and (192.168.1.10, 232.1.1.1) should be displayed.</li> </ul>
<p><b>A</b></p>	<pre> switch#show ip pim sparse-mode mroute  IP Multicast Routing Table  (*,*,RP) Entries: 0 (*,G) Entries: 3 (S,G) Entries: 2 (S,G,rpt) Entries: 2 FCR Entries: 0 REG Entries: 0  (*, 229.1.1.1) RP: 192.168.10.10 RPF nbr: 0.0.0.0 RPF idx: None Upstream State: JOINED  00 01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31                 </pre>

**Common Errors**

- IPv4 unicast routing is incorrectly configured.
- IPv4 multicast routing is not enabled on a certain router.
- SSM is not enabled on a router or the SSM group address is different from that of the others'.

- PIM-SM is not enabled on an interface (for example, the interface is configured as a C-RP or C-BSR interface, or is used to connecting to the user host or used as an interface of the multicast source).
- IGMPv3 is not enabled on an interface connecting to the used host.
- RP is not configured on the network.
- A static RP is not configured on a router, or the configured static RP is different from that on other routers.
- C-RPs are configured on the network, but C-BSRs are not.
- Static RPs, C-RPs or C-BSRs are unreachable for unicast routes.

### 19.5.2 Configuring PIM-SM Neighbors

#### Configuration Effect

- Coordinate protocol parameters and adjust parameters in the Hello packet.
- A RIM router is used to discover neighbors, coordinate protocol parameters, and maintain neighbor relationships.
- Maintain neighbor relationships and filter the neighbors.

#### Notes

- Basic PIM-SM functions must be configured.

#### Configuration Steps

- Configure parameters on PIM router interfaces If not specified.

#### Verification

Configure the parameters of a Hello packet sent from an interface and run **debug ip pim sparse-mode packet** to display the parameters.

Enable neighbor filtering and run **show ip pim sparse-mode neighbor** to display neighbor information.

#### Related Commands

##### ▾ Configuring the Interval for Sending Hello Packets

<b>Command</b>	<b>ip pim query-interval</b> <i>interval-seconds</i>
<b>Parameter Description</b>	Indicates the interval for sending Hello packets, Indicates the suppression time of a register packet in the unit of seconds. The value ranges from 1 to 65,535 (30 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Every time when the interval for sending Hello packets is updated, the holdtime value is automatically updated as 3.5 times of the interval. If the result of the interval for sending Hello packets multiplied by 3.5 is greater than 65,535, the holdtime value is forcibly updated as 18,725.

##### ▾ Configuring the Prune Propagation Delay

<b>Command</b>	<b>ip pim propagation-delay</b> <i>milliseconds</i>
<b>Parameter</b>	<i>milliseconds</i> : The unit is ms. The value ranges from 1 to 32,767 (500 by default).

<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Once the prune propagation delay or prune override interval is changed, the Join/Prune packet override interval will be changed.</p> <p>As specified by the protocol, the Join/Prune packet override interval must be smaller than the holdtime of a Join/Prune packet; otherwise, short break-up of traffic may be caused. The administrator should maintain such configuration.</p>

#### ✎ Configuring the Prune Override Interval

<b>Command</b>	<b>ip pim override-interval</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is ms. The value ranges from 1 to 65,535 (2,500 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Once the prune propagation delay or prune override interval is changed, the Join/Prune packet override interval will be changed.</p> <p>As specified by the protocol, the Join/Prune packet override interval must be smaller than the holdtime of a Join/Prune packet; otherwise, short break-up of traffic may be caused. The administrator should maintain such configuration.</p>

#### ✎ Enabling Suppression Capability of an Interface for Sending Join Packets

<b>Command</b>	<b>ip pim neighbor-tracking</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Once Join packets suppression of an interface is enabled, when the present router is to send a Join packet to the upstream neighbor, which has sent a Join packet to its own upstream neighbor, the present router will not send the Join packet; if Join packets suppression is disabled, the Join packet will be sent. When Join packets suppression from downstream receivers are disabled, upstream neighbors will learn how many downstream neighbors are there by counting the Join packets it received, which is called neighbor tracking.</p>

#### ✎ Configuring the Delay for Sending Hello Packets

<b>Command</b>	<b>ip pim triggered-hello-delay</b> <i>interval-seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : The unit is second. The value ranges from 1 to 5 (5 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When a PIM interface is enabled or detects a new neighbor, a triggered-hello-delay packet is used to generate a random time. Within the time, the interface sends Hello packets.

#### ✎ Configuring the DR Priority of a Hello Packet

<b>Command</b>	<b>ip pim dr-priority</b> <i>priority-value</i>
----------------	---

<b>Parameter</b>	<i>priority-value</i> : Indicates the priority. A greater value indicates a higher priority.
<b>Description</b>	The value ranges from 0 to 4,294,967,294 (1 by default).
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>A DR may be selected based on the following principles:</p> <p>If all the Hello packets sent from the routers on a local area network (LAN) are configured with priorities, when selecting a DR, the priorities will be compared, and the router with the highest priority will be selected as the DR. If the priority of all routers is the same, their IP addresses will be compared, and the router with the maximum IP address will be selected as the DR.</p> <p>If the priority of the Hello packets sent from a certain router is not configured, the IP addresses of the routers will be compared, and the router with the maximum IP address will be selected as the DR.</p>

### ▾ Configuring Neighbor Filtering

<b>Command</b>	<b>ip pim neighbor-filter <i>access_list</i></b>
<b>Parameter Description</b>	<i>access_list</i> : Configures the range of neighbor addresses using a standard IP ACL. The value can be set from 1 to 99 or a string.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Enabling neighbor filtering can enhance the security of the PIM network and limit the range of legible neighbor addresses. Once a neighbor is filtered out, PIM-SM will not establish peering with it or stop the peering with it.

### ▾ Displaying the Neighbor Information of an Interface

<b>Command</b>	<b>show ip pim sparse-mode neighbor [ <i>detail</i> ]</b>
<b>Parameter Description</b>	<b>detail</b> : Displays detailed information.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure the interval for sending Hello packets as 50s.</li> <li>● Configure the prune propagation delay as 400 ms.</li> <li>● Configure the prune override interval as 3,000 ms.</li> <li>● Enable suppression capability of an interface for sending Join packets.</li> <li>● Configure the delay for sending Hello packets as 3s.</li> <li>● Configure the DR priority of a hello packet as 5.</li> </ul>
	<pre> FS# configure terminal FS (config)#int gi 0/1 FS (config-if-GigabitEthernet 0/1)#ip pim query-interval 50 FS (config-if-GigabitEthernet 0/1)#ip pim propagation-delay 400 </pre>

	<pre>FS (config-if-GigabitEthernet 0/1)#ip pim override-interval 3000 FS (config-if-GigabitEthernet 0/1)#ip pim triggered-hello-delay 3 FS (config-if-GigabitEthernet 0/1)#ip pim neighbor-tracking</pre>
<b>Verification</b>	Run <b>debug ip pim sparse-mode packet</b> to display the parameters of a Hello packet.
	<pre>FS# debug ip pim sparse-mode packet 00:01:49:43: %7: VRF(0): Hello send to GigabitEthernet 0/1 00:01:49:43: %7: Send Hello packet 00:01:49:43: %7: Holdtime: 175 00:01:49:43: %7: T-bit: on 00:01:49:43: %7: Propagation delay:400 00:01:49:43: %7: Override interval: 3000 00:01:49:43: %7: DR priority: 5 00:01:49:43: %7: Gen ID: 355154648 00:01:49:43: %7: RPF Vectorcapable</pre>
<b>Configuration Steps</b>	Configure neighbor filtering and set the allowed address range to 192.168.1.0 to 192.168.1.255.
	<pre>FS# configure terminal FS (config)#int gi 0/1 FS (config-if-GigabitEthernet 0/1)# ip pim neighbor-filter 1 % access-list 1 not exist FS(config)# access-list 1 permit 192.168.1.0 0.0.0.255 FS(config)#</pre>
<b>Verification</b>	Display neighbor information before neighbor filtering is configured.
	<pre>FS# show ip pim sparse-mode neighbor Neighbor          Interface          Uptime/Expires    Ver  DR Address                                     Priority/Mode 192.168.36.89     GigabitEthernet 0/1  01:12:13/00:01:32  v2   1 / P</pre>
	Display neighbor information after neighbor filtering is configured.
	<pre>FS# show ip pim sparse-mode neighbor</pre>

**Common Errors**

- Basic PIM-SM functions are not configured or the configuration is not successful.

### 19.5.3 Configuring BSR Parameters

#### Configuration Effect

- Configure the address range of BSM packets.

#### Notes

- Basic PIM-SM functions must be configured.
- C-RPs and C-BSRs must be configured.
- Boarders must be configured on the interfaces between domains.

#### Configuration Steps

##### ▾ Configuring Boarders

- Boarders must be configured if there are multiple domains.
- Boarders are configured on the interfaces separating two domains.

##### ▾ Configuring BSM Packets Limit on a PIM Router

- Optional.
- If not specified, BSM packets limit can be configured on all PIM routers.

##### ▾ Configuring a C-BSR to Inspect the Address Range of a C-PR

- Optional.
- If not specified, C-PR range inspection can be configured on all C-BSRs.

##### ▾ Allowing a C-BSR to Receive a C-RP-ADV Packet Whose Prefix-Count Is 0

- Optional.
- If not specified, this function can be configured on all C-BSRs.

#### Verification

##### ▾ Border Inspection

Enable basic PIM-SM functions. Configure two routers to be in different domains, configure Router B as the C-BSR, and Router A to receive BSM packets.

Configure the junction of Router A and Router B as the border so that Router A does not receive BSM packets.

##### ▾ Configuring to Inspect BSM Packets Limit on a PIM Router

When basic PIM-SM functions are enabled, and Router B is set as the C-BSR, Router A can receive BSM packets. When the address range of C-BSRs are limited on Router A, BSM packets will not be received by Router A.

##### ▾ Configuring a C-BSR to Inspect the Address Range of a C-PR

When basic PIM-SM functions are enabled, Router B is set as the C-BSR, and Router A as the C-RP, if the address range of the C-RPs is limited on C-BSR, Router B will not receive the packets sent from the C-RPs.

#### Related Commands

### ▾ Configuring BSR Borders

<b>Command</b>	<b>ip pim bsr-border</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	To prevent BSM flooding, you can configure a BSR border on an interface, so that the BSM packets arriving at this interface will be discarded but not forwarded.

### ▾ Configuring BSM Packets Limit on a PIM Router

<b>Command</b>	<b>ip pim accept-bsr list { &lt;1-99&gt;   &lt;1300-1999&gt;   WORD }</b>
<b>Parameter Description</b>	<b>list access-list:</b> Configures the range of BSR addresses using a standard IP ACL. The value can be 1 to 99, 1,300 to 1,999, or a string.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this function is enabled, PIM-SM routers receive only the BSM packets sent from legible BSRs.

### ▾ Configuring a C-BSR to Inspect the Address Range of a C-PR

<b>Command</b>	<b>ip pim accept-crp list access-list</b>
<b>Parameter Description</b>	<b>list access-list:</b> Specifies the range of C-RP addresses and the multicast group addresses they serve using an extended IP ACL. The value can be 100 to 199, 2,000 to 2,699, or a string.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command should be configured on a C-BSR. When the C-BSR becomes a BSR, it can set the range of legible C-RP addresses and the range of multicast group addresses they serves.

### ▾ Displaying BSM Packets Information

<b>Command</b>	<b>show ip pim sparse-mode bsr-router</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Displaying the Packets of All RPs and the Multicast Group Addresses They Serve

<b>Command</b>	<b>show ip pim sparse-mode rp mapping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

▾ **Configuring BSR Borders**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● On Router A, configure the address of the C-RP as 192.168.8.8.</li> <li>● On Router B, configure the address of the C-RP as 192.168.5.5, and the address of the C-BSR as 192.168.6.6.</li> <li>● Configure a BSR boarder on the junction of Router A and Router B.</li> </ul>
	<pre>FS# configure terminal FS(config)# int GigabitEthernet 0/1 FS(config-if-GigabitEthernet 0/1)# ip pim bsr-border FS(config)# end</pre>
<b>Verification</b>	Before configuring the boarder, display the BSM information on Router A.
	<pre>FS# show ip pim sparse-mode bsr-router  PIMv2 Bootstrap information  This system is the Bootstrap Router (BSR)    BSR address: 192.168.6.6    Uptime:      01:14:25, BSR Priority: 64, Hash mask length: 10    Next bootstrap packet in 00:00:52    Role: Candidate BSR   Priority: 64, Hash mask length: 10    State: Elected BSR    Candidate RP: 192.168.8.8 (Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:06</pre>
	 Candidate RP: Indicates all the C-RPs configured on the existing router. It does not include the C-RPs configured on other routers.
	After the boarder is configured, display the BSM information on Router A.
	<pre>FS# show ip pim sparse-mode bsr-router</pre>

▾ **Configuring BSM Packets Limit on a PIM Router, Filtering BSM Source Addresses, and Configuring the Range of BSM Source Addresses to 192.168.1.1 to 192.168.1.255**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● On Router A, configure the address of the C-RP as 192.168.8.8.</li> <li>● On Router B, configure the address of the C-RP as 192.168.5.5, and the address of the C-BSR as 192.168.6.6.</li> <li>● On Router A, configure the range of allowed BSM source addresses to 192.168.1.1 to 192.168.1.255.</li> </ul>
	<pre>FS# configure terminal FS(config)# ip pim accept-bsr list 1</pre>

	<pre>% access-list 1 not exist FS(config)# access-list 1 permit 192.168.1.0 0.0.0.255 FS(config)#</pre>
<b>Verification</b>	Before configuring BSM packets limit, display the BSM information on Router A.
	<pre>FS#show ip pim sparse-mode bsr-router  PIMv2 Bootstrap information    BSR address: 192.168.6.6    Uptime:      00:00:11, BSR Priority: 64, Hash mask length: 10    Expires:     00:01:59    Role: Non-candidateBSR   Priority: 0, Hash mask length: 10    State: AcceptPreferred    Candidate RP: 192.168.8.8(Loopback 0)      Advertisement interval 60 seconds      Next Cand_RP_advertisement in 00:00:06</pre>
	After BSM packets limit is configured, display the BSM information on Router A.
	<pre>FS# show ip pim sparse-mode bsr-router  Candidate RP: 192.168.8.8(Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:06</pre>

↘ **Configuring a C-BSR to Inspect the Address Range of a C-PR, Filtering C-RP Addresses, and Configuring the Range of C-RP Addresses to 192.168.1.1 to 192.168.1.255**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● On Router A, configure the address of the C-RP as 192.168.8.8.</li> <li>● On Router B, configure the address of the C-RP as 192.168.5.5, and the address of the C-BSR as 192.168.6.6.</li> <li>● On Router B, configure the range of allowed C-RP source addresses to 192.168.1.1 to 192.168.1.255.</li> </ul>
	<pre>FS# configure terminal FS(config)# ip pim accept-crp list 100  % access-list 1 not exist FS(config)# access-list 1 permit 192.168.1.0 0.0.0.255 FS(config)#</pre>
<b>Verification</b>	Before configuring C-RP filtering, display the information of all RP groups on Router B.
	<pre>FS#show ip pim sparse-mode rp mapping  PIM Group-to-RP Mappings  This system is the Bootstrap Router (v2)</pre>

	<p>Group(s): 224.0.0.0/4</p> <p>RP: 192.168.8.8(Not self)</p> <p>Info source: 192.168.8.8, via bootstrap, priority 192</p> <p>Uptime: 00:15:16, expires: 00:02:18</p> <p>RP: 192.168.5.5(Self)</p> <p>Info source: 192.168.6.6, via bootstrap, priority 192</p> <p>Uptime: 18:52:30, expires: 00:02:00</p>
	After C-RP filtering is configured, display the information of all RP groups on Router B.
	<pre>FS#show ip pim sparse-mode rp mapping</pre> <p>PIM Group-to-RP Mappings</p> <p>This system is the Bootstrap Router (v2)</p> <p>Group(s): 224.0.0.0/4</p> <p>RP: 192.168.5.5(Self)</p> <p>Info source: 192.168.6.6, via bootstrap, priority 192</p> <p>Uptime: 21:38:20, expires: 00:02:10</p>
	 After C-RP filtering is configured on a router, only the C-RP packets sent from other routers are filtered, and those sent from the present router are not filtered.

### Common Errors

- Basic PIM-SM functions are not configured or the configuration is not successful.
- C-BSRs are not configured.
- The BSR border is not configured on the interfaces of different domains.

### 19.5.4 Configuring RP and DR Parameters

#### Configuration Effect

- Ignore the C-RP priority and reselect an RP.
- Detect the reachability of an RP for the source DR.
- Configure the range of (S, G) addresses of source register packets, and allow the ASM to serve only the multicast packets within the range.
- Limit the speed of the source DR for sending register packets.
- Configure the checksum of the register packet length.
- Configure an RP to decapsulate register packets and forward the multicast packets to downstream interfaces.
- Configure the source IP address of a register packet.
- Configure the suppression time of a register packet.
- Configure the inspection time of a null register packet.

- Configure the (S, G) lifetime based on the register packet received by an RP.

#### Notes

- Basic PIM-SM functions must be configured.

#### Configuration Steps

##### ✚ Ignoring the C-RP Priority and Reselecting an RP

- Optional.
- If not specified, the C-RP priority can be disabled on every router.

##### ✚ Detecting the Reachability of an RP for the Source DR

- Optional.
- If not specified, this function can be enabled on the DR connected directly to the data source.

##### ✚ Configuring the Range of Source Register (S, G) Addresses

- Optional.
- If not specified, source register address filtering can be enabled on all C-RPs or static RPs.

##### ✚ Limiting the Speed of the Source DR for Sending Register Packets

- Optional.
- If not specified, this function can be enabled on the source DR.

##### ✚ Configuring the Checksum of the Register Packet Length

- Optional.
- If not specified, this function can be enabled on all C-RPs or static RPs.

##### ✚ Configuring Whether to Forward the Multicast Packet After Decapsulating a Register Packet

- Optional.
- If not specified, this function can be enabled on all C-RPs or static RPs.

##### ✚ Configuring the Source IP Address of a Register Packet

- Optional.
- If not specified, the source IP address of a register packet can be configured on the DR connected directly to the data source.

##### ✚ Configuring the Suppression Time of a Register Packet

- Optional.
- If not specified, the suppression time of a register packet can be configured on the DR connected directly to the data source.

##### ✚ Configuring the Inspection Time of a Null Register Packet

- Optional.
- If not specified, the inspection time of a null register packet can be configured on the DR connected directly to the data source.

### ↘ **Configuring the (S, G) Lifetime Based on the Register Packet Received by an RP**

- Optional.
- If not specified, the (S, G) lifetime can be configured on all C-RPs or static RPs.

#### **Verification**

### ↘ **Ignoring the C-RP priority**

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the C-RP address as 192.168.5.5, priority as 200, and C-BSR address as 192.168.6.6.

- Run **show ip pim sparse-mode rp** 233.3.3.3 to display the RPs of the present group.

### ↘ **Enabling the Source DR to Detect RP Reachability**

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the C-RP address as 192.168.5.5, priority as 192, and C-BSR address as 192.168.6.6. Enable Router B to detect RP reachability.

- Run **show running-config** to check whether the preceding configurations take effect.

### ↘ **Configuring the Range of Source Register (S, G) Addresses**

On Router A, configure the C-RP address as 192.168.8.8, and default priority as 192. On Router B, configure the address of the C-BSR as 192.168.6.6. Configure the source address a 192.168.1.100 and the multicast group address as 233.3.3.3. On Router A, configure the range of allowed source multicast group addresses to 192.168.2.0 to 192.168.2.255.

- Run **show ip pim sparse-mode mroute** to display the (S, G) entry.

### ↘ **Limiting the Speed of the Source DR for Sending Register Packets**

Configure the speed of Router B for sending register packets, and run **show ip pim sparse-mode track** to display the number of packets that has been sent.

### ↘ **Configuring the Checksum of the Register Packet Length**

On Router A, configure to calculate the checksum of the entire register packet length but not just the packet header. Run **show running-config** to check the configuration.

### ↘ **Forwarding an RP Register Packet After It Is Decapsulated**

On Router A, configure to forward a register packet after it is decapsulated. Run **show running-config** to display the configuration.

### ↘ **Configuring the Source IP Address of a Register Packet**

Configure the source address of a register packet on Router B, and run **show running-config** to display the configuration.

### ↘ **Configuring the Suppression Time of a Register Packet and the Inspection Time of a Null Register Packet**

On Router B, configure the suppression time and inspection time of a register packet, and run **show ip pim sparse-mode track** to display the configuration.

### ↘ **Configuring an RP to Receive Register Packets and the (S, G) Lifetime**

On Router A, configuring an RP to receive register packets and the (S, G) lifetime, and run **show ip pim sparse-mode mroute** to display the maximum (S, G) lifetime.

## Related Commands

### ▾ Ignoring the C-RP priority

<b>Command</b>	<b>ip pim ignore-rp-set-priority</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Displaying the RP Corresponding to a Group

<b>Command</b>	<b>show ip pim sparse-mode rp-hash</b> <i>group-address</i>
<b>Parameter Description</b>	<i>group-address</i> : Indicates the parsed multicast group address.
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling the Source DR to Detect RP Reachability

<b>Command</b>	<b>ip pim register-rp-reachability</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this function is enabled, the source DR will detect the RP reachability before sending a register packet. If the RP is unreachable, the packet will not be sent.

### ▾ Configuring the Range of Source Register (S, G) Addresses

<b>Command</b>	<b>ip pim accept-register</b> { <b>list</b> <i>access-list</i> [ <b>route-map</b> <i>map-name</i> ]   <b>route-map</b> <i>map-name</i> [ <b>list</b> <i>access-list</i> ] }
<b>Parameter Description</b>	<b>list</b> <i>access-list</i> : Configures the range of (S, G) addresses using an extended IP ACL. The value can be 100 to 199, 2,000 to 2699, or a string. <b>route-map</b> <i>map-name</i> : Configures the range of (S, G) addresses using a route map.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is run on a static RP or a C-RP to specify the source address and multicast group address of a register packet.

### ▾ Displaying a Multicast Routing Entry

<b>Command</b>	<b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates a multicast group address or source address (the two addresses cannot be multicast group addresses or source addresses at the same time). <b>Proxy</b> : Indicates the RPF vector carried by an entry.
<b>Command</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	You can specify either a multicast group address or source address, or both a multicast group address and source address; or you can specify neither a multicast group address nor source address. The two addresses cannot be multicast group addresses or source addresses at the same time.

#### ▾ Limiting the Speed of the Source DR for Sending Register Packets

<b>Command</b>	<b>ip pim register-rate-limit rate</b>
<b>Parameter Description</b>	<i>Rate</i> : Indicates the maximum number of register packets that can be sent each second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command takes effect for only the register packet of each (S, G) packet, but not all the register packets in the entire system. Enabling this command can reduce the burden on the source DR and RPs. Only the packets within the speed limit can be sent.

#### ▾ Displaying the Counters of PIM-SM Packets

<b>Command</b>	<b>show ip pim sparse-mode track</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode/Global configuration mode/Interface configuration mode
<b>Usage Guide</b>	The start time for counting PIM-SM packets is automatically enabled upon system startup. Run <b>clear ip pim sparse-mode track</b> to reset the start time and clear the PIM-SM packet counters.

#### ▾ Calculating the Checksum of the Entire Register Packet Length

<b>Command</b>	<b>ip pim register-checksum-wholepkt [ group-list access-list ]</b>
<b>Parameter Description</b>	<b>group-list access-list</b> : Configures the multicast group addresses applicable to this configuration using an ACL. <i>access-list</i> : The value can be set to 1 to 99, and 1300 to 1999. It also supports the naming of the ACL.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	You can enable this function if you want to calculate the length of the entire PIM-SM packet, including that of the multicast packet encapsulated in the register packet, but not just the length of the PIM-SM packet header. If <b>group-list access-list</b> is specified, this configuration takes effect for all multicast group addresses.

#### ▾ Enabling an RP to Decapsulate a Register Packet and Forward the Multicast Packet to Interfaces

<b>Command</b>	<b>ip pim register-decapsulate-forward</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is configured on a static RP or a C-RP. It is used to decapsulate a register packet with multicast packet and forward the multicast packet to interfaces. If there are too many register packets to be decapsulated, the CPU will be greatly burdened. In this case, this function is recommended to be disabled.

### ▾ Configuring the Source IP Address of a Register Packet

<b>Command</b>	<b>ip pim register-source</b> { <i>local_address</i>   <i>Interface-type interface-number</i> }
<b>Parameter Description</b>	<i>local_address</i> : Specifies the source IP address of a register packet. <i>interface-type interface-number</i> : Specifies the IP address of this interface as the source IP address of the register packet.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The specified address must be reachable. When an RP sends a Register-Stop packet, the PIM router corresponds to this address need to respond. Therefore, it is recommended that a loopback address (or other physical addresses) be used. This configuration does not require the enabling of PIM.

### ▾ Configuring the Suppression Time of a Register Packet

<b>Command</b>	<b>ip pim register-suppression</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the suppression time of a register packet in the unit of seconds. The value ranges from 1 to 65,535 (60 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If you configure this parameter on a DR, the suppression time of a register packet sent from the DR will be changed. If <b>ip pim rp-register-kat</b> is not configured and if you configure this parameter on an RP, the RP keepalive will be changed.

### ▾ Configuring the Inspection Time of a Null Register Packet

<b>Command</b>	<b>ip pim probe-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the inspection time of a null register packet in the unit of seconds. The value ranges from 1 to 65,535 (5 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The inspection time of a null register packet indicates the period of time for sending a null register packet to an RP before the timeout of suppression time. The inspection time cannot exceed half of the suppression time; otherwise, the configuration will not take effect, and a warning message will be displayed. Meanwhile, the result of suppression time multiplied by 3 plus the inspection time cannot exceed 65,535, otherwise, a warning will be displayed.

### ▾ Configuring the Interval of KATs on an RP

<b>Command</b>	<b>ip pim rp-register-kat</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the interval of a KAT in the unit of second. The value ranges from 1 to 65,535 (210 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

### ▾ Configuring the RPs of Corresponding Multicast Group Addresses When the C-RP Priority is Considered or Not Considered

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● On Router A, configure the address of the C-RP as 192.168.8.8.</li> <li>● On Router B, configure the address of the C-RP as 192.168.5.5, priority as 200, and the address of the C-BSR as 192.168.6.6.</li> <li>● Display the group corresponding to 233.3.3.3.</li> <li>● Configure to ignore the C-RP priority on Router B.</li> </ul>
	<pre>FS# configure terminal FS(config)# ip pim ignore-rp-set-priority</pre>
<b>Verification</b>	Display the information before you configure to ignore the C-RP priority.
	<pre>FS# show ip pim sparse-mode rp-hash 233.3.3.3       RP: 192.168.8.8  Info source: 192.168.8.8, via bootstrap  PIMv2 Hash Value 10(mask 255.192.0.0) RP 192.168.8.8, via bootstrap, priority 192, hash value 1084558102 RP 192.168.5.5, via bootstrap, priority 200, hash value 1094656709</pre>
	Display the information after you configure to ignore the C-RP priority.
	<pre>FS# show ip pim sparse-mode rp-hash 233.3.3.3       RP: 192.168.5.5  Info source: 192.168.6.6, via bootstrap  PIMv2 Hash Value 10(mask 255.192.0.0) RP 192.168.8.8, via bootstrap, priority 192, hash value 1084558102 RP 192.168.5.5, via bootstrap, priority 200, hash value 1094656709</pre>

### ▾ Configuring to Inspect the Reachability of a Source RP

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure to inspect the reachability of a source RP.</li> </ul>
	<pre>FS(config)# ip pim register-rp-reachability</pre>
<b>Verification</b>	Run <b>show running-config</b> to check whether the following information is displayed.
	<pre>FS(config)#show running-config ip pim register-rp-reachability</pre>

### ▾ Configuring the Range of Source Register (S, G) Addresses

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure source address filtering on Router A. The allowed address range is from 192.168.2.0 to 192.168.2.255.</li> </ul>
	<pre> FS#show ip pim sparse-mode mroute  FS(config)#ip pim accept-register list 101  % access-list 101 not exist  FS(config)#access-list 101 permit ip 192.168.2.0 0.0.0.255 any  FS#show ip pim sparse-mode mroute                     </pre>
<p><b>Verification</b></p>	<p>Before enabling source address filtering, run <b>show ip pim sparse-mode mroute</b> to display the multicast entry, and check whether the (S, G) entry and (S, G, RPT) entry exist.</p>

**Common Errors**

- Basic PIM-SM functions are not configured or the configuration is not successful.
- The (S, G) of register packets is not configured on a C-RP or static RP, or the configuration is not successful.
- The ACL for limiting the (S, G) of register packets is not configured or the range of (S, G) in this ACL is not correctly configured.
- The range of (S, G) of register packets on each C-RP or static RP is not the same.

### 19.5.5 Configuring the Interval for Sending a Join/Prune Packet

#### Configuration Effect

- Change the interval for sending a Join/Prune packet to form an RPT or SPT.

#### Notes

- Basic PIM-SM functions must be configured.

#### Configuration Steps

- Configure the interval for sending a Join/Prune packet.

#### Verification

On Router B, configure the interval for sending a Join/Prune packet as 120s. Run **show ip pim sparse-mode mroute** to display the lifetime of the entry.

#### Related Commands

##### ⌵ Configuring the Interval for Sending a Join/Prune Packet

<b>Command</b>	<b>ip pim jp-timer seconds</b>
<b>Parameter</b>	<i>Seconds</i> : Indicates the interval for sending a Join/Prune packet.
<b>Description</b>	The unit is second. The value ranges from 1 to 65,535 (60 by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### Configuration Example

**19.5.6 Configuring the Router of Last Hop to Switch from an RPT to SPT**

**Configuration Effect**

- Switch from an RPT to SPT

## Notes

- Basic PIM-SM functions must be configured.

## Configuration Steps

- Configure the router of last hop to switch from an RPT to SPT.

## Verification

Configure basic PIM-SM functions first. Configure the source DR to send the data traffic (\*, 233.3.3.3), and the receiving end to join group 233.3.3.3 forcibly to form an RPT. Configure the receiver DR to switch from the RPT to SPT forcibly. Run **show running-config** to display the result.

## Related Commands

### ▾ Enabling SPT switchover

<b>Command</b>	<code>ip pim spt-threshold [ group-list access-list ]</code>
<b>Parameter</b>	
<b>Description</b>	<b>group-list access-list:</b> Specifies the range of multicast group addresses allowed for SPT switchover using an ACL. <b>access-list:</b> The supported value ranges from 1 to 99 or 1,300 to 1,999. Naming an ACL is also supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If <b>group-list access-list</b> is not specified, all groups are allowed to perform SPT switchover.

## Configuration Example

### ▾ Configuring the Router of Last Hop to Switch from an RPT to SPT

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic PIM-SM functions. (Omitted)</li> <li>● Configure the source DR to send the data traffic of group 233.3.3.3.</li> <li>● Configure the receiver DR to receive the data traffic of group 233.3.3.3.</li> <li>● Configure the receiver DR of last hop to switch from an RPT to SPT.</li> </ul>
	FS(config)#ip pim spt-threshold
<b>Verification</b>	Run <b>show running-config</b> to display the configuration.
	<pre>! ! ip pim jp-timer 120 ip pim spt-threshold ip pim rp-candidate Loopback 0 ! ! !</pre>

## 19.6 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears multicast routing entries.	<b>clear ip mroute</b> { *   <i>group-address</i> [ <i>source-address</i> ] }
Clears the counters of multicast routes.	<b>clear ip mroute statistics</b> { *   <i>group-address</i> [ <i>source-address</i> ] }
Clears the information about dynamic RPs.	<b>clear ip pim sparse-mode bsr rp-set</b> *
Clears the counters of PIM-SM packets.	<b>clear ip pim sparse-mode track</b>

### Displaying

Description	Command
Displays the details of BSR information.	<b>show ip pim sparse-mode bsr-router</b>
Displays the PIM-SM information of an interface.	<b>show ip pim sparse-mode interface</b> [ <i>interface-type interface-number</i> ] [ <b>detail</b> ]
Displays the local IGMP information about a PIM-SM interface.	<b>show ip pim sparse-mode local-members</b> [ <i>interface-type interface-number</i> ]
Displays the information about a PIM-SM multicast routing entry, and displays the RPF vector of a PIM-SM entry using <b>proxy</b> .	<b>show ip pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ] [ <b>proxy</b> ]
Displays the information about PIM-SM neighbors.	<b>show ip pim sparse-mode neighbor</b> [ <b>detail</b> ]
Displays the information about the next hop of PIM-SM obtained from the NSM.	<b>show ip pim sparse-mode nexthop</b>
Displays the information about the RP corresponding the multicast group address <i>group-address</i> .	<b>show ip pim sparse-mode rp-hash</b> <i>group-address</i>
Displays the information about all the RPs and the groups they serve.	<b>show ip pim sparse-mode rp mapping</b>
Displays the number of PIM-SM packets sent and received since the statistic start time.	<b>show ip pim sparse-mode track</b>

## 20 Configuring PIM-SMv6

### 20.1 Overview

Protocol Independent Multicast (PIM) is a multicast routing protocol.

PIM does not rely on a specific unicast routing protocol. It uses the unicast routing table established by any unicast routing protocol to complete the reverse path forwarding (RPF) check and establish multicast routes. PIM does not need to transmit and receive multicast route updates. Therefore, the overhead of PIM is much lower than that of other multicast routing protocols.

PIM defines two modes: dense mode and sparse mode. Protocol Independent Multicast Sparse Mode (PIM-SM) is applicable to various network environments.

**i** PIM-SM running on IPv6 is called PIM-SMv6.

**Protocols and Standards**

- RFC4601: Protocol Independent Multicast -Sparse Mode (PIM-SM)
- RFC5059: Bootstrap Router (BSR) Mechanism for Protocol Independent Multicast (PIM)
- RFC3962: Protocol Independent Multicast - Dense Mode protocol
- RFC4607: Source-Specific Multicast for IP

**20.2 Applications**

Application	Description
ASM Implementation by Using PIM-SMv6	A receiver receives packets from any multicast source.
SSM Implementation by Using PIM-SMv6	A receiver selects a multicast source.
Application Example of an Embedded RP	An embedded RP address is configured within the IPv6 multicast group address.
PIM-SMv6 Application in a Hot Backup Environment	The multicast PIM-SMv6 protocol runs in a hot backup environment.

**20.2.1 ASM Implementation by Using PIM-SMv6**

**Scenario**

The multicast service is provided only in one domain.

As shown in the following figure, receivers receive packets from any multicast source.

Figure 7-1

<b>Remarks</b>	R1 is directly connected to the multicast source.
----------------	---

R2 is configured as a rendezvous point (RP).  
 R3 is directly connected to Receiver A.  
 R4 is directly connected to Receiver B.

### Deployment

- Run the Open Shortest Path First for IPv6 (OSPFv6) protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Run the Internet Group Management Protocol version 6 (IGMPv6) protocol in a user host network segment to implement group member management.

### 20.2.2 SSM Implementation by Using PIM-SMv6

#### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, receivers receive packets from a specific multicast source.

Figure 7-2

**Remarks** R1 is directly connected to the multicast source.  
 R2 is configured as an RP.  
 R2 is directly connected to Receiver A.  
 R2 is directly connected to Receiver B.

### Deployment

- Run the OSPFv6 protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Enable the source-specific multicast (SSM) function of the PIM-SMv6 protocol to implement the SSM function.
- Run the Internet Group Management Protocol version 3 (IGMPv3) in a user host network segment to implement group member management.

### 20.2.3 Application Example of an Embedded RP

#### Scenario

The multicast service is provided only in one domain.

As shown in the following figure, an RP address is configured for R2 to make the router become an embedded RP.

Figure 7- 3

<b>Remarks</b>	<p>R1 is directly connected to the multicast source.</p> <p>R2 is configured as an RP.</p> <p>R2 is directly connected to Receiver A.</p> <p>R2 is directly connected to Receiver B.</p> <p>R2 is configured as an embedded RP.</p>
----------------	---

**Deployment**

- Run the OSPFv6 protocol in the domain to implement unicast routing.
- Run the PIM-SMv6 protocol in the domain to implement multicast routing.
- Enable the SSM function of the PIM-SMv6 protocol to implement the SSM function.
- Run the IGMPv3 protocol in a user host network segment to implement group member management.
- Configure the RP address and embedded RP on R2.

**20.2.4 PIM-SMv6 Application in a Hot Backup Environment**

**Scenario**

In a hot backup environment, run PIM-SMv6. A device performs hot backup switching to ensure that traffic is not interrupted.

Figure 7-4

**Remarks**

R1 is connected to the video server, R2 is directly connected to the receiver, and R2 runs in hot backup mode.  
A Layer-3 multicast protocol runs on R1 and R2.

**Deployment**

- Run OSPF on R1 and R2 to implement unicast routing.
- Run PIM-SMv6 on R1 and R2 to implement multicast routing.
- Make R2 run in two-node cluster hot backup mode.

**Remarks**

R2 may perform hot backup switching in the hot backup environment. In this case, the query interval of PIM Hello packets (the default value is 30 seconds) needs to be adjusted on R2 because the keepalive timer of the neighbor in PIM Hello packets of R1 may have expired (the default value is 3.5 times the query interval, that is, 105 seconds). The multicast function relies on the unicast function currently, and the multicast function starts converge after the unicast function converge is complete. For example, the default graceful restart (GR) converge time of the unicast function is 120 seconds. It is recommended that the query interval of PIM Hello packets be set to 60 seconds. The keepalive time of the neighbor in PIM Hello packets is 210 seconds. In this scenario, the query interval of PIM Hello packets need to be set with a reference to the GR converge time of the unicast function and the value of 3.5 times the query interval of PIM Hello packets must be larger than the GR converge time of the unicast function. In addition, if the converge time of the unicast function is long, the transmission interval of PIM Join/Prune packets also need to be adjusted, because the keepalive time of PIM Join/Prune packets is 3.5 times the transmission interval of PIM Join/Prune packets. The default keepalive time of PIM Join/Prune packets is 210 seconds. If R2 is configured as a dynamic RP, the interval for a candidate RP (C-RP) to transmit C-RP notifications also needs to be adjusted. The default transmission interval is 60 seconds and the keepalive time is 2.5 times the transmission interval of C-RP notifications. For example, if the converge time of the unicast function is longer than 150 seconds, the transmission interval of C-RP notifications needs to be adjusted. In a hot backup environment, it is recommended that the query interval of PIM Hello packets be larger than the default value (30 seconds). Otherwise, the keepalive timer of the neighbor in PIM Hello packets of the peer end times out during hot backup switching.

**20.3 Features****Basic Concepts**

### PIM Router and PIM Interface

Routers where the PIM protocol is enabled are called PIM routers. Interfaces where the PIM protocol is enabled are called PIM interfaces.

Multicast packets are forwarded by PIM routers. The PIM interfaces for receiving multicast packets are called upstream interfaces, and the PIM interfaces for transmitting multicast packets are called downstream interfaces.

Network segments where upstream interfaces are located are called upstream network segments. Network segments where downstream interfaces are located are called downstream network segments.

### PIM Network and PIM Domain

PIM routers are connected through PIM interfaces and form a PIM network.

On some PIM interfaces, borders are set to divide a large PIM network into multiple PIM domains. The borders may reject specific multicast packets or limit transmission of PIM messages.

### ↘ Multicast Distribution Tree, DR, RP

Multicast packets are transmitted from one point to multiple points. The forwarding path presents a tree structure. This forwarding path is called a multicast distribution tree (MDT). MDTs are classified into two types:

- Rendezvous point tree (RPT): Uses the rendezvous point (RP) as the root and designated routers (DRs) connected to group members as leaves.
- Shortest path tree (SPT): Use the DR connected to a multicast source as the root and the RPs or DRs connected to group members as leaves.

DRs and RPs are function roles of PIM routers.

- RPs collect information about multicast sources and group members in the network.
- The DR connected to a multicast source reports multicast source information to the RP and the DRs connected to group members report the group member information to the RP.

### ↘ (\*,G), (S,G)

- (\*,G): Indicates the packets transmitted from any source to Group G, routing entries corresponding to the packets, and forwarding path (RPT) corresponding to the packets.
- (S,G): Indicates the packets transmitted from Source S to Group G, routing entries corresponding to the packets, and forwarding path (SPT) corresponding to the packets.

### ↘ ASM, SSM

PIM-SM supports two multicast service models: any-source multicast (ASM) and source-specific multicast (SSM), which are applicable to different multicast address segments.

- ASM: In the ASM model, a user host cannot select a multicast source. The user host joins a multicast group and receives all packets sent from all sources to the multicast group.
- SSM: In the SSM model, a user host can select a multicast source. The user host specifies the source address when joining a multicast group, and then receives packets only from the specified source to the multicast group.

 SSM model requirement: Other network services must be used to enable a user host to know the position of a multicast source in advance so that the user host selects the multicast source.

### Overview

Feature	Description
Establishment of PIM Neighbor Relationships	Neighbor relationships are established between PIM routers to form a PIM network.
DR Election	In the shared network segment connected to group members, DR election is conducted among PIM neighbors to elect the DR connected to group members. In the shared network segment connected to a multicast source, DR election is conducted among PIM neighbors to elect the DR connected to the multicast source.
RP Mechanism	In a PIM network, the RP is statically configured or dynamically elected so that each PIM router knows the position of the RP.
Registration Information About a Multicast Source	When a multicast source arises in a network, the DR connected to the multicast source transmits the Register packet to the RP so that the RP obtains information about the multicast source and multicast packets.

RPT Establishment	When a group member arises in a network, the DR connected to the group member transmits the Join packet in the RP direction to establish an RPT. If there is a multicast source in the network, the multicast packet transmitted to the RP can reach the group member along the RPT.
SPT Establishment	When a data packet reaches the DR connected to a group member, the DR connected to the group member transmits the Join packet in the multicast source direction to establish an SPT. Then, multicast packets are forwarded along the SPT.
ASM and SSM Models	PIM routers provide multicast services of the ASM model and SSM model. The SSM model is used for groups within the SSM address range, and the ASM model is used for other groups.

### 20.3.1 Establishment of PIM Neighbor Relationships

Neighbor relationships are established between PIM routers to form a PIM network. Neighbor relationships must be established between PIM routers before other PIM control messages are exchanged or multicast packets are forwarded.

#### Working Principle

A Hello message is sent by a PIM interface. For the multicast packet for encapsulating the Hello message, the destination address is ff02::d (indicating all PIM routers in the same network segment), the source address is the IP address of the PIM interface, and the time to live (TTL) value is 1.

Hello messages are used to discover neighbors, negotiate about protocol parameters, and maintain neighbor relationships.

#### ✎ Discovering PIM Neighbors

PIM routers in the same network segment receive multicast packets with the destination address of ff02::d. In this way, the PIM routers obtain neighbor information and establish neighbor relationships.

When a PIM interface is enabled or detects a new neighbor, the Triggered-Hello-Delay message is used to generate a random time period. Within the time period, the interface sends Hello packets.

#### ✎ Negotiating About Protocol Parameters

A Hello message contains multiple protocol parameters, which are described as follows:

- DR\_Priority: Indicates the priority of each router interface for DR election. A higher priority means a higher possibility of being elected as the DR.
- Holdtime: Indicates the timeout time in which a neighbor is held in the reachable state.
- LAN\_Delay: Indicates the delay for transmitting a Prune message in a shared network segment.
- Override-Interval: Indicates the prune override time carried in a Hello message.

When a PIM router receives a Prune message from an upstream interface, it indicates that other downstream interfaces exist in the shared network segment. If the PIM router still needs to receive multicast data, it must send a Prune Override message to the upstream interface within the time of **Override-Interval**.

$LAN\_Delay + Override-Interval = PPT$  (Prune-Pending Timer). After a PIM router receives a Prune message from a downstream interface, it does not immediately perform pruning but waits for PPT timeout. After the PPT times out, the PIM router performs pruning. Within the time of PPT, if the PIM router receives a Prune Override message from the downstream interface, it cancels pruning.

#### ✎ Maintaining Neighbor Relationships

A Hello message is sent periodically between PIM routers. If a Hello packet is not received from a PIM neighbor within Holdtime, the neighbor is considered unreachable and is deleted from the neighbor list. Any changes in PIM neighbors will cause multicast topology changes in the network. If an upstream neighbor or a downstream neighbor in an MDT is unreachable, multicast routing re-convergence is performed again and the MDT is migrated.

## Related Configuration

### ▾ Enabling the PIM-SMv6 Function on an Interface

By default, the PIM-SMv6 function is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable the PIM-SMv6 function on an interface.

The PIM-SMv6 function must be enabled on an interface so that the interface participates in the operation of PIM protocols. If the PIM-SMv6 function is disabled on an interface that functions as a DR, static RP, candidate - rendezvous point (C-RP), or candidate - bootstrap router (C-BSR), the corresponding protocol role does not take effect.

### ▾ Adjusting the Transmission Interval of Hello Messages on an Interface

By default, Hello messages are transmitted at an interval of 30 seconds.

Run the **ipv6 pim query-interval seconds** command to adjust the transmission interval of Hello messages on an interface. The value ranges from 1 to 65,535.

A larger value of *interval-seconds* means a larger transmission interval of Hello messages and a smaller value of *interval-seconds* means a smaller transmission interval of Hello messages.

## 20.3.2 DR Election

In the shared network segment connected to group members, DR election is conducted among PIM neighbors to elect the DR connected to the group members.

In the shared network segment connected to a multicast source, DR election is conducted among PIM neighbors to elect the DR connected to the multicast source.

The DR transmits the Join/Prune message in the MDT root node direction for the directly connected group members, or transmits data of the directly connected multicast source to the MDT.

### Working Principle

The neighbor IP address and DR priority are obtained from Hello packets of neighbors during establishment of PIM neighbor relationships, so as to elect the DR.

The key of DR election is the DR priorities and IP addresses of interfaces.

### ▾ Interface DR Priority

A higher interface DR priority means a higher probability that a PIM router is successfully elected as the DR during the DR election.

### ▾ Interface IP Address

If interfaces of PIM routers share the same DR priority during DR election, IP addresses of neighbors are compared. A larger IP address means a higher probability that a PIM router is successfully elected as the DR.

## Related Configuration

### ▾ Setting IP Addresses of Interfaces

By default, no IP addresses are configured for interfaces.

Run the **ipv6 address** command to set an IP address for an interface.

When PIM routers share the same DR priority, the PIM router with a larger IP address is elected as the DR.

### ▾ Enabling the PIM-SMv6 Function on an Interface

By default, the PIM-SMv6 function is disabled on an interface.

Run the **ipv6 pim sparse-mode** command to enable or disable the PIM-SMv6 function on an interface.

The PIM-SMv6 function must be enabled on an interface so that the interface participates in the operation of PIM protocols. If the PIM-SMv6 function is disabled on an interface that functions as a DR, static RP, C-RP, or C-BSR, the corresponding protocol role does not take effect.

### ▾ Adjusting the DR Priority of an Interface

By default, the DR priority is 1.

Run the **ipv6 pim dr-priority *priority-value*** command to adjust the DR priority of an interface. The priority value ranges from 0 to 4,294,967,294.

The DR priority of an interface is used to elect the DR in the directly connected network segment of the interface. A larger priority value means a higher probability that a PIM router is elected as the DR.

## 20.3.3 BSR Mechanism

In a PIM network, the bootstrap router (BSR) periodically generates bootstrap messages (BSMs) including information about a series of C-RPs and relevant group addresses. BSMs are transmitted hop by hop in the entire domain. PIM routers throughout the network receive BSMs and record information about C-RPs and the relevant group addresses.

### Working Principle

One or more C-BSRs are configured in the PIM-SMv6 domain and the BSR is elected from the candidate BSRs according to certain rules.

### Related Configuration

#### ▾ Configuring a C-BSR

By default, no C-BSR is configured.

Run the **ipv6 pim bsr-candidate *interface-type interface-number* [ *hash-mask-length* [ *priority-value* ] ]** command to configure or cancel a C-BSR.

C-BSRs elect the globally unique BSR in the PIM-SM domain by means of BSM learning and election. The BSR transmits BSMs.

#### ▾ Configuring the BSR Border

By default, no BSR border is configured.

Run the **ipv6 pim bsr-border** command to configure or cancel the BSR border.

After this command is configured for an interface, the interface immediately discards the received BSMs and does not forward BSMs, thereby preventing BSM flooding. No BSR border is configured if this command is not configured.

### ▾ Defining the Valid BSR Range

By default, the BSMs of BSRs are not filtered.

Run the **ipv6 pim accept-bsr list** *ipv6\_access-list* command to define or cancel the BSR range.

After this command is configured, the valid BSR range is defined. If this command is not configured, the device with the PIM-SMv6 function enabled will receive all BSMs.

### ▾ Configuring a C-BSR to Restrict the Address Range of Valid C-RPs and the Range of Multicast Groups Served by the C-RPs

A C-BSR receives notifications from all C-RPs.

Run the **ipv6 pim accept-crp list** *ipv6\_access-list* command to configure whether to filter notifications from C-RPs.

After this command is configured, the C-BSR restricts the address range of valid C-RPs and the range of multicast groups served by the C-RPs. If this command is not configured, the C-BSR receives notifications from all C-RPs.

### ▾ Configuring a C-BSR to Receive C-RP-ADV Packets with prefix-count of 0

By default, a C-BSR does not receive C-RP-ADV packets with prefix-count of 0.

Run the **ipv6 pim accept-crp-with-null-group** command to configure whether to receive C-RP-ADV packets with prefix-count of 0.

After this command is configured, the C-BSR can receive C-RP-ADV packets with prefix-count of 0. If this command is not configured, the C-BSR does not process C-RP-ADV packets with prefix-count of 0.

## 20.3.4 RP Mechanism

In a PIM network, the RP is statically configured or dynamically elected so that each PIM router knows the position of the RP. The RP serves as the root of the RPT. The RPT establishment and the forwarding of RPT data streams must use the RP as the forwarding point.

### Working Principle

All PIM routers in a PIM domain must be able to be mapped to the same RP through a specific multicast group address. RPs are classified into static RPs and dynamic RPs in a PIM network.

#### ▾ Static RP

In static RP configuration, the RP address is directly configured on each PIM router so that all PIM routers in the PIM network know the RP address.

#### ▾ Dynamic RP

C-RPs are also configured in the PIM-SMv6 domain. These C-RPs transmit data packets that contain their addresses and information about multicast groups served by them to the BSR in unicast mode. The BSR periodically generates BSMs that contain information about a series of C-RPs and their group addresses. BSMs are transmitted hop by hop in the entire domain. Devices receive and store these BSMs. The DR at the receive end uses a hash algorithm to map a group address to the C-RP that can serve the group. Then, the RP corresponding to the group address can be determined.

### Related Configuration

#### ▾ Setting a Static RP Address

By default, no RP address is configured.

Run the **ipv6 pim rp-address** *ipv6\_rp-address* [*ipv6\_access-list*] command to configure or cancel a static RP address for a PIM router.

An RP must be configured so as to implement ASM in a PIM-SMv6 network. You can configure a static RP or dynamic RP.

If a static RP is configured in a PIM-SMv6 network, the static RP configuration on all devices in the PIM-SMv6 domain must be consistent to prevent multicast route ambiguity in the PIM-SMv6 domain.

### ▾ Configuring a C-RP Address

By default, no C-RP address is configured.

Run the **ipv6 pim rp-candidate** *interface-type interface-number* [ **priority** *priority-value* ] [ **interval** *interval-seconds* ] [ **group-list** *ipv6\_access-list* ] command to configure or cancel a PIM router as a C-RP.

C-RPs periodically transmit C-RP notifications to the BSR. Information contained in these C-RP notifications is dispersed to all PIM-SMv6 devices in the domain, thereby ensuring the uniqueness of RP mapping.

### ▾ Ignoring the RP Priority in RP Setting

By default, a C-RP with a higher priority is selected preferentially.

Run the **ipv6 pim ignore-rp-set-priority** command to specify or ignore the RP priority when selecting the RP for a group.

When one RP needs to be selected for a multicast address and multiple RPs can serve this multicast address, use this command if the RP priority needs to be ignored during the RP comparison. If this command is not configured, the RP priority will be considered during the RP comparison.

### ▾ Configuring the Static RP First

By default, a dynamic C-RP is adopted preferentially.

Run the **ipv6 pim static-rp-preferred** command to select the static RP first during RP selection.

After this command is configured, the static RP is adopted first. If this command is not configured, a C-RP is adopted first.

### ▾ Configuring the Embedded RP Function

By default, the embedded RP function is enabled for all IPv6 multicast group addresses where the RP address is embedded.

Run the **ipv6 pim rp embedded** [ **group-list** *ipv6\_acl\_name* ] command to enable the embedded RP function.

The embedded RP function is the peculiar RP discovery mechanism of IPv6 PIM. This mechanism uses the IPv6 multicast address where the RP address is embedded, to enable a multicast device to directly extract the RP address from the multicast address. By default, the embedded RP function is enabled for all IPv6 multicast group addresses where the RP address is embedded.

## 20.3.5 Registration Information About a Multicast Source

When a multicast source arises in a network, the DR connected to the multicast source transmits the Register packet to the RP so that the RP obtains information about the multicast source and multicast packets.

### Working Principle

The DR at the data source end receives a multicast data packet from the directly connected host, and encapsulates the multicast data into a Register message. Then, it transmits the Register message to the RP in unicast mode. The RP generates the (S,G) entry.

If the forwarding entry contains an outgoing interface on the RP, the RP forwards the encapsulated data packet to the outgoing interface.

If the RP does not have the forwarding entry of the current group, it starts the (S,G) entry start timer. After the timer expires, the RP transmits the Register-Stop message to the DR and deletes the entry. After the DR at the data source end receives the Register-Stop message, the DR transmits the probing packet before the Register-Stop message timer expires.

If the DR does not receive the Register-Stop message, after the timer expires, the DR at the data source end encapsulates the multicast data into the Register message and transmits it to the RP in unicast mode.

If the DR receives the Register-Stop message, it re-starts the delay and re-transmits the probing packet before the delay expires.

## Related Configuration

### ✚ Configuring Reachability Detection of RP Register Packets

By default, the RP reachability is not detected.

Run the **ipv6 pim register-rp-reachability** command to set or cancel the RP reachability detection.

If the RP reachability needs to be detected for the Register packet transmitted from the DR to the RP, you can configure this command. After this command is configured, the RP reachability is detected before the DR transmits the Register packet to the RP. That is, the DR queries the unicast routing table and static multicast routing table to check whether a route reachable to the RP exists. If no, the DR does not transmit the Register packet.

### ✚ Configuring the RP to Filter Register Packets

By default, the RP allows every received Register packet.

Run the **ipv6 pim accept-register { list ipv6\_access-list [route-map map-name ] | route-map map-name [list ipv6\_access-list] }** command to enable or disable the RP to filter received Register packets.

To filter received Register packets on the RP, configure this command. If this command is not configured, the RP allows every received Register packet. If this command is configured, only Register packets whose source addresses and group addresses are allowed by the ACL are processed. Otherwise, the Register packets are filtered out.

### ✚ Configuring the Transmission Rate Limit for Register Packets

By default, the transmission rate of Register packets is not limited.

Run the **ipv6 pim register-rate-limit rate** command to configure whether to limit the transmission rate of Register packets.

If **no** is set in this command, the transmission rate is not limited. This command is used to configure the transmission rate of Register packets from the (S,G) multicast group address rather than the transmission rate of Register packets of the entire system.

### ✚ Configuring the Checksum Calculation of a Register Packet Based on the Entire Register Packet

By default, the checksum in a Register packet is calculated in default mode specified in the protocol.

Run the **ipv6 pim register-checksum-wholepkt [ group-list ipv6\_access-list ]** command to set the packet length for checksum calculation.

If the entire PIM protocol packet including the encapsulated multicast data packet is used for checksum calculation of a Register packet, use this command. If this command is not configured, the checksum in a Register packet is calculated in default mode specified in the protocol.

### ✚ Configuring the Source Address of Register Packets

By default, the source address of Register packets uses the address of the DR interface connected to a multicast source.

Run the **ipv6 pim register-source** { *ipv6\_local\_address* | *interface-type interface-number* } command to configure the source address of Register packets.

To configure the source address of Register packets transmitted from the DR, use this command. If this command is not configured or **no** is set in this command, the source address of Register packets uses the address of the DR interface connected to a multicast source. If the address parameter of this command is used, the configured address must be a reachable unicast route. If the interface parameter of this command is used, this interface may be a loopback interface or an interface of other types and the interface address must be an advertised unicast route.

#### ▾ Configuring the Suppression Time of Register Packets

The default suppression time of Register packets is 60 seconds.

Run the **ipv6 pim register-suppression** *seconds* command to configure the suppression time.

If this command is used to configure the suppression time of Register packets, configuring the value on the DR will change the suppression time of Register packets on the DR. If the **ipv6 pim rp-register-kat** *seconds* command is not configured, defining the value on the RP will change the keepalive time on the RP.

#### ▾ Configuring the Probing Time of NULL Register Packets

The default probing time is 5 seconds.

Run the **ipv6 pim probe-interval** *interval-seconds* command to set the probing time.

The source DR transmits the NULL-Register packet to the RP within a certain interval prior to the timeout of the suppression time of the Register packet. This interval is the probing time. The default probing time is 5 seconds.

#### ▾ Configuring the Time Value of the RP KAT Timer

By default, the KAT default value is used.  $KAT\ default\ value = Registration\ suppression\ time \times 3 + Registration\ detection\ time$ .

Run the **ipv6 pim rp-register-kat** *seconds* command to set time of the KAT timer.

To configure the keepalive time of Register packets from the (S,G) multicast group address on the RP, use this command.

### 20.3.6 RPT Establishment

When a group member arises in a network, the DR connected to the group member transmits the Join packet in the RP direction to establish an RPT. If there is a multicast source in the network, the multicast packet transmitted to the RP can reach the group member along the RPT.

#### Working Principle

The RPT establishment process is as follows:

11. The DR at the receive end receives an MLD (\*,G)Include report packet from a receiver.
12. If the DR at the receive end is not the RP of Group G, the DR at the receive end transmits one (\*,G)join packet in the RP direction. The upstream device that receives the (\*,G)join packet transmits the (\*,G)join packet in the RP direction. The (\*,G)join packet is transmitted hop by hop till the RP of Group G receives the (\*,G)join packet, indicating that the DR at the receive end joins the RPT.
13. When the data source host transmits multicast data to a group, the source data is encapsulated into the Register message and is transmitted to the RP in unicast mode by the DR at the data source end. The RP decapsulates the Register message, retrieves the data packet, and then forwards it to each group member along the RPT.

14. The RP transmits the (S,G)join packet to the DR at the data source end to join the SPT of this data source.
15. After the SPT from the RP to the DR at the data source end is established, data packets from the data source are transmitted to the RP along the SPT without encapsulation.
16. When the first multicast data packet reaches the RP along the SPT, the RP transmits the Register-Stop message to the DR at the data source end to enable the DR to stop the encapsulation of Register packets. After the DR at the data source end receives the Register-Stop message, it does not encapsulate the Register packets but transmits the Register packets to the RP along the SPT of the data source. The RP forwards the Register packets to each group member along the RPT.

## Related Configuration

### 📄 Configuring the Transmission Interval of Join/Prune Packets

The default transmission interval of Join/Prune packets is 60 seconds.

Run the **ipv6 pim jp-timer seconds** command to set the transmission interval of Join/Prune packets.

To change the default transmission interval of Join/Prune packets, configure this command. If this command is not configured, the default transmission interval of Join/Prune packets is 60 seconds.

### 20.3.7 SPT Establishment

When a data packet reaches the DR connected to a group member, the DR connected to the group member transmits the Join packet in the multicast source direction to establish an SPT. Then, multicast packets are forwarded along the SPT, thereby relieving the load of the RP in the RPT and reducing the number of hops from the DR at the data source end to the receive end.

#### Working Principle

The SPT establishment process is as follows:

The DR at the receive end transmits the (\*,G)join packet to the DR at the source end along the SPT. The (\*,G)join packet is transmitted hop by hop till the DR at the source end receives the (\*,G)join packet, forming an SPT.

#### Related Configuration

By default, SPT switching is disabled.

Run the **ipv6 pim spt-threshold [ group-list ipv6\_access-list ]** command to configure whether to start SPT switching.

After this command is configured, when the DR receives the (S,G) packet from the first group member, one PIM Join message is generated and forwarded to the RP to establish a SPT tree. If **group-list** is defined, the defined group is switched from the RPT to the SPT. If **no** is set in this command and **group-list** is not defined, the switching from the RPT to the SPT is disabled and the device redirects to the RPT and transmits one Prune packet to the source. If **no** is set in this command, **group-list** is defined, and the defined ACL is a configured ACL, the ACL associated with **group-list** is cancelled and all groups are allowed to switch from the RPT to the SPT.

### 20.3.8 ASM and SSM Models

PIM-SM supports two multicast models: ASM and SSM. In the ASM model, a multicast data receiver specifies only to join a multicast group G but does not specify the multicast source S. In the SSM model, a multicast data receiver can specify both the multicast source S and multicast group G.

When the SSM model is implemented over IPv6, MLDv2 needs to be used to manage the member relationship between hosts and devices and PIM-SMv6 needs to be used to connect devices.

In the SSM model, a multicast receiver learns about the multicast source (S,G) information by means of some channels (such as accessing the server or receiving advertisements) in advance. When the multicast receiver needs to order a multicast service, it directly transmits the MLD(S,G) Join packet to the last-hop device, for example, as shown in the following figure, Multicast Receiver 1 transmits the MLD(S,G) Join packet to order the multicast service (S,G). After receiving the MLD(S,G) Join packet from the multicast receiver, the last-hop device transmits the PIM(S,G) Join packet to the multicast source hop by hop, for example, as shown in the following figure, after receiving the MLD(S,G) Join packet from Multicast Receiver 1, R1 transmits the PIM(S,G) Join packet to R3, which transmits the PIM(S,G) Join packet to R4. As a result, the SPT from the multicast receiver to the multicast source is established.

Figure 7- 5

The following conditions need to be met for the implementation of the SSM model:

- A multicast receiver learns about the multicast source (S,G) information beforehand by means of some channels. The multicast receiver initiates the MLD(S,G) Join packet to the desired multicast service.
- MLDv2 must be enabled on the interface of the last-hop device connected to the multicast receiver. MLDv1 does not support SSM.
- PIM-SM and SSM must be enabled on the intermediate devices between the multicast receiver and the multicast source.
- **i** After the SSM function is enabled, the default group range of SSM is FF3x::/32. You can run a command to change the group range of SSM.

The SSM model has the following features:

- In the SSM model, a multicast receiver can learn about the multicast source information in advance by means of some channels (for example, receiving advertisements or accessing a specified server).
- The SSM model is a specific subset of PIM-SM and processes only PIM(S,G) Join and PIM(S,G) Prune messages. It discards RPT-relevant messages within the SSM range, for example, PIM(\*,G) Join/Prune messages. For Register packets within the SSM range, it immediately responds with the Register-Stop packet.
- In the SSM model, no RP is required and the election and distribution of RP messages are not required. The established MDT is the SPT in SSM.

## 20.4 Configuration

### 20.4.1 Configuring Basic Functions of PIM-SMv6

#### Configuration Effect

- Create a PIM network to provide the IPv6 multicast service for data sources and user terminals in the network.
- Both or either of the two multicast service models (ASM and SSM) can be supported.

#### Notes

- PIM-SMv6 needs to use the IPv6 unicast routing function.
- If the PIM network needs to support the multicast service of the SSM model, MLDv3 or SSM Mapping needs to be configured.

#### Configuration Steps

##### ▾ Enabling the IPv6 Multicast Routing Function

- Mandatory.
- The IPv6 multicast routing function should be enabled on each router unless otherwise specified.

##### ▾ Enabling the PIM-SMv6 Function

- Mandatory.
- The PIM-SMv6 function should be enabled on the following interfaces unless otherwise specified: router interconnection interfaces, interface that function as a static RP, C-RP, or C-BSR, interface for connecting to a multicast source, and interface for connecting to a user host.

##### ▾ Enabling the PIM-SMv6 PASSIVE Mode

- In a PIM network, if an interface needs to receive only multicast data packets and does not need to participate in the establishment of the PIM network topology, the interface can be configured to work in PIM-SMv6 PASSIVE mode.
- The PIM-SMv6 PASSIVE function should be enabled on the following interfaces unless otherwise specified: interface for connecting the stub network device to a user host. After the PIM-SMv6 PASSIVE mode is configured, this interface neither transmits nor receives PIM packets.

##### ▾ Configuring an RP

- If a PIM network needs to support the multicast service of the ASM model, an RP must be configured.
- There are three methods of configuring an RP: configuring only a static RP, configuring only a dynamic RP, and configuring both a static RP and a dynamic RP. If both a static RP and a dynamic RP are configured, the dynamic RP is preferred.
- Configuring a static RP: A static RP should be configured on each router unless otherwise specified.
- Configuring a dynamic RP: A C-RP or C-BSR should be configured on one or more routers unless otherwise specified.

##### ▾ Enabling the SSM

- If a PIM network needs to support the multicast service of the SSM model, the SSM must be enabled.
- The SSM should be enabled on each router unless otherwise specified.

#### Verification

Make a multicast source in the network send packets to groups within the range of ASM and SSM and make a user host join the groups.

- Check whether the user host can successfully receive packets from each group.
- Check whether correct PIM-SMv6 routing entries are created on routers.

<b>Command</b>	<b>ipv6 pim sparse-mode</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Before enabling the PIM-SMv6 function, enable the multicast routing forwarding function in global configuration mode. Otherwise, multicast data packets cannot be forwarded even if the PIM-SMv6 function is enabled.</p> <p>When the PIM-SMv6 function is enabled, MLD is automatically enabled on each interface without manual configuration.</p> <p>If the message "Failed to enable PIM-SMv6 on &lt;interface name&gt;, resource temporarily unavailable, please try again" is displayed during the configuration of this command, try to configure this command again.</p> <p>If the message "PIM-SMv6 Configure failed! VIF limit exceeded in NSM!!!" is displayed during the configuration of this command, the configured number of multicast interfaces reaches the upper limit of multicast interfaces that can be configured on the device. If the PIM-SMv6 function still needs to be enabled on an interface, delete some unnecessary PIM-SMv6 or PIM-DMv6 interfaces.</p> <p>If an interface is of the tunnel type, only the 6Over4 configuration tunnel, 6Over4 GRE tunnel, 6Over6 configuration tunnel, and 6Over6 GRE tunnel support the IPv6 multicast function. The multicast function can also be enabled on tunnel interfaces that do not support the multicast function but no prompts are displayed and multicast packets are neither received nor transmitted.</p> <p>Multicast tunnels can be established only on Ethernet ports. Embedded tunnels and QoS/ACL of multicast data are not supported.</p>

### ▾ Enabling the PIM-SMv6 PASSIVE Function

<b>Command</b>	<b>ipv6 pim sparse-mode passive</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode

Usage Guide	<p>Before enabling the PIM-SMv6 function, enable the multicast routing forwarding function in global configuration mode. Otherwise, multicast data packets cannot be forwarded even if the PIM-SMv6 PASSIVE function is enabled.</p> <p>When the PIM-SMv6 function is enabled, MLD is automatically enabled on each interface without manual configuration.</p> <p>Interfaces with the PIM-SMv6 PASSIVE function enabled neither receive nor transmit PIM packets but can forward multicast packets. Therefore, the PIM-SMv6 PASSIVE mode is generally configured on the interface of the stub network device connected to a user host, so as to prevent Layer-2 flooding of PIM Hello packets.</p>
-------------	---

### ▾ Configuring a Static RP

Command	<b>ipv6 pim rp-address</b> <i>ipv6_rp-address</i> [ <i>ipv6_access-list</i> ]
Parameter	<i>ipv6_rp-address</i> : Indicates the IPv6 address of an RP.
Description	<i>ipv6_access-list</i> : References an IPv6 ACL to restrict the group address range served by the static RP. A named ACL is supported.
Command Mode	Global configuration mode
Usage Guide	<p>Multicast static RPs can be configured. A static RP and a C-RP can coexist.</p> <p>Notes:</p> <ol style="list-style-type: none"> <li>1. If both the BSR mechanism and RP static configuration are effective, the dynamic configuration is preferred.</li> <li>2. A control list can be used to statically configure the address of an RP for multiple multicast groups (using the ACL) or all multicast groups (without using the ACL), but one static RP address cannot be used multiple times.</li> <li>3. If multiple static RPs serve the same group, the static RP with a larger IPv6 address is used preferentially.</li> <li>4. Only multicast groups with the addresses allowed by the ACL are effective. By default, all multicast groups are allowed.</li> <li>5. After the configuration is complete, the static RP source address will be inserted into the group range-based static RP group tree structure. The multicast static group in each group range maintains the linked list structure of one static RP group. This linked list is arranged in descending order by IPv6 address. When an RP is selected for a group range, the RP with the largest IPv6 address will be selected.</li> <li>6. When a static RP address is deleted, this address is deleted from all existing groups and an address is selected from the existing static RP tree structure as the RP address.</li> </ol>

### ▾ Configuring a C-RP

Command	<b>ipv6 pim rp-candidate</b> <i>interface-type interface-number</i> [ <b>priority</b> <i>priority-value</i> ] [ <b>interval</b> <i>interval-seconds</i> ] [ <b>group-list</b> <i>ipv6_access-list</i> ]
Parameter Description	<p><i>interface-type interface-number</i>: Indicates an interface name. This interface address is used as the C-RP address.</p> <p><b>priority</b> <i>priority-value</i>: Specifies the priority of the C-RP. The value ranges from 0 to 255 and the default value is <b>192</b>.</p> <p><b>interval</b> <i>seconds</i>: Indicates the interval for transmitting C-RP messages to the BSR, with the unit of seconds. The value ranges from 1 to 16,383 and the default value is <b>60</b>.</p> <p><b>group-list</b> <i>ipv6_access-list</i>: References an IPv6 ACL to restrict the group address range served by the C-RP. A named ACL is supported.</p>
Command Mode	Global configuration mode
Usage Guide	In the PIM-SMv6 protocol, the RPT created by the multicast routing uses an RP as the root node. After the BSR is elected, all C-RPs periodically transmit C-RP messages to the BSR in unicast mode and then the BSR disperses the

	<p>messages in the entire PIM domain.</p> <p>To specify an interface as the C-RP of a specific group range, contain the ACL option in this command. Note that the calculation of the group range is based only on the permitted access control entries (ACEs) and denied ACEs are not involved in the calculation.</p> <p>If <b>group-list</b> ipv6_access-list is not carried in the command, all groups are served.</p>
--	---

### ↘ Configuring a C-BSR

<b>Command</b>	<b>ipv6 pim bsr-candidate</b> <i>interface-type interface-number</i> [ <i>hash-mask-length</i> [ <i>priority-value</i> ] ]
<b>Parameter</b>	<i>interface-type interface-number</i> : Indicates an interface name. This interface address is used as the C-BSR address.
<b>Description</b>	<i>hash-mask-length</i> : Indicates the hash mask length. The value ranges from 0 to 128 and the default value is <b>126</b> . <i>priority-value</i> : Indicates the priority. The value ranges from 0 to 255 and the default value is <b>64</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>A unique BSR must exist in a PIM-SMv6 domain. The BSR collects and advertises RP information. The unique well-known BSR is elected from multiple C-BSRs by means of BSMs. All C-BSRs consider that they are the BSR before knowing the BSR information. They periodically transmit BSMs that contain the BSR address and priority in the PIM-SMv6 domain.</p> <p>This command can be used to enable a device to transmit one BSM to all PIM neighbors by using the allocated BSR address. Each neighbor compares the original BSR address with the address in the received BSM. If the IPv6 address in the received BSM is equal to or larger than its BSR address, the neighbor stores this address as the BSR address and forwards the BSM. Otherwise, the neighbor discards the BSM.</p> <p>The current device deems that it is the BSR till it receives a BSM from another C-BSR and learns that the C-BSR has a higher priority (or the same priority but a larger IPv6 address).</p>

### ↘ Enabling the SSM

<b>Command</b>	<b>ipv6 pim ssm</b> { <b>default</b>   <b>range</b> <i>ipv6_access-list</i> }
<b>Parameter</b>	<b>default</b> : The default group address range of SSM is FF3x::/32.
<b>Description</b>	<b>range</b> <i>ipv6_access-list</i> : References an IPv6 ACL to restrict the SSM group address range. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To apply SSM in a PIM-SMv6 network, you must configure this command.

### ↘ Displaying the PIM-SM Routing Table

<b>Command</b>	<b>show ipv6 pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ]
<b>Parameter</b>	<i>group-or-source-address</i> : Indicates the group address or source address. The two addresses cannot be group addresses or source addresses at the same time.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	A group address, a source address, or both group address and source address can be specified each time. You can also not specify a specific group address or source address but you cannot specify two group addresses or two source addresses at the same time.

## Configuration Example

### ↘ Creating the IPv6 Multicast Service on an IPv6 Network to Support ASM and SSM

<b>Scenario</b> <b>Figure 7- 6</b>	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure an IPv6 unicast routing protocol (such as OSPFv6) on the routers and ensure that the unicast routes of the loopback interfaces are reachable. (Omitted)</li> <li>● Enable the IPv6 multicast routing function on all routers.</li> <li>● Enable the PIM-SMv6 function on device interconnection interfaces, interface for connecting to the user host, and interface for connecting to the multicast source.</li> <li>● Configure a C-RP and a C-BSR on the loopback interfaces of Router A and Router B. Enable the PIM-SMv6 function on the loopback interfaces.</li> <li>● Enable SSM on all routers.</li> <li>● Enable MLDv3 on the router interface for connecting to the user host. (Omitted)</li> </ul>
<b>A</b>	<pre> switch(config)#ipv6 multicast-routing switch(config)#ipv6 pim ssm default switch(config)#int gi 0/2 switch(config-if-GigabitEthernet 0/2)#ipv6 add 2000::2/64 switch(config-if-GigabitEthernet 0/2)#ipv6 pim sparse-mode switch(config-if-GigabitEthernet 0/2)#exit switch(config)#int gi 0/1 switch(config-if-GigabitEthernet 0/1)#ipv6 add 1000::1/64 switch(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode switch(config-if-GigabitEthernet 0/1)#exit switch(config)#int Loopback 0 switch(config-if-Loopback 0)#ipv6 add 3000::5/64 switch(config-if-Loopback 0)#ipv6 pim sparse-mode switch(config-if-Loopback 0)#exit switch(config)#ipv6 pim rp-candidate Loopback 0 </pre>
<b>B</b>	<pre> FS(config)#ipv6 multicast-routing </pre>

	<pre> FS(config)#ipv6 pim ssm default  FS(config)#int gi 0/2  FS(config-if-GigabitEthernet 0/2)#ipv6 add 2000::1/64  FS(config-if-GigabitEthernet 0/2)#ipv6 pim sparse-mode  FS(config-if-GigabitEthernet 0/2)#exit  FS(config)#int gi 0/1  FS(config-if-GigabitEthernet 0/1)#ipv6 add 1100::1/64  FS(config-if-GigabitEthernet 0/1)#ipv6 pim sparse-mode  FS(config-if-GigabitEthernet 0/1)#exit  FS(config)#int Loopback 0  FS(config-if-Loopback 0)#ipv6 add 5000::5/64  FS(config-if-Loopback 0)#ipv6 pim sparse-mode  FS(config-if-Loopback 0)#exit  FS(config)#ipv6 pim bsr-candidate Loopback 0                 </pre>
<p><b>Verification</b></p>	<p>Make Source(2000::2/64) send packets to G1(ff16::1) and make User join G1.</p> <ul style="list-style-type: none"> <li>● Check the multicast packets received by the User. The User should be able to receive multicast packets from G1.</li> <li>● Check PIM-SMv6 routing tables on Router A and Router B. Entries should exist on the PIM-SMv6 routing tables.</li> </ul>
<p><b>A</b></p>	<pre> switch(config)# show ipv6 pim sparse-mode mroute  IPv6 Multicast Routing Table  (*,*,RP) Entries: 0  (*,G) Entries: 1  (S,G)Entries: 1  (S,G,rpt) Entries: 1  FCREntries: 0  REG Entries: 0  (*, ff16::1)  RP: 3000::5  RPF nbr: ::  RPF idx: None  Upstream State: JOINED  00 01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31                 </pre>

**Common Errors**

- IPv6 unicast routing is incorrectly configured.
- IPv6 multicast routing is not enabled on a router.
- SSM is not enabled on a router or the SSM group address range of the router is different from that of other routers.
- PIM-SMv6 is not enabled on an interface (for example, interface that is specified as a C-RP or C-BSR, or interface that functions as the gateway of a user host or multicast source).
- MLDv3 is not enabled on an interface connected to a user host.
- No RP is configured in the network.
- No static RP is configured on a router or the configured static RP is different from that on other routers.
- A C-RP is configured but no C-BSR is configured in the network.
- The unicast route to the static RP, C-RP, or C-BSR is unreachable.

**20.4.2 Configuring PIM Neighbor Parameters**

**Configuration Effect**

- Negotiate about protocol parameters and adjust parameters in a Hello packet.
- PIM routers discover neighbors, negotiate about protocol parameters, and maintain neighbor relationships.
- Protect neighbor relationships to restrict neighbors.

## Notes

- The basic functions of PIM-SMv6 must be configured.

## Configuration Steps

- Set parameters on each PIM router interface unless otherwise specified.

## Verification

Set parameters in a Hello packet on an interface and run the **debug ipv6 pim sparse-mode packet** command to check parameters in the Hello packet.

Set neighbor filtering and run the **show ipv6 pim sparse-mode neighbor** command to check the neighbor relationship.

## Related Commands

### ▾ Configuring the Transmission Interval of Hello Messages

<b>Command</b>	<b>ipv6 pim query-interval</b> <i>seconds</i>
<b>Parameter Description</b>	Indicates the transmission interval of Hello packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>30</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Each time the transmission interval of Hello messages is updated, the Holdtime of Hello messages is accordingly updated according to the following rule: The Holdtime of Hello messages is updated to 3.5 times transmission interval of Hello messages. If the transmission interval of Hello messages multiplied by 3.5 is larger than 65,535, the transmission interval of Hello messages is forcibly updated to 18,725.

### ▾ Configuring the Propagation Delay for Hello Messages

<b>Command</b>	<b>ipv6 pim propagation-delay</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is milliseconds. The value ranges from 1 to 32,767 and the default value is <b>500</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Changing the propagation delay or prune override delay will affect J/P-override-interval. According to the protocol, J/P-override-interval must be smaller than the Holdtime of Join-Prune packets. Otherwise, short flow interruption will be incurred. This must be maintained and guaranteed by network administrators.

### ▾ Configuring the Prune Override Interval for Hello Messages

<b>Command</b>	<b>ipv6 pim override-interval</b> <i>milliseconds</i>
<b>Parameter Description</b>	<i>milliseconds</i> : The unit is milliseconds. The value ranges from 1 to 65,535 and the default value is <b>2500</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Changing the propagation delay or prune override delay will affect J/P-override-interval. According to the protocol, J/P-override-interval must be smaller than the Holdtime of Join-Prune packets. Otherwise, short flow interruption will be incurred.

### ▾ Configuring the Interface Joining Suppression Capability for Hello Messages

<b>Command</b>	<b>ipv6 pim neighbor-tracking</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When the joining suppression capability of an interface is enabled and the local router needs to transmit a Join packet to an upstream neighbor, the Join packet of the local router is suppressed and is not transmitted if the local router receives a Join packet from a neighbor to the upstream router. If the joining suppression capability of the interface is disabled, the local router transmits the Join packet. When the joining suppression capability of a downstream receiver is disabled, the upstream neighbor can accurately know the number of receivers connected to the downstream neighbor through the received Join packet, thereby implementing neighbor tracking.

### ▾ Configuring the Delay of Sending Out Hello Messages

<b>Command</b>	<b>ipv6 pim triggered-hello-delay <i>seconds</i></b>
<b>Parameter Description</b>	<i>Seconds</i> : The unit is seconds. The value ranges from 1 to 5 and the default value is <b>5</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	When an interface is enabled or detects a new neighbor, the Triggered-Hello-Delay message is used to generate a random time period. Within the time period, the interface sends Hello packets.

### ▾ Configuring the DR Priority for Hello Messages

<b>Command</b>	<b>ipv6 pim dr-priority <i>priority-value</i></b>
<b>Parameter Description</b>	<i>priority-value</i> : Indicates the priority. A larger value means a higher priority. The value ranges from 0 to 4,294,967,294 and the default value is <b>1</b> .
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The process of selecting a DR is as follows: The priority parameter is set for Hello packets of devices in the same LAN. The priority is compared for the selection of a DR. The device with a higher priority is the DR. If multiple devices share the same priority, the device with a larger IP address is the DR. When the priority parameter is not set for Hello packets of a device in a LAN, the device with a larger IP address is elected as the DR in the LAN.

### ▾ Configuring Neighbor filtering

<b>Command</b>	<b>ipv6 pim neighbor-filter <i>ipv6_access-list</i></b>
<b>Parameter Description</b>	<i>ipv6_access-list</i> : References an IPv6 ACL to restrict the neighbor address range.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This command can be used to filter neighbors to strengthen the security of the PIM network and restrict the address range of legitimate neighbors. If a neighbor is rejected by an ACL, PIM-SMv6 will not establish a peering relationship

	with this neighbor or suspend the peering relationship with this neighbor.
--	--

### ▾ Displaying Neighbor Information About an Interface

<b>Command</b>	<b>show ipv6 pim sparse-mode neighbor [ detail ]</b>
<b>Parameter Description</b>	<b>detail:</b> Displays details.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the transmission interval of Hello packets of PIM-SMv6 to 50 seconds.</li> <li>● Set the propagation delay of Hello packets of PIM-SMv6 to 400 milliseconds.</li> <li>● Set the prune override interval of Hello packets of PIM-SMv6 to 3,000 milliseconds.</li> <li>● Configure the interface joining suppression capability for Hello messages of PIM-SMv6.</li> <li>● Set the delay of sending out Hello messages of PIM-SMv6 to 3 seconds.</li> <li>● Set the DR priority of Hello messages of PIM-SMv6 to 5.</li> </ul>
	<pre>switch#configure terminal switch (config)#int gi 0/1 switch (config-if-GigabitEthernet 0/1)#ipv6 pim query-interval 50 switch (config-if-GigabitEthernet 0/1)#ipv6 pim propagation-delay 400 switch (config-if-GigabitEthernet 0/1)#ipv6 pim override-interval 3000 switch (config-if-GigabitEthernet 0/1)#ipv6 pim triggered-hello-delay 3 switch (config-if-GigabitEthernet 0/1)# ipv6 pim dr-priority 5</pre>
<b>Verification</b>	Run the <b>debug ipv6 pim sparse-mode packet</b> command to check parameters in a Hello packet.
	<pre>switch # debug ipv6 pim sparse-mode packet *Jan 2 02:37:55: %7: Hello send to GigabitEthernet 0/2 *Jan 2 02:37:55: %7: Send Hello message *Jan 2 02:37:55: %7: Holdtime: 175 *Jan 2 02:37:55: %7: T-bit: off *Jan 2 02:37:55: %7: Propagationdelay: 400 *Jan 2 02:37:55: %7: Overrideinterval: 3000 *Jan 2 02:37:55: %7: DR priority: 5 *Jan 2 02:37:55: %7: Gen ID: 99572792 *Jan 2 02:37:55: %7: Secondary Addresses: *Jan 2 02:37:55: %7: 2000::2</pre>

<b>Configuration Steps</b>	Configure neighbor filtering on an interface to receive neighbor packets with the address of (8000::1/64).										
	<pre>switch(config-if-GigabitEthernet 0/2)#ipv6 pim neighbor-filter acl % access-list acl not exist switch(config-if-GigabitEthernet 0/2)#exit switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 8000::1/64 any</pre>										
<b>Verification</b>	Before neighbor filtering is configured, display the neighbor information.										
	<pre>switch#show ipv6 pim sparse-mode neighbor</pre> <table border="1"> <thead> <tr> <th>NeighborAddress</th> <th>Interface</th> <th>Uptime/Expires</th> <th>DR</th> <th>Pri/Mode</th> </tr> </thead> <tbody> <tr> <td>fe80::21a:a9ff:fe3a:6355</td> <td>GigabitEthernet 0/2</td> <td>00:32:29/00:01:16</td> <td>1 /</td> <td></td> </tr> </tbody> </table>	NeighborAddress	Interface	Uptime/Expires	DR	Pri/Mode	fe80::21a:a9ff:fe3a:6355	GigabitEthernet 0/2	00:32:29/00:01:16	1 /	
NeighborAddress	Interface	Uptime/Expires	DR	Pri/Mode							
fe80::21a:a9ff:fe3a:6355	GigabitEthernet 0/2	00:32:29/00:01:16	1 /								
<b>Verification</b>	After neighbor filtering is configured, the neighbor information is blank.										
	<pre>switch#show ipv6 pim sparse-mode neighbor</pre>										

#### Common Errors

- The basic functions of PIM-SMv6 are not configured or fail to be configured.

#### 20.4.3 Configuring BSR Parameters

##### Configuration Effect

- Restrict the range of BSMs.

##### Notes

- The basic functions of PIM-SMv6 must be configured.
- A C-RP and a C-BSR must be configured.
- The border must be configured on the interface between domains.

##### Configuration Steps

###### ▾ Configuring the Border

- The border must be configured if there are multiple domains.
- Configure the border the interface between two domains.

###### ▾ Configuring a PIM Router to Restrict BSMs

- Optional.
- This configuration can be performed on a PIM router unless otherwise specified.

### ✚ Configuring a C-BSR to Restrict the C-PR Range

- Optional.
- This configuration can be performed on all C-BSRs unless otherwise specified.

### ✚ Configuring a C-BSR to Receive C-RP-ADV Packets with prefix-count of 0

- Optional.
- This configuration can be performed on all C-BSRs unless otherwise specified.

## Verification

### ✚ Verifying the Border

Enable the basic functions of PIM-SMv6, set two routers in different domains, and set Router B as a C-BSR. Router A can normally receive BSMs.

Set the common border between Router A and Router B as a border interface. Router A cannot receive BSMs.

### ✚ Verifying a PIM Router to Restrict BSMs

Enable the basic functions of PIM-SMv6 and set Router B as a C-BSR. Router A can normally receive BSMs. Restrict the C-BSR range on Router A. Router A cannot receive BSMs.

### ✚ Verifying a C-BSR to Restrict the C-PR Range

Enable the basic functions of PIM-SMv6, set Router B as a C-BSR, set Router A as a C-RP, and restrict the C-RP range on the C-BSR. Router B cannot receive packets from the C-RP.

## Related Commands

### ✚ Configuring the BSR Border

<b>Command</b>	<b>ipv6 pim bsr-border</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The BSR border can be configured on an interface to restrict flooding of BSMs. When this interface receives BSMs, it immediately discards them and BSMs are not forwarded by this interface.

### ✚ Configuring a PIM Router to Restrict BSMs

<b>Command</b>	<b>ipv6 pim accept-bsr list <i>ipv6_access-list</i></b>
<b>Parameter Description</b>	<b>list <i>ipv6_access-list</i></b> : References an IPv6 ACL to restrict the BSR address range. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ✚ Configuring a C-BSR to Restrict the C-PR Range

<b>Command</b>	<b>ipv6 pim accept-crp list <i>ipv6_access-list</i></b>
----------------	---

<b>Parameter Description</b>	<b>list ipv6_access-list</b> : References an IPv6 ACL to restrict the address range of the C-RP and the group address range served by the C-RP. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command on a C-BSR. When this C-BSR is elected as the BSR, it can restrict the address range of the valid C-RP and the multicast group range served by the C-RP.

### ▾ Displaying BSMs

<b>Command</b>	<b>show ipv6 pim sparse-mode bsr-router</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

### ▾ Displaying All RPs Configured on the Local Device and the Multicast Groups Served by the RPs

<b>Command</b>	<b>show ipv6 pim sparse-mode rp mapping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ▾ Configuring the BSR Border

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the BSR border on the juncture interface between Router B and Router A.</li> </ul>
	FS(config-if-GigabitEthernet 0/2)#ipv6 pim bsr-border
<b>Verification</b>	Before the BSR border is configured, the BSM information of Router A is displayed as follows:

<pre>switch#show ipv6 pim sparse-mode bsr-router  PIMv2 Bootstrap information  BSR address: 5000::5  Uptime:      00:05:42, BSR Priority: 64, Hash mask length: 126  Expires:     00:01:28  Role: Non-candidate BSR Priority: 0, Hash mask length: 126  State: Accept Preferred  Candidate RP: 3000::5(Loopback 0)  Advertisement interval 60 seconds  Next Cand_RP_advertisement in 00:00:24  switch#</pre>
<p> Candidate RP: Indicates all C-RPs configured on the local router, excluding other routers.</p>
<p>After the BSR border is configured, the BSM information of Router A is displayed as follows:</p>
<pre>switch#show ipv6 pim sparse-mode bsr-router  Candidate RP: 3000::5(Loopback 0)  Advertisement interval 60 seconds  Next Cand_RP_advertisement in 00:00:53</pre>

**📌 Configuring a PIM Router to Restrict the Source Address Range of BSMs to (8000::5/64)**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure PIM Router A to restrict BSMs. The restricted source address range is (8000::5/64).</li> </ul>
<b>Verification</b>	<p>Before the BSM restriction is configured, the BSM information of Router A is displayed as follows:</p>

<pre>switch#show ipv6 pim sparse-mode bsr-router  PIMv2 Bootstrap information    BSR address: 5000::5    Uptime:      00:05:42, BSR Priority: 64, Hash mask length: 126    Expires:     00:01:28    Role: Non-candidate BSR Priority: 0, Hash mask length: 126    State: Accept Preferred  Candidate RP: 3000::5(Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:24  switch#</pre>
<p>After the BSM restriction is configured, the BSM information of Router A is displayed as follows:</p>
<pre>switch#show ipv6 pim sparse-mode bsr-router  Candidate RP: 3000::5(Loopback 0)    Advertisement interval 60 seconds    Next Cand_RP_advertisement in 00:00:34</pre>

📌 **Configuring a C-BSR to Restrict the Source Address Range of C-PR Packets to (9000::5/64)**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure Router B to restrict C-RP packets. The restricted source address range is (9000::5/64).</li> </ul>
	<pre>FS(config)#ipv6 access-list acl FS(config-ipv6-acl)#permit ipv6 9000::5/64 any FS(config-ipv6-acl)#exit FS(config)#ipv6 pim accept-crp list acl</pre>
<b>Verification</b>	<p>Before C-RP packet filtering is configured, information about all RP groups on Router B is displayed as follows:</p>

<pre> FS#show ipv6 pim sparse-mode rp mapping  PIM Group-to-RP Mappings  This system is the Bootstrap Router (v2)  Group(s): ff00::/8    RP: 3000::5(Not self)      Info source: 3000::5, via bootstrap, priority 192        Uptime: 00:02:26, expires: 00:02:08  FS#                 </pre>
<p>After C-RP packet filtering is configured, information about all RP groups on Router B is displayed as follows:</p>
<pre> FS#show ipv6 pim sparse-mode rp mapping  PIM Group-to-RP Mappings  This system is the Bootstrap Router (v2)                 </pre>

**⌵ Configuring the Static RP First**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the address of Interface Loopback0 of Router A to 3000::5. (Omitted)</li> <li>● Set the address of Interface Loopback1 of Router A to 4000::5. (Omitted)</li> <li>● Set the static address of Router A to 3300::5. (Omitted)</li> <li>● Set the static address of Router B to 3300::5.</li> <li>● Configure the static RP first on Router A.</li> </ul>
	<pre> switch(config)#ipv6 pim rp-address 3300::5  switch(config)#ipv6 pim static-rp-preferred                 </pre>
<b>Verification</b>	<p>Before static RP first is configured, display information about the RP corresponding to FF16::1.</p>
	<pre> switch#show ipv6 pim sparse-mode rp ff16::1    RP: 4000::5  Info source: 5000::5, via bootstrap  PIMv2 Hash Value 126  RP 4000::5, via bootstrap, priority 56, hash value 892666309  RP 3000::5, via bootstrap, priority 200, hash value 1161101765  RP 3300::5, static (hash value 204800453 not used)                 </pre>
<b>Verification</b>	<p>After static RP first is configured, display information about the RP corresponding to FF16::1.</p>

```

switch(config)#show ipv6 pim sparse-mode rp ff16::1
RP: 3300::5 (Static)

PIMv2 STATIC RP PREFERRED

PIMv2 Hash Value 126

RP 4000::5, via bootstrap, priority 56, hash value 892666309
RP 3000::5, via bootstrap, priority 200, hash value 1161101765
RP 3300::5, static (hash value 204800453 not used)

switch(config)#

```

### Common Errors

- The basic functions of PIM-SMv6 are not configured or fail to be configured.
- No C-BSR is configured.
- The BSR border is not configured on an interface between different domains.

#### 20.4.4 Configuring RP and DR Parameters

##### Configuration Effect

- Configure the ignorance of the C-RP priority for the RP reselection.
- Configure the DR at the data source end to detect the RP reachability.
- Restrict the (S,G) multicast group address of the data source so that the ASM model provides the multicast service only for multicast packets within the allowable range.
- Configure the rate limit for the DR at the data source end to transmit Register packets.
- Configure the checksum length of Register packets.
- Configure the source address of Register packets.
- Configure the suppression time of Register packets.
- Configure the probing time of NULL packets.
- Configure the TTL of Register packets received by the RP from the (S,G) multicast group address.
- Configure the static RP first.

##### Notes

- The basic functions of PIM-SMv6 must be configured.

##### Configuration Steps

##### ▾ Configuring the Ignorance of the C-RP Priority for the RP Reselection

- Optional.

- The ignorance of the C-RP priority can be enabled on each router unless otherwise specified.
- ▼ **Configuring the DR at the Data Source End to Detect the RP Reachability**
  - Optional.
  - The reachability detection can be enabled on the DR that is directly connected to the data source unless otherwise specified.
- ▼ **Restricting the (S,G) Address Range of Register Packets at the Data Source End**
  - Optional.
  - The (S,G) address range of Register packets at the data source end can be restricted on all routers that function as C-RPs or static RPs unless otherwise specified.
- ▼ **Restricting the Rate for the DR at the Data Source End to Transmit Register Packets**
  - Optional.
  - The transmission rate limit of Register packets can be enabled on the DR that is directly connected to the data source unless otherwise specified.
- ▼ **Configuring the Checksum Length of Register Packets**
  - Optional.
  - The checksum length of Register packets can be configured on all C-RPs or static RPs unless otherwise specified.
- ▼ **Configuring the Source Address of Register Packets**
  - Optional.
  - The source address of Register packets can be configured on the DR that is directly connected to the data source unless otherwise specified.
- ▼ **Configuring the Suppression Time of Register Packets**
  - Optional.
  - The suppression time of Register packets can be configured on the DR that is directly connected to the data source unless otherwise specified.
- ▼ **Configuring the Probing Time of NULL Packets**
  - Optional.
  - The probing time of NULL packets can be configured on the DR that is directly connected to the data source unless otherwise specified.
- ▼ **Configuring the TTL of Register Packets Received by the RP from the (S,G) Multicast Group Address**
  - Optional.
  - The TTL of Register packets from the (S,G) multicast group address can be configured on all routers that function as C-RPs or static RPs unless otherwise specified.
- ▼ **Configuring the Static RP First**
  - Optional.

- The static RP first can be configured on all routers unless otherwise specified.

## Verification

### ↘ Verifying the Ignorance of the C-RP Priority

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000::5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000::5 on Router B.

- Run the **show ipv6 pim sparse-mode rp ff16::2** command to display information about the RP that serves the current group.

### ↘ Verifying the DR at the Data Source End to Detect the RP Reachability

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000::5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000::5 on Router B. Configure the RP reachability detection on Router B.

- Run the **show running-config** command to check whether the RP reachability detection is configured.

### ↘ Verifying the Restriction of the (S,G) Address Range of Register Packets at the Data Source End

Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. Set the address to 4000::5 and priority to 56 for Interface Loopback1 on Router A. Set the C-BSR address to 5000::5 on Router B. The address of the multicast group is FF16::2. Set Router A to receive packets only from the multicast source with the source address of (1300::1/64).

- Run the **show ip pim sparse-mode mroute** command to display the (S,G) entries.

### ↘ Verifying the Rate Limit for the DR at the Data Source End to Transmit Register Packets

- Set the rate of transmitting Register packets for Router B and then run the **show ip pim sparse-mode track** command to check the number of transmitted Register packets for confirmation.

### ↘ Verifying the Checksum Length of Register Packets

- Set Router A to check a Register packet based on the entire packet rather than based only on the packet header and Register packet header. Run the **show running-config** command to check the configuration.

### ↘ Verifying the Source Address of Register Packets

- Configure the source address of Register packets on Router B and run the **show running-config** command to check the configuration on Router A.

### ↘ Verifying the Suppression Time and Probing Time of Register Packets

- Configure the suppression time and probing time of Register packets on Router B and run the **show running-config** command to check the configuration.

### ↘ Verifying the TTL of Register Packets Received by the RP from the (S,G) Multicast Group Address

- Configure the TTL of Register packets from the (S,G) multicast group address on Router A and run the **show ip pim sparse-mode mroute** command to display the maximum (S,G) TTL.

### ↘ Verifying the Static RP First

- Configure a static RP and a C-RP on Router A, configure the static RP first, and then run the **show ipv6 pim sparse-mode rp ff16::2** command to display information about the current RP.

## Related Commands

### ↳ Ignoring the C-RP Priority

<b>Command</b>	<b>ipv6 pim ignore-rp-set-priority</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ↳ Displaying Information About the RP That Serves a Group

<b>Command</b>	<b>show ipv6 pim sparse-mode rp-hash <i>group-address</i></b>
<b>Parameter Description</b>	<i>group-address</i> : Indicates the parsed group address.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	N/A

### ↳ Configuring the DR Directly Connected to the Data Source to Detect RP Reachability

<b>Command</b>	<b>ipv6 pim register-rp-reachability</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, the RP reachability is detected before Register packets are transmitted. If the RP is reachable, Register packets are transmitted. If the RP is unreachable, Register packets are not transmitted.

### ↳ Restricting the (S,G) Address Range of Register Packets at the Data Source End

<b>Command</b>	<b>ipv6 pim accept-register { list <i>ipv6_access-list</i> [route-map <i>map-name</i> ]   route-map <i>map-name</i> [list <i>ipv6_access-list</i> ] }</b>
<b>Parameter Description</b>	<b>list <i>ipv6_access-list</i></b> : References an IP extended ACL to restrict the (S,G) address range. The value range is 100-199, 2000-2699, and Word. <b>route-map <i>map-name</i></b> : Uses a route map to restrict the (S,G) address range.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, when receiving a Register packet from an unauthorized source, the RP immediately returns the Register-Stop packet.

### ↳ Displaying Multicast Routing Entries

<b>Command</b>	<b>show ipv6 pim sparse-mode mroute [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ]</b>
<b>Parameter Description</b>	<i>group-or-source-address</i> : Indicates the group address or source address. The two addresses cannot be group addresses or source addresses at the same time.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode

<b>Usage Guide</b>	A group address, a source address, or both addresses can be specified each time. You can also not specify a specific group address or source address but you cannot specify two group addresses or two source addresses at the same time.
--------------------	---

#### ▾ Configuring the Rate Limit for the DR to Transmit Register Packets

<b>Command</b>	<b>ipv6 pim register-rate-limit rate</b>
<b>Parameter Description</b>	<i>Rate</i> : Indicates the number of Register packets that are allowed to be transmitted per second. The value ranges from 1 to 65,535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the transmission rate of Register packets from the (S,G) multicast group address rather than the Register packets of the entire system. After this command is configured, the load of the source DR and RP will be relieved and Register packets whose rate does not exceed the limit will be transmitted.

#### ▾ Displaying the Statistics on PIM Packets

<b>Command</b>	<b>show ipv6 pim sparse-mode track</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, and interface configuration mode
<b>Usage Guide</b>	When the system is started, the statistics start time point is first set. Each time <b>clear ip pim sparse-mode track</b> is called, the statistics start time point is set again and the PIM packet counter is cleared.

#### ▾ Configuring the Checksum Calculation of a Register Packet Based on the Entire Packet

<b>Command</b>	<b>ipv6 pim register-checksum-wholepkt [ group-list ipv6_access-list ]</b>
<b>Parameter Description</b>	<b>group-list access-list</b> : Uses an ACL to restrict the group addresses that use this configuration. <i>access-list</i> : Supports digits <1,99> and <1300,1999>. A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The device calculates the checksum of a Register packet based on the entire PIM protocol packet including the encapsulated multicast data packet, rather than the PIM header of the Register packet. If <b>group-list ipv6_access-list</b> is not carried in this command, all group addresses apply this configuration.

#### ▾ Configuring the Source Address of Register Packets

<b>Command</b>	<b>ipv6 pim register-source { ipv6_local_address   interface-type interface-number }</b>
<b>Parameter Description</b>	<i>local_address</i> : Specifies an IPv6 address as the source address of Register packets. <i>interface-type interface-number</i> : Specifies the IPv6 address of an interface as the source address of Register packets.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The configured address must be reachable. When the RP receives a Register packet, it transmits the Register-Stop packet with the source IPv6 address of the Register packet as the destination address. PIM-SMv6 does not need to be enabled on associated interfaces.

#### ▾ Configuring the Suppression Time of Register Packets

<b>Command</b>	<b>ipv6 pim register-suppression</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the suppression time of Register packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>60</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configuring this value on the DR will change the suppression time of Register packets defined on the DR. If the <b>ipv6 pim rp-register-kat</b> command is not configured, configuring this value on the RP will change the keepalive time of the RP.

#### ▾ Configuring the Probing Time of Register Packets

<b>Command</b>	<b>ipv6 pim probe-interval</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the probing time of Register packets. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>5</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Probing time of Register packets is the interval for the source DR to transmit the NULL-Register packet to the RP prior to the timeout of the suppression time of Register packets.  The probing time of Register packets cannot be larger than half of the suppression time of Register packets. Otherwise, the configuration fails and a warning is displayed. In addition, the suppression time of Register packets multiplied by three plus the probing time of Register packets cannot be larger than 65,535. Otherwise, a warning will be displayed.

#### ▾ Configuring the KAT Interval on the RP

<b>Command</b>	<b>ipv6 pim rp-register-kat</b> <i>seconds</i>
<b>Parameter Description</b>	<i>Seconds</i> : Indicates the time of the KAT timer. The unit is seconds. The value ranges from 1 to 65,535 and the default value is <b>210</b> .
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Static RP First

<b>Command</b>	<b>ipv6 pim static-rp-preferred</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is configured, the priority of the static RP is higher than that of the RP elected by using the BSR mechanism.

### Configuration Example

#### ▾ Configuring Whether the C-RP Priority Is Considered for the Group-to-RP Mapping

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set the address to 3000::5 and priority to 200 for Interface Loopback0 on Router A. (Omitted)</li> </ul>
----------------------------	---

	<ul style="list-style-type: none"> <li>● Set the address to 4000: : 5 and priority to 56 for Interface Loopback1 on Router A. (Omitted)</li> <li>● Set the C-BSR address to 5000: : 5 on Router B. (Omitted)</li> <li>● Display the group corresponding to FF16::1.</li> <li>● Configure the ignorance of C-RP priority on Router B.</li> </ul>
	<pre>switch#configure terminal FS(config)# ipv6 pim ignore-rp-set-priority</pre>
<b>Verification</b>	Before the ignorance of the C-RP priority is configured, the following information is displayed:
	<pre>switch(config)#show ipv6 pim sparse-mode rp FF16::1 RP: 4000::5 Info source: 5000::5, via bootstrap PIMv2 Hash Value 126 RP 4000::5, via bootstrap, priority 56, hash value 892666309 RP 3000::5, via bootstrap, priority 200, hash value 1161101765</pre>
	After the ignorance of the C-RP priority is configured, the following information is displayed:
	<pre>switch(config)#show ipv6 pim sparse-mode rp FF16::1 RP: 3000::5 Info source: 5000::5, via bootstrap</pre>

📌 **Configuring the Reachability Detection of the RP Directly Connected to the Data Source**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Configure the reachability detection of the RP directly connected to the data source.</li> </ul>
	<pre>FS(config)#ipv6 pim register-rp-reachability</pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check the configuration. The following information is displayed:
	<pre>FS(config)#show running-config ! ! ! ipv6 pim register-rp-reachability ipv6 pim bsr-candidate Loopback 0 ! !</pre>

📌 **Restricting the (S,G) Address Range of Register Packets at the Data Source End**

<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Set Router A to filter packets by source address and receive packets only from the source address (1300::1/64).</li> </ul>
	<pre>switch(config)#ipv6 pim accept-register list acl % access-list 101 not exist switch(config)#ipv6 access-list acl switch(config-ipv6-acl)#permit ipv6 1300::1/64 any switch(config-ipv6-acl)#exit</pre>
<p><b>Verification</b></p>	<p>Before the (S,G) address range of Register packets at the data source end is restricted, run the <b>show ipv6 pim sparse-mode mroute</b> command to display multicast entries. The (S,G) entry and (S,G,RPT) entry exist.</p>
	<pre>switch#show ipv6 pim sparse-mode mroute  IPv6 Multicast Routing Table  (*,*,RP) Entries: 0 (*,G) Entries: 1 (S,G)Entries: 1 (S,G,rpt) Entries: 1 FCREntries:0 REG Entries: 0  (*, ff16::1) RP: 4000::5 RPF nbr::: RPF idx: None Upstream State: JOINED    00 01 02 03 04 05 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31  Local 0 . . . i . . . . . 1 . . . . . **Common Errors**

- The basic functions of PIM-SMv6 are not configured or fail to be configured.
- The (S,G) address range of Register packets at the data source end is not restricted or fails to be configured on a C-RP or static RP.
- When the (S,G) address range of Register packets at the data source end is restricted, the referenced ACL is not configured or the source/group address range allowed by the ACL is configured incorrectly.
- The source/group address ranges allowed by C-RPs or static RPs are inconsistent.

**20.4.5 Configuring the Transmission Interval of Join/Prune Packets**

**Configuration Effect**

- Change the transmission interval of Join/Prune packets to form an RPT or SPT.

**Notes**

- The basic functions of PIM-SMv6 must be configured.

**Configuration Steps**

- Configure the transmission interval of Join/Prune packets.

**Verification**

Set the transmission interval of Join/Prune packets to 120 seconds on Router B. Run the **show ipv6 pim sparse-mode mroute** command to check the entry TTL.

**Common Errors**

- The basic functions of PIM-SMv6 are not configured or fail to be configured.

**20.4.6 Configuring the Last-Hop Device to Switch from the RPT to the SPT**

**Configuration Effect**

- Switch the last-hop device from the RPT to the SPT.

**Notes**

- The basic functions of PIM-SMv6 must be configured.

**Configuration Steps**

- Configure the last-hop device to switch from the RPT to the SPT.

**Verification**

Configure basic functions of PIM-SMv6, make the DR at the data source end transmit data streams to Group FF16::1, and make the receiver forcibly join the Group FF16::1 to form a RPT. The DR at the receive end forcibly performs the switching from the RPT to SPT. Check the configuration on the RP.

## Related Commands

### ▾ Enabling the SPT Switching Function

<b>Command</b>	<code>ipv6 pim spt-threshold [group-list <i>ipv6_access-list</i> ]</code>
<b>Parameter Description</b>	<b>group-list</b> <i>ipv6_access-list</i> : References an IPv6 ACL to restrict the group address range that allows SPT switching. <i>ipv6_access-list</i> : A named ACL is supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If <b>group-list</b> <i>ipv6_access-list</i> parameter is not carried in this command, all multicast groups are allowed to conduct SPT switching.  If <b>no</b> is set in this command, <b>group-list</b> is carried, and the carried ACL is a configured ACL, the restriction of the ACL associated with <b>group-list</b> is cancelled and all groups are allowed to switch from the RPT to the SPT.

## Configuration Example

### ▾ Configuring the Last-Hop Device to Switch from the RPT to the SPT

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic functions of PIM-SMv6. (Omitted)</li> <li>● Make the DR at the data source end transmit code streams to Group FF16::1.</li> <li>● Make the DR at the receive end receive code streams from Group FF16::1.</li> <li>● Configure the last-hop device to switch from the RPT to the SPT on the DR at the receive end.</li> </ul>
	<code>switch(config)#ipv6 pim spt-threshold</code>
<b>Verification</b>	Run the <b>show running-config</b> command to check the configuration.
	<pre>switch(config)#show running-config ! ! ip pim jp-timer 120 ip pim spt-threshold ip pim rp-candidate Loopback 0 ! !</pre>

## 20.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears information about the dynamic RP.	<code>clear ipv6 pim sparse-mode bsr rp-set *</code>
Sets the packet statistics start time again and clears the PIMv6 packet counter.	<code>clear ipv6 pim sparse-mode track</code>

## Displaying

Description	Command
Displays details about the BSR.	<b>show ipv6 pim sparse-mode bsr-router</b>
Displays the PIM-SM information about an interface.	<b>show ipv6 pim sparse-mode interface</b> [ <i>interface-type interface-number</i> ] [ <b>detail</b> ]
Displays the local MLD information about a PIM-SMv6 interface.	<b>show ipv6 pim sparse-mode local-members</b> [ <i>interface-type interface-number</i> ]
Displays the PIM-SMv6 routing information.	<b>show ipv6 pim sparse-mode mroute</b> [ <i>group-or-source-address</i> [ <i>group-or-source-address</i> ] ]
Displays the PIM-SMv6 neighbor information.	<b>show ipv6 pim sparse-mode neighbor</b> [ <b>detail</b> ]
Displays next hop-relevant information, including the next-hop interface ID, address, and metric.	<b>show ipv6 pim sparse-mode nexthop</b>
Displays all RPs configured on the local device and the groups served by the RPs.	<b>show ipv6 pim sparse-mode rp mapping</b>
Displays information about the RP that serves the group address.	<b>show ipv6 pim sparse-mode rp-hash</b> <i>ipv6-group-address</i>
Displays the number of PIM packets transmitted and received from the statistics start time to the current time.	<b>show ipv6 pim sparse-mode track</b>

## 21 Configuring MSDP

### 21.1 Overview

Multicast Source Discovery Protocol is used to connect multiple rendezvous points (RPs) on the network and share the multicast source information among these RPs.

- Use MSDP among multiple Protocol Independent Multicast - Sparse-Mode (PIM-SM) domains to share the multicast source information of these PIM-SM domains to implement cross-domain multicast.
- Use MSDP in a PIM-SM domain to share the multicast source information of multiple RPs to implement anycast-RP.

#### Protocols and Standards

- RFC3618: Multicast Source Discovery Protocol(MSDP)

### 21.2 Applications

Application	Description
Cross-Domain Multicast	Connect multiple ASs, share the multicast resources among autonomous systems (ASs), and provide the multicast service across ASs.
Anycast-RP	Share the multicast source information among multiple RPs in a single AS.

### 21.2.1 Cross-Domain Multicast

#### Scenario

Connect multiple ASs, run PIM-SM within the ASs, and establish an MSDP peer relationship between RPs of different ASs.

As shown in Figure 8-1, DR 1 connected to the multicast source registers with RP 1 in the local domain. DR 2 connected to the group member host triggers a join towards RP 2 in the local domain. RP 1 uses the SA message to notify RP 2 of the multicast source information. RP 2 continues to trigger a join towards the multicast source to build a multicast distribution tree (MDT).

Cross-domain multicast allows group member hosts to apply for the multicast streams across ASs.

Figure 8-1

#### Deployment

- Run Open Shortest Path First (OSPF) within each AS, and run Border Gateway Protocol (BGP) between ASs to implement cross-domain unicast.
- Run PIM-SM within each AS, and run MSDP between ASs to implement cross-domain multicast.

### 21.2.2 Anycast-RP

#### Scenario

PIM-SM runs within each AS. Multiple RPs exist, use the same RP address, and serve the same group. An MSDP peer relationship is established between these RPs.

As shown in Figure 8-2, DR 1 connected to the multicast source registers with the nearest RP 1 in the local domain. DR 2 connected to the group member host triggers a join towards the nearest RP 2. RP 1 uses the SA message to notify RP 2 of the multicast source information. RP 2 continues to trigger a join towards the multicast source to build an MDT.

Anycast-RP provides redundancy and load balancing for RPs, and helps accelerate convergence of multicast routes.

Figure 8- 2

**Deployment**

- Run OSPF within each AS to implement intra-domain unicast.
- Run PIM-SM within each AS to implement intra-domain multicast.
- Run MSDP among RPs to share the multicast source information.

**21.3 Features**

Function	Description
Establishing an MSDP Peer Relationship	Connect multiple RPs to share the multicast source information.
Receiving and Forwarding SA Messages	Prevent SA flooding and suppress SA storms.

**21.3.1 Establishing an MSDP Peer Relationship**

**Working Principle**

Configure one or more pairs of MSDP peers on the network to connect RPs, thereby notifying other RPs of the multicast source information on an RP.

Use the TCP connection between MSDP peers through port 639. So far as the unicast route is reachable, the MSDP peer relationship can be established.

Figure 8- 3

➤ **RP Connected to the Multicast Source**

Configure the MSDP peer on the RP connected to the multicast source. Then, this RP can use SA messages to send the local multicast source information to other RPs.

As shown in Figure 8-3, DR 1 registers the multicast source information with RP 1. As a peer relationship is established between RP 1 and RP 2, RP 1 sends the multicast source information to X.

➤ **SA Message Forwarder**

Non-RPs can also act as MSDP peers, but only forwards SA messages.

As shown in Figure 8-3, X forwards SA messages sent from RP 1 to RP 2. In this way, the multicast source information is transferred to RP 2.

➤ **RP Connected to the Multicast Receiver**

Configure the MSDP peer on the RP connected to the multicast receiver. Then, this RP can trigger a join towards the multicast source based on the received SA message.

As shown in Figure 8-3, DR2 triggers a join towards RP2. As RP2 already obtains the multicast source information, RP2 continues to trigger a join towards the multicast source, thus establishing an MDT from DR1 to DR2.

**21.3.2 Receiving and Forwarding SA Messages**

**Working Principle**

An SA message contains the multicast source address, multicast group address, and RP address. The RP address is the IP address of the RP with which the multicast source is registered.

- The RP encapsulates the locally registered multicast source information in an SA message, sends the message to all its MSDP peers.

- On receiving the SA message, each MSDP peer performs the Peer-RPF check, compares the SA-Cache, and matches the SA message against the SA incoming and outgoing filtering rules. If the SA message passes the Peer-RPF check, does not exist in the SA SA-Cache, and meets the outgoing filtering rules, this SA message is forwarded to other MSDP peers.
- **i** The SA request and SA response messages are also used between MSDP peers to transfer source information of a specific group.

### ▾ Peer-RPF Check

Any SA message coming from an MSDP peer (address: N) will be checked as follows:

- **i** Judge whether the SA message passes the Peer-RPF check in the following sequence. Once the SA message passes the Peer-RPF check, accept the SA message; otherwise, drop the SA message.
45. If N is a member of the mesh group, the SA message passes the Peer-RPF check; otherwise, go to step 2.
  46. If N is the only active MSDP peer on the local device, the SA message passes the Peer-RPF check; otherwise, go to step 3.
  47. If N is the RP address in the SA message, the SA message passes the Peer-RPF check; otherwise, go to step 4.
  48. If an EBGp route to the RP address in the SA message exists on the local device, and the next hop of this route is N, the SA message passes the Peer-RPF check; otherwise, go to step 5.
  49. If an optimum route to the RP address in the SA message exists on the local device, check as follows:
    - If this optimum route is a distance vector route (such as the BGP/RIP route), and this router is advertised by N, the SA message passes the Peer-RPF check.
    - If this optimum route is a link status route (such as the OSPF/IS-IS route), and the next hop of this router is N, the SA message passes the Peer-RPF check.
    - Otherwise, go to step 6.
  50. If an optimum route to the RP address in the SA message exists on the local device, and this route is a MBGP/BGP route, extract the nearest AS of the AS-Path of this MBGP/BGP route. If the local device has multiple MSDP peers in this AS and N is the MSDP peer with the largest IP address, or N is the only MSDP peer in this AS, the SA message passes the Peer-RPF check; otherwise, go to step 7.
  51. If N is the default MSDP peer, the SA message passes the Peer-RPF check; otherwise, go to step 8.
  52. The SA message fails in the Peer-RPF check.

The Peer-RPF check helps prevent loops and SA flooding.

### ▾ Mesh Group

In a mesh group, an MSDP peer relationship is established on every two members.

- For SA messages coming from entities outside the mesh group, after passing the Peer-RPF check and SA-Cache comparison, these SA messages are forwarded to other members in the group.
- Intra-group SA messages are no longer forwarded to other members in the group.

The mesh group helps reduce the number of SA messages.

Figure 8-4

### SA Cache

The SA cache is used to buffer the SA message status. Expired SA messages will be deleted.

When an MSDP peer receives an SA message, if this message does not exist in the SA cache and passes the Peer-RPF check, the message is stored in the SA cache. If this message already exists in the SA cache, the message is ignored. This helps suppress the SA storms.

When an MSDP peer receives an SA message, if this message already exists in the SA cache, the message is immediately responded. This helps improve the protocol efficiency.

## 21.4 Configuration

Configuration Item	Description and Command
Configuring Cross-Domain Multicast	<p> This configuration is mandatory in the cross-domain multicast scenario.</p> <pre>ip msdp peer peer-address connect-source interface-type interface-number</pre> <p>Establishes an MSDP peer relationship.</p>
	<p> This configuration is mandatory in the Anycast-RP scenario.</p> <pre>ip msdp peer peer-address connect-source interface-type interface-number</pre> <p>Establishes an MSDP peer relationship.</p> <pre>ip msdp originator-id interface-type interface-number</pre> <p>Modifies the RP address in the SA message.</p>
Configuring the Peer-RPF Check Green Channel	<p> Optional. It is used to let SA message successfully pass the Peer-RPF check.</p> <pre>ip msdp default-peer peer-address [ prefix-list prefix-list-name ]</pre> <p>Configures the default MSDP peer.</p>
	<pre>ip msdp mesh-group mesh-name peer-address</pre> <p>Configures an MSDP mesh group.</p>
Enabling Security Measures	<p> Optional. It is used to prevent illegal TCP connections and suppress SA storms.</p>

Configuration Item	Description and Command	
	<b>ip msdp password peer</b> <i>peer-address</i> [ <i>encryption-type</i> ] <i>string</i>	Enables TCP MD5 encryption.
	<b>ip msdp sa-limit</b> <i>peer-address sa-limit</i>	Limits the number of SA messages in the SA cache.
Restricting Broadcasting of SA Messages	 Optional. It is used to restrict releasing, receiving, and forwarding of SA messages.	
	<b>ip msdp redistribute</b> [ <i>list access-list</i> ] [ <i>route-map route-map</i> ]	Filters the source information released locally.
	<b>ip msdp filter-sa-request</b> <i>peer-address</i> [ <i>list access-list</i> ]	Filters received SA requests.
	<b>ip msdp sa-filter in</b> <i>peer-address</i> [ <i>list access-list</i> ] [ <i>route-map route-map</i> ] [ <i>rp-list rp-access-list</i> ] [ <i>rp-route-map rp-route-map</i> ]	Filters received SA messages.
	<b>ip msdp sa-filter out</b> <i>peer-address</i> [ <i>list access-list</i> ] [ <i>route-map route-map</i> ] [ <i>rp-list rp-access-list</i> ] [ <i>rp-route-map rp-route-map</i> ]	Filters sent SA messages.
Managing MSDP Peers	 Optional. It is used to conveniently manage the MSDP peer relationship.	
	<b>ip msdp description</b> <i>peer-address text</i>	Adds a description to an MSDP peer.
	<b>ip msdp shutdown</b> <i>peer-address</i>	Shuts down an MSDP peer.
Modifying Protocol Parameters	 Optional. You are advised not to modify the default values of protocol parameters.	
	<b>ip msdp timer</b> <i>interval</i>	Modifies the TCP reconnection interval.
	<b>ip msdp ttl-threshold</b> <i>peer-address ttl-value</i>	Modify the TTL value of the multicast data packet carried in the SA message.

### 21.4.1 Configuring Cross-Domain Multicast

#### Configuration Effect

Establish the MSDP peer relationship between multiple ASs so that group member hosts can apply for the multicast streams across ASs.

#### Notes

- The inter-AC unicast route must be reachable.
- Run PIM-SM within each AS, and configure the BSR border.

#### Configuration Steps

##### ▾ Establishing an MSDP Peer Relationship

- Mandatory.
- Establish a peer relationship between RPs of the corresponding multicast PIM domain.
- Establish an MSDP peer relationship between EBGP devices of different ASs.

- Establish an MSDP peer relationship between the RP and the EBGp device in each AS.

<b>Command</b>	<b>ip msdp peer</b> <i>peer-address connect-source interface-type interface-number</i>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of a remote peer.
<b>Description</b>	<i>interface-type interface-number</i> : Indicates the local interface, which is used to establish a TCP connection with the remote peer.
<b>Defaults</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The peer relationship is a bidirectional relationship. Therefore, this command must be configured on both sides. The IP address and local interface of the MSDP peer must be the same as those of the EBGp peer.</p> <p>To ensure that SA messages can successfully pass the Peer-RPF check, you are advised to:</p> <ul style="list-style-type: none"> <li>● Configure a mesh group.</li> <li>● Configure the default MSDP peer.</li> </ul>

### Verification

Send a packet from a source (S) close to an RP to the group (G), and enable a host close to another RP to join G.

- Verify that the host can receive the (S, G) packet.
- Run the **show ip msdp summary** command on an RP in another AS to display the status of the MSDP peer.
- Run the **show ip msdp sa-cache** command on an RP in another AS to display the learned MSDP source information.

### ▾ Displaying the Learned MSDP Source Information

<b>Command</b>	<b>show ip msdp sa-cache</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If no address is specified, all the (S, G) information is displayed by default.</p> <p>If an address is specified, the device checks whether this address is a unicast or multicast address. If the address is a unicast address, this address is treated as the multicast source (S), and all (S, G) information in which the multicast source is S will be displayed. If the address is a multicast address, this address is treated as the multicast group (G), and all (S, G) information in which the multicast group is G will be displayed. If this address is neither a unicast or multicast address, no information is displayed.</p> <p>If two addresses are specified, one address is treated as the multicast source (S), and the other as the multicast group (G). If one address is the unicast address, and the other address is the multicast group address, no information is displayed.</p>

<b>D</b>	<pre>D#show ipmsdp summary  MsdpPeerStatusSummary  Peer Address  As   State  Uptime/Downtime  Reset-Count  SA-Count  Peer-Description 30.30.30.30   200  Up     00:01:420         1             1         No description  D# show ip msdp sa-cache  MSDP Source-Active Cache: 1 entries  (200.200.200.200,225.1.1.1),RP:10.10.10.10,(M)BGP/AS 100, 00:00:18/00:01:57, Peer 30.30.30.30  Learned from peer 30.30.30.30, RPF peer 30.30.30.30,  SAs received: 1, Encapsulated data received: 1</pre>

### Common Errors

- The BSR border is not configured, or is not configured on a correct interface.

- PIM-SM is not enabled on the local interface used to establish the MSDP peer connection or on the interface of the peer IP address.
- SA messages cannot pass the Peer-RPF check.

## 21.4.2 Configuring an Anycast-RP

### Configuration Effect

Establish the MSDP peer relationship within an AS to provide redundancy and load balancing for RPs.

### Notes

- The inter-AC unicast route must be reachable.
- PIM-SM must run within the AS, and multiple RPs using the same IP addresses must be configured.
- The C-RP and C-BSR cannot be configured on the same interface.

### Configuration Steps

#### ✚ Establishing an MSDP Peer Relationship

- Mandatory.
- Configure the following command on each RP of the same AS to establish an MSDP peer relationship with each of other RPs:

<b>Command</b>	<b>ip msdp peer</b> <i>peer-addressconnect-sourceinterface-typeinterface-number</i>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of a remote peer.
<b>Description</b>	<i>interface-type interface-number</i> : Indicates the local interface, which is used to establish a TCP connection with the remote peer.
<b>Defaults</b>	The MSDP peer relationship is not established.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The peer relationship is a bidirectional relationship. Therefore, this command must be configured on both sides. To ensure that SA messages can successfully pass the Peer-RPF check, you are advised to configure a mesh group.

#### ✚ Modifying the RP Address in the SA Message

- Mandatory.
- Configure the following command on each RP of the same AS:

<b>Command</b>	<b>ip msdp originator-id</b> <i>interface-type interface-number</i>
<b>Parameter</b>	<i>interface-type interface-number</i> : Uses the IP address of this interface as the RP address in the SA message.
<b>Description</b>	
<b>Defaults</b>	By default, the RP address in the SA message is not modified.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In the anycast-RP application scenario, the RP addresses on all RP devices are the same. If the RP address in an SA message is not modified, the RP device may determine that this SA message is sent by itself and therefore discards this message. Therefore, you need to configure different RP addresses for SA messages sent by different RP devices.

### Verification

Send a packet from a source (S) close to an RP to the group (G), and enable a host close to another RP to join G.

- Verify that the host can receive the (S, G) packet.
- Run the **show ip msdp sa-cache** command on an RP in another AS to display the learned MSDP source information.

#### 📌 Displaying the Learned MSDP Source Information

<b>Command</b>	<b>show ip msdp sa-cache</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If no address is specified, all the (S, G) information is displayed by default.</p> <p>If an address is specified, the device checks whether this address is a unicast or multicast address. If the address is a unicast address, this address is treated as the multicast source (S), and all (S, G) information in which the multicast source is S will be displayed. If the address is a multicast address, this address is treated as the multicast group (G), and all (S, G) information in which the multicast group is G will be displayed. If this address is neither a unicast nor multicast address, no information is displayed.</p> <p>If two addresses are specified, one address is treated as the multicast source (S), and the other as the multicast group (G). If one address is the unicast address, and the other address is the multicast group address, no information is displayed.</p>
	<pre>FS# show ip msdp sa-cache MSDP Source-Active Cache: 2 entries  (200.200.200.200, 227.1.2.2), RP: 20.20.20.20, (M)BGP/AS 100, 04:17:09/00:02:05, Peer 200.200.200.2   Learned from peer 200.200.200.2, RPF peer 200.200.200.2,   SAs received: 277, Encapsulated data received: 0  (200.200.200.200, 227.1.2.3), RP: 20.20.20.20, (M)BGP/AS 100, 04:17:09/00:02:05, Peer 200.200.200.2   Learned from peer 200.200.200.2, RPF peer 200.200.200.2,   SAs received: 277, Encapsulated data received: 0</pre>

#### Configuration Example

##### 📌 Sharing the Source information Among Anycast-RPs in the Same Multicast Domain

**Scenario**  
**Figure 8- 6**

The following table lists the interfaces and IP addresses of different devices:

Device	Interface	IP Address	Remark
A	G0/2	2.2.2.1/24	
	G0/1	1.1.1.1/24	
	Loopback0	100.100.100.100/32	The C-BSR is configured on this interface.
B	G0/2	2.2.2.2/24	
	G0/1	3.3.3.1/24	
	Loopback1	20.20.20.20/32	Used to establish an MSDP connection and modify the RP address in the SA message.
	Loopback0	10.10.10.10/32	The C-RP is configured on this interface.
C	G0/2	1.1.1.2/24	
	G0/1	4.4.4.1/24	
	Loopback1	30.30.30.30/32	Used to establish an MSDP connection and modify the RP address in the SA message.
	Loopback0	10.10.10.10/32	The C-RP is configured on this interface.
D	G0/1	4.4.4.2/24	
	G0/2	5.5.5.1/24	
E	G0/1	3.3.3.2/24	
	G0/2	6.6.6.1/24	

**Configuration Steps**

- Configure IP addresses of interfaces.
- Enable OSPF within the AS.
- Enable PIM-SM within the AS, and configure the C-BSR and C-RP.
- Establish the MSDP peer relationship between RPs, and modify the RP address in the SA message.
- Configure a mesh group.

**A**

```
A#configure terminal
A(config)#ip multicast-routing
A(config)#interface GigabitEthernet 0/1
A(config-if-GigabitEthernet 0/1)#ip pim sparse-mode
```

	<pre> A(config-if-GigabitEthernet 0/1)# exit A(config)#interface GigabitEthernet 0/2 A(config-if-GigabitEthernet 0/2)#ip pim sparse-mode A(config-if-GigabitEthernet 0/2)# exit A(config)#interface loopback 0 A(config-if-loopback 0)#ip pim sparse-mode A(config-if-loopback 0)# exit A(config)#ip pim bsr-candidate loopback0 </pre>
<b>B</b>	<pre> B#configure terminal B(config)#ip multicast-routing B(config)#interface GigabitEthernet 0/1 B(config-if-GigabitEthernet 0/1)#ip pim sparse-mode B(config-if-GigabitEthernet 0/1)# exit B(config)#interface GigabitEthernet0/2 B(config-if-GigabitEthernet 0/2)#ip pim sparse-mode B(config-if-GigabitEthernet 0/2)# exit B(config)#interface loopback 0 B(config-if-loopback 0)#ip pim sparse-mode B(config-if-loopback 0)# exit B(config)#interface loopback 1 B(config-if-loopback 1)#ip pim sparse-mode B(config-if-loopback 1)# exit B(config)#ip pim rp-candidate loopback 0 B(config)#ip msdp peer 30.30.30.30 connect-source loopback 1 B(config)# ip msdp originator-id loopback 1 B(config)#ip msdp mesh-group mesh-name 30.30.30.30 </pre>

Learned from peer 20.20.20.20, RPF peer 20.20.20.20,
```

### Common Errors

- The C-BSR and C-RP are configured on the same interface.
- The RP address in the SA message is not modified.
- SA messages cannot pass the Peer-RPF check.

### 21.4.3 Configuring the Peer-RPF Check Green Channel

#### Configuration Effect

Configure the Peer-RPF check green channel so that all SA messages sent from a specified MSDP peer can pass the Peer-RPF check.

Configure an MSDP mesh group so that all SA messages sent from members of the mesh group can pass the Peer-RPF check.

#### Notes

- The MSDP peer relationship must be established between devices.

#### Configuration Steps

##### ▾ Configuring the Default MSDP Peer

- Optional.
- On an MSDP peer, if it is not necessary to perform the Peer-RPF check on SA messages sent from a specified peer, configure this peer as the default peer.

<b>Command</b>	<code>ip msdp default-peer <i>peer-address</i> [ <b>prefix-list</b> <i>prefix-list-name</i> ]</code>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of a remote peer.
<b>Description</b>	<b>prefix-list</b> <i>prefix-list-name</i> : Specifies the prefix list, which is used to limit the RPs initiating SA messages.
<b>Defaults</b>	By default, no default peer is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If the command does not contain <b>prefix-list</b><i>prefix-list-name</i>, all SA messages are accepted.</p> <p>If the command contains <b>prefix-list</b><i>prefix-list-name</i> but the specified prefix list does not exist, all SA messages are accepted.</p> <p>If the command contains <b>prefix-list</b><i>prefix-list-name</i>, and the specified prefix list exists, only the SA messages initiated by RPs specified in this prefix list are accepted.</p>

##### ▾ Creating a Mesh Group

- Optional.

- Among multiple MSDP peers, if SA messages coming from any of these peers pass the Peer-RPF check by default, you can add these peers to a mesh group.

<b>Command</b>	<b>ip msdp mesh-group</b> <i>mesh-name</i> <i>peer-address</i>
<b>Parameter</b>	<i>mesh-name</i> : Indicates the name of the mesh group. The name is case sensitive.
<b>Description</b>	<i>peer-address</i> : Indicates the IP address of the MSDP peer to be added to the mesh group.
<b>Defaults</b>	By default, no mesh group is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	An MSDP peer relationship must be established between every two MSDP peers added to the same mesh group. All SA messages sent by members of the mesh group can pass the Peer-RPF check.

#### Verification

- Check whether SA messages sent by the default peer can pass the Peer-RPF check.
- Check the configuration of the mesh group, and check whether all SA messages sent by members of the mesh group can pass the Peer-RPF check.

#### 📄 Displaying Information about the Peer-RPF Check of a Specified MSDP Peer

<b>Command</b>	<b>show ip msdp rpf-peer</b> <i>ip-address</i>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of the SA message initiator.
<b>Description</b>	
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	N/A
	<pre> FS# show ip msdp rpf-peer 1.1.1.1 RPF peer information for 1.1.1.1 RPF peer: 200.200.200.2 RPF rule: <b>Peer is only active peer</b> RPF route/mask: Not-used RPF type: Not-used </pre>

#### 📄 Displaying the Mesh Group Configuration

<b>Command</b>	<b>show ip msdp mesh-group</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	N/A
	<pre> FS# show ip msdp mesh-group MSDP peers in each Mesh-group, &lt;Mesh-group name&gt;:&lt;# peers&gt; msdp-mesh: </pre>

	1.1.1.2
	1.1.1.3

**Configuration Example**

▾ **Configuring the Peer-RPF Check and a Mesh Group**

The following table lists the interfaces and IP addresses of different devices:

Device	Interface	IP Address	Remark
A	G0/1	20.0.0.3/24	
	Loopback0	10.1.1.1/24	
B	G0/1	20.0.0.4/24	
	Loopback0	40.0.0.1/24	
	G0/1	20.0.0.222/24	
	Loopback0	30.0.0.2/24	

**Configuration Steps**

- Configure IP addresses of interfaces.
- Enable OSPF within the AS.
- Establish the MSDP peer relationship between A and B and between A and C.
- Enable PIM-SM on the G0/1 interface of device C.
- Before configuration, there are two active MSDP peers on device A, but it is not known which one should be selected as the RPF peer. Therefore, display the RPF peer information. "RPF peer does not exist" is displayed.
- Configure the default MSDP peer, and check whether the configuration is successful.
- Configure a mesh group.

**A**

```
A#configure terminal
A(config)#ip msdp peer 20.0.0.4 connect-source gi0/1
A(config)#ip msdp peer 30.0.0.2 connect-source loopback 0
```

**B**

```
B#configure terminal
B(config)#ip msdp peer 20.0.0.3 connect-source gi0/1
```

**C**

```
C#configure terminal
```

	<pre>C(config)#ip msdp peer 10.0.0.1 connect-source loopback 0 C(config)#interface GigabitEthernet0/1 C(config-if-GigabitEthernet 0/1)#ip pim sparse-mode C(config-if-GigabitEthernet 0/1)# exit</pre>
	<ul style="list-style-type: none"> <li>● Before configuration, there are two active MSDP peers on device A, but it is not known which one should be selected as the RPF peer. Therefore, display the RPF peer information. "RPF peer does not exist" is displayed.</li> <li>● Configure the default MSDP peer. Then, display the RPF peer information. " Peer is best default peer" is displayed.</li> </ul>
A	<pre>A#configure terminal A(config)#ip msdp default-peer 30.0.0.2</pre> <ul style="list-style-type: none"> <li>● Cancel the default peer, and send the multicast source information to device C. Information is displayed on device A, indicating that the SA message is received, but does not pass the Peer-RPF check.</li> <li>● On device A, add 30.0.0.2 to the mesh group. Then, device A can receive the SA message normally.</li> </ul>
A	<pre>A#configure terminal A(config)#no ip msdp default-peer 30.0.0.2</pre>
A	<pre>A#configure terminal A(config)#ip msdp mesh-group first 30.0.0.2</pre>
Verification	N/A

#### 21.4.4 Enabling Security Measures

##### Configuration Effect

Enable MD5 encryption on TCP connections between MSDP peers to prevent illegal TCP connections.

Limit the number of SA messages in the SA cache of a specified MSDP peer to suppress SA storms.

##### Notes

- The MSDP peer relationship must be established between devices.

##### Configuration Steps

##### ▾ Configuring MD5 Encryption on TCP Connections Between MSDP Peers

- Optional.
- Configure consistent MD5 encryption on MSDP peers that require encryption.

<b>Command</b>	<b>ip msdp password peer <i>peer-address</i> [<i>encryption-type</i>] <i>string</i></b>
<b>Parameter Description</b>	<p><i>peer-address</i>: Indicates the IP address of a remote peer.</p> <p><i>encryption-type</i>: Indicates the encryption level. Currently, only levels 0 to 7 are supported. 0 is the lowest level, and 7 is the highest level. The default value is 0.</p> <p><i>string</i>: Indicates the cipher used for TCP MD5 authentication.</p>
<b>Defaults</b>	By default, MD5 encryption is not configured.
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>To authenticate the ID of an MSDP peer, enable MD5 encryption on the TCP connection established with this MSDP peer. The MSDP peer must have the consistent configuration, and the cipher must be the same; otherwise, the connection fails.</p> <p>If the configuration or cipher changes, the local device does not stop the current session, and will attempt to use a new cipher to retain the current session until timeout.</p> <p>If the encryption level is set to 7, the cipher text length must be an even number equaling to or greater than 4; otherwise, the configuration fails.</p>

### ▾ Limiting the Number of SA Messages in the SA Cache of a Specified MSDP Peer

- Optional.
- Perform this configuration if you need to limit the number of SA messages in the SA cache of a specified MSDP peer.

<b>Command</b>	<b>ip msdp sa-limit peer-address sa-limit</b>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of a remote peer.
<b>Description</b>	<i>sa-limit</i> : Indicates the maximum number of SA messages in the SA cache.
<b>Defaults</b>	The default value is 1,024.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	An MSDP peer relationship must be established between every two MSDP peers added to the same mesh group. Assume that the number of SA messages in the SA cache already exceeds the limit. After the configuration is completed, the number of SA messages in the SA cache does not exceed the limit.

### Verification

- Check the connection between peers on which MD5 encryption is configured.
- Send a number of source information packets that exceeds the limit to the peer where the maximum number of SA messages in the SA cache is configured. Check whether all the source information can be learned.

### ▾ Displaying the Number of SA Messages Learned from a Specified Peer

<b>Command</b>	<b>show ip msdp count</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	N/A
	<pre> FS# show ip msdp count SA State per Peer Counters, &lt;Peer&gt;: &lt;# SA learned&gt;   1.1.1.2          :0 100.100.100.14 :0 100.100.100.15 :0 100.100.100.200: 0 </pre>

<pre> 200.200.200.2 : 2 200.200.200.3 : 0 200.200.200.6 : 0 200.200.200.13 : 0 200.200.200.66 : 0 SA State per ASN Counters, &lt;asn&gt;: &lt;# sources&gt;/&lt;#groups&gt; Total entries: 2 100: 1/2                 </pre>
--

**Configuration Example**

▾ **Configuring MD5 Encryption on an MSDP Peer and Limiting the Number of SA Messages Sent by This MSDP Peer in the SA Cache**

<p><b>Scenario</b> Figure 8- 8</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Establish an MSDP peer relationship between A and B.</li> <li>● Configure MD5 encryption on device A.</li> <li>● After MSDP timeout, configure the MD5 cipher of the peer on device B, which is the same as the cipher on device A. Then, the session is reconnected.</li> <li>● On device A, set the maximum number of SA messages sent by the peer 20.0.0.4 in the SA cache to 10.</li> </ul>
<p><b>A</b></p>	<pre> A#configure A(config)# ip msdp password peer 20.0.0.4 0 1234567 A(config)# ip msdp sa-limit 20.0.0.4 10                 </pre>
<p><b>B</b></p>	<pre> B#configure B(config)# ip msdp password peer 20.0.0.4 0 1234567                 </pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● After MD5 is configured on device A, but is not configured on device B, a message will be displayed, indicating the MD5 encryption failure. At this time, the MSDP peer is in DOWN state.</li> <li>● A period of time after MD5 is configured on device B, the MSDP peer is in DOWN state.</li> <li>● Send 20 multicast source packets to device B. A message will be displayed on device A, indicating that the number of SA messages exceeds the limit.</li> </ul>
<p><b>A</b></p>	<pre> A# debug ip msdp sa-cache A# show ip msdp count                 </pre>

**21.4.5 Restricting Broadcasting of SA Messages**

**Configuration Effect**

Configure the SA message filtering rules to restricting broadcasting of SA messages.

#### Notes

- The MSDP peer relationship must be established between devices.

#### Configuration Steps

##### ↘ Filtering the Source Information Released Locally

- Optional.
- Configure the SA release filtering rule on an MSDP device where releasing of the SA information needs to be limited.

<b>Command</b>	<b>ip msdp redistribute [ list access-list ] [ route-map route-map ]</b>
<b>Parameter Description</b>	<b>list access-list:</b> Indicates the access control list (ACL) used to control the ranges of S and G. <b>route-map route-map:</b> Indicates the route map used to control the ranges of S and G.
<b>Defaults</b>	By default, no rule is configured to filter locally released SA information.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>After this command is configured, only the accepted (S, G) information (either coming from the local domain or other domains) can be injected to the MSDP.</p> <p>If the command contains <b>list access-list</b>, only the (S, G) information matching this ACL can be released.</p> <p>If the command contains <b>route-map route-map</b>, only the (S, G) information matching this route map can be released.</p> <p>If the command contains both parameters, only the (S, G) information matching the ACL and route map can be released.</p> <p>If the command does not contain any parameter, no (S, G) information is released.</p>

##### ↘ Filtering Received SA Requests

- Optional.
- Perform this configuration on the MSDP device where responding to the SA requests needs to be limited.

<b>Command</b>	<b>ip msdp filter-sa-request peer-address [ list access-list ]</b>
<b>Parameter Description</b>	<b>peer-address:</b> Indicates the IP address of a remote peer. <b>list access-list:</b> Indicates the ACL used to control the range of the group address.
<b>Defaults</b>	By default, no rule is configured to filter received SA requests.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Use this command if you need to control the SA requests that can be accepted and responded.</p> <p>If the command does not contain <b>list access-list</b>, all SA requests will be ignored.</p> <p>If the command contains <b>list access-list</b>, but this AC does not exist, all SA requests will be ignored.</p> <p>If the command contains <b>list access-list</b>, and this AC exists, only the SA requests allowed by the ACL will be accepted, and others are ignored.</p>

##### ↘ Filtering Received SA Messages

- Optional.

- Perform this configuration on an MSDP device where the incoming SA information needs to be limited.

<b>Command</b>	<b>ip msdp sa-filter in</b> <i>peer-address</i> [ <b>list</b> <i>access-list</i> ] [ <b>route-map</b> <i>route-map</i> ] [ <b>rp-list</b> <i>rp-access-list</i> ] [ <b>rp-route-map</b> <i>rp-route-map</i> ]
<b>Parameter Description</b>	<p><i>peer-address</i>: Indicates the IP address of a remote peer.</p> <p><b>list</b> <i>access-list</i>: Indicates the number or name of the extended IP ACL of a specified (S, G). It is used to control the multicast source information (S, G) that is allowed to pass.</p> <p><b>route-map</b> <i>route-map</i>: Indicates the name of the route map of the specified (S, G). The multicast source information (S, G) is allowed to pass only when the AS path of the route on the S matches the AS path in the route map.</p> <p><b>rp-list</b> <i>rp-access-list</i>: Indicates the number or name of the standard ACL of a specified RP. It is used to control the RPs, of which the multicast source information (S, G) that is allowed to pass.</p> <p><b>rp-route-map</b> <i>rp-route-map</i>: Indicates the name of the route map of a specified RP. The multicast source information (S, G) is allowed to pass only when the AS path of the route on the RP matches the AS path in the route map.</p>
<b>Defaults</b>	By default, no rule is configured to filter incoming SA messages.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If this command is configured, but no ACL or route map is specified, all incoming SA messages will be filtered. If only one keyword (<b>list</b> or <b>route-map</b>) is specified, and every multicast source record (S, G) in the SA message meets the rule specified by the keyword, the multicast source record (S, G) will be received.</p> <p>If either <b>rp-list</b> or <b>rp-route-map</b> is specified, and the RP address contained in the SA message meets the rule specified by this keyword, this SA message will be received.</p> <p>If two or more of the keywords (including <b>list</b>, <b>route-map</b>, <b>rp-list</b>, and <b>rp-route-map</b>) are specified, only multicast source record (S, G) in the SA message that meets the rules specified by all the available keywords can be received.</p>

### 📄 Filtering Sent SA Messages

- Optional.
- Perform this configuration on an MSDP device where the outgoing SA information needs to be limited.

<b>Command</b>	<b>ip msdp sa-filter out</b> <i>peer-address</i> [ <b>list</b> <i>access-list</i> ] [ <b>route-map</b> <i>route-map</i> ] [ <b>rp-list</b> <i>rp-access-list</i> ] [ <b>rp-route-map</b> <i>rp-route-map</i> ]
<b>Parameter Description</b>	<p><i>peer-address</i>: Indicates the IP address of a remote peer.</p> <p><b>list</b> <i>access-list</i>: Indicates the number or name of the extended IP ACL of the specified (S, G). It is used to control the multicast source information (S, G) that is allowed to pass.</p> <p><b>route-map</b> <i>route-map</i>: Indicates the name of the route map of the specified (S, G). The multicast source information (S, G) is allowed to pass only when the AS path of the route on the S matches the AS path in the route map.</p> <p><b>rp-list</b> <i>rp-access-list</i>: Indicates the number or name of the standard ACL of a specified RP. It is used to control the RPs, of which the multicast source information (S, G) that is allowed to pass.</p> <p><b>rp-route-map</b> <i>rp-route-map</i>: Indicates the name of the route map of a specified RP. The multicast source information (S, G) is allowed to pass only when the AS path of the route on the RP matches the AS path in the route map.</p>
<b>Defaults</b>	By default, no rule is configured to filter outgoing SA messages.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If this command is configured, but no ACL or route map is specified, no SA message will be sent to this MSDP peer.</p> <p>If only one of the keywords (including <b>list</b>, <b>route-map</b>, <b>rp-list</b>, and <b>rp-route-map</b>) is specified, any multicast source record (S, G) that meets the rule specified by the keyword will be forwarded to this MSDP peer.</p>

	If two or more of the keywords (including <b>list</b> , <b>route-map</b> , <b>rp-list</b> , and <b>rp-route-map</b> ) is specified, any multicast source record (S, G) that meets the rules specified by all the available keywords will be forwarded to this MSDP peer.
--	--

**Verification**

- Check whether SA messages initiated by the local device meet the filtering rules.
- Check whether SA messages learned by the local device meet the filtering rules.

▾ **Displaying SA Messages Initiated by the Local Device**

<b>Command</b>	<b>show ip msdp sa-originated</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the local device is the RP of PIM-SM, multicast source (S, G) information is registered on the RP, and the MSDP peer is configured on the local device, you can run this command to display the (S, G) information initiated by the local device.</p> <p>The (S, G) information displayed by this command has met the criteria specified by the redistribution command <b>ip msdp redistribute</b>, but such (S, G) information can be sent to the MSDP peer only when the information meets the outgoing SA information filtering rules specified by the <b>ip msdp sa-filter out</b> command.</p>
	<pre>FS# show ip msdp sa-originated MSDP Source-Active Originated: 5 entries (192.168.23.78, 225.0.0.1), RP: 192.168.23.249 (192.168.23.79, 225.0.0.2), RP: 192.168.23.249 (192.168.23.80, 225.0.0.3), RP: 192.168.23.249 (192.168.23.81, 225.0.0.4), RP: 192.168.23.249 (192.168.23.82, 225.0.0.5), RP: 192.168.23.249</pre>

**Configuration Example**

▾ **Configuring Rules for Filtering Incoming or Outgoing SA Messages**

	The following table lists the interfaces and IP addresses of different devices:			
	<b>Device</b>	<b>Interface</b>	<b>IP Address</b>	<b>Remark</b>
	A	G0/1	20.0.0.3/24	
		Loopback0	10.1.1.1/24	
	B	G0/1	20.0.0.4/24	
		Loopback0	40.0.0.1/24	
		G0/1	20.0.0.222/24	
		Loopback0	30.0.0.2/24	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Complete the basic configuration, as described in section 8.4.3 "Configuring the Peer-RPF Check Green Channel".</li> <li>● Configure rules for filtering incoming SA messages on device A.</li> <li>● Configure rules for filtering outgoing SA messages on device A.</li> <li>● Send the multicast source information to device C.</li> </ul>			
<b>A</b>	<pre> A#configure A(config)# ip msdp sa-filter in 30.0.0.2 A(config)# ip msdp sa-filter in 30.0.0.2 list 100 A(config)# ip access-list extended 100 A(config-ext-nacl)# permit ip host 20.0.0.100 host 225.0.0.1 A(config)# ip msdp sa-filter in 30.0.0.2 rp-list rp-acl-1 A(config)# ip access-list standard rp-acl-1 A(config-std-nacl) # permit host 20.0.0.221 A(config)# ip msdp sa-filter in 30.0.0.2 rp-route-map rp-rm-1 A(config)# route-map rp-rm-1 A(config-route-map)#match as-path 1 A(config)# ip as-path access-list 1 permit 2  A#configure A(config)# ip msdp sa-filter out 30.0.0.2 A(config)# ip msdp sa-filter out 30.0.0.2 list 101 A(config)# ip access-list extended 101 A(config-ext-nacl)# permit ip host 20.0.0.100 host 225.0.0.1 A(config)# ip msdp sa-filter out 30.0.0.2 rp-list rp-acl-2 A(config)# ip access-list standard rp-acl-2 A(config-std-nacl) # permit host 20.0.0.221 A(config)# ip msdp sa-filter out 30.0.0.2 rp-route-map rp-rm-2 A(config)# route-map rp-rm-1 A(config-route-map)#match as-path 1 A(config)# ip as-path access-list 1 permit 2 </pre>			

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Send the multicast source information to device C in various scenarios.</li> <li>● On device A, check whether the learned multicast source information meets the incoming requirements.</li> <li>● On device B, check whether the learned multicast source information meets the outgoing requirements.</li> </ul>
<b>A</b>	A#show ip msdp sa-cache
<b>B</b>	B#show ip msdp sa-cache
<b>C</b>	B#show ip msdp sa-originated

### 21.4.6 Managing MSDP Peers

#### Configuration Effect

Manage MSDP peers by adding descriptions to a specified MSDP or reset an MSDP peer.

#### Notes

- MSDP peers must be created in advance.

#### Configuration Steps

##### ✚ Configuring the Description for an MSDP Peer

- Optional.
- Perform this configuration on an MSDP peer that should be managed.

<b>Command</b>	<b>ip msdp description</b> <i>peer-address text</i>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of a remote peer.
<b>Description</b>	<i>text</i> : Indicates the string that describes the MSDP peer.
<b>Defaults</b>	By default, no description information is configured of an MSDP peer.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

##### ✚ Shutting Down an MSDP Peer

- Optional.
- Perform this configuration when it is required to temporarily shut down the connection with a specified peer.

<b>Command</b>	<b>ip msdp shutdown</b> <i>peer-address</i>
<b>Parameter</b>	<i>peer-address</i> : Indicates the IP address of an MSDP peer.
<b>Description</b>	
<b>Defaults</b>	By default, an MSDP peer is not shut down.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command shuts down only the TCP connection with an MSDP peer, but does not delete this MSDP peer or configuration of this MSDP peer.

#### Verification

- Display information about a specified MSDP peer, and check whether the description and peer status meet the requirements.

## ▾ Displaying Information about a Specified MSDP Peer

<b>Command</b>	<code>show ip msdp peer [ peer-address]</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	N/A
	<pre> FS#show ip msdp peer 20.0.0.1 MSDP PEER 20.0.0.1 (No description), AS unknown  Connection status:  State: Listen,Resets: 1,Connection source: GigabitEthernet0/1(20.0.0.2) Uptime(Downtime): 00:00:25, Message sent/received: 13/19  Input messages discarded: 0  Connection and counters cleared 00:13:25 ago  Local Address of connection: 20.0.0.2  MD5 signature protection on MSDP TCP connection: enabled  SA Filtering:  Input (S,G) Access-list filter: None Input (S,G) route-map filter: None Input RP Access-list filter: None Input RP Route-map filter: None Output (S,G) Access-list filter: None Output (S,G) Route-map filter: None Output RP Access-list filter: None Output RP Route-map filter: None  SA-Requests:  Input filter: None  Peerttlthreshold:0  SAs learned from this peer: 2, SAs limit: No-limit  Message counters:  SA messages discarded: 0 SA messages in/out: 13/0 SARequests discarded/in: 0/0 SA Responses out: 0 Data Packets in/out: 6/0 </pre>

**Configuration Example**

📌 **Configuring the Description of an MSDP Peer and Shutting Down the Connection with This Peer**

<p><b>Scenario</b> Figure 8- 10</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Establish the MSDP peer relationship between device A and device B.</li> <li>● Configure the description "peer-router-B" for the peer 20.0.0.4 on device A.</li> <li>● Wait 60, and shut down the connection with the MSDP peer 20.0.0.4 on device A.</li> </ul>
<p><b>A</b></p>	<pre>A#configure A(config)# ip msdp peer 20.0.0.4 connect-source gi0/1 A(config)# ip msdp description 20.0.0.4 peer-router-B A(config)# end A# show ip msdp peer 20.0.0.4 ..... A#configure A(config)# ip msdp shutdown 20.0.0.4 A(config)# show ip msdp peer 20.0.0.4</pre>
<p><b>B</b></p>	<pre>B# configure B(config)# ip msdp peer 20.0.0.3 connect-source gi0/1 B(config)# end</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Run the <b>show ip msdp peer [ peer-address ]</b> command to display the brief information of a specified peer, including the description and connection status of this MSDP peer.</li> </ul>
<p><b>A</b></p>	<pre>A# show ip msdp peer 20.0.0.4</pre>

**21.4.7 Modifying Protocol Parameters**

**Configuration Effect**

Manage MSDP peers by adding descriptions to a specified MSDP or reset an MSDP peer.

**Notes**

- MSDP peers must be created in advance.

**Configuration Steps**

📌 **Configuring the TCP Reconnection Interval of an MSDP Peer**

- Optional.
- Perform this configuration on the device where the TCP reconnection interval of an MSDP peer needs to be modified.

<b>Command</b>	<b>ip msdp timer <i>interval</i></b>
<b>Parameter Description</b>	<i>interval</i> : Indicates the TCP reconnection interval. The unit is second. The value ranges from 1 to 60. The default value is 30.
<b>Defaults</b>	By default, the reconnection interval is 30s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Within the TCP reconnection interval, the MSDP peer on the proactive connection side can initiate at most one TCP connection. In some application scenarios, you can shorten the TCP reconnection interval to accelerate convergence of the MSDP peer relationship.

### ✚ Configuring the TTL of the Multicast Packet Contained in the SA Message

- Optional.
- Perform this configuration on the MSDP device where inter-RP transfer of multicast packets should be restricted.

<b>Command</b>	<b>ip msdp ttl-threshold <i>peer-address</i> <i>ttl-value</i></b>
<b>Parameter Description</b>	<i>peer-address</i> : Indicates the IP address of an MSDP peer. <i>peer-address</i> <i>ttl-value</i> : Indicates the TTL value. The value ranges from 0 to 255. The default value is 0.
<b>Defaults</b>	By default, the TTL value of the multicast packet contained in the SA message is not restricted.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command restricts the sending of multicast packet encapsulated in the SA message. A multicast packet is sent to the MSDP peer only when the TTL value in the IP header of the multicast packet is equal to or greater than the preset TTL threshold. If the the TTL value in the IP header of the multicast packet is smaller than the preset TTL threshold, the multicast packet will be removed from the SA message and discarded before the SA message is sent to the MSDP peer.  This command affects the sending of multicast packet in the SA message, but does not affect the sending of the multicast source information (S, G) in the SA message.

### ✚ Configuring the MSDP Peer Capacity Supported by a Device

- Optional.
- If the default capacity (64 MSDP peers) is insufficient to support applications, you can modify the capacity on the device.

<b>Command</b>	<b>ip msdp peer-limit <i>peer-limit</i></b>
<b>Parameter Description</b>	<i>peer-limit</i> : Indicates the maximum number of MSDP peers that can be configured. The value ranges from 1 to 128. The default value is 64.
<b>Defaults</b>	By default, at most 64 peers can be configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the maximum number of MSDP peers supported by a device. When configuring this command, if the number of MSDP peers on the device exceeds the value to be configured, a prompt will be displayed, and the configuration fails. The configuration can succeed only after the extra number peers are deleted.

▾ **Configuring the SA Cache Capacity Supported by a Device**

- Optional.
- Perform this configuration on a device where the SA cache capacity should be adjusted.

<b>Command</b>	<code>ip msdp global-sa-limit sa-limit</code>
<b>Parameter</b>	<i>sa-limit</i> : Indicates the maximum capacity of the SA cache supported by the device. The value ranges from 1 to 4,096.
<b>Description</b>	The default value is 1,024.
<b>Defaults</b>	By default, the SA cache supports 1,024 SA messages.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to adjust the SA cache capacity of the device. You are advised to configure this command when the device is being started.</p> <p>If the capacity is increased when MSDP is in service, the adjustment does not affect the SA cache that is originally learned.</p> <p>If the capacity is increased when MSDP is in service, all SA caches that are originally learned from other devices or the SA caches initiated by the local devices must be deleted and re-learned.</p>

**Verification**

- Shut down the connection with an MSDP peer. After the reconnection interval elapses, check whether the MSDP peer is in UP date again.

**Configuration Example**

▾ **Setting the MSDP Peer Reconnection Interval to 20s**

<b>Scenario</b> Figure 8- 11	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Establish the MSDP peer relationship between device A and device B.</li> <li>● On device A, set the MSDP peer reconnection interval to 20s.</li> </ul>
<b>A</b>	<pre>A#configure A(config)# ip msdp peer 20.0.0.4 connect-source gi0/1 A(config)# ip msdp description 20.0.0.4 peer-router-B A(config)# end A# show ip msdp peer 20.0.0.4 ..... A#configure A(config)# ip msdp timer 20 A(config)# end</pre>
<b>B</b>	<pre>B# configure</pre>

	B(config)# ip msdp peer 20.0.0.3 connect-source gi0/1 B(config)# end
<b>Verification</b>	<ul style="list-style-type: none"> <li>● On device B, shut down and then immediately reconnect the connection with the MSDP peer.</li> <li>● Check whether the MSDP peer is in UP state within 20s.</li> </ul>
<b>A</b>	A#debug ip msdp timer
<b>B</b>	B# configure B(config)# show ip msdp peer 20.0.0.3

## 21.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Resets the TCP connection with a specified MSDP peer.	<b>clear ip msdp peer</b> <i>peer-address</i>
Clears the SA cache.	<b>clear ip msdp sa-cache</b> [ <i>group-address</i> ]
Clears the statistics of MSDP peers.	<b>clear ip msdp statistics</b> [ <i>peer-address</i> ]

### Displaying

Description	Command
Displays the number of sources and number of groups generated by SA messages.	<b>show ip msdp count</b> [ <i>as-number</i> ]
Displays information about a mesh group.	<b>show ip msdp mesh-group</b>
Displays detailed information about MSDP peers.	<b>show ip msdp peer</b> [ <i>peer-address</i> ]
Displays information about the MSDP RPF peer corresponding to the specified initiator address.	<b>show ip msdp rpf-peer</b> <i>ip-address</i>
Displays the learned (S, G) information.	<b>show ip msdpsa-cache</b> [ <i>group-address</i>   <i>source-address</i> ] [ <i>group-address</i> ] [ <i>source-address</i> ] [ <i>as-number</i> ]
Displays the (S, G) information initiated by the local device.	<b>show ip msdpsa-originated</b>
Displays brief information about all MSDP peers.	<b>show ip msdp summary</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
-------------	---------

Debugs MSDP peers.	<code>debug ip msdp peer</code>
--------------------	---------------------------------

## 22 Configuring IGMP Snooping

### 22.1 Overview

Internet Group Management Protocol (IGMP) snooping is a mechanism of listening to IP multicast. It is used to manage and control the forwarding of IP multicast traffic within VLANs, realizing Layer-2 multicasting.

As shown in the following figure, when a Layer-2 device is not running IGMP snooping, IP multicast packets are broadcasted within the VLAN; when the Layer-2 device is running IGMP snooping, IP multicast packets are transmitted only to profile members.

Figure 9-1 Networking Topology of IP Multicast Forwarding within the VLAN Before and After IGMP Snooping Is Run on the Layer-2 Device

#### Protocols and Standards

- RFC4541: Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches

### 22.2 Applications

Application	Description
Layer-2 Multicast Control	Enables precise forwarding of Layer-2 multicast packets to avoid flooding at this layer.
Shared Multicast Services (Multicast VLAN)	Multiple users can share the multicast traffic of the same VLAN.

Premium Channels and Preview	Controls the range of multicast addresses that allow user demanding and allows preview for profiles who are inhibited from demanding.
------------------------------	---

**22.2.1 Layer-2 Multicast Control**

**Scenario**

As shown in the following figure, multicast packets are transmitted to users through a Layer-2 switch. When Layer-2 multicast control is not performed, namely, when IGMP snooping is not implemented, multicast packets are flooded to all the users including those who are not expected to receive these packets. After IGMP snooping is implemented, the multicast packets from an IP multicast profile will no longer be broadcast within the VLAN but transmitted to designated receivers.

Figure 9- 2 Networking Topology of Implementing Layer-2 Multicast Control (Multicast VLAN)

**Deployment**

Configure basic IGMP snooping functions.

**22.2.2 Shared Multicast Services (Multicast VLAN)**

**Scenario**

In Shared VLAN Group Learning (SVGL) mode or IVGL-SVGL mode (IVGL: Independent VLAN Group Learning), a device running IGMP snooping can provide shared multicast services (or multicast VLAN services) to the VLAN users. Typically, this function is used to provide the same video-on-demand (VOD) services to multiple VLAN users.

The following figure shows the operation of a Layer-2 multicast device in SVGL mode of IGMP snooping. The multicast router sends a multicast packet to VLAN 1, and the Layer-2 multicast device automatically transfers the packet to VLAN 1, VLAN 2, and VLAN 3. In this way, the multicast services of VLAN 1 are shared by VLAN 2 and VLAN 3.

Figure 9- 3 Networking Topology of Shared Multicast Services (Multicast VLAN)

- i** If the Layer-2 multicast device operates in IVGL mode, the router must send a packet to each VLAN, which wastes bandwidth and burdens the Layer-2 multicast device.

### Deployment

- Configure basic IGMP snooping functions (in SVGL mode or IVGL-SVG mode).

### 22.2.3 Premium Channels and Preview

#### Scenario

In VOD application, by limiting the range of the multicast addresses that a user host can access, unpaid users will not be able to watch the premium channels. Thereafter, the preview service is offered to unpaid users before they decide whether to pay for it.

The users can preview a premium channel for a certain period of time (for example 1 minute) after demanding it.

#### Deployment

- Configure basic IGMP snooping functions (in any working mode).
- Configure the range of multicast addresses that a user can access.
- Enable the preview function for VOD profiles that are denied access.

## 22.3 Features

### Basic Concepts

#### 📌 Multicast Router Ports and Member Ports

- i** IGMP snooping is VLAN-based. The ports involved refer to the member ports within the VLAN.

The device running IGMP snooping identifies the ports within the VLAN as a multicast router port or member port so as to manage and control the forwarding of IP multicast traffic within the VLAN. As shown in the following figure, when IGMP snooping is run on a Layer-2 device, multicast traffic enters the multicast router port and exits from the member ports.

Figure 9- 4 Networking Topology of Two IGMP Snooping Ports

- **Multicast router port:** The location of the multicast source is directed by the port on the Layer-2 multicast device which is connected to the multicast router (Layer-3 multicast device): By listening to IGMP packets, the Layer-2 multicast device can automatically detect the multicast router port and maintain the port dynamically. It also allows users to configure a static router port.
- **Member port:** The port is on a Layer-2 multicast device and is connected to member hosts. It directs the profile members. It is also called the Listener Port. By listening to IGMP packets, the Layer-2 multicast device can automatically detect the member port and maintain the port dynamically. It also allows users to configure a static member port.

### ▾ IGMP Snooping Forwarding Entry

The device running IGMP snooping forwards IP multicast packets in accordance with the IGMP snooping forwarding entry.

An IGMP snooping forwarding entry includes the following items: source address (S), profile address (G), VLAN ID (VLAN\_ID), multicast router port, and member port. It indicates that packets of required features (including S, G, and VLAN\_ID) should enter the multicast router port and exit from a member port. An IGMP snooping forwarding entry is identified using a group of S, G, and VLAN\_ID.

To display the IGMP snooping forwarding entry, run the **show ip igmp snooping gda-table** command.

```
FS#showipigmpsnoopinggda-table
Multicast Switching Cache Table
D:DYNAMIC //Dynamic member port
S:STATIC //Static member port
M:MROUTE //Multicast router port (dynamic or static)
(*,233.3.6.29,1): //(S: any; G: 233.3.6.29; VLAN_ID: VLAN 1)
VLAN(1) 3 OPORTS:
GigabitEthernet 0/3(S)
GigabitEthernet 0/2(M)
GigabitEthernet 0/1(D)
(*,233.3.6.30,1): //S: any; G: 233.3.6.30; VLAN_ID: VLAN 1)
VLAN(1) 2 OPORTS:

GigabitEthernet 0/2(M)

GigabitEthernet 0/1(D)

## Overview

Feature	Description
Listening to IGMP Packets	Discovers and identifies the router port and member port to establish and maintain the IGMP snooping forwarding entries. :
IGMP Snooping Working Modes	Provides independent or shared multicast services to the user VLAN.
Multicast Security Control	Controls the multicast service scope and load to prevent illegal multicast traffic.
Profile	Defines the range of multicast addresses that permit or deny user requests for reference of other functions.
Handling QinQ	Sets the forwarding mode of multicast packets on the QinQ interface.
IGMP Querier	On a network without a Layer-3 multicast device, the Layer-2 multicast device acts as an IGMP querier.

### 22.3.1 Listening to IGMP Packets

A device running IGMP snooping analyzes IGMP packets received, and finds and identifies the router port and member port using these packets, thereby creating and maintaining an IGMP snooping entry.

#### Working Principle

A device running IGMP snooping can identify and handle the following types of IGMP packets:

#### Query Packets

-  An IGMP querier periodically sends General Query packets. When the IGMP querier receives Leave packets, it sends Group-Specific Query packets.

When the device running IGMP snooping receives the Query packets, it performs the following operations within the VLAN:

- Forward the IGMP Query packets to all the ports (except the receiving port of these packets).
- If the receiving port is a dynamic router port, reset the aging timer. If the timer expires, the port will no longer be used as the dynamic router port.
- If the receiving port is not a dynamic router port, use it as a dynamic router port and enable the aging timer. If the timer expires, the port will no longer be used as the dynamic router port.
- For general queries, reset the aging timer for all the dynamic member ports. If the timer expires, the port will no longer be used as the dynamic member port for the general group. By default, the maximum response time carried by the IGMP query packets is used as the timeout time of the aging timer. If **ip igmp snooping query-max-response-time** is run, the time displayed is used as the timeout time of the aging timer.
- For designated query packets, reset the aging timer for all the dynamic member ports of the designated profile. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile. By default, the maximum response time carried by the IGMP query packets is used as the timeout time of the aging timer. If **ip igmp snooping query-max-response-time** is run, the time displayed is used as the timeout time of the aging timer.

- If dynamic router port learning is disabled, IGMP snooping will not learn the dynamic router port.

#### ↘ Report Packets

 When a member host receives a query, it responds to the query with a Report packet. If a host requests to join a profile, it will also send a report.

 . For IGMPv3 Report packets, FS products only process group information contained in the packets .

When the device running IGMP snooping receives the Report packets, it performs the following operations within the VLAN:

- Forward the Report packets from all the router ports. After the **ip igmp snooping suppression enable** command is run in one IGMP query cycle, only the first report received by each profile will be forwarded.
- If the port on which Report packets are received is a dynamic member port, reset the aging timer. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile.
- If the port on which Report packets are received is not a dynamic member port, use it as a dynamic member port and enable the aging timer. If the timer expires, the port will no longer be used as the dynamic member port of the designated profile.

#### ↘ Leave Packets

 If a host requests to leave a profile, it will send a Leave packet.

When the device running IGMP snooping receives the Leave packets, it performs the following operations within the VLAN:

- Forward the leave packets from all the router ports.
- If the port on which leave packets are received is a dynamic member port and the Leave function is enabled, the port will be immediately deleted from the IGMP snooping forwarding entry of the designated profile and will no longer be used as the dynamic member port.
- If the port on which the leave packets are received is a dynamic member port and the Leave function is disabled, the port state should be maintained.

### Related Configuration

#### ↘ Configuring a Static Router Port

Run the **ip igmp snooping vlan mrouter interface** command to configure a static router port.

#### ↘ Configuring a Static Member Port

Run the **ip igmp snooping vlan static interface** command to configure a static member port.

#### ↘ Enabling ReportSuppression

Report suppression is disabled by default.

Run the **ip igmp snooping suppression enable** command to enable report suppression.

After report suppression is enabled, in one IGMP query cycle, only the first Report packet received by each profile will be forwarded.

The source media access control (MAC) address of the forwarded report will be changed to the MAC address of the device.

#### ↘ Enabling Immediate Leave

Immediate leave is disabled by default.

Run the **ip igmp snooping fast-leave enable** command to enable immediate leave.

### ▾ Enabling Dynamic Router Port Learning

Dynamic router port learning is enabled by default.

Run the **no ip igmp snooping mrouter learn pim-dvmrp** command to disable dynamic router port learning.

Run the **no ip igmp snooping vlan vid mrouter learn pim-dvmrp** command to disable dynamic router port learning for designated VLANs.

### ▾ Configuring the Aging Time of a Dynamic Router Port

The default aging time is 300s.

When a dynamic router port receives a query packet, the aging timer of the port is enabled or reset; if the aging time is not configured, the maximum response time carried by the query packet is used as the aging time.

Run **ip igmp snooping dyn-mr-aging-time** to configure the aging time of the dynamic router port.

### ▾ Configuring the Aging Time of a Dynamic Member Port

The default aging time is 260s.

When a dynamic member port receives a query packet, the aging timer of the port is enabled or reset, and the aging time is the maximum response time carried by the query packet.

When a dynamic member port receives a Report packet, the aging timer of the port is enabled or reset, and the aging time is the maximum response time of the dynamic member port.

Run **ip igmp snooping host-aging-time** to configure the aging time of the dynamic member port.

### ▾ Configuring the Maximum Response Time of a Query Packet

The maximum response time of a query packet is not configured by default and the maximum response time carries by the query packet is used.

Run **ip igmp snooping query-max-response-time** to configure the maximum response time of a query packet.

## 22.3.2 IGMP Snooping Working Modes

A device running in the three modes (IVGL, SVGL, and IVGL-SVGL) of IGMP snooping can provide independent multicast services or shared multicast services to the user VLAN.

### Working Principle

#### ▾ IVGL

In IVGL mode, a device running IGMP snooping can provide independent multicast services to each user VLAN.

Independent multicast services indicate that multicast traffic can be forwarded only within the VLAN it belongs to, and a user host can subscribe to the multicast traffic within the VLAN that the host belongs to.

#### ▾ SVGL

In SVGL mode, a device running IGMP snooping can provide shared multicast services to the user VLAN.

Shared multicast services can be provided only on shared VLANs and sub VLANs and SVGL multicast addresses are used. In a shared VLAN, the multicast traffic within the range of SVGL multicast addresses is forwarded to a sub VLAN, and the user hosts within the sub VLAN subscribe to such multicast traffic from the shared VLAN.

- In a shared VLAN and sub VLAN, shared multicast services will be provided to the multicast traffic within the range of SVGL multicast addresses. Other multicast traffic will be discarded.
- Other VLANs (except shared VLANs and sub VLANs) apply to independent multicast services.
-  When the user VLAN is set to a shared VLAN or sub VLAN, shared multicast services are provided; when a user VLAN is set to other VLANs, independent multicast services are provided.

#### ▾ IVGL-SVGL

IVGL-SVGL mode is also called the hybrid mode. In this mode, a device running IGMP snooping can provide both shared and independent multicast services to the user VLAN.

- In a shared VLAN and sub VLAN, multicast services will be provided to the multicast traffic within an SVGL profile. For other multicast traffic, independent multicast services will be provided.
- Other VLANs (except shared VLANs and sub VLANs) apply to independent multicast services.
-  When a user VLAN is configured as a shared VLAN or sub VLAN, both public multicast services and independent multicast services are available. When a user VLAN is configured as a VLAN other than shared VLAN and sub VLAN, only the independent multicast services are available.

#### Related Configuration

##### ▾ Enabling IGMP Snooping and Selecting a Working Mode

IGMP snooping is disabled by default.

Run the **ip igmp snooping ivgl** command to enable IGMP snooping in IVGL mode.

Run the **ip igmp snooping svgl** command to enable IGMP snooping in SVGL mode.

Run the **ip igmp snooping ivgl-svgl** command to enable IGMP snooping in IVGL-SVGL mode.

A working mode must be designated when enabling IGMP snooping, namely, one of the preceding working modes must be selected.

##### ▾ Configuring Shared VLAN

The shared VLAN is VLAN 1 by default.

Run the **ip igmp snooping svgl vlan** command to designate a VLAN as the shared VLAN.

In SVGL mode and IVGL-SVGL mode, only one VLAN can be configured as the shared VLAN.

##### ▾ Configuring Sub VLAN

By default, a sub VLAN is any VLAN except the shared VLAN.

Run the **ip igmp snooping svgl subvlan** command to designate a VLAN as the sub VLAN.

In SVGL mode and IVGL-SVGL mode, the number of sub VLANs is not limited.

##### ▾ Configuring an SVGL Profile

No default setting.

Run the **ip igmp snooping svgl profile *profile\_num*** command to configure the address range of an SVGL profile.

In SVGL mode and IVGL-SVGL mode, the SVGL profile range must be configured; otherwise, shared multicast services cannot be provided.

### 22.3.3 IGMP Security Control

A device running IGMP snooping can control the multicast service scope and load, and effectively prevents illegal multicast traffic.

#### Working Principle

##### ▾ Configuring the Profile Filtering for User Demanding

By configuring the profile list that a user can access, you can customize the multicast service scope to guarantee the interest of operators and prevent illegal multicast traffic.

To enable this function, you should use a profile to define the range of multicast addresses that a user is allowed to access.

- When the profile is applied on a VLAN, you can define the multicast addresses that a user is allowed to access within the VLAN.
- When the profile is applied on an interface, you can define the multicast addresses that a user is allowed to access under the port.

##### ▾ Multicast Preview

If the service provider wants to allow the users to preview some multicast video traffic that denies the users' access, and stop the multicast video traffic after the preview duration is reached, the user-based multicast preview function should be provided.

The multicast preview function is used together with multicast permission control. For example, in the application of videos, the administrator controls some premium channels by running the **ip igmp profile** command on a port or VLAN. In this way, unsubscribed users will not be able to watch these channels on demand. If users want to preview the channels before they decide whether to pay for watching or not, the multicast preview function can be enabled, allowing the premium channels to be previewed by unpaid users for a certain period of time (for example 1 minute).

##### ▾ Controlling the Maximum Number of Profiles Allowed for Concurrent Request

If there is too much multicast traffic requested at the same time, the device will be severely burdened. Configuring the maximum number of profiles allowed for concurrent request can guarantee the bandwidth.

- You can limit the number of profiles allowed for concurrent request globally.
- You can also limit the number of profiles allowed for concurrent request on a port.

##### ▾ Controlling the Entry of Multicast Traffic

By running the **ip igmp snooping source-check port** command to enable source port inspection, you can restrict the entry of multicast traffic to prevent illegal traffic.

- When source port inspection is enabled, only the multicast traffic entered from the router port is considered as legal; the traffic from other ports is considered as illegal and will be discarded.
- When source port inspection is disabled, the traffic entered from any port is considered as legal.

##### ▾ Configuring the Source IP Inspection for Multicast Traffic

By enabling source IP inspection, you can restrict the IP address of multicast traffic to prevent illegal traffic.

Source IP inspection includes the inspection of the source IP addresses of specific profiles and of default profiles.

- Inspection of the source IP addresses of default profiles (also called source-check default-server): Specifies the source IP addresses for all the multicast profiles within all VLANs. Only the multicast traffic whose source IP address is the same as the set one is considered as legal.

- Inspection of the source IP addresses of specific profiles (also called limit-ipmc): Specifies the source IP addresses for specific multicast profiles within specific VLANs. Among the multicast traffic received from the specific multicast profiles within the VLANs, only the one with the same source IP address as the set one is considered as legal and will be forwarded by the multicast device; other traffic will be discarded.

## Related Configuration

### ↘ Configuring the Profile Filtering

By default, profiles are not filtered and allow user access.

To filter multicast profiles, run the **ip igmp snooping filter** command in interface configuration mode or global configuration mode.

### ↘ Enabling Preview

Preview is not enabled by default.

Run the **ip igmp snooping preview** command to enable preview and restrict the range of the profiles permitted for multicast preview.

Run the **ip igmp snooping preview interval** to set the multicast preview duration.

### ↘ Configuring the Maximum Number of Profiles Allowed for Concurrent Request on a Port

By default, the number of profiles allowed for concurrent request is not limited.

Run the **ip igmp snooping max-groups** command to configure the maximum number of profiles allowed for concurrent request.

### ↘ Configuring the Maximum Number of Multicast Profiles Allowed Globally

By default, the maximum number of multicast profiles allowed globally is 65,536.

Run the **ip igmp snooping l2-entry-limit** command to configure the maximum number of multicast profiles allowed globally.

### ↘ Enabling Source Port Inspection

By default, source port inspection is not configured.

Run the **ip igmp snooping source-check port** command to enable source port inspection.

### ↘ Enabling Source IP Inspection

By default, source IP inspection is disabled.

- Run the **ip igmp snooping source-check default-server address** command to enable source IP inspection and specify the default source IP address (applicable to any profile of any VLAN).
- (Optional) Run the **ip igmp snooping limit-ipmc vlan vid address group-address server source-address** command to specify a specific source IP address for a specific profile of specific VLAN (applicable to a specific profile of specific VLAN).

First, you must enable source IP inspection to specify default source address, and then a specific source address can be specified for a specific profile of specific VLAN. If a source address is specified for a specific profile of specific VLAN, the multicast traffic of the specific profile will perform inspection for the source address specified by this command. Other multicast traffic will perform inspection for default source addresses.

### 22.3.4 IGMP Profile

A multicast profile is used to define the range of multicast addresses that permit or deny user demanding request for reference of other functions.

#### Working Principle

The profile is used to define the range of multicast addresses.

When SVGL mode is enabled, an SVGL profile is used to define the range of SVGL multicast addresses.

When the multicast filter is configured on an interface, a profile is used to define the range of multicast addresses that permit or deny user request under the interface.

When a VLAN filter is configured, a profile is used to define the range of multicast addresses that permit or deny user request under within the VLAN.

When the preview function is enabled, a profile is used to define the range of multicast address allowed for preview.

#### Related Configuration

##### 📄 Configuring a Profile

Default configuration:

- Create a profile, which is **deny** by default.

Configuration steps:

- Run the **ip igmp profile *profile-number*** command to create a profile.
- Run the **range *low-address high\_address*** command to define the range of multicast addresses. Multiple address ranges are configured for each profile.
- (Optional) Run the **permit** or **deny** command to permit or deny user request (**deny** by default). Only one **permit** or **deny** command can be configured for each profile.

### 22.3.5 IGMP QinQ

#### Working Principle

On a device with IGMP snooping enabled and dot1q-tunnel (QinQ) port configured, IGMP snooping will handle the IGMP packets received by the QinQ port using the following two approaches:

- Approach 1: Create a multicast entry on the VLAN where IGMP packets are located. The forwarding of IGMP packets on the VLAN where these packets are located is called transparent transmission. For example, presume that IGMP snooping is enabled for a device, Port A is designated as the QinQ port, the default VLAN of this port is VLAN 1, and it allows the passage of VLAN 1 and VLAN 10 packets. When a multicast Query packet is sent by VLAN 10 to Port A, IGMP snooping establishes a multicast entry for VLAN 10 and forwards the multicast Query packet to the router port of VLAN 10.
- Approach 2: Create a multicast entry on the default VLAN of the QinQ port. Encapsulate the multicast packet with the VLAN tag of the default VLAN where the QinQ port is located and forward the packet within the default VLAN. For example, presume that IGMP snooping is enabled for a device, Port A is designated as the QinQ port, the default VLAN of this port is VLAN 1, and it allows the passage of VLAN 1 and VLAN 10 packets. When a multicast Query packet is sent by VLAN 10 to Port A, IGMP snooping establishes a multicast entry for VLAN 1, encapsulates the multicast query packet with the tag of VLAN 1, and forward the packet to VLAN 1 router port.

## Related Configuration

### ▾ Configuring QinQ

By default, IGMP snooping works in the mode specified in Approach 2.

Run the `ipigmp snooping tunnel` command to implement Approach 1.

### 22.3.6 IGMP Querier

On a network with a Layer-3 multicast device, the Layer-3 multicast device acts as an IGMP querier. In this case, a Layer-2 device needs only to listen to IGMP packets to establish and maintain the forwarding entry, realizing Layer-2 multicast.

On a network without a Layer-3 multicast device, the Layer-2 multicast device must be configured with the IGMP querier function so that the device can listen to IGMP packets. In this case, a Layer-2 device needs to act as an IGMP querier as well as listen to IGMP packets to establish and maintain the forwarding entry to realize Layer-2 multicast.

#### Working Principle

A Layer-2 device acts as an IGMP querier to periodically send IGMP Query packets, listen to and maintain the IGMP Report packets replied by a user, and create a Layer-2 multicast forwarding entry. You can adjust relevant parameters of the Query packets sent by the IGMP querier through configuration.

When the device receives a Protocol-Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP) packet, it considers that a multicast router, which will act as an IGMP querier, exists on the network and disables the querier function. In this way, IGMP routing will not be affected.

When the device receives the IGMP Query packets from other devices, it will compete with other devices for the IGMP querier.

#### ▾ Enabling the Querier Function

You can enable the querier for a specific VLAN or all VLANs.

Only when the global querier function is enabled can the queriers for specific VLANs take effect.

#### ▾ Specifying the IGMP Version for a Querier

The version of IGMP used for sending Query packets can be configured as IGMPv1 or IGMPv2.

#### ▾ Configuring the Source IP Address of a Querier

You can configure the source IP address of a query packets sent by the querier based on VLANs.

When the source IP address of the querier is not configured, the querier will not take effect.

#### ▾ Configuring the Query Interval of a Querier

You can configure the intervals for sending global Query packets based on different queriers on different VLANs.

#### ▾ Configuring the Maximum Response Time of a Query Packet

You can configure the maximum response time carried by a Query packet that is sent by a querier. As IGMPv1 does not support the carrying of maximum response time by a Query packet, this configuration does not take effect when the querier is running IGMPv1.

You can configure different maximum response time for queriers on different VLANs.

#### ▾ Configuring the Aging Time of a Querier

When other IGMP queriers exist on a network, the existing device will compete with other queriers. If the existing device fails to be elected and is in the non-querier state, the aging timer of a querier will be enabled. After the timer expires, other queriers on the network are considered as expired and the existing device will be resumed as the querier.

## Related Configuration

### ▾ Enabling the Querier Function

By default, the querier function of a device is disabled.

Run the **ip igmp snooping querier** command to enable the global querier function.

Run the **ip igmp snooping vlan num querier** command to enable the querier function for specific VLANs.

### ▾ Specifying the IGMP Version for a Querier

By default, a querier runs IGMPv2.

Run the **ip igmp snooping querier version** command to configure the global querier version.

Run the **ip igmp snooping vlan querier version** command to specify the querier version for specific VLANs.

### ▾ Configuring the Source IP Address of a Querier

By default, the source IP address of a querier is 0.

Run the **ip igmp snooping querier address** command to enable global source IP addresses of queriers.

Run the **ip igmp snooping vlan querier address** command to specify the source IP addresses of the queriers on specific VLANs.

### ▾ Configuring the Query Interval of a Querier

By default, the query interval of a querier is 60s.

Run the **ip igmp snooping querier query-interval** command to enable the global query interval of queriers.

Run **ip igmp snooping vlan querier query-interval** to specify the global query interval of the queriers on specific VLANs.

### ▾ Configuring the Maximum Response Time of a Query Packet

By default, the maximum response time of a query packet is 10s.

Run the **ip igmp snooping querier max-response-time** command to configure the maximum response time of the query packets sent by global queriers.

Run the **ip igmp snooping vlan querier max-response-time** command to specify the maximum response time of the query packets sent by the queriers on specific VLANs.

### ▾ Configuring the Aging Time of a Querier

By default, the aging time of a querier is 125s.

Run the **ip igmp snooping querier max-response-time** command to configure the aging time of global queriers.

Run the **ip igmp snooping vlan querier max-response-time** command to configure the aging time of queriers on specific VLANs.

## 22.4 Configuration

Configuration			Description and Command	
Configuring Basic IGMP Snooping Functions (IVGL Mode)			Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in IVGL mode.	
			<b>ip igmp snooping ivgl</b>	Enables global IGMP snooping in IVGL mode.
			<b>no ip igmp snooping vlan num</b>	Disables IGMP snooping for a VLAN.
Configuring Basic IGMP Snooping Functions (SVGL Mode)			Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in SVGL mode.	
			<b>ip igmp snooping svgl</b>	Enables global IGMP snooping in IVGL mode.
			<b>no ip igmp snooping vlan num</b>	Disables IGMP snooping for a VLAN.
			<b>ip igmp snooping svgl profile profile_num</b>	Configures the SVGL profile.
			<b>ip igmp snooping svgl vlan</b>	Specifies the SVGL shared VLAN.
Configuring Basic IGMP Snooping Functions (IVGL-SVGL Mode)			Any of IVGL mode, SVGL mode, and IVGL-SVGL mode must be selected. It is used to enable IGMP snooping in IVGL-SVGL mode.	
			<b>ip igmp snooping ivgl-svgl</b>	Enables global IGMP snooping in IVGL-SVGL mode.
			<b>no ip igmp snooping vlan num</b>	Disables IGMP snooping for a VLAN.
			<b>ip igmp snooping svgl profile profile_num</b>	Configures the SVGL profile.
			<b>ip igmp snooping svgl vlan</b>	Specifies the SVGL shared VLAN.
Configuring the Packet Processing			(Optional) It is used to adjust relevant configurations for processing protocol packets.	
			<b>ip igmp snooping vlan vlan-id mrouter interface interface-id</b>	Configures a static router port.
			<b>p igmp snooping vlan vid static group-address interface interface-type interface-number</b>	Configures a static member port.
			<b>ip igmp snooping vlan vlan-id mrouter learn pim-dvmrp</b>	Enables dynamic router port learning.
			<b>ip igmp snooping dyn-mr-aging-time time</b>	Configures the aging time of a dynamic router port.
			<b>ip igmp snooping host-aging-time time</b>	Configures the aging time of a dynamic member port.
			<b>ip igmp snooping fast-leave enable</b>	Enables the immediate-leave function for a dynamic member port.
			<b>ip igmp snooping query-max-response-time time</b>	Configures the maximum response time of an IGMP query packet.
			<b>ip igmp snooping suppression enable</b>	Enables IGMP Report packet suppression.
			Configuring IGMP Security Control	
<b>ip igmp snooping filter profile-number</b>	Configures the profile filtering for user access.			
<b>ip igmp snooping vlan num filter profile-number</b>	Configures the per-VLAN profile filtering for			

		user access.
	<b>ip igmp snooping l2-entry-limit</b> <i>number</i>	Configures the maximum number of profiles globally for user access.
	<b>ip igmp snooping max-groups</b> <i>number</i>	Configures the maximum number of dynamic profiles for user access.
	<b>ip igmp snooping source-check port</b>	Enables source IP inspection, which ensures the multicast traffic from the router port is legal.
	<b>ip igmp snooping source-check default-server</b> <i>address</i>	Enables source IP inspection. The multicast traffic whose source IP address matches the specified source IP address is considered as legal traffic.
	<b>ip igmp snooping limit-ipmc vlan</b> <i>vid address</i> <i>group-address server source-address</i>	Specifies a VLAN. In the multicast traffic of multicast addresses, the one whose source IP address matches the specified source IP address is considered as legal traffic.
	<b>ip igmp snooping preview</b> <i>profile-number</i>	Enables the preview function for a specified profile.
	<b>ip igmp snooping preview interval</b> <i>num</i>	Configures the preview duration.
Configuring an IGMP Profile	 (Optional) It is used to define the range of multicast addresses that permits or denies the access of a user host.	
	<b>ip igmp profile</b> <i>profile-number</i>	Creates a profile.
	<b>range</b> <i>low-address high_address</i>	Configures the profile range.
	<b>permit</b>	Permits the access of a user host.
Configuring IGMP QinQ	 (Optional) It is used to configure QinQ interface to forward multicast packets using the VLAN identifier (VID) carried by packets.	
	<b>ip igmp snooping tunnel</b>	Configures QinQ to transmit IGMP packets transparently.
Configuring an IGMP Querier	 (Optional) It is used to enable IGMP querier function on a network without a Layer-3 multicast device.	
	<b>ip igmp snooping querier</b>	Enables global querier function.
	<b>ip igmp snooping vlan</b> <i>num querier</i>	Enables the querier for a VLAN.
	<b>ip igmp snooping querier version</b> <i>num</i>	Specifies the IGMP version for queriers globally.
	<b>ip igmp snooping vlan</b> <i>num querier version num</i>	Specifies the IGMP version for a querier of a VLAN.
	<b>ip igmp snooping querier address</b> <i>a.b.c.d</i>	Configures the source IP address of queriers globally.
	<b>ip igmp snooping vlan</b> <i>num querier address</i> <i>a.b.c.d</i>	Configures the source IP address for a querier of a VLAN.
<b>ip igmp snooping querier query-interval</b> <i>num</i>	Configures the query interval of queriers	

		globally.
<b>ip igmp snooping vlan num querier query-interval num</b>		Configures the query interval for a querier of a VLAN.
<b>ip igmp snooping querier max-response-time num</b>		Configures the maximum response time for query packets globally.
<b>ip igmp snooping vlan num querier max-response-time num</b>		Configures the maximum response time of query packets for a VLAN.
<b>ip igmp snooping querier timer expiry num</b>		Configures the aging timer for queriers globally.
<b>ip igmp snooping vlan num querier timer expiry num</b>		Configures the aging timer for a querier of a VLAN.

### 22.4.1 Configuring Basic IGMP Snooping Functions (IVGL Mode)

#### Configuration Effect

- Enable IGMP snooping to realize Layer-2 multicast.
- Provide independent multicast services to each VLAN.

#### Notes

- IP multicast cannot be realized in SVGL mode. If IP multicast must be used, select the IVGL mode.

#### Configuration Steps

##### ✚ Enabling Global IGMP Snooping in IVGL Mode

Mandatory.

After IGMP snooping is enabled globally, this function will be enabled for all VLANs.

If not specified, it is advised to run global IGMP snooping on all the devices connected user hosts.

##### ✚ Disabling IGMP Snooping for a VLAN

(Optional) You can use this function if you wish to disable IGMP snooping on specified VLANs.

Only when global IGMP snooping is enabled can it be disabled on specified VLANs.

In IVGL mode, each VLAN can enjoy independent multicast services. Disabling any VLAN multicast services will not interfere in the services provided to the others.

#### Verification

- Run the **show ip igmp snooping gda-table** command to display the IGMP snooping forwarding table and verify that the member ports include only those connecting member hosts.
- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in IVGL mode.

#### Related Commands

##### ✚ Enabling Global IGMP Snooping in IVGL Mode

<b>Command</b>	<b>ip igmp snooping ivgl</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this command is executed, IGMP snooping will be run on all VLANs. By default, IGMP snooping is disabled.

#### ↘ Disabling IGMP Snooping for a VLAN

<b>Command</b>	<b>no ip igmp snooping vlan <i>num</i></b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Only when global IGMP snooping is enabled can it be disabled on specified VLANs. In IVGL mode, you can disable IGMP snooping on any VLAN.

#### ↘ Displaying the IGMP Snooping Entry

<b>Command</b>	<b>show ip igmp snooping gda-table</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	This command is used to verify that the ports include only those connecting member hosts.

#### ↘ Displaying the IGMP Snooping Working Mode

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If a device is running in IVGL mode, the following information is displayed: <pre>IGMP Snooping running mode: IVGL</pre>

### Configuration Example

#### ↘ Providing Layer-2 Multicast Services for the Subnet Hosts

<p><b>Scenario</b> <b>Figure 9- 5</b></p>	
	<p>A is the multicast router and is connected directly to the multicast source. B is the Layer-2 device and is connected directly to the user host. Receiver 1, Receiver 2, and Receiver 3 belong to VLAN 1.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN.</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# ip igmp snooping ivgl</pre>
<p><b>Verification</b></p>	<p>Send packets from the source (10.1.1.1) to G (229.1.1.1) to add Receiver 1 to G.</p> <ul style="list-style-type: none"> <li>● Confirm that the packets (10.1.1.1 and 229.1.1.1) are received by Receiver 1.</li> <li>● Display the IGMP snooping forwarding entry on B and ensure that the port (10.1.1.1, 229.1.1.1, 1) includes only Fa0/2.</li> <li>● Check whether the IGMP snooping working mode is IVGL.</li> </ul>
<p><b>B</b></p>	<pre>B# show ip igmp snooping gda-table  Multicast Switching Cache Table</pre>

### Common Errors

- The working mode of IGMP snooping is improper.

### 22.4.2 Configuring Basic IGMP Snooping Functions (SVGL Mode)

#### Configuration Effect

- Enable IGMP snooping and select SVGL mode to realize Layer-2 multicast.
- Share the VLAN multicast services.

## Configuration Steps

### ✚ Enabling Global IGMP Snooping in SVGL Mode

Mandatory.

Enable global IGMP snooping in SVGL mode.

Configure the range of associated SVGL profiles.

### ✚ Specifying the SVGL Shared VLAN

(Optional) By default, VLAN 1 is used as the shared VLAN. You can adjust this configuration for other options.

### ✚ Specifying the SVGL Sub VLAN

(Optional) By default, all the VLANs are used as the sub VLANs of SVGL and can share the multicast services of the shared VLAN. You can adjust this configuration for other options.

## Verification

- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in SVGL mode.
- Run the **show ip igmp snooping gda-table** command to check whether inter-VLAN multicast entries are properly formed.

## Related Commands

### ✚ Enabling Global IGMP Snooping in SVGL Mode

<b>Command</b>	<b>ip igmp snooping svgl</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, IGMP snooping is disabled. After the SVGL mode is selected, the range of profiles within SVGL multicast addresses needs to be associated.

### ✚ Configuring the SVGL profile

<b>Command</b>	<b>ip igmp snooping svgl profile <i>profile_num</i></b>
<b>Parameter</b>	<i>profile_num</i> : Configures SVGL to associate a profile.
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, no profile is associated with SVGL.

### ✚ Specifying the SVGL Shared VLAN

<b>Command</b>	<b>ip igmp snooping svgl vlan <i>vid</i></b>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN.

<b>Description</b>	
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	By default, VLAN 1 is used as the shared VLAN.

▾ Specifying the SVGL Sub VLAN

<b>Command</b>	<b>ip igmp snooping svgl subvlan</b> <i>vid-range</i>
<b>Parameter Description</b>	<i>vid-range</i> : Indicates VLAN ID or the range of VLAN IDs.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	By default, all the VLANs except the shared VLAN are used as sub VLANs.

▾ Displaying the IGMP Snooping Working Mode

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If a device is running in SVGL mode, the following information is displayed: <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;">IGMP Snooping running mode: SVGL</div>

Configuration Example

▾ Enabling SVGL on the Access Device

<p><b>Scenario</b> Figure 9- 6</p>	
	<p>A is the multicast router and is connected directly to the multicast source.                  B is the Layer-2 device and is connected directly to the user host.                  Receiver 1 is connected to VLAN 2, Receiver 2 is connected to VLAN 3, and Receiver 3 is connected to VLAN 4.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> </ul>

	<ul style="list-style-type: none"> <li>● Enable IGMP snooping on B and select SVGL mode.</li> <li>● Configure the range of associated SVGL multicast addresses on B.</li> </ul>
<b>A</b>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse- mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit</pre>

```

### Common Errors

- The SVGL profile is not configured.
- The sent multicast traffic is not within the SVGL profile.

### 22.4.3 Configuring Basic IGMP Snooping Functions (IVGL-SVGL Mode)

#### Configuration Effect

- Enable IGMP snooping and select IVGL-SVGL mode to realize Layer-2 multicast.
- The SVGL profiles can share the multicast services.
- The non-SVGL profiles run in IVGL mode.

#### Configuration Steps

##### ✎ Enabling Global IGMP Snooping in IVGL-SVGL Mode

Mandatory.

Enable global IGMP snooping in IVGL-SVGL mode.

Configure the range of associated SVGL profiles.

##### ✎ Specifying the SVGL Shared VLAN

(Optional) By default, VLAN 1 is used as the shared VLAN. You can adjust this configuration for other options.

##### ✎ Specifying the SVGL Sub VLAN

(Optional) By default, all the VLANs are used as the sub VLANs of SVGL and can share the multicast services of the shared VLAN. You can adjust this configuration for other options.

### Verification

- Run the **show ip igmp snooping** command to display the basic IGMP snooping information and verify that IGMP snooping is working in IVGL-SVGL mode.
- Run the **show ip igmp snooping gda-table** command to check whether inter-VLAN multicast entries are properly formed for the SVGL profiles.
- Run the **show ip igmp snooping gda-table** command to check whether intra-VLAN multicast entries are properly formed for the SVGL profiles.

### Related Commands

#### ▾ Enabling Global IGMP Snooping in IVGL-SVGL Mode

<b>Command</b>	<b>ip igmp snooping ivgl-svgl</b>

### Common Errors

- The SVGL profile is not configured.
- The sent multicast traffic is not within the SVGL profile.
- The IVGL multicast traffic cannot be forwarded within the SVGL profile.

### 22.4.4 Configuring the Packet Processing

#### Configuration Effect

- Configure specified ports as the static router ports to receive the multicast traffic from all profiles.

- Configure specified ports as the static member ports to receive the multicast traffic from specified profiles
- Enable Report packets suppression to forward only the first Report packet from a specified VLAN or profile to the router port within a query interval, and the following Report packets will not be forwarded to the router port, thereby reducing the quantity of packets on the network.
- Configure the immediate-leave function to delete a port from the entry of member ports when a leave packet is received by the port.
- Disable dynamic router port learning to disable the learning of any router port.
- Based on network load and configuration of a multicast device, you can adjust the aging time of a router port and member port as well as the maximum response time of a query packet.

#### Notes

- Only when basic IGMP snooping is configured can relevant configurations take effect.

#### Configuration Steps

##### ▾ Configuring a Static Router Port

- Optional.
- You can perform this configuration if you want to specify a static port to receive all the multicast traffic within the VLAN.

##### ▾ Configuring a Static Member Port

- Optional.
- You can perform this configuration if you want to specify a static port to receive specific multicast traffic within the VLAN.

##### ▾ Enabling Report Packet Suppression

- Optional.
- When there are numerous receivers to receive the packets from the same multicast profile, you can enable Report packets suppression to suppress the number of Report packets to be sent.

##### ▾ Enabling the Immediate-Leave Function

- Optional.
- When there is only one receiver on a port, you can enable Leave to speed up the convergence of protocol upon leave.

##### ▾ Disabling Dynamic Router Port Learning

- Optional.
- This function is used when multicast traffic needs to be forwarded only within the Layer-2 topology but not to a Layer-3 router.

##### ▾ Configuring the Aging Time of a Dynamic Router Port

- Optional.
- You can configure the aging time based on network load.

##### ▾ Configuring the Aging Time of a Dynamic Member Port

- Optional.
- You can configure the aging time based on the interval for sending IGMP query packets by the connected multicast router. Typically, the aging time is calculated as follows: Interval for sending IGMP query packets x 2 + Maximum response time of IGMP

packets

### ▾ Configuring the Maximum Response Time of a Query Packet

- Optional.
- You can configure the aging time based on network load.

#### Verification

- Run the **show ip igmp snooping mrouter** command to check whether the configured static router port has an "S" in the displayed configuration information.
- Run the **show ip igmp snooping gda** command to check whether the configured static member port is marked with an S.
- Run the **show ip igmp snooping** command to check whether Report packets suppression, immediate leave, router port learning, router port aging time, member port aging time, and the maximum response time of the Query packet take effect.

#### Related Commands

### ▾ Configuring a Static Router Port

<b>Command</b>	<b>ip igmp snooping vlan <i>vid</i> mrouter interface <i>interface-type</i> <i>interface-number</i></b>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.
<b>Description</b>	<i>interface-type interface-number</i> : Indicates an interface name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	In SVGL mode, if a sub VLAN is not configured, only the configurations for the static router port within the shared VLAN can take effect, and the others can be configured but cannot take effect. If a sub VLAN is configured, only the configurations for the static router port within the shared VLAN or a non-sub VLAN can take effect, and the others can be configured but cannot take effect.  In IVGL-SVGL mode, if a sub VLAN is not configured, the configurations for the static router ports within all the VLANs can take effect; if a sub VLAN is configured, only the configurations for the static router port within the shared VLAN or a non-sub VLAN can take effect, and the others can be configured but cannot take effect.  In IVGL mode, the configurations for the static router ports within all the VLANs can take effect.

### ▾ Configuring a Static Member Port

<b>Command</b>	<b>ip igmp snooping vlan <i>vid</i> static <i>group-address</i> interface <i>interface-type</i> <i>interface-number</i></b>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.
<b>Description</b>	<i>group-address</i> : Indicates a profile address.  <i>interface-type interface-number</i> : Indicates an interface name.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, no static member port is configured.

### ▾ Enabling Report Packet Suppression

<b>Command</b>	<b>ip igmp snooping suppression enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	<p>When Report packets suppression is enabled, only the first Report packet from a specified VLAN or profile is forwarded to the router port within a Query interval, and the following Report packets will not be forwarded to the router port, thereby reducing the quantity of packets on the network.</p> <p>Only the IGMPv1 and IGMPv2 Report packets can be suppressed, and the IGMPv3 Report packets cannot be suppressed.</p>

#### ▾ Enabling the Immediate-Leave Function

<b>Command</b>	<b>ip igmp snooping fast-leave enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>When this function is enabled, a port will be deleted from the entry of the member port when the port receives a leave packet. After that, the packets will no longer be forwarded to this port when it receives the query packets of specified profiles. Leave packets include the IGMPv2 Leave packets as well as the IGMPv3 Report packets that include types but carry no source address.</p> <p>The immediate-leave function applies only to the scenario where only one host is connected to a device port. It is used to conserve bandwidth and resources.</p>

#### ▾ Enabling Dynamic Router Port Learning

<b>Command</b>	<b>ip igmp snooping [ vlan <i>vid</i> ] mrouter learn pim-dvmrp</b>
<b>Parameter Description</b>	<b>vlan <i>vid</i></b> : Specifies a VLAN. This configuration applies to all VLANs by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>A router port is the port that is connected directly to a multicast device running IGMP snooping and a multicast neighbor device running multicast routing protocol. By default, dynamic router port learning is enabled and the device automatically listens to IGMP Query packets, DVMRP packets, and PIM Hello packets.</p>

#### ▾ Configuring the Aging Time of a Dynamic Router Port

<b>Command</b>	<b>ip igmp snooping dyn-mr-aging-time <i>seconds</i></b>
<b>Parameter Description</b>	<b><i>seconds</i></b> : Indicates the aging time of a dynamic router port in the unit of seconds. The value ranges from 1 to 3,600.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If a dynamic router port does not receive an IGMP general query packet or a PIM Hello packet before the aging timer expires, the device will delete this port from the router port entry.</p> <p>When dynamic router port learning is enabled, you can run this command to adjust the aging time of the dynamic router port. If the aging time is too short, the multicast device may frequently add or delete a router port.</p>

#### ▾ Configuring the Aging Time of a Dynamic Member Port

<b>Command</b>	<b>ip igmp snooping host-aging-time <i>seconds</i></b>
<b>Parameter</b>	<b><i>seconds</i></b> : Indicates the aging time.

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The aging time of a dynamic member port indicates the time when a device port receives the IGMP join packet sent from host for subscribing to an IP multicast profile.</p> <p>When the IGMP join packet is received, the aging time of the dynamic member port will be reset. The value of the timer time is host-aging-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port. After the aging time is configured, the aging time of following received IGMP join packets will be host-aging-time. This configuration takes effect after the next IGMP join packet is received, and the timer of the port in use will not be refreshed.</p>

### ✎ Configuring the Maximum Response Time of a Query Packet

<b>Command</b>	<b>ip igmp snooping query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the maximum response time.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>When an IGMP general Query packet is received, the multicast device will reset the aging time of all the dynamic member ports, which is query-max-response-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port.</p> <p>When an IGMP profile-specific Query packet is received, the multicast device will reset the aging time of all the dynamic member ports of the specific profile, which is query-max-response-time. If the timer expires, the multicast device deems that no user host for receiving the multicast packet exists under the port, and will delete the port from the entry of IGMP snooping member port.</p> <p>This configuration takes effect after the next Query packet is received, and the timer in use will not be refreshed. The timer of an IGMPv3 profile-specific Query packet is not refreshed.</p>

### ✎ Displaying Router Ports

<b>Command</b>	<b>show ip igmp snooping mroute</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the router port is successfully configured, an "S" will be displayed in the port information.</p> <pre>FS(config)#show ip igmp snooping mrouter Multicast Switching Mroute Port     D: DYNAMIC     S: STATIC (*, *, 1):</pre>

	VLAN(1) 1 MROUTES: GigabitEthernet 0/1(S)
--	--

### ▾ Displaying the Information of Dynamic Router Port Learning

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	Run the <b>show ip igmpsnooping</b> command to display the aging time and learning status of the dynamic router port. Dynamic Mroute Aging Time : 300(Seconds) Multicastrouter learning mode:pim-dvmrp

### ▾ Displaying the Information of a Member Port

<b>Command</b>	<b>show ip igmp snooping gda-table</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If the member port is successfully configured, an "S" will be displayed in the port information. FS(config)#show ip igmp snooping gda-table Multicast Switching Cache Table D: DYNAMIC S: STATIC M: MROUTE (* ,224.1.1.1, 1): VLAN(1) 1 OPORTS: GigabitEthernet 0/1(S)

### ▾ Displaying Other Parameters

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	Run the <b>show ip igmp snooping</b> command to display the aging time of the router port, aging time of the dynamic member port, response time of the query packet, and Report packets suppression, and immediate leave. IGMP Fast-Leave: Enable IGMP Report suppress: Enable

	<p>Query Max Response Time: 20(Seconds)</p> <p>Dynamic Mroute Aging Time : 300(Seconds)</p> <p>DynamicHostAging Time : 260(Seconds)</p>
--	---

### Configuration Example

#### ⚡ Configuring a Static Router Port and Static Member Port

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Configure a static router port and static member port.</li> </ul>
	<pre> FS# configure terminal FS(config)# ip igmp snooping vlan 1 mrouter interface GigabitEthernet 0/0 FS(config)# ip igmp snooping vlan 1 static 224.1.1.1 interface GigabitEthernet 0/0 FS(config)# end                     </pre>
<b>Verification</b>	<p>Run the <b>show ip igmp snooping mrouter</b> and <b>show ip igmp snooping gda-table</b> commands to check whether the configuration takes effect.</p>
	<pre> FS#show ip igmp snooping mrouter Multicast Switching Mroute Port   D: DYNAMIC   S: STATIC (*, *, 1):   VLAN(1) 1 MROUTES:     GigabitEthernet 0/0(S)  FS#show ip igmp snooping gda-table Multicast Switching Cache Table   D: DYNAMIC   S: STATIC   M: MROUTE (*, 224.1.1.1, 1):   VLAN(1) 1 OPORTS:     GigabitEthernet 0/0(SM)                     </pre>

▾ Enabling Report Packet Suppression

<p><b>Scenario</b> Figure 9- 8</p>	
	<p>A is the multicast router and is connected directly to multicast Source 1. B is a Layer-2 device and is connected directly to the user host and multicast Source 2. Receiver 1, Receiver 2, and Receiver 3 are connected to VLAN 1.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> <li>● Enable Report packets suppression on B.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1 A(config-if-GigabitEthernet 0/1)# ip pim sparse-mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit</pre>
<p><b>B</b></p>	<pre>B# configure terminal B(config)# ip igmp snooping ivgl B(config)# ip igmp snooping suppression enable</pre>
<p><b>Verification</b></p>	<p>Check whether Receiver 1 and Receiver 2 are added to profile 239.1.1.1, and only the IGMP Report packets of profile 239.1.1.1 are forwarded from interface Gi0/1 of B.</p>

<b>B</b>	<pre> B# show ip igmp snooping  IGMP Snooping running mode: IVGL  IGMP Snooping L2-entry-limit: 65536  Source port check: Disable  Source ip check: Disable  IGMP Fast-Leave: Disable  IGMP Report suppress: Enable  IGMP Goble Querier: Disable  IGMP Preview: Disable  IGMP Tunnel: Disable  IGMP Preview group aging time : 60(Seconds)  Dynamic Mroute Aging Time : 300(Seconds)  Dynamic Host Aging Time : 260(Seconds)                 </pre>
----------	---

**↘ Configuring Other Parameters**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Enable Immediate-leave function.</li> <li>● Disable router port learning.</li> <li>● Configure the aging time of a router port.</li> <li>● Configuring the aging time of a member port.</li> <li>● Configure the response time of a Query packet.</li> </ul>
	<pre> FS# configure terminal  FS(config)# ip igmp snooping fast-leave enable  FS(config)# no ip igmp snooping mrouter learn pim-dvmrp  FS(config)# ip igmp snooping dyn-mr-aging-time 200  FS(config)# ip igmp snooping host-aging-time 100  FS(config)# ip igmp snooping query-max-response-time 60  FS(config)# end                 </pre>
<b>Verification</b>	<p>Run the <b>show ip igmp snooping</b> command to check whether the configuration is successful.</p>
	<pre> FS# show ip igmp snooping  IGMP Snooping running mode: IVGL  IGMP Snooping L2-entry-limit: 65536  Source port check: Disable  Source ip check: Disable                 </pre>

	IGMP Fast-Leave: Enable
	IGMP Report suppress: Enable
	IGMP Globle Querier: Disable
	IGMP Preview: Disable
	IGMP Tunnel: Disable
	Query Max Response Time: 60(Seconds)
	IGMP Preview group aging time : 60(Seconds)
	DynamicMrouteAgingTime : 200(Seconds)
	Dynamic Host Aging Time : 100(Seconds)

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.

### 22.4.5 Configuring IGMP Security Control

#### Configuration Effect

- Configure the range of multicast addresses that a user can access.
- Configure to allow a user from an unauthorized profile to preview a multicast channel.
- Configure the number of multicast addresses that a user can access.
- Configure to limit a user to receive only the multicast traffic from a router port to prevent illegal multicast traffic sent by the end user.
- Configure to limit a user to receive only the multicast traffic from designated source IP addresses to prevent illegal multicast traffic.

#### Notes

- Basic IGMP snooping functions must be configured.

#### Configuration Steps

##### ▾ Configuring the Profile Filtering

- Optional.
- If you want to limit the profile packets to be received by a port, you can configure the profile filtering on the port.
- If you want to limit the multicast packets to be received by a VLAN, you can configure the per-VLAN profile filtering.

##### ▾ Enabling Multicast Preview

- Optional.
- You can enable multicast preview for a user from an unauthorized profile.

##### ▾ Configuring the Maximum Number of Profiles

- Optional.
- If you want to limit the number of multicast profiles that a port is allowed to receive, you can configure the maximum number of

multicast profiles allowed for this port.

- If you want to limit the number of multicast profiles that global ports are allowed to receive, you can configure the maximum number of multicast profiles allowed for these ports.

#### ▾ Configuring Source Port Inspection

- Optional.
- You can perform this configuration if you want to allow a port to receive only the multicast traffic from the router port.

#### ▾ Configuring Source IP Inspection

- Optional.
- You can perform this configuration to specify the source IP address for all the multicast profiles of all VLANs. Only the multicast traffic whose source IP address is the same as the set one is considered as legal.
- You can also specify the source IP addresses for specific multicast profiles within specific VLANs. Among the multicast traffic received from the specific multicast profiles within the VLANs, only the one with the same source IP address as the set one is considered as legal and will be forwarded by the multicast device; other traffic will be discarded.

#### Verification

- Run the **show ip igmp snooping interfaces** command to display the profile filtering and the maximum number of multicast profiles for a port.
- Run the **show ip igmp snooping vlan** command to display the per-VLAN profile filtering.
- Run the **show ip igmp snooping** command to check whether the maximum number of global multicast profiles, preview function, source port inspection, and source IP address inspection take effect.

#### Related Commands

##### ▾ Configuring the Profile Filtering

<b>Command</b>	<b>ip igmp snooping filter <i>profile-number</i></b>
<b>Parameter</b>	<i>profile-number</i> : Indicates a profile number.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

##### ▾ Configuring the Per-VLAN Profile Filtering

<b>Command</b>	<b>ip igmp snooping vlan <i>vid</i> filter <i>profile-number</i></b>
<b>Parameter</b>	<i>vid</i> : Indicates a VLAN. The value ranges from 1 to 4,094.
<b>Description</b>	<i>profile-number</i> : Indicates a profile number.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Maximum Number of Profiles on a Port

<b>Command</b>	<b>ip igmp snooping max-groups</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of multicast profiles.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	This value indicates only the number of dynamic multicast profiles, and the number of static profiles is not included. The counter of multicast profiles is based on the VLAN that the port belongs to. For example, if a port belongs to three VLANs, and all three of them receive a request packet from multicast profile 224.1.1.1 simultaneously, then the counter of multicast profiles will be 3 but not 1.

### ▾ Configuring the Maximum Number of Global Profiles

<b>Command</b>	<b>ip igmp snooping l2-entry-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of multicast profiles.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This value includes the number of both dynamic profiles as well as static profiles.

### ▾ Configuring Source Port Inspection

<b>Command</b>	<b>ip igmp snooping source-check port</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After source port inspection is enabled, the multicast traffic received by a device will be discarded if no router port is detected in the network environment.

### ▾ Configuring Source IP Inspection

<b>Command</b>	<b>ip igmp snooping source-check default-server</b> <i>source-address</i>
<b>Parameter Description</b>	<i>source-address</i> : Indicates the source IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling Source IP Inspection for a Specific Profile

<b>Command</b>	<b>ip igmp snooping limit-ipmc vlan</b> <i>vid address group-address server source-address</i>
<b>Parameter Description</b>	<i>vid</i> vlan id <i>group-address</i> : Indicates a profile address. <i>source-address</i> : Indicates the source IP address.
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	N/A
--------------------	-----

### ▾ Enabling Preview

<b>Command</b>	<b>ip igmp snooping preview</b> <i>profile-number</i>
<b>Parameter Description</b>	<i>profile number</i> : Indicates the range of multicast addresses allowed for preview. The value ranges from 1 to 1,024.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Preview Duration

<b>Command</b>	<b>ip igmp snooping preview interval</b> <i>num</i>
<b>Parameter Description</b>	<i>num</i> : Specifies the preview duration which ranges from 1s to 300s (60s by default).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This configuration allows unauthorized users to receive multicast traffic within the preview duration. After the duration is met, the preview will be stopped; the preview can be resumed in 300s.

### ▾ Displaying the Per-Port Profile Filtering

<b>Command</b>	<b>show ip igmp snooping interface</b>									
<b>Parameter Description</b>	N/A									
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode									
<b>Usage Guide</b>	<p>If the function is configured, the profile will be displayed, for example:</p> <pre>FS#show ip igmp snooping interfaces gigabitEthernet 0/1</pre> <table border="1"> <thead> <tr> <th>Interface</th> <th>Filter profile number</th> <th>max-group</th> </tr> <tr> <th>-----</th> <th>-----</th> <th>-----</th> </tr> </thead> <tbody> <tr> <td>GigabitEthernet 0/1</td> <td>1</td> <td></td> </tr> </tbody> </table>	Interface	Filter profile number	max-group	-----	-----	-----	GigabitEthernet 0/1	1	
Interface	Filter profile number	max-group								
-----	-----	-----								
GigabitEthernet 0/1	1									

### ▾ Displaying the Per-VLAN Profile Filtering

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the function is configured, the profile will be displayed, for example:</p> <pre>IGMP VLAN filter: 1</pre>

### ▾ Displaying the Maximum Number of Interface Profiles

<b>Command</b>	<b>show ip igmp snooping interface</b>
----------------	--

<b>Parameter Description</b>	N/A									
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode									
<b>Usage Guide</b>	<p>If the maximum number of multicast addresses for a port is configured, the value will be displayed, for example:</p> <pre>FS#show ip igmp snooping interfaces gigabitEthernet 0/1</pre> <table border="1"> <thead> <tr> <th>Interface</th> <th>Filter profile number</th> <th>max-group</th> </tr> </thead> <tbody> <tr> <td>-----</td> <td>-----</td> <td>-----</td> </tr> <tr> <td>GigabitEthernet0/1</td> <td>1</td> <td>200</td> </tr> </tbody> </table>	Interface	Filter profile number	max-group	-----	-----	-----	GigabitEthernet0/1	1	200
Interface	Filter profile number	max-group								
-----	-----	-----								
GigabitEthernet0/1	1	200								

#### ▾ Displaying the Maximum Number of Global Profiles

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the function is configured, the profile will be displayed, for example:</p> <pre>IGMP Snooping L2-entry-limit: 65536</pre>

#### ▾ Displaying the Information of Source Port Inspection

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If source port inspection is enabled, the following information will be displayed:</p> <pre>Source port check: Enable</pre>

#### ▾ Displaying the Information of Source IP Inspection

<b>Command</b>	<b>show ip igmp snooping vlan</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If source IP address inspection is enabled, the following information will be displayed:</p> <pre>Source ip check: Enable</pre>

#### ▾ Displaying the Information of the Preview Function

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	<p>If the range of multicast addresses for a port is configured, preview will be enabled, for example:</p> <pre>IGMP Preview: Enable IGMP Preview group aging time : 60(Seconds)</pre>

**Configuration Example**

➤ **Configuring the Profile Filtering and the Maximum Number of Demanded Profiles**

<p><b>Scenario</b> Figure 9-9</p>	
	<p>A is the multicast router and is connected directly to multicast Source 1.          B is a Layer-2 device and is connected directly to the user host and multicast Source 2.          Receiver 1, Receiver 2, and Receiver 3 are connected to VLAN 1.          By configuring VLAN 1, you can configure to allow the users within VLAN 1 to receive only the profiles whose addresses range from 225.1.1.1 to 225.1.255.255.          You can configure Receiver 1 to receive only the profiles whose addresses range from 225.1.1.1 to 225.1.1.255, Receiver 2 to receive only the profiles whose addresses range from 225.1.2.1 to 255.1.2.255, and Receiver 3 to receive only the profiles whose addresses range from 225.1.3.1 to 225.1.3.255.          At most 10 profiles can be added to a port and at most 100 profiles can be added globally.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Configure the IP address and VLAN. (Omitted)</li> <li>● Enable multicast routing on A and enable the multicast routing protocol on Layer-3 interface (Gi0/1 and VLAN 1).</li> <li>● Enable IGMP snooping on B and select IVGL mode.</li> <li>● Configure the range and maximum number of multicast addresses on B.</li> </ul>
<p><b>A</b></p>	<pre>A# configure terminal A(config)# ip multicast-routing A(config)# interface GigabitEthernet 0/1</pre>

	<pre> A(config-if-GigabitEthernet 0/1)# ip pim sparse- mode A(config-if-GigabitEthernet 0/1)# exit A(config)# interface vlan 1 A(config-if-VLAN 1)# ip pim sparse-mode A(config-if-VLAN 1)# exit </pre>

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.
- The multicast router port is not learned, leading to failure to receive the multicast traffic.
- The IP address for source IP inspection is inconsistent with the multicast IP address, leading to failure to receive the multicast traffic.

#### 22.4.6 Configuring an IGMP Profile

##### Configuration Effect

- Create an IGMP filtering profile.

##### Configuration Steps

###### ▾ Creating a Profile

- (Optional) Create an IGMP filtering profile.

###### ▾ Configuring the Profile Range

- (Optional) Configure the range of multicast profile addresses.

###### ▾ Configuring the Profile Filtering

- (Optional) Configure the filtering mode of profile to **permit** or **deny**.

##### Verification

- Run the **show running-config** command to check whether the preceding configurations take effect.

##### Related Commands

###### ▾ Creating a Profile

<b>Command</b>	<code>ip igmp profile <i>profile-number</i></code>
<b>Parameter Description</b>	<i>profile-number</i> : Indicates the number of a profile.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	

###### ▾ Configuring the Profile Range

<b>Command</b>	<code>range <i>low-ip-address</i> [ <i>high-ip-address</i> ]</code>
<b>Parameter Description</b>	<i>low-ip-address</i> : Specifies the start address. <i>low-ip-address</i> : Specifies the end address. Only one address is configured by default.
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	You can configure multiple addresses. If the IP addresses of different ranges are consecutive, the addresses will be combined.

###### ▾ Configuring the Profile Filtering

<b>Command</b>	<b>deny</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	If the filtering mode of profile is set to <b>deny</b> while the range of multicast profiles is not specified, no profile is to be denied, which means to permit all profiles.

### ↘ Configuring the Profile Filtering

<b>Command</b>	<b>permit</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Profile configuration mode
<b>Usage Guide</b>	If the filtering mode of profile is set to <b>permit</b> while the range of multicast profiles is not specified, no profile is to be permitted, which means to deny all profiles.

### Configuration Example

#### ↘ Creating a Filtering Profile

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Create a filtering profile.</li> </ul>
	<pre> B(config)#ipigmp profile 1 B(config-profile)#permit B(config-profile)#range B(config-profile)#range 224.1.1.1 235.1.1.1 B(config-profile)# </pre>
<b>Verification</b>	Run the <b>show running-config</b> command to check whether the configuration is successful.
	<pre> ip igmp profile 1   permit   range 224.1.1.1 235.1.1.1 ! </pre>

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.
- The mode of profile is set to **permit** while the range of multicast profiles is not specified, leading to the denial of all profiles.

### 22.4.7 Configuring IGMP QinQ

#### Configuration Effect

- Create a multicast entry on the VLAN where IGMP packets are located. Forward IGMP packets on the VLAN where these packets are located, realizing transparent transmission.

#### Notes

- Basic IGMP snooping functions must be configured.

#### Configuration Steps

##### ▾ Configuring QinQ Transparent Transmission

- If the QinQ interface needs to forward multicast packets on the VLANs where the VIDs of the packets specify, enable QinQ to realize transparent transmission.

#### Verification

- Run the **show ip igmp snooping** command to check whether the configuration takes effect.

#### Related Commands

##### ▾ Configuring QinQ Transparent Transmission

<b>Command</b>	<b>ip igmp snooping tunnel</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Enable QinQ to realize transparent transmission of IGMP packets.

##### ▾ Displaying QinQ Configuration

<b>Command</b>	<b>show ip igmp snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	If QinQ is enabled, the following content is displayed. <pre>IGMP Tunnel: Enable</pre>

#### Configuration Example

##### ▾ Configuring QinQ Transparent Transmission

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure basic IGMP snooping functions.</li> <li>● Configure QinQ transparent transmission.</li> </ul> <pre>FS# configure terminal FS(config)#ipigmpsnoopingtunnel FS(config)#FS(config)#end</pre>
<b>Verification</b>	Run the <b>show ip igmp snooping</b> command to check whether the configuration is successful.

	IGMP Tunnel: Enable
--	---------------------

### Common Errors

- Basic IGMP snooping functions are not configured or the configuration is not successful.

### 22.4.8 Configuring an IGMP Querier

#### Configuration Effect

- Configure the device as an IGMP querier, which will send IGMP Query packets periodically and collect user demanding information.

#### Notes

- Basic IGMP snooping functions must be configured.

#### Configuration Steps

##### ▾ Enabling the Querier Function

- (Optional) Enable IGMP querier function globally or for a specified VLAN.
- (Optional) Disable the IGMP querier function for a specified VLAN.

##### ▾ Configuring the Source IP Address of a Querier

- (Optional) You can configure the source IP address of a Query packet sent by the querier based on VLANs.
- After a querier is enabled, a source IP address must be specified for the querier; otherwise, the configuration will not take effect.

##### ▾ Configuring the Maximum Response Time of a Query Packet

- (Optional) Adjust the maximum response time carried by an IGMP Query packet. As IGMPv1 does not support the carrying of maximum response time by a Query packet, this configuration does not take effect when the querier is running IGMPv1.

##### ▾ Configuring the Query Interval of a Querier

- (Optional) Adjust the interval of the IGMP querier for sending query packets.

##### ▾ Configuring the Aging Timer of a Querier

- (Optional) Configure the aging timer of other IGMP queriers on the network.

##### ▾ Specifying the IGMP Version for a Querier

- (Optional) Specify the IGMP version for a querier (IGMPv2 by default).

#### Verification

- Run the **show ip igmp snooping querier detail** command to check whether the configuration takes effect.

#### Related Commands

##### ▾ Enabling the IGMP Querier Function

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier</b>
<b>Parameter</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default.

<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	IGMP querier for a specified VLAN will take effect only after global IGMP querier is enabled. If global IGMP querier is disabled, IGMP querier for all the VLANs will be disabled.

#### ✚ Configuring the Source IP Address of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier address a.b.c.d</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>a.b.c.d:</b> Indicates the source IP address.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After a querier is enabled, a source IP address must be specified for the querier; otherwise, the configuration will not take effect. If the source IP address is specified by a VLAN, the address will be used preferentially.

#### ✚ Configuring the Maximum Response Time of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier max-response-time seconds</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>seconds:</b> Indicates the maximum response time. in the unit of seconds. The value ranges from 1 to 25.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the query interval is specified by a VLAN, the value will be used preferentially.

#### ✚ Configuring the Query Interval of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier address a.b.c.d</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>seconds:</b> Indicates the query interval in the unit of seconds. The value ranges from 1 to 18,000.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the query interval is specified by a VLAN, the value will be used preferentially.

#### ✚ Configuring the Aging Timer of a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier timer expiry seconds</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default. <b>seconds:</b> Indicates the timeout time in the unit of seconds. The value ranges from 60 to 300.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A device may fail to be elected as the querier even when its querier function is enabled. If a device that fails to be elected does not receive the Query packet sent by the querier in the aging time, the querier in use is considered as expired, and a new round of election will be raised. If the aging time is specified by a VLAN, the value will be used preferentially.

#### ✚ Specifying the IGMP Version for a Querier

<b>Command</b>	<b>ip igmp snooping [ vlan vid ] querier version 1</b>
<b>Parameter Description</b>	<b>vlan vid:</b> Specifies a VLAN. This configuration applies to all VLANs by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A querier can be run in IGMPv1 and IGMPv2 (IGMPv2 by default). You can also run a command to configure the version to IGMPv1. If the IGMP version for a querier is specified by a VLAN, the version will be used preferentially.

### 📌 Displaying the IGMP Querier Configuration

<b>Command</b>	<b>show ip igmp snooping querier detail</b>								
<b>Parameter Description</b>	N/A								
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode								
<b>Usage Guide</b>	<p>If QinQ is enabled, the following content is displayed.</p> <pre>FS(config)#show ip igmp snooping querier detail</pre> <table border="1"> <thead> <tr> <th>Vlan</th> <th>IP Address</th> <th>IGMP Version</th> <th>Port</th> </tr> </thead> <tbody> <tr> <td colspan="4">-----</td> </tr> </tbody> </table> <p>Global IGMP switch querier status</p> <pre>----- admin state           : Enable admin version         2 source IP address     : 1.1.1.1 query-interval (sec)  60 max-response-time (sec) 10 querier-timeout (sec) 125</pre> <p>Vlan 1: IGMP switch querier status</p> <pre>----- admin state           : Disable admin version         2 source IP address     : 1.1.1.1 query-interval (sec)  60 max-response-time (sec) 10 querier-timeout (sec) 125</pre>	Vlan	IP Address	IGMP Version	Port	-----

---

### Common Errors

- The source IP address is not configured for the querier and the querier does not take effect.

## 22.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears the statistics on IGMP snooping.	<b>clear ip igmp snooping statistics</b>
Clears the dynamic router ports and member ports.	<b>clear ip igmp snooping gda-table</b>

### Displaying

Description	Command
Displays basic IGMP snooping configurations.	<b>show ip igmp snooping [ vlan <i>vlan-id</i> ]</b>
Displays the statistics on IGMP snooping.	<b>show ip igmp snooping statistics [ vlan <i>vlan-id</i> ]</b>
Displays the router ports.	<b>show ip igmp snooping mrouter</b>
Displays the IGMP snooping entries.	<b>show ip igmp snooping gda-table</b>
Displays the profile.	<b>show ip igmp profile [ <i>profile-number</i> ]</b>
Displays the IGMP snooping configurations on an interface.	<b>show ip igmp snooping interface <i>interface-name</i></b>
Displays the IGMP querier.	<b>show ip igmp snooping querier [ detail ]</b>
Displays user information.	<b>show ip igmp snooping user-info</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs all IGMP Snooping functions.	<b>debug igmp-snp</b>
Debugs the IGMP snooping events.	<b>debug igmp-snp event</b>

Debugs the IGMP snooping packets.	<b>debug igmp-snp packet</b>
Debugs the communications between IGMP snooping and MSF.	<b>debug igmp-snp msf</b>
Debugs the IGMP snooping alarms.	<b>debug igmp-snp warning</b>

## 23 Configuring MLD Snooping

### 23.1 Overview

Multicast Listener Discovery (MLD) Snooping is used to control and manage the forwarding behaviors of IPv6 multicast packets at Layer 2.

The device running MLD Snooping analyzes MLD packets received by a port to create a mapping between the port and the MAC multicast address and forwards IPv6 multicast data at Layer 2 based on the mapping. When MLD Snooping is disabled, IPv6 multicast data packets are broadcasted at Layer 2. When MLD Snooping is enabled, multicast data packets of a known IPv6 multicast group are forwarded to a specified receiver at Layer 2 instead of being broadcasted at Layer 2.

#### Protocols and Standards

RFC4541: Considerations for Internet Group Management Protocol (IGMP) and Multicast Listener Discovery (MLD) Snooping Switches

#### 23.1.1 Two Types of MLD Snooping Ports

As shown in Figure 10- 1, the Layer-3 multicast device is connected to the multicast source. MLD Snooping is enabled on the access device. Host A and Host B are receivers (that is, members of the IPv6 multicast group).

Figure 10- 1 Two Types of MLD Snooping Ports

- Multicast router port: Indicates the port on the access device for connecting to the Layer-3 multicast device, for example, Port Eth0/1 of the access device.
- Member port: Is short for IPv6 multicast group member port, also called listener port, and indicates the port on the access device for connecting to an IPv6 multicast group member, for example, Port Eth0/2 and Port Eth0/3 on the access device.

### 23.1.2 Work Mode of MLD Snooping

- **DISABLE mode:** MLD Snooping does not take effect in this mode. That is, the Layer-2 multicast device does not "snoop" MLD packets between the host and the router, and multicast streams are broadcasted within VLANs.
- **Independent VLAN Group Learn (IVGL) mode:** In this mode, multicast streams between VLANs are mutually independent. A host can request only the multicast router port in the same VLAN as the host to receive multicast packets, and can forward the received multicast data packets of any VLAN only to the member port and multicast router port in the same VLAN as the host.
- **Shared VLAN Group Learn (SVGL) mode:** In this mode, hosts of VLANs share the same multicast stream. A host in one VLAN can request multicast streams of another VLAN. When a shared VLAN is specified, only the multicast data streams of this VLAN can be forwarded to hosts of other VLANs. Multicast data streams of a shared VLAN, can be forwarded to the member ports of this multicast address, even though some member ports do not belong to the shared VLAN. In SVGL mode, MLD profiles must be used to allocate a batch of multicast address ranges to SVGL. Within the multicast address ranges, member ports in the multicast forwarding entries support trans-VLAN packet forwarding. By default, all the group ranges are not within the SVGL application ranges, and all the multicast packets are discarded.
- **IVGL-SVGL mode:** In this mode, IVGL and SVGL coexist. You can use MLD profiles to allocate a batch of multicast address ranges to SVGL. Within the multicast address ranges, member ports in the multicast forwarding entries support trans-VLAN packet forwarding. Member ports in the multicast forward entries corresponding to other multicast address ranges must belong to the same VLAN.

### 23.1.3 Working Principle of MLD Snooping

The device running MLD Snooping processes different MLD packets as follows:

#### MLD QUERY

The Layer-3 multicast device regularly sends an MLD General Query packet to all hosts and routers (with the address of FF02::1) in the local network segment, to query the IPv6 multicast group members in this network segment. When receiving the MLD General Query packet, the device running MLD Snooping forwards the packet all ports in the VLAN except the one receiving the packet, and processes the port receiving the packet as follows:

- If the port is already in the router multicast port list, its aging timer is reset.
- If the port is not contained in the router multicast port list, the port is added to the router multicast port list and its aging timer is started.
- Each time the Layer-2 multicast device receives an MLD General Query packet, it starts the aging timer for each member port, and updates the timer time to the configured maximum response time of MLD query packet. When the aging timer time of a port is reduced to 0, it is deemed that no member receives multicast streams through this port, and therefore, the Layer-2 multicast device deletes the port from the MLD Snooping forwarding table.
- Each time the Layer 2 multicast device receives a MLD Group-Specific Query packet, it starts the aging timer for each member port in the specific group, and updates the timer time to the configured maximum response time of MLD query packet. When the aging timer time of a port is reduced to 0, it is deemed that no member receives multicast streams through this port, and therefore, the Layer-2 multicast device deletes the port from the MLD Snooping forwarding table.
- When the Layer-2 multicast device receives a MLD Group-Specific Query packet, it no longer updates the preceding two types of timers.

#### MLD REPORT

In either of the following cases, the host sends an MLD Membership Report packet to the MLD querier.

- After receiving an MLD query (General Query or Group-Specific Query) packet, an IPv6 multicast group member host responds with an MLD Membership Report packet.
- If a host needs to join an IPv6 multicast group, it actively sends an MLD Membership Report packet to MLD querier to request to join this IPv6 multicast group.

When receiving an MLD Membership Report packet, the device running MLD Snooping forwards it to all multicast router ports in the VLAN, retrieves, from the packet, the address of the IPv6 multicast group that the host needs to join, and processes the port receiving the packet as follows:

- If there is no forwarding entry corresponding to the IPv6 multicast group, the forwarding entry is created, the port is added to the egress port list as a dynamic member port, and its aging timer is started.
- If there is a forwarding entry corresponding to the IPv6 multicast group but the port is not contained in the egress port list, the port is added to the egress port list as a dynamic member port, and its aging timer is started.
- If there is a forwarding entry corresponding to the IPv6 multicast group and dynamic member port is contained in the egress port list, its aging timer is reset.

### MLD LEAVE

When a host leaves an IPv6 multicast group, it sends an MLD Leave packet (with the address of FF02::2) to notify the multicast router that it has left the IPv6 multicast group. When receiving an MLD Leave packet from a member port, the device running MLD Snooping directly forwards it to the multicast router port. If the fast leave function is enabled, the device directly deletes the port from the forwarding port list of the relevant multicast group.

#### 23.1.4 Source PortCheck

The source port check function of MLD Snooping improves the network security.

This function strictly limits the ingress ports of MLD multicast streams. When this function is disabled, multicast streams from any port are valid and the Layer-2 multicast device forwards them to registered member ports according to the forwarding list of MLD Snooping. When this function is enabled, multicast streams only from the multicast router ports are valid and the Layer-2 multicast device forwards them to registered ports. Multicast data streams from non-multicast router ports are invalid and discarded.

### 23.2 Applications

Application	Description
MLD Snooping SVGL Trans-VLAN Multicast On demand	MLD Snooping works in SVGL mode
Source Port Filtering	Multicast streams only from multicast router ports are received.

#### 23.2.1 MLD Snooping SVGL Trans-VLAN Multicast On demand

##### Scenario

As shown in Figure 10- 2, Host A of VLAN 3 and Host B of VLAN 4 order a video. The video streams are in VLAN 2.

- Enable the SVGL mode on the access device and set a shared VLAN 2.

Figure 10- 2

<b>Remarks</b>	<p>VLAN 2 is a shared VLAN.</p> <p>VLAN 3 and VLAN 4 are the VLANs through which the video on-demand service is output.</p>
----------------	---

#### Deployment

- Enable the Layer-3 multicast protocol on the Layer-3 multicast device.
- Enable the SVGL mode on the Layer-2 device.

#### 23.2.2 Source Port Filtering

##### Scenario

As shown in Figure 10-3, when the source port check function is configured, video streams can be received only from the source multicast router port. Multicast video streams from other ports are invalid and discarded. Note that when the source port check function is configured, there shall be at least one multicast router port. Otherwise, packet filtering is not performed on the multicast router port even though the source port filtering is enabled. When the source port check function is not configured, multicast video streams from all ports are received by default.

- Enable the IVGL mode on the access device.

Figure 10- 3

<b>Remarks</b>	Port Eth0/1 is a multicast router port and Port Eth0/2 is a non-multicast router port. Video servers send same multicast video streams. Hosts A and B can receive multicast streams only from Video Server A.
----------------	---

**Deployment**

- Enable the source port check function and configure a static multicast router port.
- Enable the IVGL mode on the Layer-2 device.

**23.3 Features**

**Basic Concepts**

📌 **Multicast Router Port and Member Port**

Multicast router ports are classified into dynamic multicast router ports and static multicast router ports. If MLD Snooping is enabled, when the dynamic multicast router port learning function is enabled on a port, after receiving an MLD Query or PIMv6-Hello packet, the port learns the dynamic multicast router port and starts the aging timer of the dynamic multicast router port. A static multicast router port can be added by configuring the `ipv6 mld snooping vlan mrouter` command.

Member ports are classified into dynamic member ports and static member ports. If MLD Snooping is enabled, after receiving an MLD Report packet, a port learns the dynamic member router port and starts the aging timer of the dynamic member port. A static member port can be added by configuring the `ipv6 mld snooping vlan static interface` command.

📌 **Fast Leave and Packet Suppression**

When the fast leave function is enabled, a port is directly deleted after receiving an MLD Leave packet. The fast leave function is applicable only to scenarios in which only one user is connected to a port, and helps save the bandwidth. When multiple users are connected to a port, if the fast leave function is enabled, other users wanting to receive packets fail to receive any packets.

When the packet suppression function is enabled, only the first MLD Report packet is forwarded within one query period.

**Overview**

Feature	Description
---------	-------------

Globally Enabling MLD Snooping	Globally enables MLD Snooping and configures the work mode.
VLAN-based MLD Snooping	Enables or disables MLD Snooping for a single VLAN when MLD Snooping is globally enabled.
Aging Time of Multicast Router Ports	Adjusts the aging time of dynamic multicast router ports. The default aging time is 300s.
Dynamic Multicast Router Port Learning	After receiving an MLD query packet or a PIMv6 Hello packet, the port is learnt as a dynamic multicast router port.
Fast Leave of Multicast Group Member Ports	A member port can be quickly deleted, instead of being aged and deleted after the query interval of a Group-Specific Query expires.
MLD Report Packet Suppression	Only the first Report packet is processed within one query period, reducing the work load of the module.
Source Port Check	Multicast streams received only from a multicast router port can be forwarded. Packets received from non-multicast router ports cannot be forwarded.
Port-based Specific Multicast Group Filtering	Only multicast group packets that meet the filter conditions can be received.
Maximum Number of Multicast Groups Supported by a Port	Limits the maximum number of multicast groups that a port can join.

### 23.3.1 Globally Enabling MLD Snooping

Globally enable MLD Snooping and configure the work mode. Multicast forwarding entries can be learnt and multicast streams are forwarded to a specified port.

#### Working Principle

Enable MLD Snooping. When an MLD Report packet with the time to live (TTL) of 1 is received, a multicast forwarding entry is created and the forwarding egress is this port.

#### ↳ Learning a Dynamic Member Port

After a valid MLD Report packet is received, a dynamic member port is learnt and a forwarding entry is generated. The forwarding egress of this entry is the member port.

#### ↳ Coordinating Parameters

Configure the MLD Report packet suppression function.

#### Related Configuration

Configure the MLD Report packet suppression function so that only the first Report is processed within one query period, thereby reducing the number of packets in the network.

### 23.3.2 VLAN-based MLD Snooping

Enable or disable MLD Snooping for a single VLAN. By default, if MLD Snooping is globally enabled, the MLD Snooping function of each VLAN is enabled.

## Related Configuration

Globally configure MLD Snooping. Then configure MLD Snooping for a single VLAN.

### 23.3.3 Aging Time of Multicast Router Ports

Multicast router ports are classified into dynamic multicast router ports and static multicast router ports. By default, the aging time of a dynamic multicast router port is 300s. Static multicast router ports are not aged.

## Related Configuration

Ability of learning from dynamic multicast router port learning function

### 23.3.4 Dynamic Multicast Router Port Learning

By default, all ports support the dynamic multicast router port learning function.

## Working Principle

When a port supports the dynamic multicast router port learning function, after receiving an MLD query packet or a PIMv6 Hello packet, the port is learnt as a dynamic multicast router port.

## Related Configuration

Configure a port as a static multicast router port.

### 23.3.5 Aging Time of Dynamic Member Ports

Member ports are classified into dynamic member ports and static member ports. By default, the aging time of a dynamic member port is 260s. Static member ports are not aged.

### 23.3.6 Fast Leave of Multicast Group Member Ports

By default, the fast leave function of multicast group member ports are disabled. If the fast leave function is enabled, the port is directly deleted after receiving a done packet.

### 23.3.7 MLD Report Packet Suppression

By default, the MLD report packet suppression function is disabled. If the function is enabled, only the first Report packet is processed within one query interval, thereby reducing the number of packets in the network.

### 23.3.8 Source Port Check

The source port check function is disabled by default.

## Working Principle

When the source port check function is enabled, packets only from multicast router ports are valid and packets from non-multicast router ports are invalid.

## Related Configuration

Configure a port as a static multicast router port.

### 23.3.9 Port-based Specific Multicast Group Filtering

Under certain circumstances, you may use the port filtering function to control a port to forward multicast packets only of a certain range.

### 23.3.10 Maximum Number of Multicast Groups Supported by a Port

The maximum number of multicast groups that a port is allowed to join can control the maximum number of multicast groups supported by the port.

## 23.4 Configuration

Configuration	Description and Command	
Configuring Basic Functions of MLD Snooping	<b>ipv6 mld snooping</b>	Enables MLD Snooping and specifies the work mode.
	<b>ipv6 mld snooping vlan <i>vlan-id</i> mrouter interface <i>interface-id</i></b>	Configures the static multicast router port.
	<b>ipv6 mld snooping vlan <i>vlan-id</i> static <i>ip-addr</i> interface <i>interface-id</i></b>	Configures a static member port.
	<b>ipv6 mld profile <i>profile-num</i></b>	Configures a profile.
	<b>ipv6 mld snooping source-check port</b>	Configures source port check.
	<b>ipv6 mld snooping filter <i>profile-num</i></b>	Configures multicast group filtering for a port.
	<b>ipv6 mld snooping max-groups <i>num</i></b>	Configures the maximum number of multicast groups that a port can join.

### 23.4.1 Configuring Basic Functions of MLD Snooping

#### Configuration Effect

- Enable MLD Snooping and configure the work mode.

#### Notes

- Enable MLD Snooping and set the work mode to SVGL. The MLD Snooping SVGL mode cannot coexist with IPv4 or IPv6 Layer-3 multicasting.
- When the work mode is SVGL or IVGL-SVGL, a profile must be associated to specify the multicast group range in which the SVGL mode applies.

#### Configuration Steps

##### ▾ Enabling IPv6 MLD Snooping

- Mandatory.

#### Verification

Run the **show ipv6 mld snooping** command to check whether MLD Snooping is enabled.

- Check whether the device can create correct multicast forwarding entries.

#### Related Commands

### ▾ Enabling IPv6 MLD Snooping

<b>Command</b>	<b>ipv6 mld snooping mode</b>
<b>Parameter</b>	<b>mode:</b> Specifies the work mode.
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ▾ Configuring a Profile

<b>Command</b>	<b>ipv6 mld profile profile-num</b>
<b>Parameter</b>	<b>profile-num:</b> Indicates the profile number.
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Run this command to configure a profile and enter the profile configuration mode.

### ▾ Configuring a Static Multicast Router Port

<b>Command</b>	<b>ipv6 mld snooping vlan vlan-id mrouter interface interface-id</b>
<b>Parameter</b>	<b>vlan-id:</b> Indicates the VLAN ID.
<b>Description</b>	<b>interface-id:</b> Indicates interface changes.
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ▾ Configuring a Static Member Port

<b>Command</b>	<b>ipv6 mld snooping vlan vlan-id static ip-addr interface interface-id</b>
<b>Parameter</b>	<b>vlan-id:</b> Indicates the VLAN ID.
<b>Description</b>	<b>ip-addr:</b> Indicates the group address. <b>interface-id:</b> Indicates interface changes.
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ▾ Configuring Source Port Check

<b>Command</b>	<b>ipv6 mld snooping source-check port</b>
<b>Parameter</b>	
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	-

### ▾ Configuring Port-based Multicast Group Filtering

<b>Command</b>	<b>ipv6 mld snooping filter profile-num</b>
----------------	---

<b>Parameter</b>	<i>profile-num</i> : Indicates the profile number.
<b>Description</b>	
<b>Command</b>	Interface configuration port
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ✎ Configuring the Maximum Number of Multicast Groups Supported by a Port

<b>Command</b>	<b>ipv6 mld snooping max-groups num</b>
<b>Parameter</b>	<i>num</i> : Indicates the number of groups.
<b>Description</b>	
<b>Command</b>	Interface configuration port
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ✎ Configuring Report Packet Suppression

<b>Command</b>	<b>ipv6 mld snooping suppression enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<p>When the Report packet suppression function is enabled, only the first Report packet of a specific VLAN and group is forwarded to a multicast router port within one query interval. The subsequent Report packets are forwarded to the multicast router port, so as to reduce the number of packets in the network.</p> <p>This function can only suppress the Report packets of MLDv1. It is invalid on the Report packets of MLDv2.</p>

#### ✎ Configuring Port Fast Leave

<b>Command</b>	<b>ipv6 mld snooping fast-leave enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	<p>When the port fast leave function is enabled, after receiving a Leave packet, the port is directly deleted from the member ports in the corresponding forwarding entries. Later, when receiving a relevant Group-Specific Query packet, the device does not forward the packet to this port. The Leaver packet includes the Leave packet of MLDv1, include type of MLDv2, and Report packet containing no source address.</p> <p>This function is applicable only to scenarios in which only one user is connected to a port, and helps save bandwidth and resources.</p>

#### ✎ Configuring Dynamic Multicast Router Port Learning

<b>Command</b>	<b>ipv6 mld snooping [ vlan vid ] mrouter learn</b>
<b>Parameter</b>	vlan-id: Specifies a VLAN ID. This function is applicable to all VLANs by default.
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	

<b>Usage Guide</b>	A multicast router port is a port that directly connects an MLD Snooping-enabled multicast device to a neighbor multicast device in which a multicast routing protocol is enabled. By default, when the dynamic multicast router port learning function is enabled, the device automatically listens to the MLD Query/PIM Hello packet and dynamically identifies a multicast router port.
--------------------	--

#### ▾ Configuring Aging Time of Dynamic Multicast Router Ports

<b>Command</b>	<b>ipv6 mld snooping dyn-mr-aging-time</b> <i>seconds</i>
<b>Parameter Description</b>	<b>seconds:</b> Indicates the aging time of dynamic multicast router ports. The unit is second and the value ranges from 1 to 3,600.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If a dynamic multicast router port does not receive an MLD General Query packet or a PIM Hello packet before the timeout of its aging time, the device deletes the port from the multicast router port list.  When the dynamic multicast router learning function is enabled, you can use this command to adjust the aging time of dynamic multicast router ports. If the aging time is too short, a multicast router port may be added and deleted frequently.

#### ▾ Configuring Aging Time of Dynamic Member Ports

<b>Command</b>	<b>ipv6 mld snooping host-aging-time</b> <i>seconds</i>
<b>Parameter Description</b>	<b>seconds:</b> Indicates the aging time.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The aging time of a dynamic member port refers to the aging time set when a dynamic member port of a device receives from the host an MLD packet of joining a certain IPv6 multicast group.  After receiving an MLD Join packet from a dynamic member port, the device resets the aging timer of the dynamic member port and sets the timer time to host-aging-time. If the timer times out, it is deemed that no user host receives multicast packets through this port, and then the multicast device deletes the port from the MLD Snooping member port list. After this command is configured, the aging timer value of dynamic member ports when MLD Join packets are received subsequently is host-aging-time. The aging time takes effect immediately after configuration and the timers of started member ports are updated.

#### ▾ Configuring Response Time of Query Packets

<b>Command</b>	<b>ipv6 mld snooping query-max-response-time</b> <i>seconds</i>
<b>Parameter Description</b>	<b>seconds:</b> Indicates the response time.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After receiving an MLD General Query packet from a port, the multicast device resets the aging timers of all dynamic member ports and sets the timer time to query-max-response-time. If the timer times out, it is deemed that no user host receives multicast packets through the port, and then the multicast device deletes the port from the MLD Snooping member portlist.  After receiving an MLD Group-Specific Query packet from a port, the multicast device resets the aging timers of all dynamic member ports in the specific group and sets the timer time to query-max-response-time. If the timer times

	<p>out, it is deemed that no user host receives multicast packets through the port, and then the multicast device deletes the port from the MLD Snooping member port list.</p> <p>The configuration takes effect when the a query packet is received next time, and the configuration of currently started timers are not updated. For Group-Specific Query packets of MLDv2, timers are not updated.</p>
--	---

### ▾ Checking Multicast Router Ports

<b>Command</b>	<b>show ipv6 mld snooping mroute</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, interface configuration mode
<b>Usage Guide</b>	<p>If a multicast router port is successfully configured, the mark "S" is shown in the interface information displayed. For example:</p> <pre>FS(config)#show ipv6 mld snooping mrouter Multicast Switching Mroute Port   D: DYNAMIC   S: STATIC (*, *, 1):   VLAN(1) 1 MROUTES:     GigabitEthernet 0/1(S)</pre>

### ▾ Checking Dynamic Multicast Router Port Learning

<b>Command</b>	<b>show ipv6 mld snooping</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, interface configuration mode
<b>Usage Guide</b>	<p>Run the <b>show ip igmp snooping</b> command to check the aging time and learning status of dynamic multicast router ports.</p> <pre>Dynamic Mroute Aging Time : 300(Seconds) Multicast router learning mode: Enable</pre>

### ▾ Checking Member Ports

<b>Command</b>	<b>show ipv6 mld snooping gda-table</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, interface configuration mode
<b>Usage Guide</b>	<p>If a member port is successfully configured, the mark "S" is shown in the interface information displayed. For example:</p>

```
FS(config)#show ipv6 mld snooping gda-table
Multicast Switching Cache Table
D: DYNAMIC
S: STATIC
M: MROUTE
(*, FF15:::100, 1):
VLAN(1) 2 OPORTS:
GigabitEthernet 3/7(S)
```

↘ **Checking Other Parameters**

<b>Command</b>	<b>show ipv6 mld snooping</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, interface configuration mode
<b>Usage Guide</b>	Run the <b>show ipv6 mld snooping</b> command to check the aging time of multicast router ports, aging time of dynamic member ports, response time of query packet, and Report packet suppression, and fast leave parameters.  MLD-snooping mode: IVGL  Source port check: Disable  MLD Fast-Leave: Disable  MLD Report suppress: Disable  Query Max Response Time: 10 (Seconds)  Dynamic Mroute Aging Time: 300(Seconds)  Dynamic Host Aging Time: 260(Seconds)

## 23.5 Monitoring

### Clearing

Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears MLD Snooping multicast forwarding entries.	<b>clear ipv6 mld snooping gda-table</b>
Clears MLD Snooping statistics.	<b>clear ipv6 mld snooping statistics</b>

### Displaying

Description	Command
Displays the current MLD Snooping mode.	<b>show ipv6 mld snooping</b>

Displays MLD Snooping forwarding entries.	<b>show ipv6 mld snooping gda-table</b>
Displays MLD Snooping statistics.	<b>show ipv6 mld snooping statistics</b>
Displays MLD Snooping multicast router ports.	<b>show ipv6 mld snooping mrouter</b>
Displays MLD Snooping interface information, interface filtering profiles and maximum number of groups that a port can join.	<b>show ipv6 mld snooping interfaces</b> <i>interface-type interface-name</i>
Displays multicast information about a single VLAN, on which MLD Snooping is configured.	<b>show ipv6 mld snooping vlan</b> <i>vid</i>
Displays an MLD Profile.	<b>show ipv6 mld profile</b> <i>profile-number</i>

## Security Configuration

1. Configuring AAA
2. Configuring RADIUS
3. Configuring TACACS+
4. Configuring SCC
5. Configuring Password Policy
6. Configuring Storm Control
7. Configuring SSH

8. Configuring URPF
9. Configuring CPP
10. Configuring DHCP Snooping
11. Configuring NFPP
12. Configuring Security-log

## 1 Configuring AAA

### 1.1 Overview

Authentication, authorization, and accounting (AAA) provides a unified framework for configuring the authentication, authorization, and accounting services. FS Networks devices support the AAA application.

AAA provides the following services in a modular way:

**Authentication:** Refers to the verification of user identities for network access and network services. Authentication is classified into local authentication and authentication through Remote Authentication Dial In User Service (RADIUS) and Terminal Access Controller Access Control System+ (TACACS+).

**Authorization:** Refers to the granting of specific network services to users according to a series of defined attribute-value (AV) pairs. The pairs describe what operations users are authorized to perform. AV pairs are stored on network access servers (NASs) or remote authentication servers.

**Accounting:** Refers to the tracking of the resource consumption of users. When accounting is enabled, NASs collect statistics on the network resource usage of users and send them in AV pairs to authentication servers. The records will be stored on authentication servers, and can be read and analyzed by dedicated software to realize the accounting, statistics, and tracking of network resource usage.

AAA is the most fundamental method of access control. FS Networks also provides other simple access control functions, such as local username authentication and online password authentication. Compared to them, AAA offers higher level of network security.

AAA has the following advantages:

- Robust flexibility and controllability
- Scalability
- Standards-compliant authentication
- Multiple standby systems

## 1.2 Applications

Application	Description
Configuring AAA in a Single-Domain Environment	AAA is performed for all the users in one domain.
Configuring AAA in a Multi-Domain Environment	AAA is performed for the users in different domains by using different methods.

### 1.2.1 Configuring AAA in a Single-Domain Environment

#### Scenario

In the network scenario shown in Figure 1- 1, the following application requirements must be satisfied to improve the security management on the NAS:

53. To facilitate account management and avoid information disclosure, each administrator has an individual account with different username and password.
54. Users must pass identity authentication before accessing the NAS. The authentication can be in local or centralized mode. It is recommended to combine the two modes, with centralized mode as active and local mode as standby. As a result, users must undergo authentication by the RADIUS server first. If the RADIUS server does not respond, it turns to local authentication.
55. During the authentication process, users can be classified and limited to access different NASs.
56. Permission management: Users managed are classified into Super User and Common User. Super users have the rights to view and configure the NAS, and common users are only able to view NAS configuration.
57. The AAA records of users are stored on servers and can be viewed and referenced for auditing. (The TACACS+ server in this example performs the accounting.)

Figure 1- 1

<b>Remarks</b>	<p>User A, User B, and User C are connected to the NAS in wired or wireless way.</p> <p>The NAS is an access or convergence switch.</p> <p>The RADIUS server can be the Windows 2000/2003 Server (IAS), UNIX system component, and dedicated server software provided by a vendor.</p> <p>The TACACS+ server can be the dedicated server software provided by a vendor.</p>
----------------	---

**Deployment**

- Enable AAA on the NAS.
- Configure an authentication server on the NAS.
- Configure local users on the NAS.
- Configure the authentication service on the NAS.
- Configure the authorization service on the NAS.
- Configure the accounting service on the NAS.

**1.2.2 Configuring AAA in a Multi-Domain Environment**

**Scenario**

Configure the domain-based AAA service on the NAS.

- A user can log in by entering the username PC1@FS.net or PC2@FS.com.cn and correct password on an 802.1X client.
- Permission management: Users managed are classified into Super User and Common User. Super users have the rights to view and configure the NAS, and common users are only able to view NAS configuration.
- The AAA records of users are stored on servers and can be viewed and referenced for auditing.

Figure 1- 2

<b>Remarks</b>	<p>The clients with the usernames PC1@FS.net and PC2@FS.com.cn are connected to the NAS in wired or wireless way.</p> <p>The NAS is an access or convergence switch.</p>
----------------	--

The Security Accounts Manager (SAM) server is a universal RADIUS server provided by FS Networks.

## Deployment

- Enable AAA on the NAS.
- Configure an authentication server on the NAS.
- Configure local users on the NAS.
- Define an AAA method list on the NAS.
- Enable domain-based AAA on the NAS.
- Create domains and AV sets on the NAS.

## 1.3 Features

### Basic Concepts

#### Local Authentication and Remote Server Authentication

Local authentication is the process where the entered passwords are verified by the database on the NAS.

Remote server authentication is the process where the entered passwords are checked by the database on a remote server. It is mainly implemented by the RADIUS server and TACACS+ server.

#### Method List

AAA is implemented using different security methods. A method list defines a method implementation sequence. The method list can contain one or more security protocols so that a standby method can take over the AAA service when the first method fails. On FS devices, the first method in the list is tried in the beginning and then the next is tried one by one if the previous gives no response. This method selection process continues until a security method responds or all the security methods in the list are tried out. Authentication fails if no method in the list responds.

A method list contains a series of security methods that will be queried in sequence to verify user identities. It allows you to define one or more security protocols used for authentication, so that the standby authentication method takes over services when the active security method fails. On FS devices, the first method in the list is tried in the beginning and then the next is tried one by one if the previous gives no response. This method selection process continues until a method responds or all the methods in the method list are tried out. Authentication fails if no method in the list responds.

 The next authentication method proceeds on FS devices only when the current method does not respond. When a method denies user access, the authentication process ends without trying other methods.

Figure 1- 3

Figure 1-3 shows a typical AAA network topology, where two RADIUS servers (R1 and R2) and one NAS are deployed. The NAS can be the client for the RADIUS servers.

Assume that the system administrator defines a method list, where the NAS selects R1 and R2 in sequence to obtain user identity information and then accesses the local username database on the server. For example, when a remote PC user initiates dial-up access, the NAS first queries the user's identity on R1. When the authentication on R1 is completed, R1 returns an Accept response to the NAS. Then the user is permitted to access the Internet. If R1 returns a Reject response, the user is denied Internet access and the connection is terminated. If R1 does not respond, the NAS considers that the R1 method times out and continues to query the user's identity on R2. This process continues as the NAS keeps trying the remaining authentication methods, until the user request is authenticated, rejected, or terminated. If all the authentication methods are responded with Timeout, authentication fails and the connection will be terminated.

-  The Reject response is different from the Timeout response. The Reject response indicates that the user does not meet the criteria of the available authentication database and therefore fails in authentication, and the Internet access request is denied. The Timeout response indicates that the authentication server fails to respond to the identity query. When detecting a timeout event, the AAA service proceeds to the next method in the list to continue the authentication process.
-  This document describes how to configure AAA on the RADIUS server. For details about the configuration on the TACACS+ server, see the *Configuring TACACS+*.

### AAA Server Group

You can define an AAA server group to include one or more servers of the same type. If the server group is referenced by a method list, the NAS preferentially sends requests to the servers in the referenced server group when the method list is used to implement AAA.

### VRF-Enabled AAA Group

Virtual private networks (VPNs) enable users to share bandwidths securely on the backbone networks of Internet service providers (ISPs). A VPN is a site set consisting of shared routes. An STA site connects to the network of an ISP through one or multiple interfaces. AAA supports assigning a VPN routing forwarding (VRF) table to each user-defined server group.

When AAA is implemented by the server in a group assigned with a VRF table, the NAS sends request packets to the remote servers in the server group. The source IP address of request packets is an address selected from the VRF table according to the IP addresses of the remote servers.

If you run the **ip radius/tacacs+ source-interface** command to specify the source interface for the request packets, the IP address obtained from the source interface takes precedence over the source IP address selected from the VRF table.

### Overview

Feature	Description
AAA Authentication	Verifies whether users can access the Internet.
AAA Authorization	Determines what services or permissions users can enjoy.
AAA Accounting	Records the network resource usage of users.
Multi-Domain AAA	Creates domain-specific AAA schemes for 802.1X stations (STAs) in different domains.
<u>Login Switch for the AAA Slave Device</u>	Provides a login switch to control login of the AAA slave device.
<u>Authorization Result Caching</u>	Caches authorization results returned from the server.

### 1.3.1 AAA Authentication

Authentication, authorization, and accounting are three independent services. The authentication service verifies whether users can access the Internet. During authentication, the username, password, and other user information are exchanged between devices to complete users' access or service requests. You can use only the authentication service of AAA.

-  To configure AAA authentication, you need to first configure an authentication method list. Applications perform authentication according to the method list. The method list defines the types of authentication and the sequence in which they are performed. Authentication methods are implemented by specified applications. The only exception is the default method list. All applications use the default method list if no method list is configured.

#### ▾ AAA Authentication Scheme

- No authentication (**none**)

The identity of trusted users is not checked. Normally, the no-authentication (None) method is not used.

- Local authentication (**local**)

Authentication is performed on the NAS, which is configured with user information (including usernames, passwords, and AV pairs). Before local authentication is enabled, run the **username password/secret** command to create a local user database.

- Remote server group authentication (**group**)

Authentication is performed jointly by the NAS and a remote server group through RADIUS or TACACS+. A server group consists of one or more servers of the same type. User information is managed centrally on a remote server, thus realizing multi-device centralized and unified authentication with high capacity and reliability. You can configure local authentication as standby to avoid authentication failures when all the servers in the server group fail.

#### ▾ AAA Authentication Types

FS products support the following authentication types:

- Login authentication

Users log in to the command line interface (CLI) of the NAS for authentication through Secure Shell (SSH), Telnet, and File Transfer Protocol (FTP).

- Enable authentication

After users log in to the CLI of the NAS, the users must be authenticated before CLI permission update. This process is called Enable authentication (in Privileged EXEC mode).

#### Related Configuration

##### ▾ Enabling AAA

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

##### ▾ Configuring an AAA Authentication Scheme

By default, no AAA authentication scheme is configured.

Before you configure an AAA authentication scheme, determine whether to use local authentication or remote server authentication. If the latter is to be implemented, configure a RADIUS or TACACS+ server in advance. If local authentication is selected, configure the local user database information on the NAS.

## ▾ Configuring an AAA Authentication Method List

By default, no AAA authentication method list is configured.

Determine the access mode to be configured in advance. Then configure authentication methods according to the access mode.

### 1.3.2 AAA Authorization

AAA authorization allows administrators to control the services or permissions of users. After AAA authorization is enabled, the NAS configures the sessions of users according to the user configuration files stored on the NAS or servers. After authorization, users can use only the services or have only the permissions permitted by the configuration files.

#### ▾ AAA Authorization Scheme

- Direct authorization (**none**)

Direct authorization is intended for highly trusted users, who are assigned with the default permissions specified by the NAS.

- Local authorization (**local**)

Local authorization is performed on the NAS, which authorizes users according to the AV pairs configured for local users.

- Remote server-group authorization (**group**)

Authorization is performed jointly by the NAS and a remote server group. You can configure local or direct authorization as standby to avoid authorization failures when all the servers in the server group fail.

#### ▾ AAA Authorization Types

- EXEC authorization

After users log in to the CLI of the NAS, the users are assigned with permission levels (0 to 15).

- Config-commands authorization

Users are assigned with the permissions to run specific commands in configuration modes (including the global configuration mode and sub-modes).

- Console authorization

After users log in through consoles, the users are authorized to run commands.

- Command authorization

Authorize users with commands after login to the CLI of the NAS.

- Network authorization

After users access the Internet, the users are authorized to use the specific session services. For example, after users access the Internet through PPP and Serial Line Internet Protocol (SLIP), the users are authorized to use the data service, bandwidth, and timeout service.

#### Related Configuration

##### ▾ Enabling AAA

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

##### ▾ Configuring an AAA Authorization Scheme

By default, no AAA authorization scheme is configured.

Before you configure an AAA authorization scheme, determine whether to use local authorization or remote server-group authorization. If remote server-group authorization needs to be implemented, configure a RADIUS or TACACS+ server in advance. If local authorization needs to be implemented, configure the local user database information on the NAS.

#### ✚ **Configuring an AAA Authorization Method List**

By default, no AAA authorization method list is configured.

Determine the access mode to be configured in advance. Then configure authorization methods according to the access mode.

### 1.3.3 AAA Accounting

In AAA, accounting is an independent process of the same level as authentication and authorization. During the accounting process, start-accounting, update-accounting, and end-accounting requests are sent to the configured accounting server, which records the network resource usage of users and performs accounting, audit, and tracking of users' activities.

In AAA configuration, accounting scheme configuration is optional.

#### ✚ **AAA Accounting Schemes**

- No accounting (**none**)

Accounting is not performed on users.

- Local accounting (**local**)

Accounting is completed on the NAS, which collects statistics on and limits the number of local user connections. Billing is not performed.

- Remote server-group accounting (**group**)

Accounting is performed jointly by the NAS and a remote server group. You can configure local accounting as standby to avoid accounting failures when all the servers in the server group fail.

#### ✚ **AAA Accounting Types**

- EXEC accounting

Accounting is performed when users log in to and out of the CLI of the NAS.

- Command accounting

Records are kept on the commands that users run on the CLI of the NAS.

- Network accounting

Records are kept on the sessions that users set up to access the Internet.

### Related Configuration

#### ✚ **Enabling AAA**

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

#### ✚ **Configuring an AAA Accounting Scheme**

By default, no AAA accounting method is configured.

Before you configure an AAA accounting scheme, determine whether to use local accounting or remote server-group accounting. If remote server-group accounting needs to be implemented, configure a RADIUS or TACACS+ server in advance. If local accounting needs to be implemented, configure the local user database information on the NAS.

### ✚ Configuring an AAA Accounting Method List

By default, no AAA accounting method list is configured.

Determine the access mode to be configured in advance. Then configure accounting methods according to the access mode.

### 1.3.4 Multi-Domain AAA

In a multi-domain environment, the NAS can provide the AAA services to users in different domains. The user AVs (such as usernames and passwords, service types, and permissions) may vary with different domains. It is necessary to configure domains to differentiate the user AVs in different domains and configure an AV set (including an AAA service method list, for example, RADIUS) for each domain.

Our products support the following username formats:

1. userid@domain-name
2. domain-name\userid
3. userid.domain-name
4. userid

The fourth format (userid) does not contain a domain name, and it is considered to use the **default** domain name.

The NAS provides the domain-based AAA service based on the following principles:

- Resolves the domain name carried by a user.
- Searches for the user domain according to the domain name.
- Searches for the corresponding AAA method list name according to the domain configuration information on the NAS.
- Searches for the corresponding method list according to the method list name.
- Provides the AAA services based on the method list.

**i** If any of the preceding procedures fails, the AAA services cannot be provided.

Figure 1-4 shows the typical multi-domain topology.

Figure 1-4

### Related Configuration

#### ✚ Enabling AAA

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

#### ▾ **Configuring an AAA Method List**

By default, no AAA method list is configured.

For details, see section 5.2.1, section 5.2.2, and section 5.2.3.

#### ▾ **Enabling the Domain-Based AAA Service**

By default, the domain-based AAA service is disabled.

To enable the domain-based AAA service, run the **aaa domain enable** command.

#### ▾ **Creating a Domain**

By default, no domain is configured.

To configure a domain, run the **aaa domain domain-name** command.

#### ▾ **Configuring an AV Set for a Domain**

By default, no domain AV set is configured.

A domain AV set contains the following elements: AAA method lists, the maximum number of online users, whether to remove the domain name from the username, and whether the domain name takes effect.

#### ▾ **Displaying Domain Configuration**

To display domain configuration, run the **show aaa domain** command.

 The system supports a maximum of 32 domains.

### **1.3.5 Login Switch for the AAA Slave Device**

A login switch is provided to control login of the AAA slave device. By default, the switch is off, so the slave device is not allowed to login. When the switch is turned on, the slave device can login.

#### **Related Configuration**

#### ▾ **Enabling AAA**

By default, AAA is disabled.

To enable AAA, run the **aaa new-model** command.

#### ▾ **Configuring a Login Switch for the AAA Slave Device**

By default, the slave device is not allowed to login.

Run the **aaa slave-login allow** command to permit login of the slave device.

### **1.3.6 Authorization Result Caching**

The AAA module caches authorization results returned from the server. Therefore, later authorizations at the same level can be operated based on the cached resources.

## Related Configuration

### ▾ Configuring Authorization Result Caching

By default, authorization results are not cached.

To enable authorization result caching, run the **aaa command-author cache** command.

## 1.4 Configuration

Configuration	Description and Command	
Configuring AAA Authentication	 Mandatory if user identities need to be verified.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa authentication login</b>	Defines a method list of login authentication.
	<b>aaa authentication enable</b>	Defines a method list of Enable authentication.
	<b>aaa authentication ppp</b>	Defines a method list of PPP authentication.
	<b>aaa authentication sslvpn</b>	Defines a method list of SSL VPN authentication.
	<b>login authentication</b>	Applies login authentication to a specific terminated line.
	<b>dot1x authentication</b>	Indicates 802.1x authentication.
	<b>aaa local authentication attempts</b>	Sets the maximum number of login attempts.
	<b>aaa local authentication lockout-time</b>	Sets the lockout time for a login user.
Configuring AAA Authorization	 Mandatory if different permissions and services need to be assigned to users.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa authorization exec</b>	Defines a method list of EXEC authorization.
	<b>aaa authorization commands</b>	Defines a method list of command authorization.
	<b>aaa authorization network</b>	Configures a method list of network authorization.
	<b>authorization exec</b>	Applies EXEC authorization methods to a specified VTY line.
	<b>authorization commands</b>	Applies command authorization methods to a specified VTY line.
Configuring AAA Accounting	 Mandatory if accounting, statistics, and tracking need to be performed on the network resource usage of users.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa accounting exec</b>	Defines a method list of EXEC accounting.
	<b>aaa accounting commands</b>	Defines a method list of command accounting.
	<b>aaa accounting network</b>	Defines a method list of network accounting.
	<b>accounting exec</b>	Applies EXEC accounting methods to a specified VTY line.
	<b>accounting commands</b>	Applies command accounting methods to a specified VTY line.
	<b>aaa accounting update</b>	Enables accounting update.

Configuration	Description and Command	
	<b>aaa accounting update periodic</b>	Configures the accounting update interval.
Configuring an AAA Server Group	 Recommended if a server group needs to be configured to handle AAA through different servers in the group.	
	<b>aaa group server</b>	Creates a user-defined AAA server group.
	<b>server</b>	Adds an AAA server group member.
	<b>ip vrf forwarding</b>	Configures the VRF attribute of an AAA server group.
Configuring the Domain-Based AAA Service	 Mandatory if AAA management of 802.1X access STAs needs to be performed according to domains.	
	<b>aaa new-model</b>	Enables AAA.
	<b>aaa domain enable</b>	Enables the domain-based AAA service.
	<b>aaa domain</b>	Creates a domain and enters domain configuration mode.
	<b>accounting network</b>	Associates the domain with a network accounting method list.
	<b>authorization network</b>	Associates the domain with a network authorization method list.
	<b>state</b>	Configures the domain status.
<b>username-format</b>	Configures whether to contain the domain name in usernames.	
<u>Configuring a Login Switch for the AAA Slave Device</u>	 Mandatory if a login switch needs to be configured for the AAA slave device.	
	<b>aaa slave-login allow</b>	Allows login of the slave device.
<u>Configuring Authorization Result Caching</u>	 Mandatory if later authorizations at the same level need to be operated based on the former results.	
	<b>aaa command-author cache</b>	Caches authorization results.

### 1.4.1 Configuring AAAAuthentication

#### Configuration Effect

Verify whether users are able to obtain access permission.

#### Notes

- If an authentication scheme contains multiple authentication methods, these methods are executed according to the configured sequence.
- The next authentication method is executed only when the current method does not respond. If the current method fails, the next method will be not tried.
- When the **none** method is used, users can get access even when no authentication method gets response. Therefore, the **none** method is used only as standby.
-  Normally, do not use None authentication. You can use the **none** method as the last optional authentication method in special cases. For example, all the users who may request access are trusted users and the users' work must not be delayed by system

faults. Then you can use the **none** method to assign access permissions to these users when the authentication server does not respond. It is recommended that the local authentication method be added before the **none** method.

- If AAA authentication is enabled but no authentication method is configured and the default authentication method does not exist, users can directly log in to the Console without being authenticated. If users log in by other means, the users must pass local authentication.
- When a user enters the CLI after passing login authentication (the **none** method is not used), the username is recorded. When the user performs Enable authentication, the user is not prompted to enter the username again, because the username that the user entered during login authentication is automatically filled in. However, the user must enter the password previously used for login authentication.
- The username is not recorded if the user does not perform login authentication when entering the CLI or the **none** method is used during login authentication. Then, a user is required to enter the username each time when performing Enable authentication.

## Configuration Steps

### ▾ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

### ▾ Defining a Method List of Login Authentication

- Run the **aaa authentication login** command to configure a method list of login authentication.
- This configuration is mandatory if you need to configure a login authentication method list (including the configuration of the default method list).
- By default, no method list of login authentication is configured.

### ▾ Defining a Method List of Enable Authentication

- Run the **aaa authentication enable** command to configure a method list of Enable authentication.
- This configuration is mandatory if you need to configure an Enable authentication method list. (You can configure only the default method list.)
- By default, no method list of Enable authentication is configured.

### ▾ Defining a Method List of PPP Authentication

- Run the **aaa authentication ppp** command to configure a method list of PPP authentication.
- This configuration is mandatory if you need to configure an authentication method list for PPP dial-up access.
- By default, no method list of PPP authentication is configured.

### ▾ Defining a Method List of SSL VPN Authentication

- Run the **aaa authentication sslvpn** command to configure a method list of SSL VPN authentication.
- This configuration is mandatory if you need to configure an SSL VPN authentication method list (including the configuration of the default method list).

- By default, no method list of SSL VPN authentication is configured.

#### ↘ Applying Login Authentication to a Specific Terminated Line

- In the Line mode, run the **login authentication** command to apply login authentication to a specific terminated line.
- This configuration is mandatory, if you need to apply login authentication to a specific terminated line.
- By default, the default method list is applied to all terminated lines.

#### ↘ Setting the Maximum Number of Login Attempts

- Optional.
- By default, a user is allowed to enter passwords up to three times during login.

#### ↘ Setting the Maximum Lockout Time After a Login Failure

- Optional.
- By default, a user is locked for 15 minutes after entering wrong passwords three times.

#### Verification

- Run the **show aaa method-list** command to display the configured method lists.
- Run the **show aaa lockout** command to display the settings of the maximum number of login attempts and the maximum lockout time after a login failure.
- Run the **show running-config** command to display the authentication method lists associated with login authentication authentication.

#### Related Commands

##### ↘ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

##### ↘ Defining a Method List of Login Authentication

<b>Command</b>	<b>aaa authentication login { default   list-name } method1 [ method2...]</b>
<b>Parameter</b>	<b>default:</b> With this parameter used, the configured method list will be defaulted.
<b>Description</b>	<p><i>list-name:</i> Indicates the name of a login authentication method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>local</b>, <b>none</b>, and <b>group</b>. A method list contains up to four methods.</p> <p><b>local:</b> Indicates that the local user database is used for authentication.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for authentication. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	<p>If the AAA login authentication service is enabled on the NAS, users must perform login authentication negotiation through AAA. Run the <b>aaa authentication login</b> command to configure the default or optional method lists for login authentication.</p> <p>In a method list, the next method is executed only when the current method does not receive response.</p> <p>After you configure login authentication methods, apply the methods to the VTY lines that require login authentication; otherwise, the methods will not take effect.</p>
--------------------	---

### ▾ Defining a Method List of Enable Authentication

<b>Command</b>	<b>aaa authentication enable default</b> <i>method1</i> [ <i>method2...</i> ]
<b>Parameter Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><b>list-name:</b> Indicates the name of an Enable authentication method list in characters.</p> <p><b>method:</b> Indicates authentication methods from <b>enable</b>, <b>local</b>, <b>none</b>, and <b>group</b>. A method list contains up to four methods.</p> <p><b>enable:</b> Indicates that the password that is configured using the <b>enable</b> command is used for authentication.</p> <p><b>local:</b> Indicates that the local user database is used for authentication.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for authentication. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If the AAA login authentication service is enabled on the NAS, users must perform Enable authentication negotiation through AAA. Run the <b>aaa authentication enable</b> command to configure the default or optional method lists for Enable authentication.</p> <p>In a method list, the next method is executed only when the current method does not receive response.</p>

### ▾ Defining a Method List of PPP or SSL VPN Authentication

<b>Command</b>	<b>aaa authentication { ppp   sslvpn } { default   list-name }</b> <i>method1</i> [ <i>method2...</i> ]
<b>Parameter Description</b>	<p><b>ppp:</b> Configures a method list of PPP authentication.</p> <p><b>sslvpn:</b> Configures a method list of SSL VPN authentication.</p> <p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><b>list-name:</b> Indicates the name of an PPP authentication method list in characters.</p> <p><b>method:</b> Indicates authentication methods from <b>local</b>, <b>none</b>, <b>group</b>, and <b>subs</b>. A method list contains up to four methods.</p> <p><b>local:</b> Indicates that the local user database is used for authentication.</p> <p><b>none:</b> Indicates that authentication is not performed.</p> <p><b>group:</b> Indicates that a server group is used for authentication. Currently, the RADIUS and the TACACS+ server group is supported.</p> <p><b>subs:</b> Specifies the SUBS authentication method using the SUBS database.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>If the AAA PPP authentication service is enabled on the NAS, users must perform PPP authentication negotiation through AAA. Run the <b>aaa authentication ppp</b> command to configure the default or optional method lists for PPP authentication.</p> <p>In a method list, the next method is executed only when the current method does not receive response.</p>

### Setting the Maximum Number of Login Attempts

<b>Command</b>	<b>aaa local authentication attempts</b> <i>max-attempts</i>
<b>Parameter Description</b>	<i>max-attempts</i> : Indicates the maximum number of login attempts. The value ranges from 0 to 2,147,483,647.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to set the maximum number of times a user can attempt to login. 0 indicates no limit.

### Setting the Maximum Lockout Time After a Login Failure

<b>Command</b>	<b>aaa local authentication lockout-time</b> <i>lockout-time</i>
<b>Parameter Description</b>	<i>lockout-time</i> : Indicates the time during which a user is locked after entering wrong passwords up to the specified times. The value ranges from 1 to 2,147,483,647, in the unit of minutes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to set the maximum time during which a user is locked after entering wrong passwords up to the specified times.

## Configuration Example

### Configuring AAA Login Authentication

Configure a login authentication method list on the NAS containing **group** *radius* and **local** methods in order.

<b>Scenario</b> Figure 1-5	
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if group-server authentication needs to be implemented. Configure the local user database information on the NAS if local authentication needs to be implemented. (This example requires the configuration of a RADIUS server and local database information.)</p> <p>Step 3: Configure an AAA authentication method list for login authentication users. (This example uses <b>group</b> <i>radius</i> and <b>local</b> in order.)</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authentication method is used.</p>
<b>NAS</b>	<pre> FS#configure terminal FS(config)#username user password pass FS(config)#aaa new-model FS(config)#radius-server host 10.1.1.1 FS(config)#radius-server key FS FS(config)#aaa authentication login list1 group radius local FS(config)#line vty 0 20 </pre>

	<pre>FS(config-line)#login authentication list1 FS(config-line)#exit</pre>
<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre>FS#show aaa method-list  Authentication method-list:  aaa authentication login list1 group radius local  Accounting method-list:  Authorization method-list:</pre>
	<p>Assume that a user remotely logs in to the NAS through Telnet. The user is prompted to enter the username and password on the CLI.</p> <p>The user must enter the correct username and password to access the NAS.</p>
<b>User</b>	<pre>User Access Verification  Username:user  Password:pass</pre>

### 📌 Configuring AAA Enable Authentication

Configure an Enable authentication method list on the NAS containing **group radius, local**, and then **enable** methods in order.

<p><b>Scenario</b></p> <p><b>Figure 1- 6</b></p>	<pre> graph LR     User[User] --- Gi01[Gi 0/1] --- NAS[NAS]     NAS --- Gi02[Gi 0/2] --- Server[Server]     Server --- IP[10.1.1.1]     </pre>
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if group-server authentication needs to be implemented. Configure the local user database information on the NAS if local authentication needs to be implemented. Configure Enable authentication passwords on the NAS if you use Enable password authentication.</p> <p>Step 3: Configure an AAA authentication method list for Enable authentication users.</p> <p><b>i</b> You can define only one Enable authentication method list globally. You do not need to define the list name but just default it. After that, it will be applied automatically.</p>
<b>NAS</b>	<pre>FS#configure terminal FS(config)#username user privilege 15 password pass FS(config)#enable secret w</pre>

	<pre>FS(config)#aaa new-model FS(config)#radius-server host 10.1.1.1 FS(config)#radius-server key FS FS(config)#aaa authentication enable default group radius local enable</pre>
<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre>FS#show aaa method-list  Authentication method-list:  aaa authentication enable default group radius local enable  Accounting method-list:  Authorization method-list:</pre>
	The CLI displays an authentication prompt when the user level is updated to level 15. The user must enter the correct username and password to access the NAS.
<b>NAS</b>	<pre>FS&gt;enable Username:user Password:pass FS#</pre>

### Common Errors

- No RADIUS server or TACACS+ server is configured.
- Usernames and passwords are not configured in the local database.

### 1.4.2 Configuring AAAAuthorization

#### Configuration Effect

- Determine what services or permissions authenticated users can enjoy.

#### Notes

- EXEC authorization is often used with login authentication, which can be implemented on the same line. Authorization and authentication can be performed using different methods and servers. Therefore, the results of the same user may be different. If a user passes login authentication but fails in EXEC authorization, the user cannot enter the CLI.
- The authorization methods in an authorization scheme are executed in accordance with the method configuration sequence. The next authorization method is executed only when the current method does not receive response. If authorization fails using a method, the next method will be not tried.

- Command authorization is supported only by TACACS+.
- Console authorization: The FSOS can differentiate between the users who log in through the Console and the users who log in through other types of clients. You can enable or disable command authorization for the users who log in through the Console. If command authorization is disabled for these users, the command authorization method list applied to the Console line no longer takes effect.

## Configuration Steps

### ▾ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

### ▾ Defining a Method List of EXEC Authorization

- Run the **aaa authorization exec** command to configure a method list of EXEC authorization.
- This configuration is mandatory if you need to configure an EXEC authorization method list (including the configuration of the default method list).
- By default, no EXEC authorization method list is configured.
-  The default access permission level of EXEC users is the lowest. (Console users can connect to the NAS through the Console port or Telnet. Each connection is counted as an EXEC user, for example, a Telnet user and SSH user.)

### ▾ Defining a Method List of Command Authorization

- Run the **aaa authorization commands** command to configure a method list of command authorization.
- This configuration is mandatory if you need to configure a command authorization method list (including the configuration of the default method list).
- By default, no command authorization method list is configured.

### ▾ Configuring a Method List of Network Authorization

- Run the **aaa authorization network** command to configure a method list of network authorization.
- This configuration is mandatory if you need to configure a network authorization method list (including the configuration of the default method list).
- By default, no authorization method is configured.

### ▾ Applying EXEC Authorization Methods to a Specified VTY Line

- Run the **authorization exec** command in line configuration mode to apply EXEC authorization methods to a specified VTY line.
- This configuration is mandatory if you need to apply an EXEC authorization method list to a specified VTY line.
- By default, all VTY lines are associated with the default authorization method list.

### ▾ Applying Command Authorization Methods to a Specified VTY Line

- Run the **authorization commands** command in line configuration mode to apply command authorization methods to a specified VTY line.

- This configuration is mandatory if you need to apply a command authorization method list to a specified VTY line.
- By default, all VTY lines are associated with the default authorization method list.

#### ✚ Enabling Authorization for Commands in Configuration Modes

- Run the **aaa authorization config-commands** command to enable authorization for commands in configuration modes.
- By default, authorization is disabled for commands in configuration modes.

#### ✚ Enabling Authorization for the Console to Run Commands

- Run the **aaa authorization console** command to enable authorization for console users to run commands.
- By default, authorization is disabled for the Console to run commands.

#### Verification

Run the **show running-config** command to verify the configuration.

#### Related Commands

##### ✚ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

##### ✚ Defining a Method List of EXEC Authorization

<b>Command</b>	<b>aaa authorization exec { default   list-name } method1 [ method2...]</b>
<b>Parameter Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of an EXEC authorization method list in characters.</p> <p><i>method:</i> Specifies authentication methods from <b>local</b>, <b>none</b>, and <b>group</b>. A method list contains up to four methods.</p> <p><b>local:</b> Indicates that the local user database is used for EXEC authorization.</p> <p><b>none:</b> Indicates that EXEC authorization is not performed.</p> <p><b>group:</b> Indicates that a server group is used for EXEC authorization. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The FSOS supports authorization of the users who log in to the CLI of the NAS to assign the users CLI operation permission levels (0 to 15). Currently, EXEC authorization is performed only on the users who have passed login authentication. If a user fails in EXEC authorization, the user cannot enter the CLI.</p> <p>After you configure EXEC authorization methods, apply the methods to the VTY lines that require EXEC authorization; otherwise, the methods will not take effect.</p>

##### ✚ Defining a Method List of Command Authorization

<b>Command</b>	<b>aaa authorization commands level { default   list-name } method1 [ method2...]</b>
<b>Parameter</b>	<b>default:</b> With this parameter used, the configured method list will be defaulted.

<b>Description</b>	<p><i>list-name</i>: Indicates the name of a command authorization method list in characters.</p> <p><i>method</i>: Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none</b>: Indicates that command authorization is not performed.</p> <p><b>group</b>: Indicates that a server group is used for command authorization. Currently, the TACACS+ server group is supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The FSOS supports authorization of the commands executable by users. When a user enters a command, AAA sends the command to the authentication server. If the authentication server permits the execution, the command is executed. If the authentication server forbids the execution, the command is not executed and a message is displayed showing that the execution is rejected.</p> <p>When you configure command authorization, specify the command level, which is used as the default level. (For example, if a command above Level 14 is visible to users, the default level of the command is 14.)</p> <p>After you configure command authorization methods, apply the methods to the VTY lines that require command authorization; otherwise, the methods will not take effect.</p>

#### ↘ Configuring a Method List of Network Authorization

<b>Command</b>	<b>aaa authorization network { default   list-name } method1 [ method2...]</b>
<b>Parameter Description</b>	<p><b>default</b>: With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name</i>: Indicates the name of a network authorization method list in characters.</p> <p><i>method</i>: Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none</b>: Indicates that authentication is not performed.</p> <p><b>group</b>: Indicates that a server group is used for network authorization. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The FSOS supports authorization of network-related service requests such as PPP and SLIP requests. After authorization is configured, all authenticated users or interfaces are authorized automatically.</p> <p>You can configure three different authorization methods. The next authorization method is executed only when the current method does not receive response. If authorization fails using a method, the next method will be not tried.</p> <p>RADIUS or TACACS+ servers return a series of AV pairs to authorize authenticated users. Network authorization is based on authentication. Only authenticated users can perform network authorization.</p>

#### ↘ Enabling Authorization for Commands in Configuration Modes (Including the Global Configuration Mode and Sub-Modes)

<b>Command</b>	<b>aaa authorization config-commands</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If you need to enable authorization for commands only in non-configuration modes (for example, privileged EXEC mode), disable authorization in configuration modes by using the <b>no</b> form of this command. Then users can run commands in configuration mode and sub-modes without authorization.

### ▾ Enabling Authorization for the Console to Run Commands

<b>Command</b>	<b>aaa authorization console</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The FSOS can differentiate between the users who log in through the Console and the users who log in through other types of clients. You can enable or disable command authorization for the users who log in through the Console. If command authorization is disabled for these users, the command authorization method list applied to the Console line no longer takes effect.

### Configuration Example

#### ▾ Configuring AAA EXEC Authorization

Configure login authentication and EXEC authorization for users on VTY lines 0 to 4. Login authentication is performed in local mode, and EXEC authorization is performed on a RADIUS server. If the RADIUS server does not respond, users are redirected to the local authorization.

<b>Scenario</b> Figure 1-7	
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if remote server-group authorization needs to be implemented. If local authorization needs to be implemented, configure the local user database information on the NAS.</p> <p>Step 3: Configure an AAA authorization method list according to different access modes and service types.</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authorization method is used. EXEC authorization is often used with login authentication, which can be implemented on the same line.</p>
<b>NAS</b>	<pre> FS#configure terminal FS(config)#username user password pass FS(config)#username user privilege 6 FS(config)#aaa new-model FS(config)#radius-server host 10.1.1.1 FS(config)#radius-server key test FS(config)#aaa authentication login list1 group local FS(config)#aaa authorization exec list2 group radius local FS(config)#line vty 0 4 FS(config-line)#login authentication list1 FS(config-line)# authorization exec list2 FS(config-line)#exit </pre>

<b>Verification</b>	Run the <b>show run</b> and <b>show aaa method-list</b> commands on the NAS to display the configuration.
<b>NAS</b>	<pre> FS#show aaa method-list  Authentication method-list:  aaa authentication login list1 group local  Accounting method-list:  Authorization method-list:  aaa authorization exec list2 group radius local </pre>
	<pre> FS# show running-config  aaa new-model ! aaa authorization exec list2 group local aaa authentication login list1 group radius local ! username user password pass username user privilege 6 ! radius-server host 10.1.1.1 radius-server key 7 093b100133 ! line con 0 line vty 0 4   authorization exec list2   login authentication list1 ! End </pre>

### 📌 Configuring AAA Command Authorization

Provide command authorization for login users according to the following default authorization method: Authorize level-15 commands first by using a TACACS+ server. If the TACACS+ server does not respond, local authorization is performed. Authorization is applied to the users who log in through the Console and the users who log in through other types of clients.

<b>Scenario</b> <b>Figure 1- 8</b>	
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>Step 2: Configure a RADIUS or TACACS+ server in advance if remote server-group authorization needs to be implemented. If local authorization needs to be implemented, configure the local user database information on the NAS.</p> <p>Step 3: Configure an AAA authorization method list according to different access modes and service types.</p> <p>Step 4: Apply the configured method list to an interface or line. Skip this step if the default authorization method is used.</p>
<b>NAS</b>	<pre> FS#configure terminal FS(config)#username user1 password pass1 FS(config)#username user1 privilege 15 FS(config)#aaa new-model FS(config)#tacacs-server host 192.168.217.10 FS(config)#tacacs-server key aaa FS(config)#aaa authentication login default local FS(config)#aaa authorization commands 15 default group tacacs+ local FS(config)#aaa authorization console </pre>
<b>Verification</b>	<p>Run the <b>show run</b> and <b>show aaa method-list</b> commands on the NAS to display the configuration.</p>
<b>NAS</b>	<pre> FS#show aaa method-list  Authentication method-list: aaa authentication login default local  Accounting method-list:  Authorization method-list: aaa authorization commands 15 default group tacacs+ local </pre>
	<pre> FS#show run  ! aaa new-model ! aaa authorization console aaa authorization commands 15 default group tacacs+ local aaa authentication login default local </pre>

```

↘ **Configuring AAA Network Authorization**

<p><b>Scenario</b> Figure 1- 9</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA.                  Step 2: Configure a RADIUS or TACACS+ server in advance if remote server-group authorization needs to be implemented. If local authorization needs to be implemented, configure the local user database information on the NAS.                  Step 3: Configure an AAA authorization method list according to different access modes and service types.                  Step 4: Apply the configured method list to an interface or line. Skip this step if the default authorization method is used.</p>
<p><b>NAS</b></p>	<pre> FS#configure terminal FS(config)#aaa new-model FS(config)#radius-server host 10.1.1.1 FS(config)#radius-server key test FS(config)#aaa authorization network default group radius none FS(config)# end                 </pre>

<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre>FS#show aaa method-list  Authentication method-list:  Accounting method-list:  Authorization method-list:  aaa authorization network default group radius none</pre>

### Common Errors

N/A

### 1.4.3 Configuring AAA Accounting

#### Configuration Effect

- Record the network resource usage of users.
- Record the user login and logout processes and the commands executed by users during device management.

#### Notes

About accounting methods:

- If an accounting scheme contains multiple accounting methods, these methods are executed according to the method configuration sequence. The next accounting method is executed only when the current method does not receive response. If accounting fails using a method, the next method will be not tried.
- After the default accounting method list is configured, it is applied to all VTY lines automatically. If a non-default accounting method list is applied to a line, it will replace the default one. If you apply an undefined method list to a line, the system will display a message indicating that accounting on this line is ineffective. Accounting will take effect only when a defined method list is applied.

EXEC accounting:

- EXEC accounting is performed only when login authentication on the NAS is completed. EXEC accounting is not performed if login authentication is not configured or the **none** method is used for authentication. If Start accounting is not performed for a user upon login, Stop accounting will not be performed when the user logs out.

Command accounting

- Only the TACACS+ protocol supports command accounting.

#### Configuration Steps

##### ▾ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.

- By default, AAA is disabled.

#### ▾ Defining a Method List of EXEC Accounting

- Run the **aaa accounting exec** command to configure a method list of EXEC accounting.
- This configuration is mandatory if you need to configure an EXEC accounting method list (including the configuration of the default method list).
- The default access permission level of EXEC users is the lowest. (Console users can connect to the NAS through the Console port or Telnet. Each connection is counted as an EXEC user, for example, a Telnet user and SSH user.)
- By default, no EXEC accounting method list is configured.

#### ▾ Defining a Method List of Command Accounting

- Run the **aaa accounting commands** command to configure a method list of command accounting.
- This configuration is mandatory if you need to configure a command accounting method list (including the configuration of the default method list).
- By default, no command accounting method list is configured. Only the TACACS+ protocol supports command accounting.

#### ▾ Defining a Method List of Network Accounting

- Run the **aaa accounting network** command to configure a method list of network accounting.
- This configuration is mandatory if you need to configure a network accounting method list (including the configuration of the default method list).
- By default, no network accounting method list is configured.

#### ▾ Applying EXEC Accounting Methods to a Specified VTY Line

- Run the **accounting exec** command in line configuration mode to apply EXEC accounting methods to a specified VTY line.
- This configuration is mandatory if you need to apply an EXEC accounting method list to a specified VTY line.
- You do not need to run this command if you apply the default method list.
- By default, all VTY lines are associated with the default accounting method list.

#### ▾ Applying Command Accounting Methods to a Specified VTY Line

- Run the **accounting commands** command in line configuration mode to apply command accounting methods to a specified VTY line.
- This configuration is mandatory if you need to apply a command accounting method list to a specified VTY line.
- You do not need to run this command if you apply the default method list.
- By default, all VTY lines are associated with the default accounting method list.

#### ▾ Enabling Accounting Update

- Optional.
- It is recommended that accounting update be configured for improved accounting accuracy.
- By default, accounting update is disabled.

### ▾ Configuring the Accounting Update Interval

- Optional.
- It is recommended that the accounting update interval not be configured unless otherwise specified.

#### Verification

Run the **show running-config** command to verify the configuration.

#### Related Commands

### ▾ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

### ▾ Defining a Method List of EXEC Accounting

<b>Command</b>	<b>aaa accounting exec { default   list-name } start-stop method1 [ method2...]</b>
<b>Parameter Description</b>	<p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of an EXEC accounting method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none:</b> Indicates that EXEC accounting is not performed.</p> <p><b>group:</b> Indicates that a server group is used for EXEC accounting. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The FSOS enables EXEC accounting only when login authentication is completed. EXEC accounting is not performed if login authentication is not performed or the <b>none</b> authentication method is used.</p> <p>After accounting is enabled, when a user logs in to the CLI of the NAS, the NAS sends a start-accounting message to the authentication server. When the user logs out, the NAS sends a stop-accounting message to the authentication server. If the NAS does not send a start-accounting message when the user logs in, the NAS will not send a stop-accounting message when the user logs out.</p> <p>After you configure EXEC accounting methods, apply the methods to the VTY lines that require EXEC accounting; otherwise, the methods will not take effect.</p>

### ▾ Defining a Method List of Command Accounting

<b>Command</b>	<b>aaa accounting commands level { default   list-name } start-stop method1 [ method2...]</b>
<b>Parameter Description</b>	<p><i>level:</i> Indicates the command level for which accounting will be performed. The value ranges from 0 to 15. After a command of the configured level is executed, the accounting server records related information based on the received accounting packet.</p> <p><b>default:</b> With this parameter used, the configured method list will be defaulted.</p> <p><i>list-name:</i> Indicates the name of a command accounting method list in characters.</p> <p><i>method:</i> Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p>

	<p><b>none</b>: Indicates that command accounting is not performed.</p> <p><b>group</b>: Indicates that a server group is used for command accounting. Currently, the TACACS+ server group is supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>The FSOS enables command accounting only when login authentication is completed. Command accounting is not performed if login authentication is not performed or the <b>none</b> authentication method is used. After accounting is enabled, the NAS records information about the commands of the configured level that users run and sends the information to the authentication server.</p> <p>After you configure command accounting methods, apply the methods to the VTY lines that require command accounting; otherwise, the methods will not take effect.</p>

### ▾ Defining a Method List of Network Accounting

<b>Command</b>	<b>aaa accounting network { default   list-name } start-stop method1 [ method2...]</b>
<b>Parameter Description</b>	<p><b>default</b>: With this parameter used, the configured method list will be defaulted.</p> <p><b>list-name</b>: Indicates the name of a network accounting method list in characters.</p> <p><b>start-stop</b>: Indicates that a start-accounting message and a stop-accounting message are sent when a user accesses a network and when the user disconnects from the network respectively. The start-accounting message indicates that the user is allowed to access the network, regardless of whether accounting is successfully enabled.</p> <p><b>method</b>: Indicates authentication methods from <b>none</b> and <b>group</b>. A method list contains up to four methods.</p> <p><b>none</b>: Indicates that network accounting is not performed.</p> <p><b>group</b>: Indicates that a server group is used for network accounting. Currently, the RADIUS and TACACS+ server groups are supported.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The FSOS sends record attributes to the authentication server to perform accounting of user activities. The <b>start-stop</b> keyword is used to configure user accounting options.

### ▾ Enabling Accounting Update

<b>Command</b>	<b>aaa accounting update</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Accounting update cannot be used if the AAA services are not enabled. After the AAA services are enabled, run this command to enable accounting update.

### ▾ Configuring the Accounting Update Interval

<b>Command</b>	<b>aaa accounting update periodic interval</b>
<b>Parameter Description</b>	<b>interval</b> : Indicates the accounting update interval, in the unit of minutes. The shortest is 1 minute.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Accounting update cannot be used if the AAA services are not enabled. After the AAA services are enabled, run this command to configure the accounting update interval.

## Configuration Example

### Configuring AAA EXEC Accounting

Configure login authentication and EXEC accounting for users on VTY lines 0 to 4. Login authentication is performed in local mode, and EXEC accounting is performed on a RADIUS server.

<b>Scenario</b> <b>Figure 1- 10</b>	
<b>Configuration Steps</b>	<p>Step 1: Enable AAA.</p> <p>If remote server-group accounting needs to be implemented, configure a RADIUS or TACACS+ server in advance.</p> <p>Step 2: Configure an AAA accounting method list according to different access modes and service types.</p> <p>Step 3: Apply the configured method list to an interface or line. Skip this step if the default accounting method is used.</p>
<b>NAS</b>	<pre> FS#configure terminal FS(config)#username user password pass FS(config)#aaa new-model FS(config)#radius-server host 10.1.1.1 FS(config)#radius-server key test FS(config)#aaa authentication login list1 group local FS(config)#aaa accounting exec list3 start-stop group radius FS(config)#line vty 0 4 FS(config-line)#login authentication list1 FS(config-line)# accounting exec list3 FS(config-line)#exit </pre>
<b>Verification</b>	<p>Run the <b>show run</b> and <b>show aaa method-list</b> commands on the NAS to display the configuration.</p>
<b>NAS</b>	<pre> FS#show aaa method-list  Authentication method-list: aaa authentication login list1 group local  Accounting method-list: aaa accounting exec list3 start-stop group radius  Authorization method-list: </pre>
	<pre> FS# show running-config aaa new-model </pre>

```

!
aaa accounting exec list3 start-stop group radius
aaa authentication login list1 group local
!
username user password pass
!
radius-server host 10.1.1.1
radius-server key 7 093b100133
!
line con 0
line vty 0 4
    accounting exec list3
    login authentication list1
!
End
    
```

### ⚡ Configuring AAA Command Accounting

Configure command accounting for login users according to the default accounting method. Login authentication is performed in local mode, and command accounting is performed on a TACACS+ server.

<p><b>Scenario</b> Figure 1- 11</p>	
<p><b>Configuration Steps</b></p>	<p>Step 1: Enable AAA. If remote server-group accounting needs to be implemented, configure a RADIUS or TACACS+ server in advance. Step 2: Configure an AAA accounting method list according to different access modes and service types. Step 3: Apply the configured method list to an interface or line. Skip this step if the default accounting method is used.</p>
<p><b>NAS</b></p>	<pre> FS#configure terminal FS(config)#username user1 password pass1 FS(config)#username user1 privilege 15 FS(config)#aaa new-model FS(config)#tacacs-server host 192.168.217.10 FS(config)#tacacs-server key aaa FS(config)#aaa authentication login default local     </pre>

	FS(config)#aaa accounting commands 15 default start-stop group tacacs+
<b>Verification</b>	Run the <b>show aaa method-list</b> command on the NAS to display the configuration.
<b>NAS</b>	<pre> FS#show aaa method-list  Authentication method-list:  aaa authentication login default local  Accounting method-list:  aaa accounting commands 15 default start-stop group tacacs+  Authorization method-list: </pre>
	<pre> FS#show run  !  aaa new-model  !  aaa authorization config-commands  aaa accounting commands 15 default start-stop group tacacs+  aaa authentication login default local  !  !  nfpp  !  vlan 1  !  username user1 password0pass1  username user1 privilege 15  no service password-encryption  !  tacacs-server host 192.168.217.10  tacacs-server key aaa  !  line con 0  line vty 0 4 </pre>

```

!
!
end

```

### Common Errors

N/A

## 1.4.4 Configuring an AAA Server Group

### Configuration Effect

- Create a user-defined server group and add one or more servers to the group.
- When you configure authentication, authorization, and accounting method lists, name the methods after the server group name so that the servers in the group are used to handle authentication, authorization, and accounting requests.
- Use self-defined server groups to separate authentication, authorization, and accounting.

### Notes

In a user-defined server group, you can specify and apply only the servers in the default server group.

### Configuration Steps

#### ▾ Creating a User-Defined AAA Server Group

- Mandatory.
- Assign a meaningful name to the user-defined server group. Do not use the predefined **radius** and **tacacs+** keywords in naming.

#### ▾ Adding an AAA Server Group Member

- Mandatory.
- Run the **server** command to add AAA server group members.
- By default, a user-defined server group does not have servers.

#### ▾ Configuring the VRF Attribute of an AAA Server Group

- Optional.
- Run the **ip vrf forwarding** command to configure the VRF attribute of an AAA server group.
- By default, the AAA server group belongs to the global VRF table.

### Verification

Run the **show aaa group** command to verify the configuration.

### Related Commands

#### ▾ Creating a User-Defined AAA Server Group

Command	<code>aaa group server {radius   tacacs+} name</code>
---------	---

<b>Parameter Description</b>	<i>name</i> : Indicates the name of the server group to be created. The name must not contain the <b>radius</b> and <b>tacacs+</b> keywords because they are the names of the default RADIUS and TACACS+ server groups.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure an AAA server group. Currently, the RADIUS and TACACS+ server groups are supported.

➤ **Adding an AAA Server Group Member**

<b>Command</b>	<b>server</b> <i>ip-addr</i> [ <b>auth-port</b> <i>port1</i> ] [ <b>acct-port</b> <i>port2</i> ]
<b>Parameter Description</b>	<i>ip-addr</i> : Indicates the IP address of a server. <i>port1</i> : Indicates the authentication port of a server. (This parameter is supported only by the RADIUS server group.) <i>port2</i> : Indicates the accounting port of a server. (This parameter is supported only by the RADIUS server group.)
<b>Command Mode</b>	Server group configuration mode
<b>Usage Guide</b>	When you add servers to a server group, the default ports are used if you do not specify ports.

➤ **Configuring the VRF Attribute of an AAA Server Group**

<b>Command</b>	<b>ip vrf forwarding</b> <i>vrf_name</i>
<b>Parameter Description</b>	<i>vrf_name</i> : Indicates the name of a VRF table.
<b>Command Mode</b>	Server group configuration mode
<b>Usage Guide</b>	Use this command to assign a VRF table to the specified server group.

**Configuration Example**

➤ **Creating an AAA Server Group**

Create RADIUS server groups named g1 and g2. The IP addresses of the servers in g1 are 10.1.1.1 and 10.1.1.2, and the IP addresses of the servers in g2 are 10.1.1.3 and 10.1.1.4.

<p><b>Scenario</b> Figure 1- 12</p>	
<p><b>Prerequisites</b></p>	<ol style="list-style-type: none"> <li>1. The required interfaces, IP addresses, and VLANs have been configured on the network, network connections have been set up, and the routes from the NAS to servers are reachable.</li> <li>2. Enable AAA.</li> </ol>

<p><b>Configuration Steps</b></p>	<p>Step 1: Configure a server (which belongs to the default server group).                  Step 2: Create user-defined AAA server groups.                  Step 3: Add servers to the AAA server groups.</p>
<p><b>NAS</b></p>	<pre> FS#configure terminal FS(config)#radius-server host 10.1.1.1 FS(config)#radius-server host 10.1.1.2 FS(config)#radius-server host 10.1.1.3 FS(config)#radius-server host 10.1.1.4 FS(config)#radius-server key secret FS(config)#aaa group server radius g1 FS(config-gs-radius)#server 10.1.1.1 FS(config-gs-radius)#server 10.1.1.2 FS(config-gs-radius)#exit FS(config)#aaa group server radius g2 FS(config-gs-radius)#server 10.1.1.3 FS(config-gs-radius)#server 10.1.1.4 FS(config-gs-radius)#exit                 </pre>
<p><b>Verification</b></p>	<p>Run the <b>show aaa group</b> and <b>show run</b> commands on the NAS to display the configuration.</p>
<p><b>NAS</b></p>	<pre> FS#show aaa group Type      Reference Name ----- radius    1          radius tacacs+   1          tacacs+ radius    1          g1 radius    1          g2                 </pre>
	<pre> FS#show run ! radius-server host 10.1.1.1 radius-server host 10.1.1.2 radius-server host 10.1.1.3 radius-server host 10.1.1.4 radius-server key secret !                 </pre>

```
aaa group server radius g1
server 10.1.1.1
server 10.1.1.2
!
aaa group server radius g2
server 10.1.1.3
server 10.1.1.4
!
!
```

### Common Errors

- For RADIUS servers that use non-default authentication and accounting ports, when you run the **server** command to add servers, specify the authentication or accounting port.
- Only the RADIUS server group can be configured with the VRF attribute.

### 1.4.5 Configuring the Domain-Based AAA Service

#### Configuration Effect

Create AAA schemes for 802.1X users in different domains.

#### Notes

About referencing method lists in domains:

- The AAA method lists that you select in domain configuration mode should be defined in advance. If the method lists are not defined in advance, when you select them in domain configuration mode, the system prompts that the configurations do not exist.
- The names of the AAA method lists selected in domain configuration mode must be consistent with those of the method lists defined for the AAA service. If they are inconsistent, the AAA service cannot be properly provided to the users in the domain.

About the default domain:

- Default domain: After the domain-based AAA service is enabled, if a username does not carry domain information, the AAA service is provided to the user based on the default domain. If the domain information carried by the username is not configured in the system, the system determines that the user is unauthorized and will not provide the AAA service to the user. If the default domain is not configured initially, it must be created manually.
- When the domain-based AAA service is enabled, the default domain is not configured by default and needs to be created manually. The default domain name is **default**. It is used to provide the AAA service to the users whose usernames do not carry domain information. If the default domain is not configured, the AAA service is not available for the users whose usernames do not carry domain information.

About domain names:

- The domain names carried by usernames and those configured on the NAS are matched in the longest matching principle. For example, if two domains, **domain.com** and **domain.com.cn** are configured on a NAS and a user sends a request carrying **aaa@domain.com**, the NAS determines that the user belongs to **domain.com**, instead of **domain.com.cn**.
- If the username of an authenticated user carries domain information but the domain is not configured on the NAS, the AAA service is not provided to the user.

## Configuration Steps

### ✚ Enabling AAA

- Mandatory.
- Run the **aaa new-model** command to enable AAA.
- By default, AAA is disabled.

### ✚ Enabling the Domain-Based AAA Service

- Mandatory.
- Run the **aaa domain enable** command to enable the domain-based AAA service.
- By default, the domain-based AAA service is disabled.

### ✚ Creating a Domain and Entering Domain Configuration Mode

- Mandatory.
- Run the **aaa domain** command to create a domain or enter the configured domain.
- By default, no domain is configured.

### ✚ Associating the Domain with an 802.1X Authentication Method List

- Run the **authentication login** command to associate the domain with the login authentication method list.
- Run the **authentication enable** command to associate the domain with the enable authentication method list.
- This configuration is mandatory if you need to specify the login or enable authentication method list to the domain.
- If no authentication method list is specified, the default list is enabled.

### ✚ Associating the Domain with a Network Accounting Method List

- Run the **accounting network** command to associate the domain with a network accounting method.
- This configuration is mandatory if you need to apply a specified network accounting method list to the domain.
- If a domain is not associated with a network accounting method list, by default, the global default method list is used for accounting.

### ✚ Associating the Domain with a Commands, or EXEC Accounting Method List

- Run the **accounting {commands | exec} { default | /list-name }** command to associate the domain with a commands, or EXEC accounting method.
- This configuration is mandatory if you need to apply a specified commands, or EXEC accounting method list to the domain.
- If a domain is not associated with a commands, or EXEC accounting method list, by default, the global default method list is used for accounting.

### ↘ Associating the Domain with a Network Authorization Method List

- Run the **authorization network** command to associate the domain with a network authorization method list.
- This configuration is mandatory if you need to apply a specified network authorization method list to the domain.
- If a domain is not associated with a network authorization method list, by default, the global default method list is used for authorization.

### ↘ Associating the Domain with a Commands, or EXEC Authorization Method List

- Run the **authorization{commands|exec}{default|list-name}** command to associate the domain with a commands, or EXEC authorization method list.
- This configuration is mandatory if you need to apply a specified commands or EXEC authorization method list to the domain.
- If a domain is not associated with a commands or EXEC authorization method list, by default, the global default method list is used for authorization.

### ↘ Configuring the Domain Status

- Optional.
- When a domain is in Block state, the users in the domain cannot log in.
- By default, after a domain is created, its state is Active, indicating that all the users in the domain are allowed to request network services.

### ↘ Configuring Whether to Contain the Domain Name in Usernames

- Optional.
- By default, the usernames exchanged between the NAS and an authentication server carry domain information.

### ↘ Configuring the Maximum Number of Domain Users

- Optional.
- By default, the maximum number of access users allowed in a domain is not limited.

### Verification

Run the **show aaa domain** command to verify the configuration.

### Related Commands

#### ↘ Enabling AAA

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To enable the AAA services, run this command. None of the rest of AAA commands can be effective if AAA is not enabled.

#### ↘ Enabling the Domain-Based AAA Service

<b>Command</b>	<b>aaa domain enable</b>
----------------	--------------------------

<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Use this command to enable the domain-based AAA service.

#### ↘ Creating a Domain and Entering Domain Configuration Mode

<b>Command</b>	<b>aaa domain</b> { <b>default</b>   <i>domain-name</i> }
<b>Parameter</b>	<b>default</b> : Uses this parameter to configure the default domain.
<b>Description</b>	<i>domain-name</i> : Indicates the name of the domain to be created.
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Use this command to configure a domain to provide the domain-based AAA service. The <b>default</b> parameter specifies the default domain. If a username does not carry domain information, the NAS uses the method list associated with the default domain to provide the AAA service to the user. The <i>domain-name</i> parameter specifies the name of the domain to be created. If the domain name carried by a username matches the configured domain name, the NAS uses the method list associated with this domain to provide the AAA service to the user. The system supports a maximum of 32 domains.

#### ↘ Associating the Domain with an Login Authentication Method List

<b>Command</b>	<b>authentication login</b> { <b>default</b>   <i>list-name</i> }
<b>Parameter</b>	<b>default</b> : Indicates that the default method list is used.
<b>Description</b>	<i>list-name</i> : Indicates the name of the method list to be associated.
<b>Command</b>	Domain configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Use this command to associate the domain with a login authentication method list.

#### ↘ Associating the Domain with an Enable Authentication Method List

<b>Command</b>	<b>authentication enable</b> { <b>default</b>   <i>list-name</i> }
<b>Parameter</b>	<b>default</b> : Indicates that the default method list is used.
<b>Description</b>	<i>list-name</i> : Indicates the name of the method list to be associated.
<b>Command</b>	Domain configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Use this command to associate the domain with an Enable authentication method list.

#### ↘ Associating the Domain with a Network Accounting Method List

<b>Command</b>	<b>accounting network</b> { <b>default</b>   <i>list-name</i> }
<b>Parameter</b>	<b>default</b> : Indicates that the default method list is used.
<b>Description</b>	<i>list-name</i> : Indicates the name of the method list to be associated.
<b>Command</b>	Domain configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Use this command to associate the domain with a network accounting method list.

#### ↘ Associating the Domain with a Commands Accounting Method List

<b>Command</b>	<b>accounting commands</b> { <b>default</b>   <i>list-name</i> }
----------------	--

<b>Parameter</b>	<b>default:</b> Indicates that the default method list is used.
<b>Description</b>	<i>list-name:</i> Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command to associate the domain with a Commands accounting method list.

#### ↘ Associating the Domain with an EXEC Accounting Method List

<b>Command</b>	<b>accounting exec { default   list-name }</b>
<b>Parameter</b>	<b>default:</b> Indicates that the default method list is used.
<b>Description</b>	<i>list-name:</i> Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command to associate the domain with an EXEC accounting method list.

#### ↘ Associating the Domain with a Network Authorization Method List

<b>Command</b>	<b>authorization network { default   list-name }</b>
<b>Parameter</b>	<b>default:</b> Indicates that the default method list is used.
<b>Description</b>	<i>list-name:</i> Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	

#### ↘ Associating the Domain with a Commands Authorization Method List

<b>Command</b>	<b>authorization commands { default   list-name }</b>
<b>Parameter</b>	<b>default:</b> Indicates that the default method list is used.
<b>Description</b>	<i>list-name:</i> Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Associating the Domain with an EXEC Authorization Method List

<b>Command</b>	<b>authorization exec { default   list-name }</b>
<b>Parameter</b>	<b>default:</b> Indicates that the default method list is used.
<b>Description</b>	<i>list-name:</i> Indicates the name of the method list to be associated.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Domain Status

<b>Command</b>	<b>state { block   active }</b>
<b>Parameter</b>	<b>block:</b> Indicates that the configured domain is invalid.
<b>Description</b>	<b>active:</b> Indicates that the configured domain is valid.
<b>Command Mode</b>	Domain configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Use this command to make the configured domain valid or invalid.

#### ▾ Configuring Whether to Contain the Domain Name in Usernames

<b>Command</b>	<b>username-format { without-domain   with-domain }</b>
<b>Parameter Description</b>	<b>without-domain:</b> Indicates to remove domain information from usernames. <b>with-domain:</b> Indicates to keep domain information in usernames.
<b>Command Mode</b>	Domain configuration mode
<b>Usage Guide</b>	Use this command in domain configuration mode to determine whether to include domain information in usernames when the NAS interacts with authentication servers in a specified domain.

#### Common Errors

N/A

### 1.4.6 Configuring a Login Switch for the AAA Slave Device

#### Configuration Effect

When the switch is turned on, the slave device is allowed to login; otherwise, the slave device cannot login.

The configuration remains valid unless a change is made.

#### Notes

The **aaa new-model** command should be run first.

#### Configuration Steps

##### ▾ Configuring a Login Switch for the AAA Slave Device

- Optional.
- By default, the slave device is not allowed to login.

#### Verification

Run the **show run** command to verify the configuration.

#### Related Commands

##### ▾ Configuring a Login Switch for the AAA Slave Device

<b>Command</b>	<b>aaa slave-login allow</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	By default, the switch is off, so the slave device is not allowed to login. When the switch is turned on, the slave device can login.

## Configuration Example

### Configuring a Login Switch for the AAA Slave Device

<b>Scenario</b> <b>Figure 1-13</b>	
<b>Configuration Steps</b>	<p>The following example shows how to configure a login switch for the AAA slave device</p> <p>Step 1: Enable AAA.</p> <p>Step 2: Turn on the login switch.</p>
<b>NAS</b>	<pre>FS#configure terminal FS(config)#aaa new-model FS(config)#aaa slave-login allow</pre>
<b>Verification</b>	<p>Run the <b>show run</b> command on the NAS to display the configuration.</p>
<b>NAS</b>	<pre>FS#sh run   inc aaa</pre>
	<pre>aaa new-model aaa slave-login allow</pre>

### Common Errors

N/A

## 1.4.7 Configuring Authorization Result Caching

### Configuration Effect

After this feature is configured, the AAA module caches authorization results returned from the server. Therefore, later authorizations at the same level can be operated based on the cache.

### Notes

The cached authorization results, originating from specific levels of sessions and commands, can be applied only to sessions and commands at these levels.

### Configuration Steps

#### Configuring Authorization Result Caching

- Optional.
- By default, authorization results are not cached.

### Verification

Run the **show run** command to verify the configuration.

**Related Commands**

▾ **Configuring Authorization Result Caching**

<b>Command</b>	<b>aaa command-author cache</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The AAA device caches authorization results returned from the server. Therefore, later authorizations at the same level can be operated based on the cached resources.

**Configuration Example**

▾ **Configuring Authorization Result Caching**

<b>Scenario</b> Figure 1-14

## 2 Configuring RADIUS

### 2.1 Overview

The Remote Authentication Dial-In User Service (RADIUS) is a distributed client/server system.

RADIUS works with the Authentication, Authorization, and Accounting (AAA) to conduct identity authentication on users who attempt to access a network, to prevent unauthorized access. In FSOS implementation, a RADIUS client runs on a device or Network Access Server (NAS) and transmits identity authentication requests to the central RADIUS server, where all user identity authentication information and network service information are stored. In addition to the authentication service, the RADIUS server provides authorization and accounting services for access users.

RADIUS is often applied in network environments that have high security requirements and allow the access of remote users. RADIUS is a completely open protocol and the RADIUS server is installed on many operating systems as a component, for example, on UNIX, Windows 2000, and Windows 2008. Therefore, RADIUS is the most widely applied security server currently.

The Dynamic Authorization Extensions to Remote Authentication Dial In User Service is defined in the IETF RFC3576. This protocol defines a user offline management method. Devices communicate with the RADIUS server through the Disconnect-Messages (DMs) to bring authenticated users offline. This protocol implements compatibility between devices of different vendors and the RADIUS server in terms of user offline processing.

In the DM mechanism, the RADIUS server actively initiates a user offline request to a device, the device locates a user according to the user session information, user name, and other information carried in the request and brings the user offline. Then, the device returns a response packet that carries the processing result to the RADIUS server, thereby implementing user offline management of the RADIUS server.

### Protocols and Standards

- RFC2865: Remote Authentication Dial In User Service (RADIUS)
- RFC2866: RADIUS Accounting
- RFC2867: RADIUS Accounting Modifications for Tunnel Protocol Support
- RFC2869: RADIUS Extensions
- RFC3576: Dynamic Authorization Extensions to Remote Authentication Dial In User Service (RADIUS)

## 2.2 Applications

Application	Description
Providing Authentication, Authorization, and Accounting Services for Access Users	Authentication, authorization, and accounting are conducted on access users on a network, to prevent unauthorized access or operations.
Forcing Users to Go Offline	The server forces an authenticated user to go offline.

### 2.2.1 Providing Authentication, Authorization, and Accounting Services for Access Users

#### Scenario

RADIUS is typically applied in the authentication, authorization, and accounting of access users. A network device serves as a RADIUS client and transmits user information to a RADIUS server. After completing processing, the RADIUS server returns the authentication acceptance/authentication rejection/accounting response information to the RADIUS client. The RADIUS client performs processing on the access user according to the response from the RADIUS server.

Figure 2- 1 Typical RADIUS Networking Topology

Remarks	
	<p>PC 1 and PC 2 are connected to the RADIUS client as access users in wired or wireless mode, and initiate authentication and accounting requests.</p> <p>The RADIUS client is usually an access switch or aggregate switch.</p> <p>The RADIUS server can be a component built in the Windows 2000/2003, Server (IAS), or UNIX operating system or dedicated server software provided by vendors.</p>

#### Deployment

- Configure access device information on the RADIUS server, including the IP address and shared key of the access devices.
- Configure the AAA method list on the RADIUS client.
- Configure the RADIUS server information on the RADIUS client, including the IP address and shared key.
- Enable access control on the access port of the RADIUS client.
- Configure the network so that the RADIUS client communicates with the RADIUS server successfully.

### 2.2.2 Forcing Users to Go Offline

#### Scenario

The RADIUS server forces authenticated online users to go offline for the sake of management.

See Figure 2- 1 for the networking topology.

#### Deployment

- Add the following deployment on the basis of 1.2.1 "Deployment".
- Enable the RADIUS dynamic authorization extension function on the RADIUS client.

## 2.3 Features

### Basic Concepts

#### Client/Server Mode

- **Client:** A RADIUS client initiates RADIUS requests and usually runs on a device or NAS. It transmits user information to the RADIUS server, receives responses from the RADIUS server, and performs processing accordingly. The processing includes accepting user access, rejecting user access, or collecting more user information for the RADIUS server.
- **Server:** Multiple RADIUS clients map to one RADIUS server. The RADIUS server maintains the IP addresses and shared keys of all RADIUS clients as well as information on all authenticated users. It receives requests from a RADIUS client, conducts authentication, authorization, and accounting, and returns processing information to the RADIUS client.

#### Structure of RADIUS Packets

The following figure shows the structure of RADIUS packets.

- **Code:** Identifies the type of RADIUS packets, which occupies one byte. The following table lists the values and meanings.

Code	Packet Type	Code	Packet Type
1	Access-Request	4	Accounting-Request
2	Access-Accept	5	Accounting-Response
3	Access-Reject	11	Access-Challenge

- **Identifier:** Indicates the identifier for matching request packets and response packets, which occupies one byte. The identifier values of request packets and response packets of the same type are the same.
- **Length:** Identifies the length of a whole RADIUS packet, which includes **Code**, **Identifier**, **Length**, **Authenticator**, and **Attributes**. It occupies two bytes. Bytes that are beyond the **Length** field will be truncated. If the length of a received packet is smaller than the value of **Length**, the packet is discarded.
- **Authenticator:** Verifies response packets of the RADIUS server by a RADIUS client, which occupies 16 bytes. This field is also used for encryption/decryption of user passwords.
- **Attributes:** Carries authentication, authorization, and accounting information, with the length unfixed. The **Attributes** field usually contains multiple attributes. Each attribute is represented in the Type, Length, Value (TLV) format. Type occupies one byte and indicates the attribute type. The following table lists common attributes of RADIUS authentication, authorization, and

accounting. Length occupies one byte and indicates the attribute length, with the unit of bytes. Value indicates the attribute information.

Attribute No.	Attribute Name	Attribute No.	Attribute Name
1	User-Name	43	Acct-Output-Octets
2	User-Password	44	Acct-Session-Id
3	CHAP-Password	45	Acct-Authentic
4	NAS-IP-Address	46	Acct-Session-Time
5	NAS-Port	47	Acct-Input-Packets
6	Service-Type	48	Acct-Output-Packets
7	Framed-Protocol	49	Acct-Terminate-Cause
8	Framed-IP-Address	50	Acct-Multi-Session-Id
9	Framed-IP-Netmask	51	Acct-Link-Count
10	Framed-Routing	52	Acct-Input-Gigawords
11	Filter-ID	53	Acct-Output-Gigawords
12	Framed-MTU	55	Event-Timestamp
13	Framed-Compression	60	CHAP-Challenge
14	Login-IP-Host	61	NAS-Port-Type
15	Login-Service	62	Port-Limit
16	Login-TCP-Port	63	Login-LAT-Port
18	Reply-Message	64	Tunnel-Type
19	Callback-Number	65	Tunnel-Medium-Type
20	Callback-ID	66	Tunnel-Client-Endpoint
22	Framed-Route	67	Tunnel-Server-Endpoint
23	Framed-IPX-Network	68	Acct-Tunnel-Connection
24	State	69	Tunnel-Password
25	Class	70	ARAP-Password
26	Vendor-Specific	71	ARAP-Features
27	Session-Timeout	72	ARAP-Zone-Access
28	Idle-Timeout	73	ARAP-Security
29	Termination-Action	74	ARAP-Security-Data
30	Called-Station-Id	75	Password-Retry
31	Calling-Station-Id	76	Prompt
32	NAS-Identifier	77	Connect-Info
33	Proxy-State	78	Configuration-Token
34	Login-LAT-Service	79	EAP-Message
35	Login-LAT-Node	80	Message-Authenticator
36	Login-LAT-Group	81	Tunnel-Private-Group-id
37	Framed-AppleTalk-Link	82	Tunnel-Assignment-id
38	Framed-AppleTalk-Network	83	Tunnel-Preference
39	Framed-AppleTalk-Zone	84	ARAP-Challenge-Response
40	Acct-Status-Type	85	Acct-Interim-Interval
41	Acct-Delay-Time	86	Acct-Tunnel-Packets-Lost
42	Acct-Input-Octets	87	NAS-Port-Id

### ✚ Shared Key

A RADIUS client and a RADIUS server mutually confirm their identities by using a shared key during communication. The shared key cannot be transmitted over a network. In addition, user passwords are encrypted for transmission for the sake of security.

### ✚ RADIUS Server Group

The RADIUS security protocol, also called RADIUS method, is configured in the form of a RADIUS server group. Each RADIUS method corresponds to one RADIUS server group and one or more RADIUS servers can be added to one RADIUS server group. For details about the RADIUS method, see the *Configuring AAA*. If you add multiple RADIUS servers to one RADIUS server group, when the communication between a device and the first RADIUS server in this group fails or the first RADIUS server becomes unreachable, the device automatically attempts to communicate with the next RADIUS server till the communication is successful or the communication with all the RADIUS servers fails.

### ✚ RADIUS Attribute Type

- Standard attributes
- The RFC standards specify the RADIUS attribute numbers and attribute content but do not specify the format of some attribute types. Therefore, the format of attribute contents needs to be configured to adapt to different RADIUS server requirements. Currently, the format of the RADIUS Calling-Station-ID attribute (attribute No.: 31) can be configured.

The RADIUS Calling-Station-ID attribute is used to identify user identities when a network device transmits request packets to the RADIUS server. The RADIUS Calling-Station-ID attribute is a string, which can adopt multiple formats. It needs to uniquely identify a user. Therefore, it is often set to the MAC address of a user. For example, when IEEE 802.1X authentication is used, the Calling-Station-ID attribute is set to the MAC address of the device where the IEEE 802.1X client is installed. The following table describes the format of MAC addresses.

Format	Description
ietf	Indicates the standard format specified in the IETF standard (RFC3580), which is separated by the separator (-). Example: 00-D0-F8-33-22-AC
Normal	Indicates the common format that represents a MAC address (dotted hexadecimal format), which is separated by the separator (.). Example: 00d0.f833.22ac
Unformatted	Indicates the format without separators. This format is used by default. Example: 00d0f83322ac

- Private attributes

RADIUS is an extensible protocol. According to RFC2865, the Vendor-Specific attribute (attribute No.: 26) is used by device vendors to extend the RADIUS protocol to implement private functions or functions that are not defined in the standard RADIUS protocol. Table 1-3 lists private attributes supported by FS products. The **TYPE** column indicates the default configuration of private attributes of FS products and the **Extended TYPE** column indicates the default configuration of private attributes of other non-FS products.

ID	Function	TYPE	Extended TYPE
1	max-down-rate	1	76
2	port-priority	2	77
3	user-ip	3	3
4	vlan-id	4	4
5	last-supPLICANT-version	5	5

ID	Function	TYPE	Extended TYPE
6	net-ip	6	6
7	user-name	7	7
8	password	8	8
9	file-directory	9	9
10	file-count	10	10
11	file-name-0	11	11
12	file-name-1	12	12
13	file-name-2	13	13
14	file-name-3	14	14
15	file-name-4	15	15
16	max-up-rate	16	16
17	current-supplicant-version	17	17
18	flux-max-high32	18	18
19	flux-max-low32	19	19
20	proxy-avoid	20	20
21	dailup-avoid	21	21
22	ip-privilege	22	22
23	login-privilege	42	42
27	ipv4-multicast-address	87	87
62	sdg-type	62	62
85	sdg-zone-name	85	85
103	sdg-group-name	103	103

## Overview

Feature	Description
RADIUS Authentication, Authorization, and Accounting	Conducts identity authentication and accounting on access users, safeguards network security, and facilitates management for network administrators.
Source Address of RADIUS Packets	Specifies the source IP address used by a RADIUS client to transmit packets to a RADIUS server.
RADIUS Timeout Retransmission	Specifies the packet retransmission parameter for a RADIUS client when a RADIUS server does not respond to packets transmitted from the RADIUS client within a period of time.
RADIUS Server Accessibility Detection	Enables a RADIUS client to actively detect whether a RADIUS server is reachable and maintain the accessibility of each RADIUS server. A reachable RADIUS server is selected preferentially to improve the handling performance of RADIUS services.
RADIUS Forced Offline	Enables a RADIUS server to actively force authenticated users to go offline.

### 2.3.1 RADIUS Authentication, Authorization, and Accounting

Conduct identity authentication and accounting on access users, safeguard network security, and facilitate management for network administrators.

#### Working Principle

Figure 2- 2

The RADIUS authentication and authorization process is described as follows:

1. A user enters the user name and password and transmits them to the RADIUS client.
2. After receiving the user name and password, the RADIUS client transmits an authentication request packet to the RADIUS server. The password is encrypted for transmission. For the encryption method, see RFC2865.
3. The RADIUS server accepts or rejects the authentication request according to the user name and password. When accepting the authentication request, the RADIUS server also issues authorization information apart from the authentication acceptance information. The authorization information varies with the type of access users.

The RADIUS accounting process is described as follows:

1. If the RADIUS server returns authentication acceptance information in Step (3), the RADIUS client sends an accounting start request packet to the RADIUS server immediately.
2. The RADIUS server returns the accounting start response packet, indicating accounting start.
3. The user stops accessing network resources and requests the RADIUS client to disconnect the network connection.
4. The RADIUS client transmits the accounting end request packet to the RADIUS server.
5. The RADIUS server returns the accounting end response packet, indicating accounting end.
6. The user is disconnected and cannot access network resources.

## Related Configuration

### ▾ Configuring RADIUS Server Parameters

No RADIUS server is configured by default.

You can run the **radius-server host** command to configure a RADIUS server.

At least one RADIUS server must be configured so that RADIUS services run normally.

#### ▾ **Configuring the AAA Authentication Method List**

No AAA authentication method list is configured by default.

You can run the **aaa authentication** command to configure a method list for different user types and select **group radius** when setting the authentication method.

The RADIUS authentication can be conducted only after the AAA authentication method list of relevant user types is configured.

#### ▾ **Configuring the AAA Authorization Method List**

No AAA authorization method list is configured by default.

You can run the **aaa authorization** command to configure an authorization method list for different user types and select **group radius** when setting the authorization method.

The RADIUS authorization can be conducted only after the AAA authorization method list of relevant user types is configured.

#### ▾ **Configuring the AAA Accounting Method List**

No AAA accounting method list is configured by default.

You can run the **aaa accounting** command to configure an accounting method list for different user types and select **group radius** when setting the accounting method.

The RADIUS accounting can be conducted only after the AAA accounting method list of relevant user types is configured.

### **2.3.2 Source Address of RADIUS Packets**

Specify the source IP address used by a RADIUS client to transmit packets to a RADIUS server.

#### **Working Principle**

When configuring RADIUS, specify the source IP address to be used by a RADIUS client to transmit RADIUS packets to a RADIUS server, in an effort to reduce the workload of maintaining a large amount of NAS information on the RADIUS server.

#### **Related Configuration**

The global routing is used to determine the source address for transmitting RADIUS packets by default.

Run the **ip radius source-interface** command to specify the source interface for transmitting RADIUS packets. The device uses the first IP address of the specified interface as the source address of RADIUS packets.

### **2.3.3 RADIUS Timeout Retransmission**

#### **Working Principle**

After a RADIUS client transmits a packet to a RADIUS server, a timer is started to detect the response of the RADIUS server. If the RADIUS server does not respond within a certain period of time, the RADIUS client retransmits the packet.

#### **Related Configuration**

### ✚ Configuring the RADIUS Server Timeout Time

The default timeout time is 5 seconds.

You can run the **radius-server timeout** command to configure the timeout time. The value ranges from 1 second to 1,000 seconds.

The response time of a RADIUS server is relevant to its performance and the network environment. Set an appropriate timeout time according to actual conditions.

### ✚ Configuring the Retransmission Count

The default retransmission count is 3.

You can run the **radius-server retransmit** command to configure the retransmission count. The value ranges from 1 to 100.

### ✚ Configuring Whether to Retransmit Accounting Update Packets

Accounting update packets are not retransmitted by default.

You can run the **radius-server account update retransmit** command to configure retransmission of accounting update packets for authenticated users.

## 2.3.4 RADIUS Server Accessibility Detection

### Working Principle

A RADIUS client actively detects whether a RADIUS server is reachable and maintains the accessibility of each RADIUS server. A reachable RADIUS server is selected preferentially to improve the handling performance of RADIUS services.

### Related Configuration

#### ✚ Configuring the Criteria for the Device to Judge That a RADIUS Server Is Unreachable

The default criteria configured for judging that a RADIUS server is unreachable meet the two conditions simultaneously: 1. The device does not receive a correct response packet from the RADIUS security server within 60 seconds. 2. The device transmits the request packet to the same RADIUS security server for consecutive 10 times.

You can run the **radius-server dead-criteria** command to configure the criteria for the device to judge that the RADIUS security server is unreachable.

#### ✚ Configuring the Test User Name for Actively Detecting the RADIUS Security Server

No test user name is specified for actively detecting the RADIUS security server by default.

You can run the **radius-server host x.x.x.testusername xxx** command to configure the test user name.

## 2.3.5 RADIUS Forced Offline

### Working Principle

Figure 2- 3 DM Message Exchange of the RADIUS Dynamic Authorization Extension Protocol

The preceding figure shows the exchange of DM messages between the RADIUS server and the device. The RADIUS server transmits the Disconnect-Request message to UDP Port 3799 of the device. After processing, the device returns the Disconnect-Response message that carries the processing result to the RADIUS server.

**Related Configuration**

N/A

**2.4 Configuration**

Configuration	Description and Command	
RADIUS Basic Configuration	(Mandatory) It is used to configure RADIUS authentication, authorization, and accounting.	
	<b>radius-serverhost</b>	Configures the IP address of the remote RADIUS security server.
	<b>radius-serverkey</b>	Configures the shared key for communication between the device and the RADIUS server.
	<b>radius-serverretransmit</b>	Configures the request transmission count, after which the device confirms that a RADIUS server is unreachable.
	<b>radius-servertimeout</b>	Configures the waiting time, after which the device retransmits a request.
	<b>radius-server account update retransmit</b>	Configures retransmission of accounting update packets for authenticated users.
	<b>ip radius source-interface</b>	Configures the source address of RADIUS packets.
Configuring the RADIUS Attribute Type	(Optional) It is used to define attribute processing adopted when the device encapsulates and parses RADIUS packets.	
	<b>radius-serverattribute31</b>	Configures the MAC address format of RADIUS attribute No. 31 (Calling-Station-ID).
	<b>radius set qoscos</b>	Sets the private attribute port-priority issued by the server to the COS value of an interface. For COS-relevant concepts, see the <i>Configuring QoS</i> .
	<b>radius support cui</b>	Configures the device to support the CUI attribute.
Configuring RADIUS Accessibility Detection	(Optional) It is used to detect whether a RADIUS server is reachable and maintain the accessibility of the RADIUS server.	
	<b>radius-server dead-criteria</b>	Configures the global criteria for judging that a RADIUS security server is unreachable.
	<b>radius-server deadtime</b>	Configures the duration for the device to stop transmitting request packets to an unreachable RADIUS server.

Configuration	Description and Command
	<p><b>radius-server host</b></p> <p>Configures the IP address of the remote RADIUS security server, authentication port, accounting port, and active detection parameters.</p>

## 2.4.1 RADIUS Basic Configuration

### Configuration Effect

- RADIUS authentication, authorization, and accounting can be conducted after RADIUS basic configuration is complete.

### Notes

- Before configuring RADIUS on the device, ensure that the network communication of the RADIUS server is in good condition.
- When running the **ip radius source-interface** command to configure the source address of RADIUS packets, ensure that the device of the source IP address communicates with the RADIUS server successfully.

### Configuration Steps

#### ▾ Configuring the Remote RADIUS Security Server

- Mandatory.
- Configure the IP address, authentication port, accounting port, and shared key of the RADIUS security server.

#### ▾ Configuring the Shared Key for Communication Between the Device and the RADIUS Server

- Optional.
- Configure a shared key in global configuration mode for servers without a shared key.

The shared key on the device must be consistent with that on the RADIUS server.

#### ▾ Configuring the Request Transmission Count, After Which the Device Confirms That a RADIUS Server Is Unreachable

- Optional.
- Configure the request transmission count, after which the device confirms that a RADIUS server is unreachable, according to the actual network environment.

#### ▾ Configuring the Waiting Time, After which the Device Retransmits a Request

- Optional.
- Configure the waiting time, after which the device retransmits a request, according to the actual network environment.

In an 802.1X authentication environment that uses the RADIUS security protocol, if a network device serves as the 802.1X authenticator and FS SU is used as the 802.1X client software, it is recommended that **radius-server timeout** be set to 3 seconds (the default value is 5 seconds) and **radius-server retransmit** be set to 2 (the default value is 3) on the network device.

#### ▾ Configuring the Source Address of RADIUS Packets

- Optional.
- Configure the source address of RADIUS packets according to the actual network environment.

### Verification

- Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using RADIUS.
- Enable the device to interact with the RADIUS server. Conduct packet capture to confirm that the device communicates with the RADIUS server over the RADIUS protocol.

## Related Commands

### ▾ Configuring the Remote RADIUS Security Server

<b>Command</b>	<b>radius-server host</b> [ oob [ <i>viamgmt_name</i> ] ] { <i>ipv4-address</i> } [auth-port <i>port-number</i> ] [acct-port <i>port-number</i> ][ test username <i>name</i> [ idle-time <i>time</i> ] [ ignore-auth-port ] [ ignore-acct-port ] ] [ key [ 0   7 ] <i>text-string</i> ]
<b>Parameter Description</b>	<p><b>oob</b>: Indicates oob authentication, that is, the source interface for transmitting packets to the RADIUS server is an mgmt port.</p> <p><b>viamgmt_name</b>: Specifies a specific mgmt port when oob supports multiple mgmt ports.</p> <p><b>ipv4-address</b>: Indicates the IPv4 address of the RADIUS security server.</p> <p><b>auth-port<i>port-number</i></b>: Indicates the UDP port for RADIUS identity authentication. The value ranges from 0 to 65,535. If it is set to 0, the host does not conduct identity authentication.</p> <p><b>acct-port<i>port-number</i></b>: Indicates the UDP port for RADIUS accounting. The value ranges from 0 to 65,535. If it is set to 0, the host does not conduct accounting.</p> <p><b>test username <i>name</i></b>: Enables the function of actively detecting the RADIUS security server and specifies the user name used for active detection.</p> <p><b>idle-time <i>time</i></b>: Indicates the interval for the device to transmit test packets to a reachable RADIUS security server. The default value is 60 minutes. The value ranges from 1 minute to 1,440 minutes (24 hours).</p> <p><b>ignore-auth-port</b>: Disables the function of detecting the authentication port of the RADIUS security server. It is enabled by default.</p> <p><b>ignore-acct-port</b>: Disables the function of detecting the accounting port of the RADIUS security server. It is enabled by default.</p> <p><b>key [ 0   7 ] <i>text-string</i></b>: Configures the shared key of the server. The global shared key is used if it is not configured.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A RADIUS security server must be defined to implement the AAA security service by using RADIUS. You can run the <b>radius-server host</b> command to define one or more RADIUS security servers. If a RADIUS security server is not added to a RADIUS server group, the device uses the global routing table when transmitting RADIUS packets to the RADIUS server. Otherwise, the device uses the VRF routing table of the RADIUS server group.

### ▾ Configuring the Shared Key for Communication Between the Device and the RADIUS Server

<b>Command</b>	<b>radius-server key</b> [ 0   7 ] <i>text-string</i>
<b>Parameter Description</b>	<p><b>text-string</b>: Indicates the text of the shared key.</p> <p><b>0   7</b>: Indicates the encryption type of the key. The value 0 indicates no encryption and 7 indicates simple encryption. The default value is 0.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	A shared key is the basis for correct communication between the device and the RADIUS security server. The same shared key must be configured on the device and RADIUS security server so that they can communicate with each other successfully.

↘ **Configuring the Request Transmission Count, After Which the Device Confirms That a RADIUS Server Is Unreachable**

<b>Command</b>	<b>radius-server retransmitretries</b>
<b>Parameter Description</b>	<i>retries</i> : Indicates the RADIUS retransmission count. The value ranges from 1 to 100.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The prerequisite for AAA to use the next user authentication method is that the current security server used for authentication does not respond. The criteria for the device to judge that a security server does not respond are that the security server does not respond within the RADIUS packet retransmission duration of the specified retransmission count. There is an interval between consecutive two retransmissions.

↘ **Configuring the Waiting Time, After which the Device Retransmits a Request**

<b>Command</b>	<b>radius-server timeoutseconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the timeout time, with the unit of seconds. The value ranges from 1 second to 1,000 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to adjust the packet retransmission timeout time.

↘ **Configuring Retransmission of Accounting Update Packets for Authenticated Users**

<b>Command</b>	<b>radius-server account update retransmit</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure retransmission of accounting update packets for authenticated users. Accounting update packets are not retransmitted by default. The configuration does not affect users of other types.

**Configuration Example**

↘ **Using RADIUS Authentication, Authorization, and Accounting for Login Users**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure the RADIUS server information.</li> <li>● Configure to use the RADIUS authentication, authorization, and accounting methods.</li> <li>● Apply the configured authentication method on the interface.</li> </ul>
<b>RADIUS Client</b>	<pre> FS#configure terminal FS (config)#aaa new-model FS (config)# radius-server host 192.168.5.22 FS (config)#radius-server host 3000::100 FS (config)# radius-server key aaa FS (config)#aaa authentication login test group radius FS (config)#aaa authorizationexecetest group radius FS (config)#aaa accountingexecetest start-stop group radius FS (config)# line vty 0 4 FS (config-line)#login authentication test FS (config-line)# authorization exec test FS (config-line)# accounting exec test </pre>
<b>Verification</b>	<p>Telnet to a device from a PC. The screen requesting the user name and password is displayed. Enter the correct user name and password to log in to the device. After obtaining a certain access level granted by the server, only run commands under this access level. Display the authentication log of the user on the RADIUS server. Perform management operations on the device as the user and then log out. Display the accounting information on the user on the RADIUS server.</p>
	<pre> FS#show running-config ! radius-server host 192.168.5.22 radius-server host 3000::100 radius-server key aaa aaa new-model aaa accounting exec test start-stop group radius aaa authorization exec test group radius aaa authentication login test group radius no service password-encryption iptcp not-send-rst ! vlan 1 ! line con 0 </pre>

```

line vty 0 4
  accounting exec test
  authorization exec test
  login authentication test
!
```

### Common Errors

- The key configured on the device is inconsistent with that configured on the server.
- No method list is configured.

### 2.4.2 Configuring the RADIUS Attribute Type

#### Configuration Effect

- Define the attribute processing adopted when the device encapsulates and parses RADIUS packets.

#### Notes

- Private attributes involved in "Configuring the RADIUS Attribute Type" refer to FS private attributes.

#### Configuration Steps

##### ▾ Configuring the MAC Address Format of RADIUS Attribute No. 31 (Calling-Station-ID)

- Optional.
- Set the MAC address format of **Calling-Station-Id** to a type supported by the server.

##### ▾ Configuring the RADIUS Private Attribute Type

- Optional.
- If the server is a FS application server, the RADIUS private attribute type needs to be configured.

##### ▾ Setting the Private Attribute port-priority Issued by the Server to the COS Value of an Interface

- Optional.
- Set the private attribute **port-priority** issued by the server to the COS value of an interface as required.

##### ▾ Configures the Device to Support the CUI Attribute

- Optional.
- Configure whether the device supports the RADIUS CUI attribute as required.

##### ▾ Configuring the Mode of Parsing Private Attributes by the Device

- Optional.
- Configure the index of a FS private attribute parsed by the device as required.

#### Verification

- Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using RADIUS.
- Enable the device to interact with the RADIUS server. Conduct packet capture to display the MAC address format of Calling-Station-Id.
- Enable the device to interact with the RADIUS server. Display the debug information of the device to check that FS private attributes are correctly parsed by the device.
- Enable the device to interact with the RADIUS server. Display the debug information of the device to check that the CUI attribute is correctly parsed by the device.

### Related Commands

#### ▾ Configuring the MAC Address Format of RADIUS Attribute No. 31 (Calling-Station-ID)

<b>Command</b>	<b>radius-server attribute 31 mac format {ietf   normal   unformatted }</b>
<b>Parameter Description</b>	<b>ietf:</b> Indicates the standard format specified in the IETF standard (RFC3580), which is separated by the separator (-). Example: 00-D0-F8-33-22-AC. <b>normal:</b> Indicates the common format that represents a MAC address (dotted hexadecimal format), which is separated by the separator (.). Example: 00d0.f833.22ac. <b>unformatted:</b> Indicates the format without separators. This format is used by default. Example: 00d0f83322ac.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Some RADIUS security servers can identify only MAC addresses in the IETF format. In this case, set the MAC address format of Calling-Station-ID to IETF.

#### ▾ Setting the Private Attribute port-priority Issued by the Server to the COS Value of an Interface

<b>Command</b>	<b>radius set qoscos</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command to use the issued QoS value as the CoS value. The QoS value is used as the DSCP value by default.

#### ▾ Configures the Device to Support the CUI Attribute

<b>Command</b>	<b>radius support cui</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Configure this command to enable the RADIUS-compliant device to support the CUI attribute.

#### ▾ Configuring the Mode of Parsing Private Attributes by the Device

<b>Command</b>	<b>Radius vendor-specific extend</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command</b>	Global configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	Use this command to identify attributes of all vendor IDs by type.

### Configuration Example

#### ✚ Configuring the RADIUS Attribute Type

<b>Scenario</b>	One authentication device
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the MAC address format of RADIUS Calling-Station-Id.</li> <li>● Set the QoS value issued by the RADIUS server as the COS value of the interface.</li> <li>● Configure the RADIUS function to support the CUI attribute.</li> <li>● Configure the device to support private attributes of other vendors.</li> </ul>
	<pre>FS(config)#radius-server attribute 31 mac format ietf FS(config)#radiussetqoscos FS(config)#radiussupport cui FS(config)#radiusvendor-specific extend</pre>
<b>Verification</b>	Conduct packet capture or display debug information of the device to check whether the RADIUS standard attributes and private attributes are encapsulated/parsed correctly.

### 2.4.3 Configuring RADIUS Accessibility Detection

#### Configuration Effect

The device maintains the accessibility status of each configured RADIUS server: reachable or unreachable. The device will not transmit authentication, authorization, and accounting requests of access users to an unreachable RADIUS server unless all the other servers in the same RADIUS server group as the unreachable server are all unreachable.

The device actively detects a specified RADIUS server. The active detection function is disabled by default. If the active detection function is enabled for a specified RADIUS server, the device will, according to the configuration, periodically transmits detection requests (authentication requests or accounting requests) to the RADIUS server. The transmission interval is as follows:

- For a reachable RADIUS server, the interval is the active detection interval of the reachable RADIUS server (the default value is 60 minutes).
- For an unreachable RADIUS server, the interval is always 1 minute.

#### Notes

All the following conditions need to be met before the active detection function is enabled for a specified RADIUS server:

- The test user name of the RADIUS server is configured on the device.
- At least one tested port (authentication port or accounting port) of the RADIUS server is configured on the device.

If the following two conditions are all met, it is deemed that a reachable RADIUS server becomes unreachable:

- After the previous correct response is received from the RADIUS server, the time set in **radius-server dead-criteria timeseconds** has elapsed.
- After the previous correct response is received from the RADIUS server, the count that the device transmits requests to the RADIUS server but fails to receive correct responses (including retransmission) reaches the value set in **radius-server dead-criteria triesnumber**.

If any of the following conditions is met, it is deemed that an unreachable RADIUS server becomes reachable:

- The device receives correct responses from the RADIUS server.
- The duration that the RADIUS server is in the unreachable state exceeds the time set in **radius-server deadtime** and the active detection function is disabled for the RADIUS server.
- The authentication port or accounting port of the RADIUS server is updated on the device.

### Configuration Steps

#### ✚ Configuring the Global Criteria for Judging That a RADIUS Security Server Is Unreachable

- Mandatory.
- Configuring the global criteria for judging that a RADIUS security server is unreachable is a prerequisite for enabling the active detection function.

#### ✚ Configuring the IP Address of the Remote RADIUS Security Server, Authentication Port, Accounting Port, and Active Detection Parameters

- Mandatory.
- Configuring active detection parameters of the RADIUS server is a prerequisite for enabling the active detection function.

#### ✚ Configuring the Duration for the Device to Stop Transmitting Request Packets to an Unreachable RADIUS Server

- Optional.
- The configured duration for the device to stop transmitting request packets to an unreachable RADIUS server takes effect only when the active detection function is disabled for the RADIUS server.

### Verification

- Run the **show radius server** command to display the accessibility information of each RADIUS server.

### Related Commands

#### ✚ Configuring the Global Criteria for Judging That a RADIUS Security Server Is Unreachable

<b>Command</b>	<b>radius-server dead-criteria { timeseconds [ triesnumber ]   triesnumber }</b>
<b>Parameter Description</b>	<p><b>timeseconds</b>: Indicates the time condition parameter. If the device fails to receive a correct response packet from a RADIUS security server within the specified time, it is deemed that the RADIUS security server meets the inaccessibility duration condition. The value ranges from 1 second to 120 seconds.</p> <p><b>triesnumber</b>: Indicates the consecutive request timeout count. If the timeout count of request packets transmitted by the device to the same RADIUS security server reaches the preset count, it is deemed that the RADIUS security server meets the consecutive timeout count condition of inaccessibility. The value ranges from 1 to 100.</p>
<b>Command Mode</b>	Global configuration mode

<b>Usage Guide</b>	If a RADIUS security server meets both the duration condition and the consecutive request timeout count condition, it is deemed that the RADIUS security server is unreachable. Users can use this command to adjust parameter values in the duration condition and consecutive request timeout count condition.
--------------------	--

↘ **Configuring the Duration for the Device to Stop Transmitting Request Packets to an Unreachable RADIUS Server**

<b>Command</b>	<b>radius-server deadtime</b> <i>minutes</i>
<b>Parameter Description</b>	<i>minutes</i> : Indicates the duration for the device to stop transmitting requests to an unreachable RADIUS security server, with the unit of minutes. The value ranges from 1 minute to 1,440 minutes (24 hours).
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If the active detection function is enabled for a RADIUS security server on the device, the time parameter in <b>radius-server deadtime</b> does not take effect on the RADIUS server. If the active detection function is disabled for a RADIUS security server, the device automatically restores the RADIUS security server to the reachable state when the duration that the RADIUS security server is in the unreachable state exceeds the time specified in <b>radius-server deadtime</b> .

**Configuration Example**

↘ **Configuring Accessibility Detection on the RADIUS Server**

<b>Scenario</b> Figure 2- 5	
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the global criteria for judging that a RADIUS security server is unreachable.</li> <li>● Configure the IP address of the remote RADIUS security server, authentication port, accounting port, and active detection parameters.</li> </ul>
<b>RADIUS Client</b>	<pre>FS(config)#radius-server dead-criteria time120 tries 5 FS(config)# radius-server host 192.168.5.22 test username test ignore-acct-port idle-time 90</pre>
<b>Verification</b>	<p>Disconnect the network communication between the device and the server with the IP address of 192.168.5.22. Conduct RADIUS authentication through the device. After 120 seconds, run the <b>show radius server</b> command to check that the server state is <b>dead</b>.</p> <pre>FS#show running-config ... radius-server host 192.168.5.22 test username test ignore-acct-port idle-time 90 radius-server dead-criteria time 120 tries 5 ...</pre>

**2.5 Monitoring**

**Clearing**

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears statistics of the RADIUS dynamic authorization extension function and restarts statistics.	<b>clear radius dynamic-authorization-extension statistics</b>

### Displaying

Description	Command
Displays global parameters of the RADIUS server.	<b>show radius parameter</b>
Displays the configuration of the RADIUS server.	<b>show radius server</b>
Displays the configuration of the RADIUS private attribute type.	<b>show radius vendor-specific</b>
Displays statistics relevant to the RADIUS dynamic authorization extension function.	<b>show radius dynamic-authorization-extension statistics</b>
Displays statistics relevant to RADIUS authentication.	<b>show radius auth statistics</b>
Displays statistics relevant to RADIUS accounting.	<b>show radius acct statistics</b>
Displays configuration of RADIUS server groups.	<b>show radius group</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the RADIUS event.	<b>debugradiusevent</b>
Debugs RADIUS packet printing.	<b>debugradiusdetail</b>
Debugs the RADIUS dynamic authorization extension function.	<b>debug radiusextension event</b>
Debugs the RADIUS dynamic authorization extension packet printing.	<b>debug radius extension detail</b>

## 3 Configuring TACACS+

### 3.1 Overview

TACACS+ is a security protocol enhanced in functions based on the Terminal Access Controller Access Control System (TACACS) protocol. It is used to implement the authentication, authorization, and accounting (AAA) of multiple users.

#### Protocols and Standards

- RFC 1492 Terminal Access Controller Access Control System

### 3.2 Applications

Application	Description
Managing and Controlling Login of End Users	Password verification and authorization need to be conducted on end users.

#### 3.2.1 Managing and Controlling Login of End Users

##### Scenario

TACACS+ is typically applied in the login management and control of end users. A network device serves as the TACACS+ client and sends a user name and password to the TACACS+ server for verification. The user is allowed to log in to the network device and perform operations after passing the verification and obtaining authorization. See the following figure.

Figure 3- 1

<b>Remarks</b>	<ul style="list-style-type: none"> <li>● A is a client that initiates TACACS+ requests.</li> <li>● B, C, and D are servers that process TACACS+ requests.</li> </ul>
----------------	--

##### Deployment

- Start the TACACS+ server on Server B, Server C, and Server D, and configure information on the access device (Device A) so that the servers provide TACACS+-based AAA function for the access device. Enable the AAA function on Device A to start authentication for the user login.
- Enable the TACACS+ client function on Device A, add the IP addresses of the TACACS+ servers (Server B, Server C, and Server D) and the shared key so that Device A communicates with the TACACS+ servers over TACACS+ to implement the AAA function.

### 3.3 Features

#### Basic Concepts

##### Format of TACACS+ Packets

Figure 3- 2

<b>4</b>	<b>8</b>	<b>16</b>	<b>24</b>	<b>32 bit</b>
Major	Minor	Packet type	Sequence no.	Flags
Session ID				
Length				

- Major Version: Indicates the major TACACS+ version number.
- Minor Version: Indicates the minor TACACS+ version number.
- PacketType: Indicates the type of packets, with the options including:  
 TAC\_PLUS\_AUTHEN: = 0x01 (authentication);  
 TAC\_PLUS\_AUTHOR: = 0x02 (authorization);  
 TAC\_PLUS\_ACCT: = 0x03 (accounting)
- Sequence Number: Indicates the sequence number of a data packet in the current session. The sequence number of the first TACACS+ data packet in a session must be 1 and the sequence number of subsequent each data packet increases by one. Therefore, the client sends data packets only with an odd sequence number and TACACS+ Daemon sends packets only with an even sequence number.
- Flags: Contains various bitmap format flags. One of the bits in the value specifies whether data packets need to be encrypted.
- Session ID: Indicates the ID of a TACACS+ session.
- Length: Indicates the body length of a TACACS+ data packet (excluding the header). Packets are encrypted for transmission on a network.

**Overview**

Feature	Description
TACACS+ Authentication, Authorization, and Accounting	Conducts authentication, authorization, and accounting on end users.

**3.3.1 TACACS+ Authentication, Authorization, and Accounting**

**Working Principle**

The following figure uses basic authentication, authorization, and accounting of user login to describe interaction of TACACS+ data packets.

Figure 3- 3

The entire basic message interaction process includes three sections:

1. The authentication process is described as follows:
  - 1) A user requests to log in to a network device.
  - 2) After receiving the request, the TACACS+ client sends an authentication start packet to the TACACS+ server.
  - 3) The TACACS+ server returns an authentication response packet, requesting the user name.
  - 4) The TACACS+ client requests the user to enter the user name.
  - 5) The user enters the login user name.
  - 6) After receiving the user name, the TACACS+ client sends an authentication continuation packet that carries the user name to the TACACS+ server.
  - 7) The TACACS+ server returns an authentication response packet, requesting the login password.
  - 8) The TACACS+ client requests the user to enter the login password.
  - 9) The user enters the login password.
  - 10) After receiving the login password, the TACACS+ client sends an authentication continuation packet that carries the login password to the TACACS+ server.
  - 11) The TACACS+ server returns an authentication response packet, prompting that the user passes authentication.
2. The user authorization starts after successful authentication:
  - 1) The TACACS+ client sends an authorization request packet to the TACACS+ server.

- 2) The TACACS+ server returns an authorization response packet, prompting that the user passes authorization.
  - 3) After receiving the authorization success packet, the TACACS+ client outputs the network device configuration screen for the user.
3. Accounting and audit need to be conducted on the login user after successful authorization:
- 1) The TACACS+ client sends an accounting start packet to the TACACS+ server.
  - 2) The TACACS+ server returns an accounting response packet, prompting that the accounting start packet has been received.
  - 3) The user logs out.
  - 4) The TACACS+ client sends an accounting end packet to the TACACS+ server.
  - 5) The TACACS+ server returns an accounting response packet, prompting that the accounting end packet has been received.

### 3.4 Configuration

Configuration	Description and Command	
Configuring TACACS+ Basic Functions	 (Mandatory) It is used to enable the TACACS+ security service.	
	<b>tacacs-server host</b>	Configures the TACACS+ server.
	<b>tacacs-server key</b>	Specifies the key shared by the server and network device.
	<b>tacacs-server timeout</b>	Configures the global waiting timeout time of the TACACS+ server for communication between a network device and the TACACS+ server.
Configuring Separate Processing of Authentication, Authorization, and Accounting of TACACS+	 (Optional) It is used to separately process authentication, authorization, and accounting requests.	
	<b>aaa group server tacacs+</b>	Configures TACACS+ server groups and divides TACACS+ servers into different groups.
	<b>nas-ip</b>	Configures the source IP address for TACACS+ packets sent from the TACACS+ server group.
	<b>server</b>	Adds servers to TACACS+ server groups.

#### 3.4.1 Configuring TACACS+ Basic Functions

##### Configuration Effect

- The TACACS+ basic functions are available after the configuration is complete. When configuring the AAA method list, specify the method of using TACACS+ to implement TACACS+ authentication, authorization, and accounting.
- When authentication, authorization, and accounting operations are performed, TACACS+ initiates the authentication, authorization, and accounting requests to configured TACACS+ servers according to the configured sequence. If response timeout occurs on a TACACS+ server, TACACS+ traverses the TACACS+ server list in sequence.

##### Notes

- The TACACS+ security service is a type of AAA service. You need to run the **aaa new-model** command to enable the security service.
- Only one security service is provided after TACACS+ basic functions are configured. To make the TACACS+ functions take effect, specify the TACACS+ service when configuring the AAA method list.

### Configuration Steps

#### ▾ Enabling AAA

- Mandatory. The AAA method list can be configured only after AAA is enabled. TACACS+ provides services according to the AAA method list.

<b>Command</b>	<b>aaa new-model</b>
<b>Parameter Description</b>	N/A
<b>Defaults</b>	The AAA function is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The AAA method list can be configured only after AAA is enabled. TACACS+ provides services according to the AAA method list.

#### ▾ Configuring the IP Address of the TACACS+ Server

- Mandatory. Otherwise, a device cannot communicate with the TACACS+ server to implement the AAA function.

<b>Command</b>	<b>tacacs-server host [oob][via mgmt_name]{ipv4-address ipv6-address} [port integer][timeout integer][key [0 7] text-string]</b>
<b>Parameter Description</b>	<p><i>ipv4-address</i>: Indicates the IPv4 address of the TACACS+ server.</p> <p><i>ipv6-address</i>: Indicates the IPv6 address of the TACACS+ server.</p> <p><b>oob</b>: Uses an MGMT port as the source interface for communicating with the TACACS+ server. A non-MGMT port is used for communication by default.</p> <p><b>via mgmt_name</b>: Specifies a specific MGMT port when oob supports multiple MGMT ports.</p> <p><b>port integer</b>: Indicates the TCP port used for TACACS+ communication. The default TCP port is 49.</p> <p><b>timeout integer</b>: Indicates the timeout time of the communication with the TACACS+ server. The global timeout time is used by default.</p> <p><b>key [0 7] text-string</b>: Indicates the shared key of the server. The global key is used if it is not configured. An encryption type can be specified for the configured key. The value <b>0</b> indicates no encryption and <b>7</b> indicates simple encryption. The default value is <b>0</b>.</p>
<b>Defaults</b>	No TACACS+ server is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>17. You can specify the shared key of the server when configuring the IP address of the server. If no shared key is specified, the global key configured using the <b>tacacs-server key</b> command is used as the shared key of the server. The shared key must be completely the same as that configured on the server.</p> <p>18. You can specify the communication port of the server when configuring the IP address.</p> <p>19. You can specify the communication timeout time of the server when configuring the IP address.</p>

### ▾ Configuring the Shared Key of the TACACS+ Server

- Optional.
- If no global communication protocol is configured using this command, set **key** to specify the shared key of the server when running the **tacacs-server host** command to add server information. Otherwise, a device cannot communicate with the TACACS+ server.
- If no shared key is specified by using **key** when you run the **tacacs-server host** command to add server information, the global key is used.

<b>Command</b>	<b>tacacs-server [ key [ 0   7 ] text-string ]</b>
<b>Parameter</b>	<i>text-string</i> : Indicates the text of the shared key.
<b>Description</b>	<b>0   7</b> : Indicates the encryption type of the key. The value <b>0</b> indicates no encryption and <b>7</b> indicates simple encryption.
<b>Defaults</b>	No shared key is configured for any TACACS+ server.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure a global shared key for servers. To specify a different key for each server, set <b>key</b> when running the <b>tacacs-server host</b> command.

### ▾ Configuring the Timeout Time of the TACACS+ Server

- Optional.
- You can set the timeout time to a large value when the link between the device and the server is unstable.

<b>Command</b>	<b>tacacs-server timeoutseconds</b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the timeout time, with the unit of seconds. The value ranges from 1 second to 1,000 seconds.
<b>Defaults</b>	The default value is 5 seconds.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the global server response timeout time. To set different timeout time for each server, set <b>timeout</b> when running the <b>tacacs-server host</b> command.

### Verification

Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using TACACS+.

- Enable the device to interact with the TACACS+ server and conduct packet capture to check the TACACS+ interaction process between the device and the TACACS+ server.
- View server logs to check whether the authentication, authorization, and accounting are normal.

### Configuration Example

#### ▾ Using TACACS+ for Login Authentication

<b>Scenario</b>  <b>Figure 3- 4</b>	
<b>Remarks</b>	<ul style="list-style-type: none"> <li>● A is a client that initiates TACACS+ requests.</li> <li>● B is a server that processes TACACS+ requests.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure the TACACS+ server information.</li> <li>● Configure the method of using TACACS+ for authentication.</li> <li>● Apply the configured authentication method on an interface.</li> </ul>
<b>A</b>	<pre> FS# configure terminal FS(config)# aaa new-model FS(config)# tacacs-server host 192.168.5.22 FS(config)# tacacs-server key aaa FS(config)# aaa authentication login test group tacacs+ FS(config)# line vty 0 4 FS(config-line)# login authentication test </pre>
<b>Verification</b>	<p>Telnet to a device from a PC. The screen requesting the username and password is displayed. Enter the correct username and password to log in to the device. View the authentication log of the user on the TACACS+ server.</p>

### Common Errors

- The AAA security service is disabled.
- The key configured on the device is inconsistent with the key configured on the server.
- No method list is configured.

### 3.4.2 Configuring Separate Processing of Authentication, Authorization, and Accounting of TACACS+

#### Configuration Effect

- The authentication, authorization, and accounting in the security service are processed by different TACACS+ servers, which improves security and achieves load balancing to a certain extent.

#### Notes

- The TACACS+ security service is a type of AAA service. You need to run the **aaa new-model** command to enable the security service.

- Only one security service is provided after TACACS+ basic functions are configured. To make the TACACS+ functions take effect, specify the TACACS+ service when configuring the AAA method list.

### Configuration Steps

#### ▾ Configuring TACACS+ Server Groups

- Mandatory. There is only one TACACS+ server group by default, which cannot implement separate processing of authentication, authorization, and accounting.
- Three TACACS+ server groups need to be configured for separately processing authentication, authorization, and accounting.

<b>Command</b>	<b>aaa group server tacacs+group-name</b>
<b>Parameter</b>	<i>group-name</i> : Indicates the name of a group. A group name cannot be radius or tacacs+, which are the names of embedded groups.
<b>Description</b>	
<b>Defaults</b>	No TACACS+ server group is configured.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Group TACACS+ servers so that authentication, authorization, and accounting are completed by different server groups.

#### ▾ Adding Servers to TACACS+ Server Groups

- Mandatory. If no server is added to a server group, a device cannot communicate with TACACS+ servers.
- In server group configuration mode, add the servers that are configured using the **tacacs-server host** command.

<b>Command</b>	<b>server { ipv4-address   ipv6-address }</b>
<b>Parameter</b>	<i>ipv4-address</i> : Indicates the IPv4 address of the TACACS+ server.
<b>Description</b>	<i>ipv6-address</i> : Indicates the IPv6 address of the TACACS+ server.
<b>Defaults</b>	No server is configured.
<b>Command Mode</b>	TACACS+ server group configuration mode
<b>Usage Guide</b>	<p>Before configuring this command, you must run the <b>aaa group server tacacs+</b> command to enter the TACACS+ server group configuration mode.</p> <p>For the address of a server configured in a TACACS+ server group, the server must be configured using the <b>tacacs-server host</b> command in global configuration mode.</p> <p>If multiple servers are added to one server group, when one server does not respond, the device continues to send a TACACS+ request to another server in the server group.</p>

#### ▾ Configuring the Source IP Address for TACACS+ Packets Sent from the TACACS+ Server Group

<b>Command</b>	<b>nas-ip { ipv4-address   ipv6-address }</b>
<b>Parameter</b>	<i>ipv4-address</i> : Indicates the source IPv4 address for the TACACS+ packets.
<b>Description</b>	<i>ipv6-address</i> : Indicates the source IPv6 address for the TACACS+ packets.
<b>Defaults</b>	No source IP address is configured.
<b>Command Mode</b>	TACACS+ server group configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Before configuring this command, you must run the <b>aaa group server tacacs+</b> command to enter the TACACS+ server group configuration mode.

#### ▾ Configuring VRF of a TACACS+ Server Group

- Optional. Configure Virtual Routing and Forwarding (VRF) if a device needs to send TACACS+ packets through a specified address.
- In server group configuration mode, use a configured VRF name to specify the routing for the communication of servers in this group.

<b>Command</b>	<b>ip vrf forwarding</b> <i>vrf-name</i>
<b>Parameter Description</b>	<i>vrf-name</i> : Indicates the VRF name.
<b>Defaults</b>	No VRF is specified by default.
<b>Command Mode</b>	TACACS+ server group configuration mode
<b>Usage Guide</b>	Before configuring this command, you must run the <b>aaa group server tacacs+</b> command to enter the TACACS+ server group configuration mode. For VRF configured in a TACACS+ server group, a valid name must be configured for VRF by using the <b>vrf definition</b> command in global configuration mode.

#### ▾ Configuring oob of a TACACS+ Server Group

- Optional. Configure oob if a device needs to send TACACS+ packets through a specified MGMT port.
- In server group configuration mode, specify routing for the communication of servers in the group.

<b>Command</b>	<b>ip oob via</b> <i>mgmt_name</i>
<b>Parameter Description</b>	<i>mgmt-name</i> : Indicates the name of a management port.
<b>Defaults</b>	No oob is specified by default.
<b>Command Mode</b>	TACACS+ server group configuration mode
<b>Usage Guide</b>	Before configuring this command, you must run the <b>aaa group server tacacs+</b> command to enter the TACACS+ server group configuration mode. If no MGMT port is specified, the MGMT0 port is used by default.

#### Verification

Configure the AAA method list that specifies to conduct authentication, authorization, and accounting on users by using TACACS+.

- Enable a device to interact with TACACS+ servers. Conduct packet capture, check that the authentication, authorization, and accounting packets are interacted with different servers, and check the source addresses in packets.

#### Configuration Example

▾ **Configuring Different TACACS+ Server Groups for Separately Processing Authentication, Authorization, and Accounting**

<p><b>Scenario</b> Figure 3- 5</p>	
<p><b>Remarks</b></p>	<ul style="list-style-type: none"> <li>● A is a client that initiates TACACS+ requests.</li> <li>● B is a server that processes TACACS+ authentication requests.</li> <li>● C is a server that processes TACACS+ authorization requests.</li> <li>● D is a server that processes TACACS+ accounting requests.</li> </ul>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable AAA.</li> <li>● Configure the TACACS+ server information.</li> <li>● Configure TACACS+ server groups.</li> <li>● Add servers to TACACS+ server groups.</li> <li>● Configure the method of using TACACS+ for authentication.</li> <li>● Configure the method of using TACACS+ for authorization.</li> <li>● Configure the method of using TACACS+ for accounting.</li> <li>● Apply the configured authentication method on an interface.</li> <li>● Apply the configured authorization method on an interface.</li> <li>● Apply the configured accounting method on an interface.</li> </ul>
	<pre> FS# configure terminal FS(FS(config)# aaa new-model FS(config)# tacacs-server host 192.168.5.22 FS(config)# tacacs-server host 192.168.5.34 FS(config)# tacacs-server host 192.168.5.44 FS(config)# tacacs-server key aaa FS(config)# aaa group server tacacs+ tacgrp1 FS(config-gs-tacacs)# server 192.168.5.22 FS(config-gs-tacacs)# exit FS(config)# aaa group server tacacs+ tacgrp2 FS(config-gs-tacacs)# server 192.168.5.34                     </pre>

<b>Verification</b>	<p>Telnet to a device from a PC. The screen requesting the user name and password is displayed. Enter the correct user name and password to log in to the device. Enter the <b>enable</b> command and enter the correct <b>enable</b> password to initiate <b>enable</b> authentication. Enter the privilege EXEC mode after passing the authentication. Perform operations on the device and then exit the device.</p> <p>View the authentication log of the user on the server with the IP address of 192.168.5.22.</p> <p>View the <b>enable</b> authentication log of the user on the server with the IP address of 192.168.5.22.</p> <p>View the <b>exec</b> authorization log of the user on the server with the IP address of 192.168.5.34.</p> <p>View the command accounting log of the user on the server with the IP address of 192.168.5.44.</p>

### Common Errors

- The AAA security service is disabled.
- The key configured on the device is inconsistent with the key configured on the server.
- Undefined servers are added to a server group.
- No method list is configured.

## 3.5 Monitoring

### Displaying

Description	Command
Displays interaction with each TACACS+ server.	<b>show tacacs</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs TACACS+.	<b>debug tacacs+</b>

## 4 Configuring SCC

### 4.1 Overview

The Security Control Center (SCC) provides common configuration methods and policy integration for various access control and network security services, so that these access control and network security services can coexist on one device to meet diversified access and security control requirements in various scenarios.

The network security services include Access Control List (ACL), Network Foundation Protection Policy (NFPP), and anti-ARP gateway spoofing. When two or more access control or network security services are simultaneously enabled on the device, or when both access control and network security services are simultaneously enabled on the device, the SCC coordinates the coexistence of these services according to relevant policies.

 For details about the access control and network security services, see the related configuration guide. This document describes the SCC only.

#### Protocol and Standards

N/A

### 4.2 Application

Typical Application	Scenario
Access Control of Extended Layer 2 Campus Networks	Students on a campus network can access the Internet based on dot1x client authentication or Web authentication. ARP spoofing between the students should be prevented. In addition, terminal devices in some departments (such as the headmaster's office) can access the Internet without authentication.

#### 4.2.1 Access Control of Extended Layer 2 Campus Networks

##### Scenario

Students on a campus network of a university usually need to be authenticated through the dot1x client or Web before accessing the Internet, so as to facilitate accounting and guarantee the benefits of the university.

- The students can access the Internet through dot1x client authentication or Web authentication.
- ARP spoofing between the students is prevented, so as to guarantee the stability of the network.
- Terminal devices in some departments (such as the headmaster's office) can access the Internet without authentication.

Figure 4-1

**Remarks**

A traditional campus network is hierarchically designed, which consists of an access layer, a core layer and a distribution layer, where the access layer performs user access control. On an extended Layer 2 campus network, however, user access control is performed by a core switch, below which access switches exist without involving any distribution device in between. The ports between the core switch and the access switches (such as switches B, C, and D in Figure 1-1) are all trunk ports.

The user access switches B, C, and D connect to PCs in various departments via access ports, and VLANs correspond to sub VLANs configured on the downlink ports of the core switch, so that access users are in different VLANs to prevent ARP spoofing.

The core switch A connects to various servers, such as the authentication server and the DHCP server. Super VLANs and sub VLANs are configured on the downlink ports. One super VLAN correspond to multiple sub VLANs, and each sub VLAN represents an access user.

**Deployment**

On the core switch, different access users are identified by VLAN and port numbers. Each access user (or a group of access users) corresponds to one VLAN. The ports on each access switch that connect to downstream users are configured as access ports, and one user VLAN is assigned to each access user according to VLAN planning. The core switch does not forward ARP requests. The core switch replies to the ARP requests from authenticated users only, so as to prevent ARP spoofing. On the core switch A, user VLANs are regarded as sub VLANs, super VLANs are configured, and SVIs corresponding to the super VLANs are configured as user gateways.

- On the downlink ports of the core switch (switch A in this example) that connect to the teachers' living area and the students' living area, both dot1x authentication and Web authentication are enabled, so that users can freely select either authentication mode for Internet access.

- Any special department (such as the headmaster's office in this example) can be allocated to a particular VLAN, and this VLAN can be configured as an authentication-exemption VLAN so that users in this department can access the Internet without authentication.

## 4.3 Features

### Basic Concepts

#### ✚ Authorization Mode

There are two authentication modes: access authentication and gateway authentication. On a traditional hierarchical network, access authentication is usually performed by access switches. On an extended Layer 2 network, the access function moves forward to a core switch while the access devices need only to support basic VLAN and Layer 2 forwarding functions. As the access authentication is performed by access switches on a traditional hierarchical network while performed by a core switch on a de-layered extended Layer 2 network, some extrinsic functions and behaviors will differ accordingly with the two different authentication modes. Therefore, the authentication mode falls into gateway authentication and access authentication. If the access authentication moves to the core switch, the core switch needs to be enabled with the gateway authentication mode to support a large number of user entries, typically including a large-capacity MAC address table, ARP table and routing table. Otherwise, the supported user capacity is subject to hardware ACL entry restrictions. In general, the capacity of hardware ACL entries is limited and cannot support a large user capacity. The access authentication mode is generally applicable only in scenarios where the access authentication is deployed on access switches.

#### ✚ Authentication-Exemption VLAN

Some special departments may be allocated to authentication-exemption VLANs to simplify network management, so that users in these departments can access network resources without authentication. For example, the headmaster's office can be divided into the authentication-exemption VLANs on the campus network, so that users in the headmaster's office can access the Internet without authentication.

#### ✚ IPv4 User Capacity

The number of IPv4 access users can be restricted to protect the access stability of online users on the Internet and improve the operational stability of the device.

 The number of IPv4 access users is not restricted by default; that is, a large number of users can get online after being authenticated, till reaching the maximum hardware capacity of the device.

 IPv4 access users include IP users (such as IP authenticated users) based on dot1x authentication, users based on Web authentication, and IP users manually bound (using IP source guard, ARP check, or other means).

#### ✚ Authenticated-User Migration

Online-user migration means that an online user can get authenticated again from different physical locations to access the network. On the campus network, however, for ease of management, students are usually requested to get authenticated from a specified location before accessing the Internet, but cannot get authenticated on other access ports. This means that the users cannot migrate. In another case, some users have the mobile office requirement and can get authenticated from different access locations. Then the users can migrate.

#### ✚ User Online-Status Detection

For a chargeable user, accounting starts immediately after the user passes the authentication and gets online. The accounting process does not end until the user actively gets offline. Some users, however, forget to get offline when leaving their PCs, or cannot get offline because of terminal problems. Then the users suffer certain economical losses as the accounting process continues. To more precisely determine whether a user is really online, we can preset a traffic value, so that the user is considered as not accessing the Internet and therefore directly brought offline when the user's traffic is lower than the preset value in a period of time or there is not traffic of the user at all in a period of time.

## Overview

Feature	Function
Authentication Mode	This feature determines whether access control is deployed on access switches or core switches depending on network deployment needs.
Authentication-Exemption VLAN	Users in a specified VLAN can be configured as authentication-exemption users.
IPv4 User Capacity	The IPv4 user capacity of a specified interface can be restricted to guarantee the access stability of users on the Internet.
Authenticated-User Migration	You can specify whether the authenticated can migrate.
User Online-Status Detection	You can specify whether to detect the traffic of online users, so that a user is forced offline when the traffic of the user is lower than a preset value in a period of time.

### 4.3.1 Authentication Mode

There are two authentication modes: access authentication and gateway authentication. In access authentication mode, access control such as dot1x or Web authentication is enabled on access switches. In gateway authentication mode, access control is enabled on core switches. On a large-scale network such as a campus network, there are hundreds of access switches. Compared with the access authentication mode, the gateway authentication mode simplifies the routine maintenance and management on the access switches, because the access switches need only to support basic VLAN and Layer 2 forwarding functions. Therefore, the gateway authentication mode is recommended.

#### Working Principle

The authentication mode on a device depends on the network layer where the access control device works. If access control is deployed on core switches (for example, on an extended Layer 2 network), gateway authentication mode on core switches is required. If access control is deployed on access switches, the authentication mode should be set to access authentication on the access switches.

 The access authentication mode applies by default. In addition, only the N18000 switches support authentication mode switching.

 Restart the device after the authentication mode is changed, so that the new authentication mode takes effect. Save the current configuration before restarting the device.

### 4.3.2 Authentication-Exemption VLAN

Authentication-exemption VLANs are used to accommodate departments with special access requirements, so that users in these departments can access the Internet without authentication such as dot1x or Web authentication.

#### Working Principle

Suppose the authentication-exemption VLAN feature is enabled on a device. When the device detects that a packet comes from an authentication-exemption VLAN, access control is not performed. In this way, users in the authentication-exemption VLAN can access the Internet without authentication. The authentication-exemption VLAN feature can be regarded as a kind of applications of secure channels.

-  A maximum of 100 authentication-exemption VLANs can be configured.
-  The authentication-exemption VLANs occupy hardware entries. When access control such as authentication is disabled, configuring authentication-exemption VLANs has the same effect as the case where no authentication-exemption VLANs are configured. Therefore, it is recommended that authentication-exemption VLANs be configured for users who need to access the Internet without authentication, only when the access control function has been enabled.
-  Although packets from authentication-exemption VLANs are exempt from access control, they still need to be checked by a security ACL. If the packets of the users in an authentication-exemption VLAN are denied according to the security ACL, the users still cannot access the Internet.
-  In gateway authentication mode, the device does not initiate any ARP request to a user in an authentication-exemption VLAN, and the ARP proxy will not work. Therefore, in gateway authentication mode, users in different authentication-exemption VLANs cannot access each other unless the users have been authenticated.

### 4.3.3 IPv4 User Capacity

To improve the operational stability of the device and guard against brutal force impacts from unauthorized users, you can restrict the total number of IPv4 access users on a certain port of the device.

#### Working Principle

If the total number of IPv4 access users is restricted, new users going beyond the total number cannot access the Internet.

-  Only the switches support the restriction on the number of IPv4 access users.
-  The number of IPv4 access users is not restricted on the device by default, but depends on the hardware capacity of the device.
-  The number of IPv4 access users includes IPv4 users based on various binding functions. Because the number of IPv4 access users is configured in interface configuration mode, the restriction includes both the number of IPv4 users generated on the port and IPv4 users globally generated. For example, you can set the maximum number of IPv4 access users on the Gi 0/1 port to 2, run commands to bind an IPv4 user to the port, and then run commands to bind a global IPv4 user to the port. Actually there are already two access users on the port. If you attempt to bind another IPv4 user or another global IPv4 user to the port, the binding operation fails.

### 4.3.4 Authenticated-User Migration

On an actual network, users do not necessarily access the Internet from a fixed place. Instead, users may be transferred to another department or office after getting authenticated at one place. They do not actively get offline but remove network cables and carry their mobile terminals to the new office to access the network. Then this brings about an issue about authenticated-user migration. If

authenticated-user migration is not configured, a user who gets online at one place cannot get online at another place without getting offline first.

### Working Principle

When authenticated-user migration is enabled, the dot1x or Web authentication module of the device detects that the port number or VLAN corresponding to a user's MAC address has changed. Then the user is forced offline and needs to be authenticated again before getting online.

-  Only the switches or wireless devices support authenticated-user migration. In addition, cross-switch migration is not supported. For example, authentication and migration are enabled on two N18000, and a user gets online after being authenticated on one of the two N18000. If the user attempts to migrate to the other N18000, the migration fails.
-  The authenticated-user migration function requires a check of users' MAC addresses, and is invalid for users who have IP addresses only.
-  The authenticated-user migration function enables a user who gets online at one place to get online at another place without getting offline first. If the user gets online at one place and then gets offline at that place, or if the user does not get online before moving to another place, the situation is beyond the control range of authenticated-user migration.
-  During migration, the system checks whether the VLAN ID or port number that corresponds to a user's MAC address has changed, so as to determine whether the user has migrated. If the VLAN ID or port number is the same, it indicates that the user does not migrate; otherwise, it indicates that the user has migrated. According to the preceding principle, if another user on the network uses the MAC address of an online user, the system will wrongly disconnect the online user unless extra judgment is made. To prevent such a problem, the dot1x or Web authentication will check whether a user has actually migrated. For a user who gets online through Web authentication or dot1x authentication with IP authorization, the dot1x or Web authentication sends an ARP request to the original place of the user if detecting that the same MAC address is online in another VLAN or on another port. If no response is received within the specified time, it indicates that the user's location has indeed changed and then the migration is allowed. If a response is received within the specified time, it indicates that the user actually does not migrate and a fraudulent user may exist on the network. In the latter case, the migration is not performed. The ARP request is sent once every second by default, and sent for a total of five times. This means that the migration cannot be confirmed until five seconds later. Timeout-related parameters, including the probe interval and probe times, can be changed using the **arp retry times times** and **arp retry interval interval** commands. For details about the specific configuration, see *ARP-SCG.doc*. It should be noted that the migration check requires the configuration of IP authorization for users based on dot1x authentication. In addition, the ARP probe is triggered only for user migration in gateway authentication mode but not triggered for user migration in access authentication mode.

### 4.3.5 User Online-Status Detection

After a user accesses the Internet, the user may forget to get offline or cannot actively get offline due to terminal faults. In this case, the user will keep being charged and therefore will suffer a certain economical loss. To protect the benefits of users on the Internet, the device provides a function to detect whether the users are really online. If the device considers that a user is not online, the device actively disconnects the user.

### Working Principle

A specific detection interval is preset on the device. If a user's traffic is lower than a certain value in this interval, the device considers that the user is not using the network and therefore directly disconnects the user.

-  Only the switches and wireless devices support the user online-status detection function.

-  The user online-status detection function applies to only users who get online through dot1x or Web authentication.
-  Currently, the N18000 supports zero-traffic detection only.
-  Currently, due to hardware chip restrictions of the N18000, the time to disconnect a user without any traffic relates to the configured MAC address aging time. If the traffic detection interval is set to m minutes and the MAC address aging time is set to n minutes, the interval from the moment when an authenticated user leaves the network without actively getting offline to the moment when the user is disconnected upon detection of zero traffic is about [m, m+n] minutes. In other words, if an online user does not incur any Internet access traffic, the user is disconnected about [m, m+n] minutes later.

## 4.4 Configuration

Configuration Item	Suggestions and Related Commands	
Configuring the Authentication Mode	 Optional configuration, which is used to configure the authentication mode for the device.	
	<b>[no] auth-mode gateway</b>	Configures the authentication mode.
Configuring Authentication-Exemption VLANs	 Optional configuration, which is used to specify the users of which VLANs can access the Internet without authentication.	
	<b>[no] direct-vlan</b>	Configures authentication-exemption VLANs.
Configuring the IPv4 User Capacity	 Optional configuration, which is used to specify the maximum number of users who are allowed to access a certain interface.	
	<b>[no] nac-author-user maximum</b>	Configures the number of IPv4 users who are allowed to access a certain interface.
Configuring Authenticated-User Migration	 Optional configuration, which is used to specify whether online users with static MAC addresses can migrate.	
	<b>[no] station-move permit</b>	Configures whether authenticated users can migrate.
Configuring User Online-Status Detection	 Optional configuration, which is used to specify whether to enable the user online-status detection function.	
	<b>offline-detect interval threshold</b>	Configures the parameters of the user online-status detection function.
	<b>no offline-detect</b>	Disables the user online-status detection function.
	<b>default offline-detect</b>	Restores the default user online-status detection mode.

### 4.4.1 Configuring the Authentication Mode

#### Configuration Effect

Perform this configuration or not perform this configuration, which shall depend on actual network deployment. On a hierarchical network, access switches perform access control and you do not need to specify the authentication mode but can simply keep the default configuration. On a de-layered extended Layer 2 network, the gateway device performs access control and then you need to

set the authentication mode to gateway authentication, so that users can be authenticated and get online after the access control service such as dot1x or Web authentication is enabled on the gateway device.

### Precautions

- If access control is deployed on the core switch, you need to change the authentication mode on the core switch to gateway authentication. If access control is not deployed on the core switch, you do not need to configure the authentication mode.
- You need to restart the device after the authentication mode is changed, so that the new authentication mode takes effect. Save the current configuration before restarting the device.

### Configuration Method

#### ▾ Configuring the Authentication Mode

- Optional configuration. It determines the access position of the device on the actual network.
- Perform the configuration according to actual network deployment. If the core switch performs access control, set the authentication mode to gateway authentication on the core switch; otherwise, simply keep the default configuration.

<b>Command</b>	<b>[ no ] auth-mode gateway</b>
<b>Parameter Description</b>	<p><b>no:</b> If the command carries this parameter, it indicates that the authentication mode is restored to access authentication; that is, the local device is only an access device and not a gateway device any longer.</p> <p><b>auth-mode gateway:</b> If the command carries this parameter, it indicates that the authentication mode is set to gateway authentication; that is, the local device is both a gateway device and an access device.</p>
<b>Defaults</b>	Access authentication mode
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>Use this command to determine the access position of the device on the network. Perform this configuration or not perform this configuration, which depends on whether the access control function is deployed on access switches on the network or deployed on the gateway device.</p> <p>Use this command to change the authentication mode configured on the device from access authentication to gateway authentication. Use the <b>no auth-mode gateway</b> command to change the authentication mode configured on the device from gateway authentication back to access authentication.</p>

### Verification

Check the configuration using the following method:

- Enable dot1x or Web authentication on one port of the device, and perform corresponding authentication on the client. After getting online, check whether you can access network resources. Then get offline, and check whether you cannot access specified network resources.

### Configuration Examples

The following configuration example describes SCC-related configuration only.

#### Setting the Authentication Mode to Gateway Authentication so that the Access Control Function Moves Up to the Core Gateway Device on a De-layered extended Layer 2 Network

<p><b>Scenario</b></p> <p>Figure 4- 1</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>On switch A (which is a core gateway device), set the authentication mode to gateway authentication.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA(config)#auth-mode gateway Please save config and reload system. SwitchA(config)#exit *Nov 7 10:13:27: %SYS-5-CONFIG_I: Configured from console by console SwitchA#reload Reload system?(Y/N)y SwitchA#</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>Use the <b>show running</b> command to check whether the configuration has taken effect.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA(config)#show running-config   include auth-mode auth-mode gateway SwitchA(config)#</pre>

#### 4.4.2 Configuring Authentication-Exemption VLANs

##### Configuration Effect

Configure authentication-exemption VLANs, so that users in these VLANs can access the Internet without experiencing dot1x or Web authentication.

### Precautions

Authentication-exemption VLANs only mean that users in these VLANs do not need to experience a check related to access authentication, but still need to experience a check based on a security ACL. If specified users or VLANs are denied according to the security ACL, corresponding users still cannot access the Internet. Therefore, during ACL configuration, you need to ensure that specified VLANs or specified users in the authentication-exemption VLANs are not blocked if you hope that users in the authentication-exemption VLANs can access the Internet without being authenticated.

### Configuration Method

#### ✚ Configuring Authentication-Exemption VLANs

- Optional configuration. To spare all users in certain VLANs from dot1x or Web authentication, configure these VLANs as authentication-exemption VLANs.
- Perform this configuration on access, convergence, or core switches depending on user distribution.
- Authentication-exemption VLANs can be configured in interface configuration mode.

<b>Command</b>	<b>[no] direct-vlan <i>vlanlist</i></b>
<b>Parameter Description</b>	<b>no:</b> If the command carries this parameter, it indicates that the authentication-exemption VLAN configuration will be deleted.  <b>vlanlist:</b> This parameter indicates the list of authentication-exemption VLANs to be configured or deleted.
<b>Defaults</b>	No authentication-exemption VLAN has been configured.
<b>Command Mode</b>	Global configuration mode, or interface configuration mode
<b>Usage Guide</b>	Use this command to configure or delete authentication-exemption VLANs.

### Verification

Check the authentication-exemption VLAN configuration using the following method:

- Enable dot1x authentication on downlink ports that connect to user terminals, add the downlink ports that connect to the user terminals to a specific VLAN, and configure the VLAN as an authentication-exemption VLAN. Then open the Internet Explorer, and enter a valid extranet address (such as [www.google.com](http://www.google.com)). If the users can open the corresponding webpage on the Internet, it indicates that the authentication-exemption VLAN is valid; otherwise, the authentication-exemption VLAN does not take effect.
- Use the **show direct-vlan** command to check the authentication-exemption VLAN configuration on the device.

<b>Command</b>	<b>show direct-vlan</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Global configuration mode
<b>UsageExample</b>	<pre>FS#show direct-vlan direct-vlan 100 FS#show direct-vlan interface gi 0/1 Port      direct-vlan ----- Gi0/1     5,7,100</pre>

**Configuration Examples**

**i** The following configuration example describes SCC-related configuration only.

**Configuring Authentication-exemption VLANs so that Specific Users Can Access the Internet without Being Authenticated**

<p><b>Scenario</b> Figure 4- 2</p>	<p>The diagram illustrates a network architecture where a central core layer (Switch A) connects to three edge Layer 2 switches (Switch B, C, and D) via trunk links. The core layer also connects to a Router. The network is divided into three distinct segments:</p> <ul style="list-style-type: none"> <li><b>Office Area (Switch B):</b> Contains the Headmaster's Office (Vlan 100) with a network segment of 192.168.100.0/24 and a gateway at 192.168.100.1/24.</li> <li><b>Staff Living Area (Switch C):</b> Contains a VLAN (Vlan 201-900) with a network segment of 192.168.200.0/24 and a gateway at 192.168.200.1/24.</li> <li><b>Student Living Area (Switch D):</b> Contains a VLAN (Vlan 1001-2000) with a network segment of 192.168.300.0/24 and a gateway at 192.168.300.1/24.</li> </ul> <p>Switch A (Core Layer) has the following configurations: SVI 100:192.168.100.1 (G2/1), SVI 200:192.168.200.1 (G2/2), and SVI 1000:192.168.300.1 (G2/3). The Router is connected to the Internet and has G0/1:192.168.5.2 and G2/20,SVI 7:192.168.5.1.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>On switch A (which is the core gateway device), set the GI 2/1 port as a trunk port, and enable dot1x authentication on this port.</li> <li>On switch A (which is the core gateway device), configure VLAN 100 to which the headmaster's office belongs as an authentication-exemption VLAN.</li> </ul>
<p><b>Switch A</b></p>	<pre>SwitchA(config)#vlan 100</pre>

	<pre>SwitchA(config-vlan)#exit SwitchA(config)#direct-vlan 100 SwitchA(config)#int GigabitEthernet 0/1 SwitchA(config-if-GigabitEthernet 0/1)#switchport mode trunk SwitchA(config-if-GigabitEthernet 0/1)#dot1x port-control auto *Oct 17 16:06:45: %DOT1X-6-ENABLE_DOT1X: Able to receive EAPOL packet and DOT1X authentication enabled.</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Open the Internet Explorer from any PC in the headmaster's office, enter a valid extranet address, and confirm that the corresponding webpage can be opened.</li> <li>● Use the <b>show direct-vlan</b> command to check whether the authentication-exemption VLAN is valid.</li> </ul>
<b>Switch A</b>	<pre>SwitchA(config)#show direct-vlan direct-vlan 100</pre>

#### 4.4.3 Configuring the IPv4 User Capacity

##### Configuration Effect

Configure the IPv4 user capacity, so as to restrict the number of users who are allowed to access an access port.

##### Precautions

N/A

##### Configuration Method

##### ▾ Configuring the IPv4 User Capacity

- Optional configuration. To limit the maximum of users who are allowed to access an access port, configure the IPv4 user capacity. The access user capacity is not limited on an access port by default. Suppose the user capacity limit is configured on a specific interface. When the number of authenticated users on the interface reaches the maximum, new users cannot be authenticated on this interface and cannot get online, until existing authenticated users get offline on the interface.
- Perform this configuration on access switches, which may be access switches on the network edge or core gateway devices.

<b>Command</b>	<pre>nac-author-user maximum <i>max-user-num</i> no nac-author-user maximum</pre>
<b>Parameter Description</b>	<p><b>no:</b> If the command carries this parameter, it indicates that the limit on the IPv4 access user capacity will be removed from the port.</p> <p><b><i>max-user-num:</i></b> This parameter indicates the maximum number of IPv4 users who allowed to access the port. The value range is from 1 to 1024.</p>
<b>Defaults</b>	The number of IPv4 access users is not limited.
<b>Command Mode</b>	Interface configuration mode

<b>Usage Guide</b>	Use this command to limit the number of IPv4 access users on a specific access port.
--------------------	--

**Verification**

Check the IPv4 user capacity configuration on a port using the following method:

- dot1x authentication: When the number of users who get online based on 1x client authentication on the port reaches the specified user capacity, no any new user can get online from this port.
- Web authentication: When the number of users who get online based on Web authentication on the port reaches the specified user capacity, no any new user can get online from this port.
- Use the **show nac-author-user [ interface interface-name ]** command to check the IPv4 user capacity configured on the device.

<b>Command</b>	<b>show nac-author-user [ interface interface-name ]</b>
<b>Parameter Description</b>	<i>interface-name</i> : This parameter indicates the interface name.
<b>Command Mode</b>	Privileged EXEC mode, global configuration mode, or interface configuration mode
<b>Usage Guide</b>	Global configuration mode
<b>Usage Example</b>	<pre> FS#show nac-author-user interface GigabitEthernet 0/1 Port      Cur_num Max_num ----- Gi0/1    0       4                     </pre>

**Configuration Examples**

The following configuration example describes SCC-related configuration only.

**Restricting the Number of IP4 Users on a Port to Prevent Excessive Access Terminals from Impacting the Network**

<p><b>Scenario</b></p> <p><b>Figure 4- 3</b></p>	
<b>Configuration</b>	<ul style="list-style-type: none"> <li>● Assume that the dot1x authentication environment has been well configured on the access switch A, and dot1x authentication is enabled on the Gi 0/2 port.</li> </ul>

<b>Steps</b>	<ul style="list-style-type: none"> <li>Set the maximum number of IPv4 access users on the Gi 0/2 port to 4.</li> </ul>
<b>Switch A</b>	<pre>SwitchA(config)#int GigabitEthernet 0/2 SwitchA(config-if-GigabitEthernet 0/2)#nac-author-user maximum 4</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Perform dot1x authentication for all the four PCs in the dormitory, so that the PCs get online. Then take an additional terminal to access the network, and attempt to perform dot1x authentication for this terminal. Verify that the terminal cannot be successfully authenticated to get online.</li> <li>Use the <b>show nac-author-user</b> command to check whether the configuration has taken effect.</li> </ul>
<b>Switch A</b>	<pre>SwitchA(config)#show nac-author-user  Port      Cur_num Max_num ----- Gi0/1     0       4</pre>

#### 4.4.4 Configuring Authenticated-User Migration

##### Configuration Effect

By default, when a user gets online after passing dot1x or Web authentication at a physical location (which is represented by a specific access port plus the VLAN number) and quickly moves to another physical location without getting offline, the user cannot get online through dot1x or Web authentication from the new physical location, unless the authenticated-user migration feature has been configured in advance.

##### Notes

- If the authenticated-user migration feature is not yet configured, an online user cannot get online from the new physical location after quickly moving from one physical location to another physical location without getting offline first. However, if the user gets offline before changing the physical location or gets offline during the location change, the user can still normally get online after being authenticated at the new physical location, even if the authenticated-user migration feature is not configured.

##### Configuration Method

##### 📌 Configuring Authenticated-User Migration

- Optional configuration. To allow users to be authenticated and get online from different physical locations, enable the authenticated-user migration function.
- Perform this configuration on access, convergence, or core switches depending on user distribution.

<b>Command</b>	<b>[no] station-move permit</b>
<b>Parameter Description</b>	<p><b>no station-move permit:</b> Indicates that authenticated-user migration is not permitted.</p> <p><b>station-move permit:</b> Indicates that authenticated-user migration is permitted.</p>
<b>Defaults</b>	Authenticated-user migration is not permitted; that is, when a user getting online from one physical location on the network moves to another physical location and attempts to get online from the new physical location without

	getting offline first, the authentication fails and the user cannot get online from the new physical location.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure authenticated-user migration.

**Verification**

Check the authenticated-user migration configuration using the following method:

- A PC is authenticated and gets online from a dot1x-based port of the device using dot1x SU client, and does not actively get offline. Move the PC to another port of the device on which dot1x authentication is enabled, and perform dot1x authentication again. Check whether the PC can successfully get online.

**Configuration Examples**

**i** The following configuration example describes SCC-related configuration only.

**Configuring Online-User Migration so that an Online User Can Perform Authentication and Get Online from Different Ports without Getting Offline First**

<p><b>Scenario</b> Figure 4- 4</p>	<p>The diagram illustrates a network setup for user migration. At the top, a cloud labeled 'Internet' is connected to 'Switch A'. To the left, an 'Authentication Server' is connected to 'Switch A' via 'GigabitEthernet 0/1'. 'Switch A' has two other ports connected to departments: 'GigabitEthernet 0/2' connects to the 'R&amp;D Dept.' and 'GigabitEthernet 0/3' connects to the 'Test Dept.'. Each department contains several PC icons, with 'PC1' and 'PC2' specifically labeled in each group.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable dot1x authentication on access ports Gi0/2 and Gi 0/3, and configure authentication parameters. The authentication is MAC-based.</li> <li>● Configure online-user migration.</li> </ul>
<p><b>Switch A</b></p>	<pre>sw1(config)#station-move permit</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● A lap-top PC in the R&amp;D department performs authentication using dot1x SU client, and gets online. Remove the network cable from the PC, connect the PC to the LAN where the test department resides, and perform</li> </ul>

	dot1x authentication for the PC again using dot1x SU client. Confirm that the PC can successfully get online.
<b>Switch A</b>	sw1(config)#show running-config   include station station-move permit

#### 4.4.5 Configuring User Online-Status Detection

##### Configuration Effect

After the user online-status detection function is enabled, if a user's traffic is lower than a certain threshold within the specified period of time, the device automatically disconnects the user, so as to avoid the economical loss incurred by constant charging to the user.

##### Precautions

It should be noted that if disconnecting zero-traffic users is configured, generally software such as 360 Security Guard will run on a user terminal by default. Then such software will send packets time and again, and the device will disconnect the user only when the user's terminal is powered off.

##### Configuration Method

##### ▾ Configuring User Online-Status Detection

- Optional configuration. A user is disconnected if the user does not involve any traffic within eight hours by default.
- Perform this configuration on access, convergence, or core switches depending on user distribution. The configuration acts on only the configured device instead of other devices on the network.
- If the traffic threshold parameter threshold is set to 0, it indicates that zero-traffic detection will be performed.

<b>Command</b>	<b>offline-detect interval <i>interval</i> threshold <i>threshold</i></b> <b>no offline-detect</b> <b>default offline-detect</b>
<b>Parameter Description</b>	<i>interval</i> : This parameter indicates the offline-detection interval. The value range is from 6 to 65535 in minutes on a switch or from 1 to 65535 in minutes on a non-switch device. The default value is 8 hours, that is, 480 minutes. <i>threshold</i> : This parameter indicates the traffic threshold. The value range is from 0 to 4294967294 in bytes. The default value is 0, indicating that the user is disconnected when no traffic of the user is detected. <b>no offline-detect</b> : Disables the user online-status detection function. <b>default offline-detect</b> : Restores the default value. In other words, an online user will be disconnected when the device detects that the user does not have any traffic within eight hours.
<b>Defaults</b>	8 hours
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure user online-status detection, so that a user is disconnected when its traffic is lower than a specific threshold within a specific period of time. Use the <b>no offline-detect</b> command to disable the user online-status detection function, or use the <b>default offline-detect</b> command to restore the default detection mode.

**Verification**

Check the user online-status detection configuration using the following method:

- After the user online-status detection function is enabled, power off the specified authenticated terminal after the corresponding user gets online. Then wait for the specified period of time, and run the online user query command associated with dot1x or Web authentication on the device to confirm that the user is already offline.

**Configuration Examples**

**i** The following configuration example describes SCC-related configuration only.

**Configuring User Online-Status Detection so that a User Is Disconnected if the User Does Not Have Traffic Within Five Minutes**

<p><b>Scenario</b> Figure 4- 5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable dot1x authentication on the access port Gi 0/2, and configure authentication parameters. The authentication is MAC-based.</li> <li>● Configure user online-status detection so that a user is disconnected if the user does not have traffic within five minutes.</li> </ul>
<p><b>Switch A</b></p>	<pre>sw1(config)# offline-detect interval 5 threshold 0</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>● Perform dot1x authentication using dot1x SU client for a PC in the R&amp;D department, so that the PC gets online. Then power off the PC, wait for 6 minutes, and run the online user query command available with dot1x authentication on switch 1 to confirm that the user of the PC is already offline.</li> </ul>
<p><b>Switch A</b></p>	<pre>sw1(config)#show running-config   include offline-detect offline-detect interval 5</pre>

## 4.5 Monitoring

### Displaying

Command	Function
<code>show direct-vlan</code>	Displays the authentication-exemption VLAN configuration.
<code>show nac-author-user [ interface <i>interface-name</i> ]</code>	Displays information about IPv4 user entries on a specific interface.

### Debugging

System resources are occupied when debugging information is output. Therefore, close the debugging switch immediately after use.

Command	Function
<code>debug scc event</code>	Debugs the SCC running process.
<code>debug scc user [ mac   author   mac ]</code>	Debugs SCC user entries.
<code>debug scc acl-show summary</code>	Debugs ACLs stored in the current SCC and delivered by various services.
<code>debug scc acl-show all</code>	Debugs all ALCs stored in the current SCC.

## 5 Configuring Password Policy

### 5.1 Overview

The Password Policy is a password security function provided for local authentication of the device. It is configured to control users' login passwords and login states.

The following sections introduce password policy only.

### 5.2 Features

#### 5.2.1 Basic Concepts

##### Minimum Password Length

Administrators can set a minimum length for user passwords according to system security requirements. If the password input by a user is shorter than the minimum password length, the system does not allow the user to set this password but displays a prompt, asking the user to specify another password of an appropriate length.

##### Strong Password Detection

The less complex a password is, the more likely it is to crack the password. For example, a password that is the same as the corresponding account or a simple password that contains only characters or digits may be easily cracked. For the sake of security, administrators can enable the strong password detection function to ensure that the passwords set by users are highly complex. After the strong password detection function is enabled, a prompt will be displayed for the following types of passwords:

1. Passwords that are the same as corresponding accounts;
2. Simple passwords that contain characters or digits only.

### ↘ Special Character Check

Special characters include ~`!@#%&\*( )\_+={}|[]\:'<>./ and space. The password only containing special characters is easy to be cracked. After enabling special character check, the password can not consist of only special characters. After enabling strong password check, a prompt will be displayed when the password only contains special characters.

### ↘ Password Life Cycle

The password life cycle defines the validity time of a user password. When the service time of a password exceeds the life cycle, the user needs to change the password.

If the user inputs a password that has already expired during login, the system will give a prompt, indicating that the password has expired and the user needs to reset the password. If the new password input during password resetting does not meet system requirements or the new passwords consecutively input twice are not the same, the system will ask the user to input the new password once again.

### ↘ Guard Against Repeated Use of Passwords

When changing the password, the user will set a new password while the old password will be recorded as the user's history records. If the new password input by the user has been used previously, the system gives an error prompt and asks the user to specify another password.

The maximum number of password history records per user can be configured. When the number of password history records of a user is greater than the maximum number configured for this user, the new password history record will overwrite the user's oldest password history record.

### ↘ Storage of Encrypted Passwords

Administrators can enable the storage of encrypted passwords for security consideration. When administrators run the **show running-config** command to display configuration or run the **write** command to save configuration files, various user-set passwords are displayed in the cipher text format. If administrators disable the storage of encrypted passwords next time, the passwords already in cipher text format will not be restored to plaintext passwords.

## 5.3 Configuration

Configuration	Description and Command
Configuring the Password Security Policy	 Optional configuration, which is used to configure a combination of parameters related to the password security policy.
	<b>password policy life-cycle</b> Configures the password life cycle.
	<b>password policy min-size</b> Configures the minimum length of user passwords.
	<b>password policy no-repeat-times</b> Sets the no-repeat times of latest password configuration, so that the passwords specified in these times of latest password configuration can no longer be used in future password configuration.
	<b>password policy strong</b> Enables the strong password detection function.
	<b>password policy printable-character-check</b> Enables special character check.

	<b>service password-encryption</b>	Sets the storage of encrypted passwords.
--	------------------------------------	--

### 5.3.1 Configuring the Password Security Policy

#### Networking Requirements

- Provide a password security policy for local authentication of the device. Users can configure different password security policies to implement password security management.

#### Notes

- The configured password security policy is valid for global passwords (configured using the commands **enable password** and **enable secret**) and local user passwords (configured using the **username name password password** command). It is invalid for passwords in Line mode.

#### Configuration Steps

##### ▾ Configuring the Password Life Cycle

- Optional
- Perform this configuration on each device that requires the configuration of a password life cycle unless otherwise stated.

##### ▾ Configuring the Minimum Length of User Passwords

- Optional
- Perform this configuration on each device that requires a limit on the minimum length of user passwords unless otherwise stated.

##### ▾ Setting the No-Repeat Times of Latest Password Configuration

- Optional
- Perform this configuration on each device that requires a limit on the no-repeat times of latest password configuration unless otherwise stated.

##### ▾ Enabling the Strong Password Detection Function

- Optional
- Perform this configuration on each device that requires strong password detection unless otherwise stated.

##### ▾ Enabling the Special Character Check

- Optional
- Perform this configuration on each device that requires strong password detection unless otherwise stated.

##### ▾ Setting the Storage of Encrypted Passwords

- Optional
- Perform this configuration on each device that requires the storage of passwords in encrypted format unless otherwise stated.

#### Verification

Configure a local user on the device, and configure a valid password and an invalid password for the user.

- When you configure the valid password, the device correctly adds the password.
- When you configure the invalid password, the device displays a corresponding error log.

#### Related Commands

##### ▾ Configuring the Password Life Cycle

<b>Command Syntax</b>	<b>password policy life-cycle</b> <i>days</i>
<b>Parameter Description</b>	<b>life-cycle</b> <i>days</i> : Indicates the password life cycle in the unit of days. The value range is from 1 to 65535.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The password life cycle is used to define the validity period of user passwords. If the user logs in with a password whose service time already exceeds the life cycle, a prompt is given, asking the user to change the password.

##### ▾ Configuring the Minimum Length of User Passwords

<b>Command Syntax</b>	<b>password policy min-size</b> <i>length</i>
<b>Parameter Description</b>	<b>min-size</b> <i>length</i> : Indicates the minimum length of passwords. The value range is from 1 to 31.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the minimum length of passwords. If the minimum length of passwords is not configured, users can input a password of any length.

##### ▾ Setting the No-Repeat Times of Latest Password Configuration

<b>Command Syntax</b>	<b>password policy no-repeat-times</b> <i>times</i>
<b>Parameter Description</b>	<b>no-repeat-times</b> <i>times</i> : Indicates the no-repeat times of latest password configuration. The value range is from 1 to 31.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After this function is enabled, all old passwords used in the several times of latest password configuration will be recorded as the user's password history records. If the new password input by the user has been used previously, the system gives an error prompt and the password modification fails. You can configure the maximum number of password history records per user. When the number of password history records of a user is greater than the maximum number configured for the user, the new password history record will overwrite the user's oldest password history record.

##### ▾ Enabling the Strong Password Detection Function

<b>Command Syntax</b>	<b>password policy strong</b>
-----------------------	-------------------------------

<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After the strong password detection function is enabled, a prompt is displayed for the following types of passwords:  1. Passwords that are the same as corresponding accounts;  Simple passwords that contain characters or digits only.

#### ▾ Enabling the Special Character Check

<b>Command Syntax</b>	<b>password policy printable-character-check</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After the special character check is enabled, a prompt is displayed for the password containing only special characters.

#### ▾ Setting the Storage of Encrypted Passwords

<b>Command Syntax</b>	<b>service password-encryption</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Before the storage of encrypted passwords is set, all passwords used in the configuration process will be displayed and stored in plaintext format, unless the passwords are configured in cipher text format. You can enable the storage of encrypted passwords for security consideration. When you run the <b>show running-config</b> command to display configuration or run the <b>write</b> command to save configuration files, various user-set passwords are displayed in the cipher text format. If you disable the storage of encrypted passwords next time, the passwords already in cipher text format will not be restored to plaintext passwords.

#### ▾ Checking User-Configured Password Security Policy Information

<b>Command Syntax</b>	<b>show password policy</b>
<b>Parameter Description</b>	-
<b>Command Mode</b>	Privileged EXEC mode/ Global configuration mode/ Interface configuration mode
<b>Usage Guide</b>	Use this command to display the password security policy configured on the device.

#### Configuration Examples

**i** The following configuration example describes configuration related to a password security policy.

**▾ Configuring Password Security Check on the Device**

<p>Typical Application</p>	<p>Assume that the following password security requirements arise in a network environment:</p> <ol style="list-style-type: none"> <li>1. The minimum length of passwords is 8 characters;</li> <li>2. The password life cycle is 90 days;</li> <li>3. Passwords are stored and transmitted in cipher text format;</li> <li>4. The number of no-repeat times of password history records is 3;</li> <li>5. Passwords shall not be the same as user names, and shall not contain simple characters or digits only.</li> </ol>
<p>Configuration Steps</p>	<ul style="list-style-type: none"> <li>● Set the minimum length of passwords to 8.</li> <li>● Set the password life cycle to 90 days.</li> <li>● Enable the storage of encrypted passwords.</li> <li>● Set the no-repeat times of password history records to 3.</li> <li>● Enable the strong password detection function.</li> </ul> <pre style="background-color: #f0f0f0; padding: 5px;"> FS# configure terminal FS(config)# password policy min-size 8 FS(config)# password policy life-cycle 90 FS(config)# service password-encryption FS(config)# password policy no-repeat-times 3 FS(config)# password policy strong                     </pre>
<p>Verification</p>	<p>When you create a user and the corresponding password after configuring the password security policy, the system will perform relevant detection according to the password security policy.</p> <ul style="list-style-type: none"> <li>● Run the <b>show password policy</b> command to display user-configured password security policy information.</li> </ul> <pre style="background-color: #f0f0f0; padding: 5px;"> FS# show password policy  Global password policy configurations:  Password encryption:           Enabled Password strong-check:        Enabled Password min-size:             Enabled (8 characters) Password life-cycle:           Enabled (90 days) Password no-repeat-times:      Enabled (max history record: 3)                     </pre>

**Common Errors**

- The time configured for giving a pre-warning notice about password expiry to the user is greater than the password life cycle.

## 5.4 Monitoring

### Displaying the Running Status

Command	Function
<code>show password policy</code>	Displays user-configured password security policy information.

## 6 Configuring Storm Control

### 6.1 Overview

When a local area network (LAN) has excess broadcast data flows, multicast data flows, or unknown unicast data flows, the network speed will slow down and packet transmission will have an increased timeout probability. This situation is called a LAN storm. A storm may occur when topology protocol execution or network configuration is incorrect.

Storm control can be implemented to limit broadcast data flows, multicast data flows, or unknown unicast data flows. If the rate of data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds. This prevents flood data from entering the LAN causing a storm.

### 6.2 Applications

Application	Description
Network Attack Prevention	Enable storm control to prevent flooding.

#### 6.2.1 Network Attack Prevention

##### Scenario

The application requirements of network attack prevention are described as follows:

- Protect devices from flooding of broadcast packets, multicast packets, or unknown unicast packets.

Figure 6-1

<b>Remarks</b>	Switch A and Switch B are access devices. PC 1, PC 2, PC 3, and PC 4 are desktop computers.
----------------	--

##### Deployment

- Enable storm control on the ports of all access devices (Switch A and Switch B).

## 6.3 Features

### Basic Concepts

#### ▾ Storm Control

If the rate of data flows (broadcast packets, multicast packets, or unknown unicast packets) received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

#### ▾ Storm Control Based on the Bandwidth Threshold

If the rate of data flows received by a device port is within the configured bandwidth threshold, the data flows are permitted to pass through. If the rate exceeds the threshold, excess data flows are discarded until the rate falls within the threshold.

#### ▾ Storm Control Based on the Packets-per-Second Threshold

If the rate of data flows received by a device port is within the configured packets-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the threshold, excess data flows are discarded until the rate falls within the threshold.

#### ▾ Storm Control Based on the Kilobits-per-Second Threshold

If the rate of data flows received by a device port is within the configured kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the threshold, excess data flows are discarded until the rate falls within the threshold.

### Overview

Feature	Description
Unicast Packet Storm Control	Limits unknown unicast packets to prevent flooding.
Multicast Packet Storm Control	Limits multicast packets to prevent flooding.
Broadcast Packet Storm Control	Limits broadcast packets to prevent flooding.

#### 6.3.1 Unicast Packet Storm Control

The unicast packet storm control feature monitors the rate of unknown unicast data flows received by a device port to limit LAN traffic and prevent flooding caused by excess data flows.

#### Working Principle

If the rate of unknown unicast data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

#### Related Configuration

#### ▾ Enabling Unicast Packet Storm Control on Ports

By default, unicast packet storm control is disabled on ports.

Run the **storm-control unicast** [ { *level percent* | *pps packets* | *rate-bps* } ] command to enable unicast packet storm control on ports.

Run the **no storm-control unicast** or **default storm-control unicast** command to disable unicast packet storm control on ports.

The default command parameters are determined by related products.

### 6.3.2 Multicast Packet Storm Control

The multicast packet storm control feature monitors the rate of multicast data flows received by a device port to limit LAN traffic and prevent flooding caused by excess data flows.

#### Working Principle

If the rate of multicast data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

#### Related Configuration

##### ↘ Enabling Multicast Packet Storm Control on Ports

By default, multicast packet storm control is disabled on ports.

Run the **storm-control multicast** [ { *level percent* | *pps packets* | *rate-bps* } ] command to enable multicast packet storm control on ports.

Run the **no storm-control multicast** or **default storm-control multicast** command to disable multicast packet storm control on ports.

The default command parameters are determined by related products.

### 6.3.3 Broadcast Packet Storm Control

The broadcast packet storm control feature monitors the rate of broadcast data flows received by a device port to limit LAN traffic and prevent flooding caused by excess data flows.

#### Working Principle

If the rate of broadcast data flows received by a device port is within the configured bandwidth threshold, packets-per-second threshold, or kilobits-per-second threshold, the data flows are permitted to pass through. If the rate exceeds the thresholds, excess data flows are discarded until the rate falls within the thresholds.

#### Related Configuration

##### ↘ Enabling Broadcast Packet Storm Control on Ports

By default, broadcast packet storm control is disabled on ports.

Run the **storm-control broadcast** [ { *level percent* | *pps packets* | *rate-bps* } ] command to enable broadcast packet storm control on ports.

Run the **no storm-control broadcast** or **default storm-control broadcast** command to disable broadcast packet storm control on ports.

The default command parameters are determined by related products.

## 6.4 Configuration

Configuration	Description and Command
Configuring Basic Functions of Storm Control	 (Mandatory) It is used to enable storm control.
	<b>storm-control</b> { <b>broadcast</b>   <b>multicast</b>   <b>unicast</b> } [ { <i>level percent</i>   <i>pps packets</i>   <i>rate-bps</i> ] <span style="float: right;">Enables storm control.</span>

### 6.4.1 Configuring Basic Functions of Storm Control

#### Configuration Effect

- Prevent flooding caused by excess broadcast packets, multicast packets, and unknown unicast packets.

#### Notes

- When you run a command (for example, **storm-control unicast**) to enable storm control, if you do not set the parameters, the default values are used.

#### Configuration Steps

##### ▾ Enabling Unicast Packet Storm Control

- Mandatory.
- Enable unicast packet storm control on every device unless otherwise specified.

##### ▾ Enabling Multicast Packet Storm Control

- Mandatory.
- Enable multicast packet storm control on every device unless otherwise specified.

##### ▾ Enabling Broadcast Packet Storm Control

- Mandatory.
- Enable broadcast packet storm control on every device unless otherwise specified.

#### Verification

- Run the **show storm-control** command to check whether the configuration is successful.

#### Related Commands

##### ▾ Enabling Unicast Packet Storm Control

<b>Command</b>	<b>storm-control unicast</b> [ { <i>level percent</i>   <i>pps packets</i>   <i>rate-bps</i> ]
<b>Parameter</b>	<i>level percent</i> : Indicates the bandwidth percentage.
<b>Description</b>	<i>pps packets</i> : Indicates the number of packets per second. <i>rate-bps</i> : Indicates the packet rate.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Storm control can be enabled only on switch ports.

▾ Enabling Multicast Packet Storm Control

<b>Command</b>	<b>storm-control multicast</b> [ { <i>level percent</i>   <b>pps packets</b>   <i>rate-bps</i> } ]
<b>Parameter Description</b>	<b>level percent</b> : Indicates the bandwidth percentage. <b>pps packets</b> : Indicates the number of packets per second. <b>rate-bps</b> : Indicates the packet rate.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Storm control can be enabled only on switch ports.

▾ Enabling Broadcast Packet Storm Control

<b>Command</b>	<b>storm-control broadcast</b> [ { <i>level percent</i>   <b>pps packets</b>   <i>rate-bps</i> } ]
<b>Parameter Description</b>	<b>level percent</b> : Indicates the bandwidth percentage. <b>pps packets</b> : Indicates the number of packets per second. <b>rate-bps</b> : Indicates the packet rate.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Storm control can be enabled only on switch ports.

Configuration Example

▾ Enabling Storm Control on Devices

<b>Scenario</b>	
<b>Figure 6-2</b>	
<b>Configuration Step</b>	<ul style="list-style-type: none"> <li>● Enable storm control on Switch A and Switch B.</li> </ul>
<b>Switch A</b>	<pre>FS(config)#interface range gigabitEthernet 0/5,0/9,0/13 FS(config-if-range)#storm-control broadcast FS(config-if-range)#storm-control multicast FS(config-if-range)#storm-control unicast</pre>
<b>Switch B</b>	<pre>FS(config)#interface range gigabitEthernet 0/1,0/5,0/9 FS(config-if-range)#storm-control broadcast FS(config-if-range)#storm-control multicast FS(config-if-range)#storm-control unicast</pre>

<b>Verification</b>	Check whether storm control is enabled on Switch A and Switch B.

Description	Command
Displays storm control information.	<b>show storm-control</b> [ <i>interface-type interface-number</i> ]

## 7 Configuring SSH

### 7.1 Overview

Secure Shell (SSH) connection is similar to a Telnet connection except that all data transmitted over SSH is encrypted. When a user in an insecure network environment logs into a device remotely, SSH helps ensure information security and powerful authentication, protecting the device against attacks such as IP address spoofing and plain-text password interception.

An SSH-capable device can be connected to multiple SSH clients. In addition, the device can also function as an SSH client, and allows users to set up an SSH connection with a SSH-server device. In this way, the local device can safely log in to a remote device through SSH to implement management.

-  Currently, a device can work as either the SSH server or an SSH client, supporting SSHv1 and SSHv2 versions. FS SSH service supports both IPv4 and IPv6.
-  Unless otherwise specified, SSH in this document refers to SSHv2.

### Protocols and Standards

- RFC 4251: The Secure Shell (SSH) Protocol Architecture
- RFC 4252: The Secure Shell (SSH) Authentication Protocol
- RFC 4253: The Secure Shell (SSH) Transport Layer Protocol
- RFC 4254: The Secure Shell (SSH) Connection Protocol
- RFC 4419: Diffie-Hellman Group Exchange for the Secure Shell (SSH) Transport Layer Protocol
- RFC 4716: The Secure Shell (SSH) Public Key File Format
- RFC 4819: Secure Shell Public Key Subsystem
- RFC 3526: More Modular Exponential (MODP) Diffie-Hellman groups for Internet Key Exchange (IKE)
- RFC 2409: The Internet Key Exchange (IKE)
- RFC 1950: ZLIB Compressed Data Format Specification version 3.3
- draft-ietf-secsh-filexfer-05: SSH File Transfer Protocol
- draft-ylonen-ssh-protocol-00: The version of the SSH Remote Login Protocol is 1.5. Comware implements the SSH server functions, but not the SSH client functions.

## 7.2 Applications

Application	Description
SSH Device Management	Use SSH to manage devices.
SSH Local Line Authentication	Use the local line password authentication for SSH user authentication.
<u>SSH</u> AAA Authentication	Use the authentication, authorization and accounting (AAA) mode for SSH user authentication.
<u>SSH</u> Public Key Authentication	Use the public key authentication for SSH user authentication.
SSH File Transfer	Use the Secure Copy (SCP) commands on the client to exchange data with the SSH server.
SSH Client Application	Use the SSH client to safely log in to a remote device for management.

### 7.2.1 SSH Device Management

#### Scenario

You can use SSH to manage devices on the precondition that the SSH server function is enabled. By default, this function is disabled. The Telnet component that comes with the Windows system does not support SSH. Therefore, a third-party client software must be used. Currently, well-compatible software includes PuTTY, Linux, and SecureCRT. The following takes the PuTTY as an example to introduce the configurations of the SSH client. Figure 7- 1 shows the network topology.

Figure 7- 1 Networking Topology of SSH Device Management

#### Deployment

Configure the SSH client as follows:

- Start the PuTTY software.
- On the **Session** option tab of PuTTY, type in the host IP address of the SSH server and SSH port number **22**, and select the connection type **SSH**.
- On the **SSH** option tab of PuTTY, select the preferred SSH protocol version **2**.
- On the **SSH authentication** option tab of PuTTY, select the authentication method **Attempt "keyboard-interactive" auth**.
- Click **Open** to connect to the SSH server.
- Type in the correct user name and password to enter the terminal login interface.

## 7.2.2 SSH Local Line Authentication

### Scenario

SSH clients can use the local line password authentication mode, as shown in Figure 7-2. To ensure security of data exchange, PC 1 and PC 2 function as the SSH clients, and use the SSH protocol to log in to the network device where the SSH server function is enabled. The requirements are as follows:

- SSH users use the local line password authentication mode.
- Five lines, including Line 0 to Line 4, are activated concurrently. The login password is "passzero" for Line 0 and "pass" for the remaining lines. Any user name can be used.

Figure 7- 2 Networking Topology of SSH Local Line Password Authentication

### Deployment

- Configure the SSH server as follows:
  1. Enable the SSH server function globally. By default, the SSH server supports two SSH versions: SSHv1 and SSHv2.
  2. Configure the key. With this key, the SSH server decrypts the encrypted password received from the SSH clients, compares the decrypted plain text with the password stored on the server, and returns a message indicating the successful or unsuccessful authentication. SSHv1 uses an RSA key, whereas SSHv2 adopts an RSA or DSA key.
  3. Configure the IP address of the FastEthernet 0/1 interface on the SSH server. The SSH client is connected to the SSH server using this IP address. The routes from the SSH clients to the SSH server are reachable.
- Configure the SSH client as follows:

Diversified SSH client software is available, including PuTTY, Linux, and OpenSSH. This document takes PuTTY as an example to explain the method for configuring the SSH clients.

1. Open the PuTTY connection tab, and select SSHv1 for authenticated login. (The method is similar if SSHv2 is selected.)
2. Set the IP address and connected port ID of the SSH server. As shown in the network topology, the IP address of the server is 192.168.23.122, and the port ID is 22. Click **Open** to start the connection. As the current authentication mode does not require a user name, you can type in any user name, but cannot be null. (In this example, the user name is "anyname".)

### 7.2.3 SSH AAA Authentication

#### Scenario

SSH users can use the AAA authentication mode for user authentication, as shown in Figure 7-3. To ensure security of data exchange, the PCs function as the SSH clients, and uses the SSH protocol to log in to the network device where the SSH server is enabled. To better perform security management, the AAA authentication mode is used for user login on the SSH clients. Two authentication methods, including Radius server authentication and local authentication, are provided in the AAA authentication method list to ensure reliability. The Radius server authentication method is preferred. If the Radius server does not respond, it turns to the local authentication.

Figure 7- 3 Networking Topology of SSH AAA Authentication

#### Deployment

- The routes from the SSH clients to the SSH server are reachable, and the route from the SSH server to the Radius server is also reachable.
- Configure the SSH server on the network device that functions as an SSH client.
- Configure the AAA parameters on the network device. When the AAA authentication mode is used, method lists are created to define the identity authentication and types, and applied to a specified service or interface.

### 7.2.4 SSH Public Key Authentication

#### Scenario

SSH clients can use the public keys for authentication, and the public key algorithm can be RSA or DSA, as shown in Figure 7-4. SSH is configured on the client so that a secure connection is set up between the SSH client and the SSH server.

Figure 7- 4 Network Topology for Public Key Authentication of SSH Users

### Deployment

- To implement public key authentication for the client, generate a key pair (RSA or DSA) on the client, configure the public key on the SSH server, and select the public key authentication mode.
- After the key is generated on the client, the SSH server will copy the file of the public key from the client to the flash and associates the file with the SSH user name. Each user can be associated with one RSA public key and one DSA public key.

## 7.2.5 SSH File Transfer

### Scenario

The SCP service is enabled on the server, and SCP commands are used on the client to transfer data to the server, as shown in Figure 7-5.

Figure 7- 5 Networking Topology of SSH File Transfer

### Deployment

- Enable the SCP service on the server.
- On the client, use SCP commands to upload files to the server, or download files from the server.

## 7.2.6 SSH Client Application

### Scenario

The SSH service is enabled on a remote SSH server, and the **ssh** command is used on the local client to set up an SSH connection with the server for secure data transmission, as shown in Figure 7-6.

Figure 7- 6 Networking Topology of SSH Client Application

### Deployment

- Enable the SSH service on the server.
- On the client, run the **ssh** command to set up an SSH connection with the server for secure data transmission.

## 7.3 Features

### Basic Concepts

#### ↘ User Authentication Mechanism

- Password authentication

During the password authentication, a client sends a user authentication request and encrypted user name and password to the server. The server decrypts the received information, compares the decrypted information with those stored on the server, and then returns a message indicating the successful or unsuccessful authentication.

- Public key authentication

During the public key authentication, digital signature algorithms, such as RSA and DSA, are used to authenticate a client. The client sends a public key authentication request to the server. This request contains information including the user name, public key, and public key algorithm. On receiving the request, the server checks whether the public key is correct. If wrong, the server directly sends an authentication failure message. If right, the server performs digital signature authentication on the client, and returns a message indicating the successful or unsuccessful authentication.

 Public key authentication is applicable only to the SSHv2 clients.

#### ↘ SSH Communication

To ensure secure communication, interaction between an SSH server and an SSH client undergoes the following seven stages:

- Connection setup

The server listens on Port 22 to the connection request from the client. After originating a socket initial connection request, the client sets up a TCP socket connection with the server.

- Version negotiation

If the connection is set up successfully, the server sends a version negotiation packet to the client. On receiving the packet, the client analyzes the packet and returns a selected protocol version to the server. The server analyzes the received information to determine whether version negotiation is successful.

- Key exchange and algorithm negotiation

If version negotiation is successful, key exchange and the algorithm negotiation are performed. The server and the client exchange the algorithm negotiation packet with each other, and determine the final algorithm based on their capacity. In addition, the server and the client work together to generate a session key and a session ID according to the key exchange algorithm and host key, which will be applied to subsequent user authentication, data encryption, and data decryption.

- User authentication

After the encrypted channel is set up, the client sends an authentication request to the server. The server repeatedly conducts authentication for the client until the authentication succeeds or the server shuts down the connection because the maximum number of authentication attempts is reached.

- Session request

After the successful authentication, the client sends a session request to the server. The server waits and processes the client request. After the session request is successfully processed, SSH enters the session interaction stage.

- Session interaction

After the session request is successfully processed, SSH enters the session interaction stage. Encrypted data can be transmitted and processed in both directions. The client sends a command to be executed to the server. The server decrypts, analyzes, and processes the received command, and then sends the encrypted execution result to the client. The client decrypts the execution result.

- Session ending

When the interaction between the server and the client is terminated, the socket connection disconnects, and the session ends.

## Overview

Feature	Description
SSH Server	Enable the SSH server function on a network device, and you can set up a secure connection with the network device through the SSH client.
SCP Service	After the SCP service is enabled, you can directly download files from the network device and upload local files to the network device. In addition, all interactive data is encrypted, featuring authentication and security.
SSH Client	You can use the SSH client on the device to set up a secure connection with the SSH server on a network device.

### 7.3.1 SSH Server

Enable the SSH server function on a network device, and you can set up a secure connection with the network device through the SSH client. You can also shut down the SSH server function to disconnect from all SSH clients.

#### Working Principle

For details about the working principle of the SSH server, see the "SSH Communication" in "Basic Concepts." In practice, after enabling the SSH server function, you can configure the following parameters according to the application requirements:

- Version: Configure the SSH version as SSHv1 or SSHv2 to connect SSH clients.
- Authentication timeout: The SSH server starts the timer after receiving a user connection request. The SSH server is disconnected from the client either when the authentication succeeds or when the authentication timeout is reached.
- Maximum number of authentication retries: The SSH server starts authenticating the client after receiving its connection request. If authentication does not succeed when the maximum number of user authentication retries is reached, a message is sent, indicating the authentication failure.
- Public key authentication: The public key algorithm can be RSA or DSA. It provides a secure connection between the client and the server. The public key file on the client is associated with the user name. In addition, the public key authentication mode is configured on the client, and the corresponding private key file is specified. In this way, when the client attempts to log in to the server, public key authentication can be implemented to set up a secure connection.

#### Related Configuration

##### ▾ Enabling the SSH Server

By default, the SSH server is disabled.

In global configuration mode, run the `[no] enable service ssh-server` command to enable or disable the SSH server.

To generate the SSH key, you also need to enable the SSH server.

##### ▾ Specifying the SSH Version

By default, the SSH server supports both SSHv1 and SSHv2, connecting either SSHv1 clients or SSHv2 clients.

Run the **ip ssh version** command to configure the SSH version supported by the SSH server.

If only SSHv1 or SSHv2 is configured, only the SSH client of the configured version can be connected to the SSH server.

#### ▾ **Configuring the SSH Authentication Timeout**

By default, the user authentication timeout is 120s.

Run the **ip ssh time-out** command to configure the user authentication timeout of the SSH server. Use the **no** form of the command to restore the default timeout. The SSH server starts the timer after receiving a user connection request. If authentication does not succeed before the timeout is reached, authentication times out and fails.

#### ▾ **Configuring the Maximum Number of SSH Authentication Retries**

By default, the maximum number of user authentication retries is 3.

Run the **ip ssh authentication-retries** command to configure the maximum number of user authentication retries on the SSH server. Use the **no** form of the command to restore the default number of user authentication retries. If authentication still does not succeed when the maximum number of user authentication retries is reached, user authentication fails.

#### ▾ **Specifying the SSH Encryption Mode**

By default, the encryption mode supported by the SSH server is Compatible, that is, supporting cipher block chaining (CBC), counter (CTR) and other encryption modes.

Run the **ip ssh cipher-mode** command to configure the encryption mode supported by the SSH server. Use the **no** form of the command to restore the default encryption mode supported by the SSH server.

#### ▾ **Specifying the SSH Message Authentication Algorithm**

By default, the message authentication algorithms supported by the SSH server are as follows: (1) For the SSHv1, no algorithm is supported; (2) For the SSHv2, four algorithms, including MD5, SHA1, SHA1-96, and MD5-96, are supported.

Run the **ip ssh hmac-algorithm** command to configure the message authentication algorithm supported by the SSH server. Use the **no** form of the command to restore the default message authentication algorithm supported by the SSH server.

#### ▾ **Configuring Support for Diffie-Hellman(DH) Key Exchange Algorithm on the SSH Server**

By default, FS's SSHv2 server supports diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, and diffie-hellman-group1-sha1 for keyexchange while the SSHv1 server support none. Run the **ip ssh key-exchange** command to configure support for Diffie-Hellman on the SSH server. Use the **no ip ssh key-exchange** command to restore the default setting.

#### ▾ **Setting ACL Filtering of the SSH Server**

By default, ACL filtering is not performed for all connections to the SSH server.

Run the **{ip | ipv6} ssh access-class** command to perform ACL filtering for all connections to the SSH server. Run **no {ip | ipv6} ssh access-class** to restore the default settings.

#### ▾ **Enabling the Public Key Authentication on the SSH Server**

Run the **ip ssh peer** command to associate the public key file on the client with the user name. When the client is authenticated upon login, a public key file is specified based on the user name.

### 7.3.2 SCP Service

The SSH server provides the SCP service to implement secure file transfer between the server and the client.

#### Working Principle

- SCP is a protocol that supports online file transfer. It runs on Port 22 based on the BSC RCP protocol, whereas RCP provides the encryption and authentication functions based on the SSH protocol. RCP implements file transfer, and SSH implements authentication and encryption.
- Assume that the SCP service is enabled on the server. When you use an SCP client to upload or download files, the SCP client first analyzes the command parameters, sets up a connection with a remote server, and starts another SCP process based on this connection. This process may run in source or sink mode. (The process running in source mode is the data provider. The process running in sink mode is the destination of data.) The process running in source mode reads and sends files to the peer end through the SSH connection. The process running in sink mode receives files through the SSH connection.

#### Related Configuration

##### ▾ Enabling the SCP Server

By default, the SCP server function is disabled.

Run the **ip scp server enable** command to enable SCP server function on a network device.

### 7.3.3 SSH Client

The SSH client is used to set up a secure connection with a remote network device on which the SSH server runs.

#### Working Principle

For details about the working principle of the SSH client, see the "SSH Communication" in "Basic Concepts."

#### Related Configuration

##### ▾ Specifying the Source Interface of the SSH Client

By default, the source address of SSH packets is searched based on the destination address.

Run the **ip ssh source-interface *interface-name*** command to specify the source interface of the SSH client.

##### ▾ Establishing a Session with the SSH Server

Run the **ssh** command to log in to a remote device that supports the SSH Server

##### ▾ Recovering an Established SSH Session

- Run the **ssh-session *session-id*** command to recover an established SSH session.

##### ▾ Disconnecting a Suspended SSH Session

- Run the **disconnect ssh-session *session-id*** command to disconnect a specified SSH session.

### 7.3.4 SCP Client

The SCP client is used to support file transfer with the remote network device on which the SCP server is enabled.

#### Working Principle

SCP is a protocol that supports online file transfer. It runs on Port 22 based on BSD RCP, while RCP provides the encryption and authentication functions based on the SSH protocol. RCP implements file transfer, and SSH implements authentication and encryption.

When you use an SCP client to upload or download files, the SCP client first parses the command parameters, sets up a connection with a remote server, and starts another SCP process based on this connection. This process may run in source or sink mode. The process serves as a data provider in source mode and reads and sends files to the peer end through the SSH connection, while serving as the destination of data in sink mode and receives the files through the SSH connection.

## Related Configuration

### ▾ Specifying Source Interface of SCP Client

By default, configure the IP address of the source interface as the source address in SSH packets.

Run the **ip scp client source-interface** *interface-name* command to specify the source interface of the SCP client.

### ▾ Establishing Connection with the SCP Server via SCP Client to Implement File Transfer

Run the **scp** command to implement file transfer with the SSH server.

## 7.4 Configuration

Configuration	Description and Command	
Configuring the SSH Server	 It is mandatory to enable the SSH server.	
	<b>enable service ssh-server</b>	Enables the SSH server.
	<b>disconnect ssh[<i>vt</i>] <i>session-id</i></b>	Disconnects an established SSH session.
	<b>crypto key generate {<i>rsa</i> <i>dsa</i>}</b>	Generates an SSH key.
	<b>ip ssh version {<i>1</i> <i>2</i>}</b>	Specifies the SSH version.
	<b>ip ssh time-out <i>time</i></b>	Configures the SSH authentication timeout.
	<b>ip ssh authentication-retries <i>retry times</i></b>	Configures the maximum number of SSH authentication retries.
	<b>ip ssh cipher-mode{<i>cbc</i>   <i>ctr</i>   <i>others</i> }</b>	Specifies the SSH encryption mode.
	<b>ip ssh hmac-algorithm{<i>md5</i>   <i>md5-96</i>   <i>sha1</i>   <i>sha1-96</i>}</b>	Specifies the SSH message authentication algorithm.
	<b>ip ssh key-exchange {<i>dh_group_exchange_sha1</i>   <i>dh_group14_sha1</i>   <i>dh_group1_sha1</i> }</b>	Configures support for Diffie-Hellman on the SSH server.
	<b>{<i>ip</i>   <i>ipv6</i>} ssh access-class { <i>access-list-number</i>   <i>access-list-name</i> }</b>	Enables ACL filtering of the SSH server.
<b>ip ssh peer <i>test</i> public-key <i>rsa</i> flash :<i>rsa.pub</i></b>	Associates an RSA public key file with a user.	
<b>ip ssh peer <i>test</i> public-key <i>dsa</i> flash:<i>dsa.pub</i></b>	Associates a DSA public key file with a user.	
Configuring the SCP Service	 Mandatory.	
	<b>ip scp server enable</b>	Enables the SCP server.
Configuring the SSH Client	 (Optional)It is used to set up a secure connection with a remote network device that supports the SSH server.	

Configuration	Description and Command	
	<code>ip ssh source-interface interface-name</code>	Specifies the source interface of the SSH client.
	<code>ssh [oob] [-v {1   2}][-c {3des   aes128-cbc   aes192-cbc   aes256-cbc}] [-l username ][-m {hmac-md5-96   hmac-md5-128   hmac-sha1-96   hmac-sha1-160}] [-p port-num ][ ip-addr/hostname][ via mgmt-name ][/source {ipA.B.C.D   ipv6 X:X:X:X::X   interface interface-name}][vrf vrf-name]</code>	Establishes an encrypted session with a remote network device.

### 7.4.1 Configuring the SSH Server

#### Configuration Effect

- Enable the SSH server function on a network device so that you can set up a secure connection with a remote network device through the SSH client. All interactive data is encrypted before transmitted, featuring authentication and security.
- You can use diversified SSH user authentications modes, including local line password authentication, AAA authentication, and public key authentication.
- You can generate or delete an SSH key.
- You can specify the SSH version.
- You can configure the SSH authentication timeout.
- You can configure the maximum number of SSH authentication retries.
- You can specify the SSH encryption mode.
- You can specify the SSH message authentication algorithm.
- You can specify ACL filtering of the SSH server.

#### Notes

- The precondition of configuring a device as the SSH server is that communication is smooth on the network that the device resides, and the administrator can access the device management interface to configure related parameters.
- The **no crypto key generate** command does not exist. You need to run the **crypto key zeroize** command to delete a key.
- The SSH module does not support hot standby. Therefore, for products that supports hot standby on the supervisor modules, if no SSH key file exist on the new active module after failover, you must run the **crypto key generate** command to re-generate a key before using SSH.

#### Configuration Steps

##### ▾ Enabling the SSH Server

- Mandatory.
- By default, the SSH server is disabled. In global configuration mode, enable the SSH server and generate an SSH key so that the SSH server state changes to ENABLE.

##### ▾ Specifying the SSH Version

- Optional.

- By default, the SSH server supports SSHv1 and SSHv2, connecting either SSHv1 or SSHv2 clients. If only SSHv1 or SSHv2 is configured, only the SSH client of the configured version can be connected to the SSH server.
- ▼ **Configuring the SSH Authentication Timeout**
  - Optional.
  - By default, the SSH authentication timeout is 120s. You can configure the user authentication timeout as required. The value ranges from 1 to 120. The unit is second.
- ▼ **Configuring the Maximum Number of SSH Authentication Retries**
  - Optional.
  - Configure the maximum number of SSH authentication retries to prevent illegal behaviors such as malicious guessing. By default, the maximum number of SSH authentication retries is 3, that is, a user is allowed to enter the user name and password three times for authentication. You can configure the maximum number of retries as required. The value ranges from 0 to 5.
- ▼ **Specifying the SSH Encryption Mode**
  - Optional.
  - Specify the encryption mode supported by the SSH server. By default, the encryption mode supported by the SSH server is Compatible, that is, supporting CBC, CTR and other encryption modes.
- ▼ **Specifying the SSH Message Authentication Algorithm**
  - Optional.
  - Specify the message authentication algorithm supported by the SSH server. By default, the message authentication algorithms supported by the SSH server are as follows: (1) For the SSHv1, no algorithm is supported; (2) For the SSHv2, four algorithms, including MD5, SHA1, SHA1-96, and MD5-96, are supported.
- ▼ **Setting ACL Filtering of the SSH Server**
  - Optional.
  - Set ACL filtering of the SSH server. By default, ACL filtering is not performed for all connections to the SSH server. According to needs, set ACL filtering to perform for all connections to the SSH server.
- ▼ **Enabling the Public Key Authentication for SSH Users**
  - Optional.
  - Only SSHv2 supports authentication based on the public key. This configuration associates a public key file on the client with a user name. When a client is authenticated upon login, a public key file is specified based on the user name.

#### Verification

- Run the **show ip ssh** command to display the current SSH version, authentication timeout, and maximum number of authentication retries of the SSH server.
- Run the **show crypto key mypubkey** command to display the public information of the public key to verify whether the key has been generated.

- Configure the public key authentication login mode on the SSH client and specify the private key file. Check whether you can successfully log in to the SSH server from the SSH client. If yes, the public key file on the client is successfully associated with the user name, and public key authentication succeeds.

## Related Commands

### ▾ Enabling the SSH Server

<b>Command</b>	<b>enable service ssh-server</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	To disable the SSH server, run the <b>no enable service ssh-server</b> command in global configuration mode. After this command is executed, the SSH server state changes to DISABLE.

### ▾ Disconnecting an Established SSH Session

<b>Command</b>	<b>disconnect ssh[<i>vt</i>] <i>session-id</i></b>
<b>Parameter</b>	<b>vt</b> : Indicates an established virtual teletype terminal (VTY) session.
<b>Description</b>	<i>session-id</i> : Indicates the ID of the established SSH session. The value ranges from 0 to 35.
<b>Command Mode</b>	Privileged EXEC mode
<b>Usage Guide</b>	Specify an SSH session ID to disconnect the established SSH session. Alternatively, specify a VTY session ID to disconnect a specified SSH session. Only an SSH session can be disconnected.

### ▾ Generating an SSH Key

<b>Command</b>	<b>crypto key generate {<i>rsa</i> <i>dsa</i>}</b>
<b>Parameter</b>	<b>rsa</b> : Generates an RSA key.
<b>Description</b>	<b>dsa</b> : Generates a DSA key.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The <b>no crypto key generate</b> command does not exist. You need to run the <b>crypto key zeroize</b> command to delete a key. SSHv1 uses an RSA key, whereas SSHv2 uses an RSA or DSA key. If an RSA key is generated, both SSHv1 and SSHv2 are supported. If only a DSA key is generated, only SSHv2 can use the key.

### ▾ Specifying the SSH Version

<b>Command</b>	<b>ip ssh version {<i>1</i> <i>2</i>}</b>
<b>Parameter</b>	<b>1</b> : Indicates that the SSH server only receives the connection requests sent by SSHv1 clients.
<b>Description</b>	<b>2</b> : Indicates that the SSH server only receives the connection requests sent by SSHv2 clients.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no ip ssh version</b> command to restore the default settings. By default, the SSH server supports both SSHv1 and SSHv2.

### ▾ Configuring the SSH Authentication Timeout

<b>Command</b>	<code>ip ssh time-out <i>time</i></code>
<b>Parameter Description</b>	<i>time</i> : Indicates the SSH authentication timeout. The value ranges from 1 to 120. The unit is second.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no ip ssh time-out</b> command to restore the default SSH authentication timeout, which is 120s.

### ▾ Configuring the Maximum Number of SSH Authentication Retries

<b>Command</b>	<code>ip ssh authentication-retries <i>retry times</i></code>
<b>Parameter Description</b>	<i>retry times</i> : Indicates the maximum number of user authentication retries. The value ranges from 0 to 5.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run the <b>no ip ssh authentication-retries</b> command to restore the default number of user authentication retries, which is 3.

### ▾ Specifying the SSH Encryption Mode

<b>Command</b>	<code>ip ssh cipher-mode{cbc   ctr   others }</code>
<b>Parameter Description</b>	<p><b>cbc</b>: Sets the encryption mode supported by the SSH server to the CBC mode. Corresponding algorithms include DES-CBC,3DES-CBC,AES-128-CBC,AES-192-CBC,AES-256-CBC, and Blowfish-CBC.</p> <p><b>ctr</b>: Sets the encryption mode supported by the SSH server to the CTR mode. Corresponding algorithms include AES128-CTR, AES192-CTR, and AES256-CTR.</p> <p><b>others</b>: Sets the encryption mode supported by the SSH server to others. The corresponding algorithm is RC4.</p>
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>This command is used to configure the encryption mode supported by the SSH server.</p> <p>On FS devices, the SSHv1 server supports the DES-CBC, 3DES-CBC, and Blowfish-CBC encryption algorithms; the SSHv2 server supports the AES128-CTR, AES192-CTR, AES256-CTR, DES-CBC, 3DES-CBC, AES-128-CBC, AES-192-CBC, AES-256-CBC, Blowfish-CBC, and RC4 encryption algorithms. These algorithms can be grouped into three encryption modes: CBC, CTR, and others.</p> <p>As the cryptography continuously develops, it is approved that encryption algorithms in the CBC and others modes can be decrypted in a limited period of time. Therefore, organizations or companies that have high security requirements can set the encryption mode supported by the SSH server to CTR to increase the security level of the SSH server.</p>

### ▾ Specifying the SSH Message Authentication Algorithm

<b>Command</b>	<code>ip ssh hmac-algorithm{md5   md5-96   sha1   sha1-96}</code>
<b>Parameter Description</b>	<p><b>md5</b>: Indicates that the message authentication algorithm supported by the SSH server is MD5.</p> <p><b>md5-96</b>: Indicates that the message authentication algorithm supported by the SSH server is MD5-96.</p> <p><b>sha1</b>: Indicates that the message authentication algorithm supported by the SSH server is SHA1.</p> <p><b>sha1-96</b>: Indicates that the message authentication algorithm supported by the SSH server is SHA1-96.</p>
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	This command is used to configure the message authentication algorithm supported by the SSH server. On FS devices, the SSHv1 server does support any message authentication algorithm; the SSHv2 server supports the MD5, SHA1, SHA1-96, and MD5-96 message authentication algorithms. You can select message authentication algorithms supported by the SSH server as required.

#### ↘ Configuring Support for DH Key Exchange Algorithm on the SSH Server

<b>Command</b>	<b>ip ssh key-exchange { dh_group_exchange_sha1   dh_group14_sha1   dh_group1_sha1 }</b>
<b>Parameter Description</b>	<b>dh_group_exchange_sha1:</b> Indicates configuration of diffie-hellman-group-exchange-sha1 for keyexchange. The key has 2,048 bytes, which cannot be edited. <b>dh_group14_sha1:</b> Indicates configuration of diffie-hellman-group14-sha1 for keyexchange. The key has 2,048 bytes. <b>dh_group1_sha1:</b> Indicates configuration of diffie-hellman-group1-sha1 for keyexchange. The key has 1,024 bytes.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure a DH key exchange method on the SSH. FS's SSHv1 server does not support DH key exchange method, while the SSHv2 server supports diffie-hellman-group-exchange-sha1, diffie-hellman-group14-sha1, and diffie-hellman-group1-sha1 for keyexchange.

#### ↘ Configuring ACL Filtering of the SSH Server

<b>Command</b>	<b>{ip   ipv6} ssh access-class { access-list-number   access-list-name }</b>
<b>Parameter Description</b>	<b>access-list-number:</b> Indicates the ACL number and the number range is configurable. The standard ACL number ranges are 1 to 99 and 1300 to 1999. The extended ACL number ranges are 100 to 199 and 2000 to 2699. Only IPv4 addresses are supported. <b>access-list-name:</b> Indicates an ACL name. Both IPv4 and IPv6 addresses are supported.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to perform ACL filtering for all connections to the SSH server. In line mode, ACL filtering is performed only for specific lines. However, ACL filtering rules of the SSH are effective to all SSH connections.

#### ↘ Configuring RSA Public Key Authentication

<b>Command</b>	<b>ip ssh peer test public-key rsaflash:rsa.pub</b>
<b>Parameter Description</b>	<b>test:</b> Indicates the user name. <b>rsa:</b> Indicates that the public key type is RSA. <b>rsa.pub:</b> Indicates the name of a public key file.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the RSA public key file associated with user <i>test</i> . Only SSHv2 supports authentication based on the public key. This command associates the public key file on the client with the user name. When the client is authenticated upon login, a public key file is specified based on the user name.

#### ↘ Configuring DSA Public Key Authentication

<b>Command</b>	<code>ip ssh peer test public-key dsaflash:dsa.pub</code>
<b>Parameter</b>	<i>test</i> : Indicates the user name.
<b>Description</b>	<b>dsa</b> : Indicates that the public key type is DSA. <i>dsa.pub</i> : Indicates the name of a public key file.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to configure the DSA key file associated with user <b>test</b> . Only SSHv2 supports authentication based on the public key. This command associates the public key file on the client with the user name. When the client is authenticated upon login, a public key file is specified based on the user name.

### Configuration Example

 The following configuration examples describe only configurations related to SSH.

#### Generating a Public Key on the SSH Server

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>crypto key generate { rsa   dsa }</b> command to generate a RSA public key for the server.</li> </ul>
<b>SSH Server</b>	<pre>FS#configure terminal FS(config)# crypto key generate rsa Choose the size of the rsa key modulus in the range of 512 to 2048 and the size of the dsa key modulus in the range of 360 to 2048 for your SignatureKeys. Choosing a key modulus greater than 512 may take a few minutes.  How many bits in the modulus [512]:</pre> <ul style="list-style-type: none"> <li>If the generation of the RSA key is successful, the following information is displayed: <pre>% Generating 512 bit RSA1 keys ...[ok] % Generating 512 bit RSA keys ...[ok]</pre> </li> <li>If the generation of the RSA key fails, the following information is displayed: <pre>% Generating 512 bit RSA1 keys ...[fail] % Generating 512 bit RSA keys ...[fail]</pre> </li> </ul>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show crypto key mypubkey rsa</b> command to display the public information about the RSA key. If the public information about the RSA key exists, the RSA key has been generated.</li> </ul>
<b>SSH Server</b>	<pre>FS(config)#show crypto key mypubkey rsa % Key pair was generated at: 1:49:47 UTC Jan 4 2013 Key name: RSA1 private Usage: SSH Purpose Key</pre>

```

Key is not exportable.

```

▾ **Specifying the SSH Version**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh version { 1   2 }</b> command to set the version supported by the SSH server to SSHv2.</li> </ul>
<b>SSH Server</b>	<pre> FS#configure terminal FS(config)#ip ssh version 2     </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to display the SSH version currently supported by the SSH server.</li> </ul>
<b>SSH Server</b>	<pre> FS(config)#show ip ssh SSH Enable - version 2.0 Authentication timeout: 120 secs Authentication retries:3 SSH SCP Server: disabled     </pre>

▾ **Configuring the SSH Authentication Timeout**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh time-out <i>time</i></b> command to set the SSH authentication timeout to 100s.</li> </ul>
<b>SSH Server</b>	<pre> FS#configure terminal FS(config)#ip sstime-out100     </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to display the configured SSH authentication timeout.</li> </ul>
<b>SSH Server</b>	<pre> FS(config)#show ip ssh     </pre>

	SSH Enable - version 2.0 Authentication timeout: 100secs Authentication retries: 3 SSH SCP Server: disabled
--	--

#### ▾ Configuring the Maximum Number of SSH Authentication Retries

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh authentication-retries <i>retry times</i></b> command to set the maximum number of user authentication retries on the SSH server to 2.</li> </ul>
<b>SSH Server</b>	<pre>FS#configure terminal FS(config)#ip ssh authentication-retries 2</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to display the configured maximum number of authentication retries.</li> </ul>
<b>SSH Server</b>	<pre>FS(config)#show ip ssh SSH Enable - version 2.0 Authentication timeout: 100 secs Authentication retries:3 SSH SCP Server: disabled</pre>

#### ▾ Specifying the SSH Encryption Mode

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh cipher-mode {cbc   ctr   others}</b> command to set the encryption mode supported by the SSH server to CTR.</li> </ul>
<b>SSH Server</b>	<pre>FS#configure terminal FS(config)# ip ssh cipher-mode ctr</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Select the CTR encryption mode on the SSH client, and verify whether you can successfully log in to the SSH server from the SSH client.</li> </ul>

#### ▾ Specifying the SSH Message Authentication Algorithm

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh hmac-algorithm {md5   md5-96   sha1   sha1-96 }</b> command to set the message authentication algorithm supported by the SSH server to SHA1.</li> </ul>
<b>SSH Server</b>	<pre>FS#configure terminal FS(config)# ip ssh hmac-algorithmsha1</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Select the SHA1 message authentication algorithm on the SSH client, and verify whether you can successfully log in to the SSH server from the SSH client.</li> </ul>

#### ▾ Configuring Support for DH Key Exchange Algorithm on the SSH Server

<b>Configuration</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh key-exchange { dh_group_exchange_sha1   dh_group14_sha1  </b></li> </ul>
----------------------	---

<b>Steps</b>	<b>dh_group1_sha1 }</b> command to configure a key exchange method on the SSH server.
<b>SSH Server</b>	FS# configure terminal FS(config)# ip ssh key-exchange dh_group14_sha1
<b>Verification</b>	<ul style="list-style-type: none"> <li>Choose diffie-hellman-group14-sha1 on the client terminal and check if successful login is performed.</li> </ul>

⌵ **Configuring the Public Key Authentication**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh peer username public-key { rsa   dsa }filename</b> command to associate a public key file of the client with a user name. When the client is authenticated upon login, a public key file (for example, RSA)is specified based on the user name.</li> </ul>
<b>SSH Server</b>	FS#configure terminal FS(config)# ip ssh peer test public-key rsaflash:rsa.pub
<b>Verification</b>	<ul style="list-style-type: none"> <li>Configure the public key authentication login mode on the SSH client and specify the private key file. Check whether you can successfully log in to the SSH server from the SSH client. If yes, the public key file on the client is successfully associated with the user name, and public key authentication succeeds.</li> </ul>

⌵ **Configuring SSH Device Management**

<b>Scenario</b> Figure 7- 7	 <p>SSH Client 192.168.23.83      IP Network      SSH Server 192.168.23.122</p> <p>You can use SSH to manage devices on the precondition that the SSH server function is enabled. By default, this function is disabled. The Telnet component that comes with the Windows does not support SSH. Therefore, a third-party client software must be used. Currently, well-compatible client software includes PuTTY, Linux, and SecureCRT. The following takes the PuTTY as an example to introduce the configurations of the SSH client.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Start the PuTTY software.</li> <li>On the <b>Session</b> option tab of PuTTY, type in the host IP address <b>192.168.23.122</b> and SSH port number <b>22</b>, and select the connection type <b>SSH</b>.</li> <li>On the <b>SSH</b> option tab of PuTTY, select the preferred SSH protocol version <b>2</b>.</li> <li>On the <b>SSH authentication</b> option tab of PuTTY, select the authentication method <b>Attempt "keyboard-interactive" auth</b>.</li> <li>Click <b>Open</b> to connect to the SSH server.</li> <li>Type in the correct user name and password to enter the terminal login interface.</li> </ul>
<b>SSH Client</b>	Figure 7- 8

**Host Name (or IP address)** indicates the IP address of the host to be logged in. In this example, the IP address is **192.168.23.122**. **Port** indicates the port ID 22, that is, the default ID of the port listened by SSH. **Connection type** is **SSH**.

Figure 7-9

As shown in Figure 7-9, select **2** as the preferred SSH protocol version in the **Protocol options** pane because SSHv2

is used for login.

Figure 7- 10

As shown in Figure 7-10, select **Attempt "keyboard-interactive" auth** as the authentication method to support authentication based on the user name and password.

Then, click **Open** to connect to the configured server host, as shown in Figure 7-11.

Figure 7-11

The **PuTTY Security Alert** box indicates that you are logging in to the client of the server 192.168.23.122, and asks you whether to receive the key sent from the server.

If you select **Yes**, a login dialog box is displayed, as shown in Figure 7- 12.

Figure 7- 12

```
192.168.23.122 - PuTTY
login as: test
test@192.168.23.122's password: █
```

Type in the correct user name and password, and you can log in to the SSH terminal interface, as shown in Figure 7-13.

Figure 7- 13

```
192.168.23.122 - PuTTY
login as: test
test@192.168.23.122's password:
Ruijie# █
```

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show ip ssh</b> command to display the configurations that are currently effective on the SSH server.</li> <li>● Run the <b>show ssh</b> command to display information about every SSH connection that has been established.</li> </ul>
	<pre>FS#show ip ssh SSH Enable - version 1.99 Authentication timeout: 120 secs Authentication retries: 3 FS#show ssh Connection Version Encryption      Hmac      State      Username           0      2.0 aes256-cbc      hmac-sha1  Session started test</pre>

▾ **Configuring SSH Local Line Authentication**

<b>Scenario</b> <b>Figure 7- 14</b>	<p>SSH users can use the local line password for user authentication, as shown in Figure 7- 14. To ensure security of data exchange, PC 1 and PC 2 function as the SSH clients, and use the SSH protocol to log in to the network device where the SSH server is enabled. The requirements are as follows:</p> <ul style="list-style-type: none"> <li>● SSH users use the local line password authentication mode.</li> <li>● Five lines, including Line 0 to Line 4, are activated concurrently. The login password is "passzero" for Line 0 and "pass" for the remaining lines. Any user name can be used.</li> </ul>
<b>Configuration Steps</b>	<p>Configure the SSH server as follows:</p> <ul style="list-style-type: none"> <li>● Enable the SSH server function globally. By default, the SSH server supports two SSH versions: SSHv1 and SSHv2.</li> <li>● Configure the key. With this key, the SSH server decrypts the encrypted password received from the SSH client, compares the decrypted plain text with the password stored on the server, and returns a message indicating the successful or unsuccessful authentication. SSHv1 uses the RSA key, whereas SSHv2 uses the RSA or DSA key.</li> <li>● Configure the IP address of the FastEthernet 0/1 interface on the SSH server. The SSH client is connected to the SSH server based on this IP address. The route from the SSH client to the SSH server is reachable.</li> </ul> <p>Configure the SSH client as follows:</p> <ul style="list-style-type: none"> <li>● Diversified SSH client software is available, including PuTTY, Linux, and SecureCRT. This document takes PuTTY as an example to explain the method for configuring the SSH client. For details about the configuration method, see "Configuration Steps."</li> </ul>
<b>SSH Server</b>	<p>Before configuring SSH-related function, ensure that the route from the SSH user to the network segment of the SSH server is reachable. The interface IP address configurations are shown in Figure 7- 15. The detailed procedures for</p>

	<pre> configuring IP addresses and routes are omitted.  FS(config)# enable service ssh-server  FS(config)#crypto key generate rsa  % You already have RSA keys.  % Do you really want to replace them? [yes/no]:  Choose the size of the key modulus in the range of 360 to 2048 for your Signature Keys. Choosing a key modulus greater than 512 may take a few minutes.  How many bits in the modulus [512]:  % Generating 512 bit RSA1 keys ...[ok]  % Generating 512 bit RSA keys ...[ok]  FS(config)#interface fastEthernet0/1  FS(config-if-fastEthernet0/1)#ip address 192.168.23.122 255.255.255.0  FS(config-if-fastEthernet0/1)#exit  FS(config)#line vty 0  FS(config-line)#password passzero  FS(config-line)#privilege level 15  FS(config-line)#login  FS(config-line)#exit  FS(config)#line vty1 4  FS(config-line)#password pass  FS(config-line)#privilege level 15  FS(config-line)#login  FS(config-line)#exit                     </pre>
<p><b>SSH</b> <b>Client(PC1/</b> <b>PC2)</b></p>	<p>Figure 7- 15</p>

Set the IP address and port ID of the SSH server. As shown in the network topology, the IP address of the server is 192.168.23.122, and the port ID is 22 (For details about the configuration method, see "Configuring SSH Device Management."). Click **Open** to start the SSH server. As the current authentication mode does not require a user name, you can type in any user name, but cannot leave the user name unspecified. (In this example, the user name is "anyname".)

**Verification**

- Run the **show running-config** command to display the current configurations.
- Verify that the SSH client configurations are correct.

**SSH Server**

```
FS#show running-config
Building configuration...

!
enable secret 5 $1$eyy2$xs28FDw4s2q0tx97
enable service ssh-server

!
interface fastEthernet0/1
ip address 192.168.23.122 255.255.255.0

!
line vty 0
privilege level 15
```

	<pre>login password passzero  line vty 1 4 privilege level 15  login password pass  !  end</pre>																				
<b>SSH Client</b>	<p>Set up a connection, and enter the correct password. The login password is "passzero" for Line 0 and "pass" for the remaining lines. Then, the SSH server operation interface is displayed, as shown in Figure 7- 16.</p> <p>Figure 7- 16</p>  <pre>192.168.23.122 - PuTTY login as: anyname Sent username "anyname" anyname@192.168.23.122's password: Ruijie#</pre>																				
	<pre>FS#show users</pre> <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th>Line</th> <th>User</th> <th>Host(s)</th> <th>Idle</th> <th>Location</th> </tr> </thead> <tbody> <tr> <td>* 0 con 0</td> <td>---</td> <td>idle</td> <td>00:00:00</td> <td>---</td> </tr> <tr> <td>1 vty 0</td> <td>---</td> <td>idle</td> <td>00:08:02</td> <td>192.168.23.83</td> </tr> <tr> <td>2 vty 1</td> <td>---</td> <td>idle</td> <td>00:00:58</td> <td>192.168.23.121</td> </tr> </tbody> </table>	Line	User	Host(s)	Idle	Location	* 0 con 0	---	idle	00:00:00	---	1 vty 0	---	idle	00:08:02	192.168.23.83	2 vty 1	---	idle	00:00:58	192.168.23.121
Line	User	Host(s)	Idle	Location

1 vty 0	---	idle	00:08:02	192.168.23.83																	
2 vty 1	---	idle	00:00:58	192.168.23.121																	

⏏ **Configuring AAA Authentication of SSH Users**

**Scenario**  
**Figure 7- 17**

SSH users can use the AAA authentication mode for user authentication, as shown in Figure 7- 17. To ensure security of data exchange, the PC functions as the SSH client, and uses the SSH protocol to log in to the network device where the SSH server is enabled. To better perform security management, the AAA authentication mode is used on the user login interface of the SSH client. Two authentication methods, including Radius server authentication and local authentication, are provided in the AAA authentication method list to ensure reliability. The Radius server authentication method is preferred. If the Radius server does not respond, select the local authentication method.

**Configuration Steps**

- The route from the SSH client to the SSH server is reachable, and the route from the SSH server to the Radius server is also reachable.
- Configure the SSH server on the network device. The configuration method is already described in the previous example, and therefore omitted here.
- Configure the AAA parameters on the network device. When the AAA authentication mode is used, method lists are created to define the identity authentication and types, and applied to a specified service or interface.

**SSH Server**

```

FS(config)# enable service ssh-server
FS(config)#crypto key generate rsa
% You already have RSA keys.
% Do you really want to replace them? [yes/no]:
Choose the size of the key modulus in the range of 360 to 2048 for your
Signature Keys. Choosing a key modulus greater than 512 may take
a few minutes.
How many bits in the modulus [512]:
% Generating 512 bit RSA1 keys ...[ok]
% Generating 512 bit RSA keys ...[ok]
FS(config)#crypto key generate dsa
Choose the size of the key modulus in the range of 360 to 2048 for your
Signature Keys. Choosing a key modulus greater than 512 may take
a few minutes.
    
```

	<pre> How many bits in the modulus [512]: % Generating 512 bit DSA keys ...[ok] FS(config)#interface gigabitEthernet1/1 FS(config-if-gigabitEthernet1/1)#ip address 192.168.217.81 255.255.255.0 FS(config-if-gigabitEthernet1/1)#exit FS#configure terminal FS(config)#aaa new-model FS(config)#radius-server host 192.168.32.120 FS(config)#radius-server key aaaradius FS(config)#aaa authentication login methodgroup radius local FS(config)#line vty 0 4 FS(config-line)#login authentication method FS(config-line)#exit FS(config)#username user1 privilege 1 password 111 FS(config)#username user2 privilege 10 password 222 FS(config)#username user3 privilege 15 password 333 FS(config)#enable secretw </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show running-config</b> command to display the current configurations.</li> <li>● This example assumes that the SAM server is used.</li> <li>● Set up a remote SSH connection on the PC.</li> <li>● Check the login user.</li> </ul>
	<pre> FS#show run aaa new-model ! aaa authentication login method group radius local ! username user1 password 111 username user2 password 222 username user2 privilege 10 username user3 password 333 username user3 privilege 15 no service password-encryption ! radius-server host 192.168.32.120 </pre>

```

```

📌 **Configuring Public Key Authentication of SSH Users**

<p><b>Scenario</b> Figure 7- 18</p>	<p>SSH Client 192.168.23.83</p> <p>IP Network</p> <p>SSH Server 192.168.23.122</p> <p>SSH users can use the public key for user authentication, and the public key algorithm is RSA or DSA, as shown in Figure 7- 18. SSH is configured on the client so that a secure connection is set up between the SSH client and the SSH server.</p>
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>To implement public key authentication on the client, generate a key pair (for example, RSA key) on the client, place the public key on the SSH server, and select the public key authentication mode.</li> <li> After the key pair is generated on the client, you must save and upload the public key file to the server and</li> </ul>

complete the server-related settings before you can continue to configure the client and connect the client with the server.

- After the key is generated on the client, copy the public key file from the client to the flash of the SSH server, and associate the file with an SSH user name. A user can be associated with one RSA public key and one DSA public key.

**SSH Client**

Run the **puttygen.exe** software on the client. Select **SSH-2 RSA** in the **Parameters** pane, and click **Generate** to generate a key, as shown in Figure 7- 19.

Figure 7- 19

When a key is being generated, you need to constantly move the mouse over a blank area outside the green progress bar; otherwise, the progress bar does not move and key generation stops, as shown in Figure 7- 20.

Figure 7- 20

To ensure security of the RSA public key authentication, the length of the generated RSA key pair must be equal to or larger than 768 bits. In this example, the length is set to 1024 bits.

Figure 7- 21

After the key pair is generated, click **Save public key**, type in the public key name **test\_key.pub**, select the storage path, and click **Save**. Then click **Save private key**. The following prompt box is displayed. Select **Yes**, type in the public key name **test\_private**, and click **Save**.

Figure 7- 22

You must select the OpenSSH key file; otherwise, the key file cannot be used. The **puttygen.exe** software can be used to generate a key file in OpenSSH format, but this file cannot be directly used by the PuTTY client. You must use **puttygen.exe** to convert the private key to the PuTTY format. Format conversion is not required for the public key file stored on the server, and the format of this file is still OpenSSH, as shown in Figure 7- 23.

Figure 7- 23

<p><b>SSH Server</b></p>	<pre>FS#configure terminal FS(config)# ip ssh peer test public-key rsaflash:test_key.pub</pre>
<p><b>Verification</b></p>	<ul style="list-style-type: none"> <li>After completing the basic configurations of the client and the server, specify the private key file <b>test_private</b> on the PuTTY client, and set the host IP address to <b>192.168.23.122</b> and port ID to <b>22</b> to set up a connection between the client and the server. In this way, the client can use the public key authentication mode to log in to the network device.</li> </ul>
	<p>Figure 7- 24</p>

### Common Errors

- The **no crypto key generate** command is used to delete a key.

### 7.4.2 Configuring the SCP Service

#### Configuration Effect

After the SCP function is enabled on a network device, you can directly download files from the network device and upload local files to the network device. In addition, all interactive data is encrypted, featuring authentication and security.

#### Notes

- The SSH server must be enabled in advance.

#### Configuration Steps

##### ↳ Enabling the SCP Server

- Mandatory.
- By default, the SCP server function is disabled. Run the **ip scp server enable** command to enable the SCP server function in global configuration mode.

#### Verification

Run the **show ip ssh** command to check whether the SCP server function is enabled.

#### Related Commands

▾ Enabling the SCP Server

<b>Command</b>	<b>ip scp server enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to enable the SCP server. Run the <b>no ip scp server enable</b> command to disable the SCP server.

Configuration Example

▾ Enabling the SCP Server

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip scp server enable</b> command to enable the SCP server.</li> </ul> <pre>FS#configure terminal FS(config)#ip scp server enable</pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>Run the <b>show ip ssh</b> command to check whether the SCP server function is enabled.</li> </ul> <pre>FS(config)#show ipssh SSH Enable - version 1.99 Authentication timeout: 120 secs Authentication retries:3 SSH SCP Server: enabled</pre>

▾ Configuring SSH File Transfer

<p><b>Scenario</b></p> <p><b>Figure 7- 25</b></p>	<p>The SCP service is enabled on the server, and SCP commands are used on the client to transfer data to the server.</p>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Enable the SCP service on the server.</li> <li><b>i</b> The SCP server uses SSH threading. When connecting to a network device for SCP transmission, the client occupies a VTY session (You can find out that the user type is SSH by running the show user command).</li> <li>On the client, use SCP commands to upload files to the server, or download files from the server.</li> </ul> <p>Syntax of the SCP command:</p> <pre>scp [-1246BCpqrv] [-c cipher] [-F ssh_config] [identity_file]       [-l limit] [-o ssh_option] [-P port] [-S program]       [[user@]host1:]file1 [...] [[user@]host2:]file2</pre>

	<pre>root@dhcpd:~#scp test@192.168.23.122:/config.text /root/config.text test@192.168.195.188's password: config.text          100% 1506    1.5KB/s   00:00 Read from remote host 192.168.195.188: Connection reset by peer</pre>

### 7.4.3 Configuring the SSH Client

#### Configuration Effect

On the network device that supports the SSH server, enable the SSH server function, and specify the user authentication method and supported SSH versions. Then, you can use the built-in SSH client function of the device to set up a secure connection with the SSH server, implementing remote device management.

#### Notes

- The SSH server function must be configured in advance on the device that needs to remotely support the SSH server.
- The SSH client must communicate with the SSH server properly.

#### Configuration Steps

##### ▾ Specifying the Source Interface of the SSH Client

- (Optional) This configuration must be performed on the SSH-client device.

##### ▾ Establishing a Session with the SSH Server

- (Optional) Use the **ssh** command on the client to set up a connection with a remote server.

- Before using this command, enable the SSH server function and configure the SSH key and authentication mode on the server.

#### ↘ Recovering an Established SSH Session

- (Optional) Run the related command to recover a session after temporary stop if necessary.

#### ↘ Disconnecting a Suspended SSH Session

- (Optional) This configuration must be performed on the SSH client if you need to disconnect a specified SSH session.

#### Verification

Run the **show ssh-session** command to display information about every established SSH client session.

#### Related Commands

#### ↘ Specifying the Source Interface of the SSH Client

<b>Command</b>	<b>ip ssh source-interface</b> <i>interface-name</i>
<b>Parameter Description</b>	<i>interface-name</i> : Specifies an interface, the IP address of which will be used as the source address of an SSH client session.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	This command is used to specify an interface, the IP address of which will be used as the global source address of an SSH client session. When the <b>ssh</b> command is used to connect to an SSH server, this global configuration will be used if a source interface or a source address is not specified for this connection. Run the <b>no ip ssh source-interface</b> command to restore the default setting.

#### ↘ Establishing a Session with the SSH Server

<b>Command</b>	<b>ssh</b> [ <i>oob</i> ] [-v {1   2}][-c {3des   aes128-cbc   aes192-cbc   aes256-cbc}] [-l <i>username</i> ][-m {hmac-md5-96   hmac-md5-128   hmac-sha1-96   hmac-sha1-160}][-p <i>port-num</i> ][ <i>ip-addr</i>   <i>hostname</i> ][ <i>via mgmt-name</i> ][/ <i>source</i> { <i>ip A.B.C.D</i>   <i>ipv6 X:X:X:X::X</i>   <b>interface</b> <i>interface-name</i> }] [ <i>vrf vrf-name</i> ]
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	User EXEC mode
<b>Usage Guide</b>	<p>The <b>ssh</b> command is used to set up a secure and encrypted connection from the local device (an SSH client) to another device (an SSH server) or any other server that supports SSHv1 or SSHv2. This connection provides a mechanism similar to the Telnet connection except that all data transmitted over this connection is encrypted. Based on authentication and encryption, the SSH client can set up a secure connection on an insecure network.</p> <ul style="list-style-type: none"> <li> SSHv1 supports only the DES (56-bit key) and 3DES (168-bit key) encryption algorithms.</li> <li> SSHv2 supports the following Advanced Encryption Standards (AES): ASE128-CBC, AES192-CBC, AES256-CBC, AES128-CTR, AES192-CTR, and AES256-CTR.</li> <li> SSHv1 does not support the Hashed Message Authentication Code (HMAC).</li> <li> If you specify an unmatched encryption or authentication algorithm when selecting an SSH version, the unmatched algorithm will be ignored when a connection is set up.</li> </ul>

#### ↘ Recovering an Established SSH Client Session

<b>Command</b>	<b>ssh-session</b> <i>session-id</i>
<b>Parameter Description</b>	<i>session-id</i> : Indicates the ID of an established SSH client session.
<b>Command Mode</b>	User EXEC mode
<b>Usage Guide</b>	This command is used to restore the use of an established SSH client session. When the <b>ssh</b> command is used to initiate an SSH client session, you can press Ctrl+Shift+6+X to temporarily exit the session. To recover this session, run the <b>ssh-session</b> command. In addition, if the session is already established, you can run the <b>show ssh-session</b> command to display information about the established session.

### ✚ Disconnecting a Suspended SSH Session

<b>Command</b>	<b>disconnect ssh-session</b> <i>session-id</i>
<b>Parameter Description</b>	<i>session-id</i> : Indicates the ID of a suspended SSH client session.
<b>Command Mode</b>	User EXEC mode
<b>Usage Guide</b>	You can specify an SSH client session ID to disconnect the specified SSH client session.

### Configuration Example

#### ✚ Specifying the Source Interface of the SSH Client

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Run the <b>ip ssh source-interface</b> <i>interface-name</i> command to specify an interface, the IP address of which will be used as the global source address of an SSH client session.</li> </ul>
	<pre>FS#configure terminal FS(config)#ipsshsource-interface gigabitEthernet 0/1</pre>
<b>Verification</b>	N/A

#### ✚ Establishing a Session with the SSH Server

<b>Scenario</b> Figure 7- 26	 <p>The SSH server function is enabled on the server. The <b>ssh</b> command is used on the client to set up a secure connection with the server.</p>

### 7.4.4 Configuring the SCP Client

#### Configuration Effect

On the network device that supports the SCP server, enable the SCP service so that users can directly download files from the network device and upload local files to the network device. In addition, all exchanged data is encrypted, featuring authentication and security.

#### Notes

- The SSH server function must be configured and the SCP service must be enabled on the device in order to remotely support the SCP server.
- The SCP client must communicate with the SCP server properly.

#### Configuration Steps

### ▾ Specifying Source Interface of SCP Client

- (Optional) Specify a source interface of the SCP client.

### ▾ Implementing File Transfer with SCP Server via SCP Client

- (Optional) Run the **scp** command to implement file transfer with the remote SCP server via the SCP client.
- Before running this command, enable the SSH server function, configure an SSH key and authentication mode, and enable the SCP server function.

#### Verification

Check whether file transfer is successful.

#### Related Commands

### ▾ Specifying Source Interface of SCP Client

### Displaying

Description	Command
Displays the effective SSH server configurations.	<b>show ipssh</b>
Displays the established SSH connection.	<b>show ssh</b>
Displays the public information of the SSH public key.	<b>show crypto key mypubkey</b>
Displays the established SSH client session.	<b>show ssh-session</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs SSH sessions.	<b>debug ssh</b>
Debugs SSH client sessions.	<b>debug ssh client</b>

## 8 Configuring URPF

### 8.1 Overview

Unicast Reverse Path Forwarding (URPF) is a function that protects the network against source address spoofing.

URPF obtains the source address and inbound interface of a received packet, and searches a forwarding entry in the forwarding table based on the source address. If the entry does not exist, the packet is dropped. If the outbound interface of the forwarding entry does not match the inbound interface of the packet, the packet is also dropped. Otherwise, the packet is forwarded.

URPF is implemented in two modes:

- **Strict mode:** It is often deployed on a point-to-point (P2P) interface, and inbound and outbound data streams must go through the network of the P2P interface.
- **Loose mode:** It is applicable to the asymmetric routes or multihomed network that have the problem of asymmetric traffic.

### Protocols and Standards

- RFC 2827: Network Ingress Filtering: DDOS Attacks which employ IP Source Address Spoofing
- RFC 3704: Ingress Filtering for Multi-homed Networks

### 8.2 Applications

Application	Description
Strict Mode	Block the packets with spoofed sourced addresses at the access layer or aggregation layer to prevent sending these packets from PCs to the core network.
Loose Mode	On a multihomed network, the user network is connected to multiple Internet service providers (ISPs), and the inbound and outbound traffic is not symmetric. Deploy the URPF loose mode on the outbound interface connected to ISPs to prevent invalid packets from

	attacking the user network.
--	-----------------------------

**8.2.1 Strict Mode**

**Scenario**

An attacker initiates an attack by sending packets with the spoofed source address 11.0.0.1. As a result, the server sends a lot of SYN or ACK packets to the hosts that do not initiate the attack, and the host with the real source address 11.0.0.1 is also affected. Even worse, if the network administrator determines that this address initiates an attack to the network, and therefore blocks all data streams coming from this source address, the denial of service (DoS) of this source address occurs.

Figure 8- 1

<b>Remarks</b>	The attacker sends spoofing packets using a spoofed address of the casualty.
----------------	--

**Deployment**

- Deploy the URPF strict mode on device A to protect the device against source address spoofing.

**8.2.2 Loose Mode**

**Scenario**

The asymmetric route is a common network application used to control the network traffic or to meet the routing policy requirements.

As shown in Figure 8-2, if the URPF strict mode is enabled on the G1/1 interface of R 1, R1 receives a packet from the network segment 192.168.20.0/24 on the G1/1 interface, but the interface obtained through the URPF check is G1/2. Therefore, this packet fails in the URPF check and is dropped.

Figure 8- 2

## Deployment

- Reversely search a route based on the source IP address of a received packet. The purpose is to find a route, and it is not required that the outbound interface of the next hop on the route must be the inbound interface of the received packet.
- The URPF loose mode can resolve the asymmetric traffic problem of the asymmetric route and prevents access of invalid data streams.

## 8.3 Features

### Basic Concepts

#### ✎ URPF Strict Mode

Obtain the source address and inbound interface of a received packet, and search a forwarding entry in the forwarding table based on the source address. If the entry does not exist, the packet is dropped. If the outbound interface of the forwarding entry does not match the inbound interface of the packet, the packet is also dropped. The strict mode requires that the inbound interface of a received packet must be the outbound interface of the route entry to the source address of the packet.

#### ✎ URPF Loose Mode

Reversely search a route based on the source IP address of a received packet. The purpose is to find a route, and it is not required that the outbound interface of the next hop on the route must be the inbound interface of the received packet. However, the route cannot be a route of a host on the local network.

#### ✎ URPF Packet Loss Rate

The URPF packet loss rate is equal to the number of packets dropped due to the URPF check per second. The unit is packets/second, that is, pps.

#### ✎ Calculation Interval of the URPF Packet Loss Rate

It is the interval from the previous time the packet loss rate is calculated to the current time the packet loss rate is calculated.

#### ✎ Sampling Interval of the URPF Packet Loss Rate

It is the interval at which the number of lost packets is collected for calculating the packet loss rate. This interval must be equal to or longer than the calculation interval of the packet loss rate.

#### ✎ Threshold of the URPF Packet Loss Rate

It refers to the maximum packet loss rate that is acceptable. When the packet loss rate exceeds the threshold, alarms can be sent to users through syslogs or trap messages. You can adjust the threshold of the packet loss rate based on the actual conditions of the network.

#### ✎ Alarm Interval of the URPF Packet Loss Rate

It is the interval at which alarms are sent to users. You can adjust the alarm based on the actual conditions of the network to prevent frequently output of logs or trap messages.

#### ✎ Calculation of the URPS Packet Loss Rate

Between the period of time from enabling of URPF to the time that the sampling interval arrives, the packet loss rate is equal to the number of lost packets measured within the sampling interval divided by the URPF enabling duration. After that, the packet loss rate is calculated as follows: Current packet loss rate = (Current number of lost packets measured at the calculation interval – Number of lost packets measured before the sampling interval)/Sampling interval

#### Overview

Feature	Description
Enabling URPF	Enable URPF to perform a URPF check, thus protecting the device against source address spoofing.
Notifying the URPF Packet Loss Rate	To facilitate monitoring of information about lost packets after URPF is enabled, FS devices support the use of syslogs and trap messages to proactively notify users of the packet loss information detected in the URPF check.

### 8.3.1 Enabling URPF

Enable URPF to perform a URPF check on IP packets, thus protecting the device against source address spoofing.

#### Working Principle

URPF can be applied to IP packets based on configurations, but the following packets are not checked by URPF:

1. After URPF is enabled, the source address of a packet is checked only if the destination address of the packet is an IPv4/IPv6 unicast address, and is not checked if the packet is a multicast packet or an IPv4 broadcast packet.
2. If the source IP address of a DHCP/BOOTP packet is 0.0.0.0 and the destination IP address is 255.255.255.255, the packet is not checked by URPF.
3. A loopback packet sent by the local device to itself is not checked by URPF.

#### ✎ URPF Configured in Interface configuration mode

URPF is performed on packets received on the configured interface. Interface configuration mode and global configuration mode are mutually exclusive.

- By default, the default route is not used for the URPF check. You can configure data to use the default route for the URPF check if necessary.
- By default, packets that fail in the URPF check will be dropped. If the ACL (*acl-name*) is configured, the packet is matched against the ACL after it fails in the URPF check. If no ACL exists, or a packet matches a deny ACL entry (ACE), the packet will be dropped. If the packet matches a permit ACE, the packet will be forwarded.

A switch supports configuration of URPF on a routed port of L3 aggregate port (AP). Switches of some models also support this configuration on SVI. (For details, contact FS's technical staff.) The following constraints exist:

- URPF does not support association with the ACL option.
- After URPF is enabled on interfaces, a URPF check is performed on all packets received on physical ports corresponding to these interfaces, which increase the scope of packets checked by URPF. If a packet received on a tunnel port is also received on the preceding physical ports, the packet is also checked by URPF. In such as scenario, be cautious in enabling URPF.
- After URPF is enabled, the route forwarding capacity of the device will be reduced by half.
- After the URPF strict mode is enabled, if a packet received on an interface matches an equal-cost route during the URPF check, the packet will be processed according to the URPF loose mode.

## Related Configuration

### 📄 Enabling URPF for a Specified Interface

By default, URPF is disabled for a specified interface.

Run the **ip verify unicast source reachable-via {rx | any} [allow-default] [acl-name]** command to enable or disable the IPv4 URPF function for a specified interface.

By default, the default route is not used for the URPF check. You can use the **allow-default** keyword to use the default route for the URPF check if necessary.

By default, packets that fail in the URPF check will be dropped. If the ACL (*acl-name*) is configured, the packet is matched against the ACL after it fails in the URPF check. If no ACL exists, or a packet matches a deny ACE, the packet will be dropped. If the packet matches a permit ACE, the packet will be forwarded.

### 8.3.2 Notifying the URPF Packet Loss Rate

To facilitate monitoring of information about lost packets after URPF is enabled, FS devices support the use of syslogs and trap messages to proactively notify users of the packet loss information detected in the URPF check.

#### Working Principle

Between the period of time from enabling of URPF to the time that the sampling interval arrives, the packet loss rate is equal to the number of lost packets measured within the sampling interval divided by the URPF enabling duration. After that, the packet loss rate is calculated as follows: Current packet loss rate = (Current number of lost packets measured at the calculation interval – Number of lost packets measured before the sampling interval)/Sampling interval

After the function of monitoring the URPF packet loss information is enabled, the device can proactively send syslogs or trap messages to notify users of the packet loss information detected in the URPF check so that users can monitor the network status conveniently.

## Related Configuration

### 📄 Configuring the Calculation Interval of the URPF Packet Loss Rate

By default, the calculation interval of the URPF packet loss rate is 30s. If the calculation interval is found too short, run the **ip verify urpf drop-rate compute interval seconds** command to modify the calculation interval.

The calculation interval of the URPF packet loss rate ranges from 30 to 300.

### 📄 Configuring the Alarm Interval of the URPF Packet Loss Rate

By default, the alarm interval of the URPF packet loss rate is 300s. If the alarm interval is found inappropriate, run the **ip verify urpf drop-rate notify hold-down seconds** command to modify the alarm interval of the URPF packet loss rate.

The unit of the alarm interval is second. The value ranges from 30 to 300.

#### ✚ Configuring the Function of Monitoring the URPF Packet Loss Information

By default, the function of monitoring the URPF packet loss information is disabled.

Run the **ip [ ipv6 ] verify urpf drop-rate notify** command to enable or disable the function of monitoring the URPF packet loss information.

#### ✚ Configuring the Threshold of the URPF Packet Loss Rate

By default, the threshold of the URPF packet loss rate is 1000 pps. If the threshold is found inappropriate, run the **ip [ ipv6 ] verify urpf notification threshold rate-value** command to modify the threshold of the URPF packet loss rate.

The unit of the threshold is pps. The value ranges from 0 to 4,294,967,295.

## 8.4 Configuration

Configuration Item	Description and Command	
Enabling URPF	 (Mandatory) It is used to enable URPF.	
	<b>ip verify unicast source reachable-via { rx   any } [ allow-default ] [ acl_name ] (Interface configuration mode)</b>	Enables URPF for a specified interface.
Configuring the Function of Monitoring the URPF Packet Loss Information	 (Optional) It is used to enable the function of monitoring the URPF packet loss information.	
	<b>ip verify urpf drop-rate compute interval seconds</b>	Configures the calculation interval of the URPF packet loss rate.
	<b>ip verify urpf drop-rate notify</b>	Configures the function of monitoring URPF packet loss information.
	<b>ip verify urpf drop-rate notify hold-down seconds</b>	Configures the alarm interval of the URPF packet loss rate.
	<b>ip verify urpf notification threshold rate-value</b>	Configures the threshold of the URPF packet loss rate.

### 8.4.1 Enabling URPF

#### Configuration Effect

- Enable URPF to perform a URPF check, thus protecting the device against source address spoofing.
- URPF enabled in interface configuration mode supports both the strict and loose modes.

#### Notes

- URPF is implemented with the help of the existing unicast routes on the network. Therefore, unicast routes must be configured on the network.

#### Configuration Steps

##### ✚ Enabling IPv4 URPF for a Specified Interface

- Mandatory.

## Verification

Enable URPF and check the source address as follows:

- If the strict mode is used, check whether a packet is forwarded only when the forwarding table contains the source address of the received IP packet and the outbound interface of the searched forwarding entry matches the inbound interface of the packet; otherwise, the packet is dropped.
- If the loose mode is used, check whether a packet is forwarded when a forwarding entry can be found in the forwarding table for the source address of the received IP packet; otherwise, the packet is dropped.

## Related Commands

### ▾ Enabling IPv4 URPF for a Specified Interface

<b>Command</b>	<code>ip verify unicast source reachable-via { rx   any } [ allow-default ] [ acl-id ]</code>
<b>Parameter Description</b>	<p><b>rx</b>: Indicates that the URPF check is implemented in strict mode. The strict mode requires that the outbound interface of the forwarding entry found in the forwarding table based on the source address of a received IP packet must match the inbound interface of the packet.</p> <p><b>any</b>: Indicates that the URPF check is implemented in loose mode. The loose mode only requires that a forwarding entry can be found in the forwarding table based on the source address of a received IP packet.</p> <p><b>allow-default</b>: (Optional) Indicates that the default route can be used for the URPF check.</p> <p><b>acl-id</b>: (Optional) Indicates the ID of the ACL. Values include 1 to 99 (IP standard access list), 100 to 199 (IP extended access list), 1300 to 1999 (IP standard access list, expanded range), and 2000 to 2699 (IP extended access list, expanded range).</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	<p>Based on the source address of a received IP packet, URPF checks whether any route to the source address exists in the forwarding table and accordingly determines whether the packet is valid. If no forwarding entry is matched, the packet is determined as invalid.</p> <p>You can enable URPF in interface configuration mode to perform a URPF check on packets received on the interface. By default, the default route is not used for the URPF check. You can use the <b>allow-default</b> keyword to use the default route for the URPF check if necessary.</p> <p>By default, packets that fail in the URPF check will be dropped. If the ACL (<i>acl-name</i>) is configured, the packet is matched against the ACL after it fails in the URPF check. If no ACL exists, or a packet matches a deny ACE, the packet will be dropped. If the packet matches a permit ACE, the packet will be forwarded.</p> <p> A switch supports configuration of URPF on a routed port or L3 AP port. In addition, the following constraints exist:</p> <ol style="list-style-type: none"> <li>1. URPF does not support association with the ACL option.</li> <li>2. After URPF is enabled on interfaces, a URPF check is performed on all packets received on physical ports corresponding to these interfaces, which increase the scope of packets checked by URPF. If a packet received on a tunnel port is also received on the preceding physical ports, the packet is also checked by URPF. In such a scenario, be cautious in enabling URPF.</li> <li>3. After URPF is enabled, the route forwarding capacity of the device will be reduced by half.</li> <li>4. After the URPF strict mode is enabled, if a packet received on an interface matches an equal-cost route during the URPF check, the packet will be processed according to the URPF loose mode.</li> </ol>

-  URPF configured in global configuration mode does not support URPF check using the default routing.
-  URPF configured in global configuration mode is mutually exclusive with URPF configured in interface configuration mode.

## Configuration Example

### Configuring the Strict Mode

Block the packets with spoofed sourced addresses at the access layer or aggregation layer to prevent sending these packets from PCs to the core network.

To meet the preceding requirement, enable URPF in strict mode on the interface between the aggregation device and the access device.

#### Scenario Figure 8- 3

#### Verification

As shown in **Figure 8-3**, enable URPF in strict mode on the aggregation devices, including FS A and FS B. The configurations are as follows:

#### FS-A

```

FS-A# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
FS-A (config)# interface gigabitEthernet0/1
FS-A (config-if-GigabitEthernet 0/1)#ip address 195.52.1.1 255.255.255.0
FS-A (config-if-GigabitEthernet 0/1)#ip verify unicast source reachable-via rx
FS-A (config-if-GigabitEthernet 0/1)# ip verify urpf drop-rate notify
FS-A (config-if-GigabitEthernet 0/1)#exit
FS-A (config)# interface gigabitEthernet0/2
FS-A (config-if-GigabitEthernet 0/2)#ip address 195.52.2.1 255.255.255.0
FS-A (config-if-GigabitEthernet 0/2)#ip verify unicast source reachable-via rx
FS-A (config-if-GigabitEthernet 0/2)# ip verify urpf drop-rate notify
FS-A (config-if-GigabitEthernet 0/2)#exit

```

<b>FS-B</b>	<pre> FS-B# configure terminal  Enter configuration commands, one per line. End with CNTL/Z.  FS-B (config)# interface gigabitEthernet0/1  FS-B (config-if-GigabitEthernet 0/1)#ip address 195.52.3.1 255.255.255.0  FS-B (config-if-GigabitEthernet 0/1)#ip verify unicast source reachable-via rx  FS-B (config-if-GigabitEthernet 0/1)# ip verify urpf drop-rate notify  FS-B (config-if-GigabitEthernet 0/1)#exit  FS-B (config)# interface gigabitEthernet0/2  FS-B (config-if-GigabitEthernet 0/2)#ip address 195.52.4.1 255.255.255.0  FS-B (config-if-GigabitEthernet 0/2)#ip verify unicast source reachable-via rx  FS-B (config-if-GigabitEthernet 0/2)# ip verify urpf drop-rate notify  FS-B (config-if-GigabitEthernet 0/2)#exit </pre>
<b>Verification</b>	<p>If source address spoofing exists on the network, run the <b>show ip urpf</b> command to display the number of spoofing packets dropped by URPF.</p>
<b>A</b>	<pre> FS-A#show ip urpf interface gigabitEthernet 0/1  IP verify source reachable-via RX  IP verify URPF drop-rate notify enabled  IP verify URPF notification threshold is 1000pps  Number of drop packets in this interface is 124  Number of drop-rate notification counts in this interface is 0  FS-A#show ip urpf interface gigabitEthernet 0/2  IP verify source reachable-via RX  IP verify URPF drop-rate notify enabled  IP verify URPF notification threshold is 1000pps  Number of drop packets in this interface is 133  Number of drop-rate notification counts in this interface is 0 </pre>
<b>B</b>	<pre> FS-B#show ip urpf interface gigabitEthernet 0/1  IP verify source reachable-via RX  IP verify URPF drop-rate notify enabled  IP verify URPF notification threshold is 1000pps  Number of drop packets in this interface is 124  Number of drop-rate notification counts in this interface is 0 </pre>

<pre> FS-B#show ip urpf interface gigabitEthernet 0/2 IP verify source reachable-via RX IP verify URPF drop-rate notify enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 250 Number of drop-rate notification counts in this interface is 0                 </pre>
--

↘ **Configuring the Loose Mode**

	<p>On the egress device FS A of user network A, to prevent invalid packets from attacking the user network, enable URPF in loose mode on the outbound interfaces G3/1 and G3/2 that connect to two ISPs.</p>
<p><b>Scenario</b> Figure 8- 4</p>	
<p><b>FS-A</b></p>	<pre> FS-A# configure terminal Enter configuration commands, one per line. End with CNTL/Z. FS-A (config)# interface gigabitEthernet3/1 FS-A (config-if-GigabitEthernet 3/1)# ip address 195.52.1.2 255.255.255.252 FS-A (config-if-GigabitEthernet 3/1)# ip verify unicast source reachable-via any FS-A (config-if-GigabitEthernet 3/1)# ip verify urpf drop-rate notify FS-A (config-if-GigabitEthernet 3/1)# exit FS-A (config)# interface gigabitEthernet3/2 FS-A (config-if-GigabitEthernet 3/2)# ip address 152.95.1.2 255.255.255.252 FS-A (config-if-GigabitEthernet 3/2)# ip verify unicast source reachable-via any FS-A (config-if-GigabitEthernet 3/2)# ip verify urpf drop-rate notify FS-A (config-if-GigabitEthernet 3/2)# end                 </pre>
<p><b>Verification</b></p>	<p>If source address spoofing exists on the network, run the <b>show ip urpf</b> command to display the number of spoofing packets dropped by URPF.</p>
<p><b>A</b></p>	<pre> FS #show ip urpf IP verify URPF drop-rate compute interval is 300s IP verify URPF drop-rate notify hold-down is 300s Interface gigabitEthernet3/1                 </pre>

<pre> IP verify source reachable-via ANY IP verify URPF drop-rate notify enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 4121 Number of drop-rate notification counts in this interface is 2 Interface gigabitEthernet3/2 IP verify source reachable-via ANY IP verify URPF drop-rate notify enabled IP verify URPF notification threshold is 1000pps Number of drop packets in this interface is 352 Number of drop-rate notification counts in this interface is 0 </pre>
--

### 8.4.2 Configuring the Function of Monitoring the URPF Packet Loss Information

#### Configuration Effect

- After the function of monitoring the URPF packet loss information is enabled, the device can proactively send syslogs or trap messages to notify users of the packet loss information detected in the URPF checks so that users can monitor the network status conveniently.

#### Notes

- URPF must be enabled.

#### Configuration Steps

##### ▾ Configuring the Calculation Interval of the URPF Packet Loss Rate

- Optional.
- Global configuration mode

##### ▾ Configuring the Alarm Interval of the URPF Packet Loss Rate

- Optional.
- Global configuration mode

##### ▾ Configuring the Function of Monitoring the URPF Packet Loss Information

- Optional.
- Interface configuration mode

##### ▾ Configuring the Threshold of the URPF Packet Loss Rate

- Optional.
- Interface configuration mode

#### Verification

Simulate a source address spoofing attack, enable URPF, and check as follows:

- Enable the alarm function. After the packet loss rate exceeds the threshold, check whether an alarm can be generated normally.

#### Related Commands

##### ▾ Configuring the Calculation Interval of the URPF Packet Loss Rate

<b>Command</b>	<b>ip verify urpf drop-rate compute interval <i>seconds</i></b>
<b>Parameter Description</b>	<b>interval <i>seconds</i></b> : Indicates the calculation interval of the URPF packet loss rate. The unit is second. The value ranges from 30 to 300. The default value is 30s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The calculation interval of the URPF packet loss rate is configured in global configuration mode. The configuration is applied to the global and interface-based calculation of the URPF packet loss rate.

##### ▾ Configuring the Alarm Interval of the URPF Packet Loss Rate

<b>Command</b>	<b>ip verify urpf drop-rate notify hold-down <i>seconds</i></b>
<b>Parameter Description</b>	<b>hold-down <i>seconds</i></b> : Indicates the alarm interval of the URPF packet loss rate. The unit is second. The value ranges from 30 to 300. The default value is 30s.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The alarm interval of the URPF packet loss rate is configured in global configuration mode. The configuration is applied to the global and interface-based alarms of the URPF packet loss rate.

##### ▾ Configuring the Function of Monitoring the IPv4 URPF Packet Loss Information

<b>Command</b>	<b>ip verify urpf drop-rate notify</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	After the function of monitoring the URPF packet loss information is enabled, the device can proactively send syslog or trap messages to notify users of the packet loss information detected in the URPF check so that users can monitor the network status conveniently.

##### ▾ Configuring the Threshold of the IPv4 URPF Packet Loss Rate

<b>Command</b>	<b>ip verify urpf notification threshold <i>rate-value</i></b>
<b>Parameter Description</b>	<b>threshold <i>rate-value</i></b> : Indicates the threshold of the URPF packet loss rate. The unit is pps. The value ranges from 0 to 4,294,967,295. The default value is 1,000 pps.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	If the threshold is 0, a notification is sent for every packet that is dropped because it fails in the URPF check. You can adjust the threshold based on the actual situation of the network.

#### Configuration Example

##### ▾ Setting the Calculation Interval of the URPF Packet Loss Rate to 120s

<b>Configuration Steps</b>	Set the calculation interval of the URPF packet loss rate to 120s in global configuration mode.
	<pre>FS#configure terminal FS(config)#ipverifyurpfdrop-ratecomputeinterval 120 FS(config)# end</pre>
<b>Verification</b>	Run the <b>show ip urpf</b> command to check whether the configuration takes effect.
	<pre>FS# show ip urpf IP verify URPF drop-rate compute interval is 120s</pre>

### ⚡ Setting the Alarm Interval of the URPF Packet Loss Rate to 120s

<b>Configuration Steps</b>	Set the alarm interval of the URPF packet loss rate to 120s in global configuration mode. The configuration takes effect on both IPv4 URPF and IPv6 URPF.
	<pre>FS#configure terminal FS(config)#ipverifyurpfdrop-ratenotifyhold-down 120 FS(config)# end</pre>
<b>Verification</b>	Run the <b>show ip urpf</b> command to check whether the configuration takes effect.
	<pre>FS# show ip urpfIP verify URPF drop-rate notify hold-down is 120s</pre>

## 8.5 Monitoring

### Clearing

 Running the **clear** commands may lose vital information and thus interrupt services.

Description	Command
Clears statistics of the number of packets dropped during the IPv4 URPF check.	<b>clear ip urpf [interface interface-name]</b>

### Displaying

Description	Command
Displays the IPv4 URPF configuration and statistics.	<b>show ip urpf [interface interface-name]</b>

### Debugging

 System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the URPF events.	<b>debug urpf event</b>
Debugs the URPF timers.	<b>debug urpf timer</b>

## 9 Configuring CPP

### 9.1 Overview

The CPU Protect Policy (CPP) provides policies for protecting the CPU of a switch.

In network environments, various attack packets spread, which may cause high CPU usages of the switches, affect protocol running and even difficulty in switch management. To this end, switch CPUs must be protected, that is, traffic control and priority-based processing must be performed for various incoming packets to ensure the processing capabilities of the switch CPUs.

CPP can effectively prevent malicious attacks in the network and provide a clean environment for legitimate protocol packets.

CPP is enabled by default. It provides protection during the entire operation of switches.

### 9.2 Applications

Application	Description
Preventing Malicious Attacks	When various malicious attacks such as ARP attacks intrude in a network, CPP divides attack packets into queues of different priorities so that the attack packets will not affect other packets.
Preventing CPU Processing Bottlenecks	Even when no attacks exist, it would become a bottleneck for CPU to handle excessive normal traffic. CPP can limit the rate of packets being sent to the CPU to ensure normal operation of switches.

#### 9.2.1 Preventing Malicious Attacks

##### Scenario

Network switches at all levels may be attacked by malicious packets, typically ARP attacks.

As shown in Figure 9- 1, switch CPUs process three types of packets: forwarding-plane, control-plane and protocol-plane. Forwarding-plane packets are used for routing, including ARP packets and IP route disconnection packets. Control-plane packets are used to manage services on switches, including Telnet packets and HTTP packets. Protocol-plane packets serve for running protocols, including BPDUs and OSPF packets.

When an attacker initiates attacks by using ARP packets, the ARP packets will be sent to the CPU for processing. Since the CPU has limited processing capabilities, the ARP packets may force out other packets (which may be discarded) and consume many CPU resources (for processing ARP attack packets). Consequently, the CPU fails to work normally. In the scenario as shown in Figure 9- 1, possible consequences include: common users fail to access the network; administrators fail to manage switches; the OSPF link between switch A and the neighbor B is disconnected and route learning fails.

Figure 9- 1 Networking Topology of Switch Services and Attacks

## Deployment

- By default, CPP classifies ARP packets, Telnet packets, IP route disconnection packets, and OSFP packets into queues of different priorities. In this way, ARP packets will not affect other packets.
- By default, CPP limits the rates of ARP packets and the rates of the priority queue where the ARP packets reside to ensure that the attack packets do not occupy too many CPU resources.
- Packets in the same priority queue with ARP packets may be affected by ARP attack packets. You can divide the packets and the ARP packets into different priority queues by means of configuration.
- When ARP attack packets exist, CPP cannot prevent normal ARP packets from being affected. CPP can only differentiate the packet type but cannot distinguish attack packets from normal packets of the same type. In this case, the Network Foundation Protection Policy (NFPP) function can be used to provide higher-granularity attack prevention.

 For description of NFPP configurations, see the *Configuring NFPP*.

### 9.2.2 Preventing CPU Processing Bottlenecks

#### Scenario

Even though no attacks exist, many packets may need to be sent to the CPU for processing at an instant.

For example, the accesses to the core device of a campus network are counted in ten thousands. The traffic of normal ARP packets may reach dozens of thousands packets per second (PPS). If all packets are sent to the CPU for processing, the CPU resources cannot support the processing, which may cause protocol flapping and abnormal CPU running.

#### Deployment

- By default, the CPP function limits the rates of ARP packets and the rates of the priority queue where the APR packets reside to control the rate of ARP packets sent to the CPU and ensure that the CPU resource consumption is within a specified range and that the CPU can normally process other protocols.
- By default, the CPP function also limits the rates of other packets at the user level.

## 9.3 Features

### Basic Concepts

#### 📄 QOS, DiffServ

Quality of Service (QoS) is a network security mechanism, a technology used to solve the problems of network delay and congestion. DiffServ refers to the differentiated service model, which is a typical model implemented by QoS for classifying service streams to provide differentiated services.

↘ **Bandwidth, Rate**

Bandwidth refers to the maximum allowable data rate, which refers to the rate threshold in this document. Packets whose rates exceed the threshold will be discarded.

The rate indicates an actual data rate. When the rate of packets exceeds the bandwidth, packets out of the limit will be discarded. The rate must be equal to or smaller than the bandwidth.

The bandwidth and rate units in this document are packets per second (pps).

↘ **L2, L3, L4**

The structure of packets is hierarchical based on the TCP/IP model.

L2 refers to layer-2 headers, namely, the Ethernet encapsulation part; L3 refers to layer-3 headers, namely, the IP encapsulation part; L4 refers to layer-4 headers, usually, the TCP/UDP encapsulation part.

↘ **Priority Queue, SP**

Packets are cached inside a switch and packets in the output direction are cached in queues. Priority queues are mapped to Strict Priorities (SPs). Queues are not equal but have different priorities.

The SP is a kind of QoS scheduling algorithm. When a higher priority queue has packets, the packets in this queue are scheduled first. Scheduling refers to selecting packets from queues for output and refers to selecting and sending the packets to the CPU in this document.

↘ **CPU interface**

Before sending packets to the CPU, a switch will cache the packets. The process of sending packets to the CPU is similar to the process of packet output. The CPU interface is a virtual interface. When packets are sent to the CPU, the packets will be output from this virtual interface. The priority queue and SP mentioned above are based on the CPU interface.

**Overview**

CPP protects the CPU by using the standard QoS DiffServ model.

Figure 9-2 CPP Implementation Model

Feature	Description
Classifier	Classifies packet types and provides assurance for the subsequent implementation of QoS policies.
Meter	Limits rates based on packet types and controls the bandwidth for a specific packet type.
Queue	Queue packets to be sent to the CPU and select different queues based on packet types.
Scheduler	Selects and schedules queues to be sent to the CPU.

Shaper	Performs rate limit and bandwidth control on priority queues and the CPU interface.
--------	---

### 9.3.1 Classifier

#### Working Principle

The Classifier classifies all packets to be sent to the CPU based on the L2, L3 and L4 information of the packets. Classifying packets is the basis for implementing QoS policies. In subsequent actions, different policies are implemented based on the classification to provide differentiated services. A switch provides fixed classification. The management function classifies packet types based on the protocols supported by the switch, for example, STP BPDU packets and ICMP packets. Packet types cannot be customized.

### 9.3.2 Meter

#### Working Principle

The Meter limits the rates of different packets based on the preset rate thresholds. You can set different rate thresholds for different packet types. When the rate of a packet type exceeds the corresponding threshold, the packets out of the limit will be discarded.

By using the Meter, you can control the rate of a packet type sent to the CPU within a threshold to prevent specific attack packets from exerting large impacts on the CPU resources. This is the level-1 protection of the CPP.

#### Related Configuration

- By default, each packet type corresponds to a rate threshold (bandwidth) and Meter policies are implemented based on the rate threshold.
- In application, you can run the **cpu-protect type packet-type bandwidth bandwidth-value** command to set Meter policies for specified packet types.

### 9.3.3 Queue

#### Working Principle

Queues are used to classify packets at level 2. You can select the same queue for different packet types; meanwhile, queues cache packets inside switches and provide services for the Scheduler and Shaper.

CPP queues are SP queues. The SPs of the packets are determined based on the time when they are added to a queue. Packets with a larger queue number have a higher priority.

#### Related Configuration

- By default, each packet type is mapped to an SP queue.
- In application, you can run the **cpu-protect type packet-type traffic-class traffic-class-num** command to select SP queues for specific packet types.

### 9.3.4 Scheduler

#### Working Principle

The Scheduler schedules packets based on SPs of queues. That is, packets in a queue with a higher priority are scheduled first.

Before being scheduled, packets to be sent to the CPU are cached in queues. When being scheduled, the packets are sent to the CPU for processing.

**i** Only the SP scheduling policy is supported and cannot be modified.

### 9.3.5 Shaper

#### Working Principle

The Shaper is used to shape packets to be sent to the CPU, that is, when the actual rate of packets is greater than the shaping threshold, the packets must stay in the queue and cannot be scheduled. When packet rates fluctuate, the Shaper ensures that the rates of packets sent to the CPU are smooth (no more than the shaping threshold).

When the Shaper is available, packets in a queue with a lower priority may be scheduled before all packets in a queue with a higher priority are scheduled. If the rate of packets in a queue with certain priority exceeds the shaping threshold, scheduling of the packets in this queue may be stopped temporarily. Therefore, the Shaper can prevent packets in queues with lower priorities from starvation (which means that only packets in queues with higher priorities are scheduled and packets in queues with higher priorities are not scheduled).

Since the Shaper limits the scheduling rates of packets, it actually plays the rate limit function. The Shaper provides level-2 rate limit for priority queues and all packets sent to the CPU (CPU interface). The Shaper and Meter functions provide 3-level rate limit together and provide level-3 protection for the CPU.

Figure 9- 3 3-Level Rate Limit of the CPP

#### Related Configuration

##### ▾ Configuring the Shaper for priority queues

- By default, each priority queue determines a shaping threshold (bandwidth).
- In application, you can run the **cpu-protect traffic-class traffic-class-num bandwidth bandwidth\_value** command to perform Shaper configuration for a specific priority queue.

##### ▾ Configuring the Shaper for the CPU Interface

- By default, the CPU interface determines a shaping threshold (bandwidth).
- Run the **cpu-protect cpu bandwidth bandwidth\_value** command to perform Shaper configuration for the CPU interface.

## 9.4 Configuration

Configuration	Description and Command	
Configuring CPP	 (Optional and configured by default) It is used to adjust the configuration parameters of CPP.	
	<b>cpu-protect type <i>packet-type</i> bandwidth</b>	Configures the Meter for a packet type.
	<b>cpu-protect type <i>packet-type</i> traffic-class</b>	Configures the priority queue for a packet type.
	<b>cpu-protect traffic-class <i>traffic-class-num</i> bandwidth</b>	Configures the Shaper for a priority queue.
	<b>cpu-protect cpu bandwidth</b>	Configures the Shaper for the CPU interface.

### 9.4.1 Configuring CPP

#### Configuration Effect

- By configuring the Meter function, you can set the bandwidth and rate limit for a packet type. Packets out of the limit will be directly discarded.
- By configuring the Queue function, you can select a priority queue for a packet type. Packets in a queue with a higher priority will be scheduled first.
- By configuring the Shaper function, you can set the bandwidth and rate limit for a CPU interface and a priority queue. Packets out of the limit will be directly discarded.

#### Notes

- Pay special attention when the bandwidth of a packet type is set to a smaller value, which may affect the normal traffic of the same type. To provide per-user CPP, combine the NFPP function.
- When the Meter and Shaper functions are combined, 3-level protection will be provided. Any level protection fights alone may bring negative effects. For example, if you want to increase the Meter of a packet type, you also need to adjust the Shaper of the corresponding priority queue. Otherwise, the packets of this type may affect other types of packets in the same priority queue.

#### Configuration Steps

##### ✚ Configuring the Meter for a packet type

- You can use or modify the default value but cannot disable it.
- You need to modify the configuration in the following cases: when packets of a type are not attackers but are discarded, you need to increase the Meter of this packet type. If attacks of a packet type cause abnormal CPU running, you need to decrease the Meter of this packet type.
- This configuration is available on all switches in a network environment.

##### ✚ Configuring the priority queue for a packet type

- You can use or modify the default value but cannot disable it.
- You need to modify the configuration in the following cases: When attacks of a packet type cause abnormality of other packets in the same queue, you can put the packet type in an unused queue. If a packet type cannot be discarded but the packet type is in the same queue with other packet types in use, you can put this packet type in a queue with a higher priority.
- This configuration is available on all switches in a network environment.

### ✚ Configuring the Shaper for a priority queue

- You can use or modify the default value and cannot disable it.
- You need to modify the configuration in the following cases: If the Meter value of a packet type is greater which causes that other packets in the corresponding priority queue do not have sufficient bandwidth, you need to increase the Shaper for this priority queue. If attack packets are put in a priority queue and no other packets are in use, you need to increase the Shaper of this priority queue.
- This configuration is available on all switches in a network environment.

### ✚ Configuring the Shaper for the CPU interface

- You can use or modify the default value and cannot disable it.
- You are not advised to change the Shaper of the CPU interface.
- This configuration is available on all switches in a network environment.

#### Verification

- Modify the configurations when the system runs abnormally, and view the system running after the modification to check whether the configurations take effect.
- Check whether the configurations take effect by viewing corresponding configurations and statistic values. For details, see the following commands.

## 9.4.2 Configuring CPP Warning

### Configuration Effect

- By configuring CPP warning, periodic detection is enabled to check whether protocol packets or packets in queues are lost.
- By configuring CPP warning of protocol packet loss, when protocol packets are lost, alarm logs are printed.
- By configuring CPP warning of packet loss in a queue, when packets in a queue are lost, alarm logs are printed.

### Notes

N/A

### Configuration Steps

#### ▾ Enabling CPP Warning and Configuring Time Interval Between Two Detections of Packet Loss

- You can run the **cpp-warn warn-period *value*** command to enable CPP warning and configure time interval between two detections of packet loss.
- By default, CPP warning is disabled.

#### ▾ Enabling CPP Warning of Protocol Packet Loss

- You can run the **cpp-warn type *packet-type* warn** command to enable CPP warning of protocol packet loss.
- By default, CPP warning of protocol packet loss is disabled.

#### ▾ Enabling CPP Warning of Packet Loss in a Queue

- You can run the **cpp-warn traffic-class *traffic-class-num* warn** command to enable CPP warning of packet loss in a queue.
- By default, CPP warning of packet loss in a queue is disabled.

## Related Commands

### ▾ Configuring Time Interval Between Two Detections of Packet Loss

<b>Command</b>	<b>cpp-warn warn-period <i>value</i></b>
<b>Parameter Description</b>	<i>value</i> : Specifies the interval between two detections of packet loss in the unit of second. The default value is 0, which means this detection is disabled.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling CPP Warning of Protocol Packet Loss

<b>Command</b>	<b>cpp-warn type <i>packet-type</i> warn</b>
<b>Parameter Description</b>	<i>packet-type</i> : Specifies a packet type. Packet types are defined.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling CPP Warning of Packet Loss in a Queue

<b>Command</b>	<b>cpp-warn traffic-class <i>traffic-class-num</i> warn</b>
<b>Parameter Description</b>	<i>traffic-class-num</i> : Specifies a priority queue.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

## Configuration Example

### ▾ Configuring CPP Warning

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Detect whether protocol packets or packets in queues are lost every 10s.</li> <li>● Print alarm logs if ARP packets are lost.</li> <li>● Print alarm logs if packets in queue 1 are lost.</li> </ul>
	<pre>FS# configure terminal FS(config)# cpp-warn warn-period 10 FS(config)# cpp-warn traffic-class 1 warn FS(config)# cpp-warn type arp warn</pre>
<b>Verification</b>	Run the <b>show run</b> command to view the configuration.
	<pre>FS# show run   inc cpp cpp-warn warn-period 10 cpp-warn type arp warn cpp-warn traffic-class 1 warn</pre>

## 9.5 Monitoring

### Clearing

Description	Command
Clears the CPP statistics.	<b>clear cpu-protect counters</b> [device <i>device_num</i> ]
Clears the CPP statistics on the master device.	<b>clear cpu-protect counters mboard</b>

### Displaying

Description	Command
Displays the configuration and statistics of a packet type.	<b>show cpu-protect type</b> <i>packet-type</i> [device <i>device_num</i> ]
Displays the configuration and statistics of a priority queue.	<b>show cpu-protect traffic-class</b> <i>traffic-class-num</i> [device <i>device_num</i> ]
Displays the configuration on a CPU interface.	<b>show cpu-protect cpu</b>
Displays all configurations and statistics on the master device.	<b>show cpu-protect</b> {mboard   summary }
Displays all configurations and statistics of CPP.	<b>show cpu-protect</b> [device <i>device_num</i> ]
Displays CPP statistics of an interface.	<b>show cpu-protect statistics</b> [ interface <i>interface-id</i> ]
Displays a CPP statistics type.	<b>show cpu-protect statistics type</b> <i>packet-type</i>

### Debugging

-  The preceding monitoring commands are available on both chassis and cassette devices in the standalone mode.
-  If the **device** value is not specified, the **clear** command is used to clear the statistics of all nodes in the system and the **show** command is used to display the configurations on the master device.
-  In the standalone mode, the parameter **device** is unavailable.

## 10 Configuring DHCP Snooping

### 10.1 Overview

DHCP Snooping: DHCP Snooping snoops DHCP interactive packets between clients and servers to record and monitor users' IP addresses and filter out illegal DHCP packets, including client request packets and server response packets. The legal user database generated from DHCP Snooping records may serve security applications like IP Source Guard.

#### Protocols and Standards

- RFC 2131: Dynamic Host Configuration Protocol
- RFC 2132: DHCP Options and BOOTP Vendor Extensions

## 10.2 Applications

Application	Description
Guarding against DHCP service spoofing	In a network with multiple DHCP servers, DHCP clients are allowed to obtain network configurations only from legal DHCP servers.
Guarding against DHCP packet flooding	Malicious network users may frequently send DHCP request packets.
Guarding against forged DHCP packets	Malicious network users may send forged DHCP request packets, for example, DHCP-RELEASE packets.
Guarding against IP/MAC spoofing	Malicious network users may send forged IP packets, for example, tampered source address fields of packets.
Preventing Lease of IP Addresses	Network users may lease IP addresses rather than obtaining them from a DHCP server.
Detecting ARP attack	Malicious users forge ARP response packets to intercept packets during normal users' communication.

### 10.2.1 Guarding Against DHCP Service Spoofing

#### Scenario

Multiple DHCP servers may exist in a network. It is essential to ensure that user PCs obtain network configurations only from the DHCP servers within a controlled area.

Take the following figure as an example. The DHCP client can only communicate with trusted DHCP servers.

- Request packets from the DHCP client can be transmitted only to trusted DHCP servers.
- Only the response packets from trusted DHCP servers can be transmitted to the client.

Figure 10- 1

<b>Remarks:</b>	<p>S is an access device.</p> <p>A is a user PC.</p> <p>B is a DHCP server within the controlled area.</p> <p>C is a DHCP server out of the controlled area.</p>
-----------------	--

#### Deployment

- Enable DHCP Snooping on S to realize DHCP packet monitoring.

- Set the port on S connecting to B as trusted to transfer response packets.
- Set the rest of ports on S as untrusted to filter response packets.

### 10.2.2 Guarding Against DHCP Packet Flooding

#### Scenario

Potential malicious DHCP clients in a network may send high-rate DHCP packets. As a result, legitimate users cannot obtain IP addresses, and access devices are highly loaded or even break down. It is necessary to take actions to ensure network stability.

With the DHCP Snooping rate limit function for DHCP packets, a DHCP client can only send DHCP request packets at a rate below the limit.

- The request packets from a DHCP client are sent at a rate below the limit.
- Packets sent at rates beyond the limit will be discarded.

#### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Limit the rates of DHCP packets from the untrusted ports.

### 10.2.3 Guarding Against Forged DHCP Packets

#### Scenario

Potential malicious clients in a network may forge DHCP request packets, consuming applicable IP addresses from the servers and probably preempting legal users' IP addresses. Therefore, it is necessary to filter out illegal DHCP packets.

For example, as shown in the figure below, the DHCP request packets sent from DHCP clients will be checked.

- The source MAC address fields of the request packets from DHCP clients must match the **chaddr** fields of DHCP packets.
- The Release packets and Decline packets from clients must match the entries in the DHCP Snooping binding database.

Figure 10- 2

#### Remarks:

S is an access device.

A and C are user PCs.  
B is a DHCP server within the controlled area.

**Deployment**

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set the port on S connecting to B as trusted to transfer response packets.
- Set the rest of ports on S as untrusted to filter response packets.
- Enable DHCP Snooping Source MAC Verification on untrusted ports of S to filter out illegal packets.

**10.2.4 Guarding Against IP/MAC Spoofing**

**Scenario**

Check IP packets from untrusted ports to filter out forged IP packets based on IP or IP-MAC fields.

For example, in the following figure, the IP packets sent by DHCP clients are validated.

- The source IP address fields of IP packets must match the IP addresses assigned by DHCP.
- The source MAC address fields of layer-2 packets must match the **chaddr** fields in DHCP request packets from clients.

Figure 10- 3

**Remarks:** S is an access device.  
A and C are user PCs.  
B is a DHCP server within the controlled area.

**Deployment**

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set all downlink ports on the S as DHCP Snooping untrusted.
- Enable IP Source Guard on S to filter IP packets.
- Enable IP Source Guard in IP-MAC based mode to check the source MAC and IP address fields of IP packets.

### 10.2.5 Preventing Lease of IP Addresses

#### Scenario

Validate the source addresses of IP packets from untrusted ports compared with DHCP-assigned addresses.

If the source addresses, connected ports, and layer-2 source MAC addresses of ports in IP packets do not match the assignments of the DHCP server, such packets will be discarded.

The networking topology scenario is the same as that shown in the previous figure.

#### Deployment

- The same as that in the section "Guarding Against IP/MAC Spoofing".

### 10.2.6 Detecting ARP Attacks

#### Scenario

Check the ARP packets from untrusted ports and filter out the ARP packets unmatched with the assignments of the DHCP server.

For example, in the following figure, the ARP packets sent from DHCP clients will be checked.

- The ports receiving ARP packets, the layer-2 MAC addresses, and the source MAC addresses of ARP packets senders shall be consistent with the DHCP Snooping histories.

Figure 10- 4

**Remarks:**

S is an access device.  
 A and C are user PCs.  
 B is a DHCP server within the controlled area.

#### Deployment

- Enable DHCP Snooping on S to realize DHCP monitoring.
- Set all downlink ports on the S as untrusted.
- Enable IP Source Guard and ARP Check on all the untrusted ports on S to realize ARP packet filtering.

All the above security control functions are only effective to DHCP Snooping untrusted ports.

## 10.3 Features

### Basic Concepts

#### ↘ DHCP Request Packets

Request packets are sent from a DHCP client to a DHCP server, including DHCP-DISCOVER packets, DHCP-REQUEST packets, DHCP-DECLINE packets, DHCP-RELEASE packets and DHCP-INFORM packets.

#### ↘ DHCP Response Packets

Response packets are sent from a DHCP server to a DHCP client, including DHCP-OFFER packets, DHCP-ACK packets and DHCP-NAK packets.

#### ↘ DHCP Snooping Trusted Ports

IP address request interaction is complete via broadcast. Therefore, illegal DHCP services will influence normal clients' acquisition of IP addresses and lead to service spoofing and stealing. To prevent illegal DHCP services, DHCP Snooping ports are divided into two types: trusted ports and untrusted ports. The access devices only transmit DHCP response packets received on trusted ports, while such packets from untrusted ports are discarded. In this way, we may configure the ports connected to a legal DHCP Server as trusted and the other ports as untrusted to shield illegal DHCP Servers.

On switches, all switching ports or layer-2 aggregate ports are defaulted as untrusted, while trusted ports can be specified.

#### ↘ DHCP Snooping Packet Suppression

To shield all the DHCP packets on a specific client, we can enable DHCP Snooping packet suppression on its untrusted ports.

#### ↘ VLAN-based DHCP Snooping

DHCP Snooping can work on a VLAN basis. By default, when DHCP Snooping is enabled, it is effective to all the VLANs of the current client. Specify VLANs help control the effective range of DHCP Snooping flexibly.

#### ↘ DHCP Snooping Binding Database

In a DHCP network, clients may set static IP addresses randomly. This increases not only the difficulty of network maintenance but also the possibility that legal clients with IP addresses assigned by the DHCP server may fail to use the network normally due to address conflict. Through snooping packets between clients and servers, DHCP Snooping summarizes the user entries including IP addresses, MAC address, VLAN ID (VID), ports and lease time to build the DHCP Snooping binding database. Combined with ARP detection and ARP check, DHCP Snooping controls the reliable assignment of IP addresses for legal clients.

#### ↘ DHCP Snooping Rate Limit

DHCP Snooping rate limit function can be configured through the rate limit command of Network Foundation Protection Policy (NFPP). For NFPP configuration, see the *Configuring NFPP*.

#### ↘ DHCP Option82

DHCP Option82, an option for DHCP packets, is also called DHCP Relay Agent Information Option. As the option number is 82, it is known as Option82. Option82 is developed to enhance the security of DHCP servers and improve the strategies of IP address assignment. The option is often configured for the DHCP relay services of a network access device like DHCP Relay and DHCP Snooping. This option is transparent to DHCP clients, and DHCP relay components realize the addition and deduction of the option.

#### ↘ Illegal DHCP Packets

Through DHCP Snooping, validation is performed on the DHCP packets passing through a client. Illegal DHCP packets are discarded, user information is recorded into the DHCP Snooping binding database for further applications (for example, ARP detection). The following types of packets are considered illegal DHCP packets.

- The DHCP response packets received on untrusted ports, including DHCP-ACK, DHCP-NACK and DHCP-OFFER packets
- The DHCP request packets carrying gateway information **giaddr**, which are received on untrusted ports
- When MAC verification is enabled, packets with source MAC addresses different with the value of the **chaddr** field in DHCP packets
- DHCP-RELEASE packets with the entry in the DHCP Snooping binding database Snooping while with untrusted ports inconsistent with settings in this binding database
- DHCP packets in wrong formats, or incomplete

### Overview

Feature	Description
Filtering DHCP packets	Perform legality check on DHCP packets and discard illegal packets (see the previous section for the introduction of illegal packets). Transfer requests packets received on trusted ports only.
Building the DHCP Snooping binding database	Snoop the interaction between DHCP clients and the server, and generate the DHCP Snooping binding database to provide basis for other filtering modules.

### 10.3.1 Filtering DHCP Packets

Perform validation on DHCP packets from untrusted ports. Filter out the illegal packets as introduced in the previous section "Basic Concepts".

#### Working Principle

During snooping, check the receiving ports and the packet fields of packets to realize packet filtering, and modify the destination ports of packets to realize control of transmit range of the packets.

#### ↘ Checking Ports

In receipt of DHCP packets, a client first judges whether the packet receiving ports are DHCP Snooping trusted ports. If yes, legality check and binding entry addition are skipped, and packets are transferred directly. For not, both the check and addition are needed.

#### ↘ Checking Packet Encapsulation and Length

A client checks whether packets are UDP packets and whether the destination port is 67 or 68. Check whether the packet length match the length field defined in protocols.

#### ↘ Checking Packet Fields and Types

According to the types of illegal packet introduced in the section "Basic Concepts", check the fields **giaddr** and **chaddr** in packets and then check whether the restrictive conditions for the type of the packet are met.

#### Related Configuration

#### ↘ Enabling Global DHCP Snooping

By default, DHCP Snooping is disabled.

It can be enabled on a device using the **ip dhcp snooping** command.

Global DHCP Snooping must be enabled before VLAN-based DHCP Snooping is applied.

▾ **Configuring VLAN-based DHCP Snooping**

By default, when global DHCP Snooping is effective, DHCP Snooping is effective to all VLANs.

Use the [ no ] **ip dhcp snooping vlan** command to enable DHCP Snooping on specified VLANs or delete VLANs from the specified VLANs. The value range of the command parameter is the actual range of VLAN numbers.

▾ **Configuring DHCP Snooping Source MAC Verification**

By default, the layer-2 MAC addresses of packets and the **chaddr** fields of DHCP packets are not verified.

When the **ip dhcp snooping verify mac-address** command is used, the source MAC addresses and the **chaddr** fields of the DHCP request packets sent from untrusted ports are verified. The DHCP request packets with different MAC addresses will be discarded.

**10.3.2 Building the Binding Database**

DHCP Snooping detects the interactive packets between DHCP clients and the DHCP server, and generate entries of the DHCP Snooping binding database according to the information of legal DHCP packets. All these legal entries are provided to other security modules of a client as the basis of filtering packets from network.

**Working Principle**

During snooping, the binding database is updated timely based on the types of DHCP packets.

▾ **Generating Binding Entries**

When a DHCP-ACK packet on a trusted port is snooped, the client's IP address, MAC address, and lease time field are extracted together with the port ID (a wired interface index) and VLAN ID. Then, a binding entry of it is generated.

▾ **Deleting Binding Entries**

When the recorded lease time of a binding entry is due, it will be deleted if a legal DHCP-RELEASE/DHCP-DECLINE packet sent by the client or a DHCP-NCK packet received on a trusted port is snooped, or the **clear** command is used.

**Related Configuration**

No configuration is needed except enabling DHCP Snooping.

**10.4 Configuration**

Configuration	Description and Command	
Configuring basic functions of DHCP Snooping	(Mandatory) It is used to enable DHCP Snooping.	
	<b>ip dhcp snooping</b>	Enables DHCP Snooping.
	<b>ip dhcp snooping suppression</b>	Enables DHCP Snooping packet suppression.
	<b>ip dhcp snooping vlan</b>	Enables VLAN-based DHCP Snooping.
	<b>ip dhcp snooping verify mac-address</b>	Configures DHCP Snooping source MAC verification.
	<b>ip dhcp snooping database write-delay</b>	Writes the DHCP Snooping binding database to

		Flash periodically.
	<b>ip dhcp snooping database write-to-flash</b>	Writes the DHCP Snooping binding database to Flash manually.
	<b>renew ip dhcp snooping database</b>	Imports the backup file storage to the DHCP Snooping Binding database.
	<b>ip dhcp snooping trust</b>	Configures DHCP Snooping trusted ports.
	<b>ip dhcp snooping bootp</b>	Enables BOOTP support.
	<b>ip dhcp snooping check-giaddr</b>	Enables DHCP Snooping to support the function of processing Relay requests.
Configuring Option82	 (Optional)It is used to optimize the address assignment by DHCP servers.	
	<b>ip dhcp snooping Information option</b>	Adds Option82 functions to DHCP request packets.
	<b>ip dhcp snooping information option format remote-id</b>	Configures the sub-potion <b>remote-id</b> of Option82 as a user-defined character string.
	<b>ip dhcp snooping vlan information option format-type circuit-id string</b>	Configures the sub-option <b>circuit-id</b> of Option82 as a user-defined character string.

#### 10.4.1 Configuring Basic Features

##### Configuration Effect

- Enable DHCP Snooping.
- Generate the DHCP Snooping binding database.
- Control the transmit range of DHCP packets.
- Filter out illegal DHCP packets.

##### Notes

- The ports on clients connecting a trusted DHCP server must be configured as trusted.
- DHCP Snooping is effective on the wired switching ports, layer-2 aggregate ports, and layer-2 encapsulation sub-interfaces. The configuration can be implemented in interface configuration mode.
- DHCP Snooping and DHCP Relay are mutually exclusive in VRF scenarios.

##### Configuration Steps

###### ▾ Enabling Global DHCP Snooping

- Mandatory.
- Unless otherwise noted, the feature should be configured on access devices.

###### ▾ Enabling or Disabling VLAN-based DHCP Snooping

- DHCP Snooping can be disabled if not necessary for some VLANs.
- Unless otherwise noted, the feature should be configured on access devices.

###### ▾ Configuring DHCP Snooping Trusted Ports

- Mandatory.
- Configure the ports connecting a trusted DHCP server as trusted.
- ▼ **Enabling DHCP Snooping Source MAC Validation**
  - This configuration is required if the **chaddr** fields of DHCP request packets match the layer-2 source MAC addresses of data packets.
  - Unless otherwise noted, the feature should be enabled on all the untrusted ports of access devices.
- ▼ **Writing the DHCP Snooping Binding Database to Flash Periodically**
  - Enable this feature to timely save the DHCP Snooping binding database information in case that client reboot.
  - Unless otherwise noted, the feature should be configured on access devices.
- ▼ **Enabling BOOTP Support**
  - Optional
  - Unless otherwise noted, the feature should be configured on access devices.
- ▼ **Enabling DHCP Snooping to Process Relay Requests**
  - Optional.
  - Unless otherwise noted, the feature should be enabled on access devices.
  -

#### Verification

Configure a client to obtain network configurations through the DHCP protocol.

- Check whether the DHCP Snooping Binding database is generated with entries on the client.

#### Related Commands

##### ▼ Enabling or Disabling DHCP Snooping

<b>Command</b>	<code>[ no ] ip dhcp snooping</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	After global DHCP Snooping is enabled, you can check DHCP Snooping using the <b>show ip dhcp snooping</b> command.

##### ▼ Configuring VLAN-based DHCP Snooping

<b>Command</b>	<code>[ no ] ip dhcp snooping vlan { <i>vlan-rng</i>   { <i>vlan-min</i> [ <i>vlan-max</i> ] } }</code>
<b>Parameter Description</b>	<i>vlan-rng</i> : Indicates the range of VLANs <i>vlan-min</i> : The minimum VLAN ID <i>vlan-max</i> : The maximum VLAN ID
<b>Command</b>	Global configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	Use this command to enable or disable DHCP Snooping on specified VLANs. This feature is available only after global DHCP Snooping is enabled.

#### ✚ Configuring DHCP Snooping Packet Suppression

<b>Command</b>	<code>[ no ] ip dhcp snooping suppression</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to reject all DHCP request packets at the port, that is, to forbid all users under the port to apply for addresses via DHCP.

#### ✚ Configuring DHCP Snooping Source MAC Verification

<b>Command</b>	<code>[ no ] ip dhcp snooping verify mac-address</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Through the source MAC address verification, the MAC addresses in link headers and the CLIENT MAC fields in the request packets sent by a DHCP CLIENT are checked for consistence. When the source MAC address verification fails, packets will be discarded.

#### ✚ Writing DHCP Snooping Database to Flash Periodically

<b>Command</b>	<code>[ no ] ip dhcp snooping database write-delay [ time ]</code>
<b>Parameter Description</b>	<i>time</i> : Indicates the interval between two times of writing the DHCP Snooping database to the Flash.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to write the DHCP Snooping database to FLASH document. This can avoid binding information loss which requires re-obtaining IP addresses to resume communication after the device restarts.

#### ✚ Writing the DHCP Snooping Database to Flash Manually

<b>Command</b>	<code>ip dhcp snooping database write-to-flash</code>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to write the dynamic user information in the DHCP Snooping database in FLASH documents in real time. If a device is upgraded from a non-QinQ version to a QinQ version (or vice versa), binding entries cannot be restored from FLASH documents because of version differences between FLASH documents.

#### ✚ Importing Flash Storage to the DHCP Snooping Binding Database

<b>Command</b>	<b>renew ip dhcp snooping database</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Privileged configuration mode
<b>Usage Guide</b>	Use this command to import the information from backup file documents to the DHCP Snooping binding database.

#### ↘ Configuring DHCP Snooping Trusted Ports

<b>Command</b>	<b>[ no ] ip dhcp snooping trust</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure a port connected to a legal DHCP server as a trusted port. The DHCP response packets received by trusted ports are transferred, while those received by untrusted ports are discarded.

#### ↘ Enabling or Disabling BOOTP Support

<b>Command</b>	<b>[ no ] ip dhcp snooping bootp</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to support the BOOTP protocol.

#### ↘ Enabling DHCP Snooping to Process Relay Requests

<b>Command</b>	<b>[ no ] ip dhcp snooping check-giaddr</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	<p>After the feature is enabled, services using DHCP Snooping binding entries generated based on Relay requests, such as IP Source Guard/802.1x authentication, cannot be deployed. Otherwise, users fail to access the Internet.</p> <p>After the feature is enabled, the <b>ip dhcp snooping verify mac-address</b> command cannot be used. Otherwise, DHCP Relay requests will be discarded and as a result, users fail to obtain addresses.</p>

### Configuration Example

#### ↘ DHCP Client Obtaining IP addresses Dynamically from a Legal DHCP Server

<p><b>Scenario</b></p> <p>Figure 10- 5</p>	
<p><b>Configuration Steps</b></p>	<ul style="list-style-type: none"> <li>● Enable DHCP Snooping on an access device (Switch B in this case).</li> <li>● Configure the uplink port (port Gi 0/1 in this case) as a trusted port.</li> </ul>
<p><b>B</b></p>	<pre> B#configure terminal  Enter configuration commands, one per line. End with CNTL/Z.  B(config)#ip dhcp snooping  B(config)#interface gigabitEthernet 0/1  B(config-if-GigabitEthernet 0/1)#ip dhcp snooping trust  B(config-if-GigabitEthernet 0/1)#end                     </pre>
<p><b>Verification</b></p>	<p>Check the configuration on Switch B.</p> <ul style="list-style-type: none"> <li>● Check whether DHCP Snooping is enabled, and whether the configured DHCP Snooping trusted port is uplink.</li> <li>● Check the DHCP Snooping configuration on Switch B, and especially whether the trusted port is correct.</li> </ul>
<p><b>B</b></p>	<pre> B#show running-config  ! ip dhcp snooping !  interface GigabitEthernet 0/1  B#show ip dhcp snooping  Switch DHCP Snooping status           :  ENABLE DHCP Snooping Verification of hwaddr status :  DISABLE DHCP Snooping database write-delay time  :  0 seconds DHCP Snooping option 82 status          :  DISABLE DHCP Snooping Support BOOTP bind status  :  DISABLE  Interface           Trusted           Rate limit(pps) -----           - GigabitEthernet0/1  YES                unlimited                     </pre>

```

B#show ip dhcp snooping binding
Total number of bindings: 1
MacAddress          IpAddress          Lease(sec)  Type           VLAN  Interface
-----
0013.2049.9014     172.16.1.2        86207      dhcp-snooping 1     GigabitEthernet0/11

```

### Common Errors

- The uplink port is not configured as a DHCP trusted port.
- Another access security option is already configured for the uplink port, so that a DHCP trusted port cannot be configured.

### 10.4.2 Configuring Option82

#### Configuration Effect

- Enable a DHCP server to obtain more information and assign addresses better.
- The Option82 function is client-oblivious.

#### Notes

- The Option82 functions for DHCP Snooping and DHCP Relay are mutually exclusive.

#### Configuration Steps

- To realize optimization of address allocation, implement the configuration.
- Unless otherwise noted, enable this function on access devices with DHCP Snooping enabled.

#### Verification

Check whether the DHCP Snooping configuration options are configured successfully.

#### Related Commands

##### ▾ Adding Option82 to DHCP Request Packets

<b>Command</b>	[ no ] ip dhcp snooping information option [ standard-format ]
<b>Parameter Description</b>	<b>standard-format</b> : Indicates a standard format of the Option82 options
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to add Option82 to DHCP request packets so that a DHCP server assigns addresses according to such information.

##### ▾ Configuring Sub-option remote-id of Option82 as User-defined Character String

<b>Command</b>	[ no ] ip dhcp snooping information option format remote-id { string ASCII-string   hostname }
<b>Parameter Description</b>	<b>string ASCII-string</b> : Indicates the content of the extensible format, the Option82 option <b>remote-id</b> , is a user-defined character string <b>hostname</b> : Indicates the content of the extensible format, the Option82 option <b>remote-id</b> , is a host name.

<b>Configuration mode</b>	Global configuration mode
<b>Usage Guide</b>	Use this command to configure the sub-option <b>remote-id</b> of the Option82 as user-defined content, which is added to DHCP request packets. A DHCP server assigns addresses according to Option82 information.

▾ **Configuring Sub-Option circuit-id of Option82 as User-defined Character String**

<b>Command</b>	<code>[ no ] ip dhcp snooping vlan <i>vlan-id</i> information option format-type circuit-id string <i>ascii-string</i></code>
<b>Parameter Description</b>	<i>vlan-id</i> : Indicates the VLAN where a DHCP request packet is <i>ascii-string</i> : Indicates the user-defined string
<b>Configuration mode</b>	Interface configuration mode
<b>Usage Guide</b>	Use this command to configure the sub-option <b>circuit-id</b> of the Option82 as user-defined content, which is added to DHCP request packets. A DHCP server assigns addresses according to Option82 information.

**Configuration Example**

▾ **Configuring Option82 to DHCP Request Packets**

<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configuring basic functions of DHCP Snooping.</li> <li>● Configuring Option82.</li> </ul>
<b>B</b>	<pre>FS# configure terminal FS(config)#ip dhcp snooping information option FS(config)# end</pre>
<b>Verification</b>	Check the DHCP Snooping configuration.
<b>B</b>	<pre>B#show ip dhcp snooping SwitchDHCP Snooping status           :  ENABLE DHCP Snooping Verification of hwaddr status :  DISABLE DHCP Snooping database write-delay time :  0seconds DHCP Snooping option 82 status        :  ENABLE DHCP Snooping Support bootp bind status :  DISABLE Interface           Trusted           Rate limit(pps) ----- GigabitEthernet0/1  YES                unlimited</pre>

**Common Errors**

- N/A

**10.5 Monitoring**

**Clearing**

 Running the clear commands may lose vital information and thus interrupt services.

Description	Command
Clears the DHCP Snooping binding database.	<b>clear ip dhcp snooping binding</b> [ <i>ip</i> ] [ <i>mac</i> ] [ <b>vlan</b> <i>vlan-id</i> ] [ <b>interface</b> <i>interface-id</i> ]

### Displaying

Description	Command
Displays DHCP Snooping configuration.	<b>show ip dhcp snooping</b>
Displays the DHCP Snooping binding database.	<b>show ip dhcp snooping binding</b>

### Debugging

 System resources are occupied when debugging information is output. Disable the debugging switch immediately after use.

Description	Command
Debugs DHCP Snooping events.	<b>debug snooping ipv4 event</b>
Disables debugging DHCP Snooping events.	<b>no debug snooping ipv4 event</b>
Debugs DHCP Snooping packets.	<b>debug snooping ipv4 packet</b>
Disables debugging DHCP Snooping packets.	<b>no debug snooping ipv4 packet</b>
Enables debugging MAC-based DHCP Snooping.	<b>debug snooping ipv4 mac-address</b> <i>H.H.H</i>
Disables debugging MAC-based DHCP Snooping.	<b>no debug snooping ipv4 mac-address</b> <i>H.H.H</i>
Enables debugging all DHCP Snooping	<b>debug snooping ipv4 all</b>
Disables debugging all DHCP Snooping	<b>no debug snooping ipv4 all</b>

## 11 Configuring NFPP

### 11.1 Overview

Network Foundation Protection Policy (NFPP) provides guards for switches.

Malicious attacks are always found in the network environment. These attacks bring heavy burdens to switches, resulting in high CPU usage and operational troubles. These attacks are as follows:

Denial of Service (DoS) attacks may consume lots of memory, entries, or other resources of a switch, which will cause system service termination.

Massive attack traffic is directed to the CPU, occupying the entire bandwidth of the CPU. In this case, normal protocol traffic and management traffic cannot be processed by the CPU, causing protocol flapping or management failure. The forwarding in the data plane will also be affected and the entire network will become abnormal.

A great number of attack packets directed to the CPU consume massive CPU resources, making the CPU highly loaded and thereby influencing device management and performance.

NFPP can effectively protect the system from these attacks. Facing attacks, NFPP maintains the proper running of various system services with a low CPU load, thereby ensuring the stability of the entire network.

## 11.2 Applications

Application	Description
Attack Rate Limiting	Due to various malicious attacks such as ARP attacks and IP scanning attacks in the network, the CPU cannot process normal protocol and management traffics, causing protocol flapping or management failure. The NFPP attack rate limiting function is used to limit the rate of attack traffic or isolate attack traffic to recover the network.
Centralized Bandwidth Allocation	If normal service traffics are too large, you need to classify and prioritize the traffics. When a large number of packets are directed to the CPU, the CPU will be highly loaded, thereby causing device management or device running failure. The centralized bandwidth distribution function is used to increase the priority of such traffics so that switches can run stably.

### 11.2.1 Attack Rate Limiting

#### Scenario

NFPP supports attack detection and rate limiting for various types of packets, including Address Resolution Protocol (ARP), Internet Control Message Protocol (ICMP), and Dynamic Host Configuration Protocol (DHCP) packets. It also allows users to define packet matching characteristics and corresponding attack detection and rate limiting policies. The attack rate limiting function takes effect based on types of packets. This section uses ARP packets as an example scenario to describe the application.

If an attacker floods ARP attack packets while CPU capability is insufficient, most of the CPU resources will be consumed for processing these ARP packets. If the rate of attacker's ARP packet rates exceeds the maximum ARP bandwidth specified in the CPU Protect Policy (CPP) of the switch, normal ARP packets may be dropped. As shown in Figure 11- 1, normal hosts will fail to access the network, and the switch will fail to send ARP replies to other devices.

Figure 11- 1

#### Deployment

- By default, the ARP attack detection and rate limiting function is enabled with corresponding policies configured. If the rate of an attacker's ARP packets exceeds the rate limit, the packets are discarded. If it exceeds the attack threshold, a monitoring user is generated and prompt information is exported.
- If the rate of an attacker's ARP packets exceeds the rate limit defined in CPP and affects normal ARP replies, you can enable attack isolation to discard ARP attack packets based on the hardware and recover the network.
- ❗ For details about CPP-related configurations, see the *Configuring CPU Protection*.
- ❗ To maximize the use of NFPP guard functions, modify the rate limits of various services in CPP based on the application environment or use the configurations recommended by the system. You can run the **show cpu-protect summary** command to display the configurations.

## 11.2.2 Centralized Bandwidth Allocation

### Scenario

A switch classifies services defined in CPP into three types: Manage, Route, and Protocol. Each type of services has an independent bandwidth. Different types of services cannot share their bandwidths. Traffics with bandwidths exceeding the thresholds will be discarded. By such service classification, service packets are processed by orders of precedence.

As shown in Figure 11-2, the switch receives a large number of Telnet packets, OSPF packets, and ARP packets, causing CPU overload. In this case, the CPU cannot process all packets, and a large quantity of packets are backlogged in the queue, causing various problems such as frequent Telnet disconnection, OSPF protocol flapping, and ARP access failure on hosts.

Figure 11- 2

### Deployment

- By default, CPU centralized bandwidth allocation is enabled to assign an independent bandwidth and bandwidth ratio to each type of services. At the time, the CPU first processes Telnet packets to ensure uninterrupted connection of Telnet service, and then processes OSPF packets to maintain OSPF protocol stability, and finally processes ARP packets.
- If the preceding problems still occur in default configurations, you can accordingly adjust the bandwidths and bandwidth ratios of various types of services.

## 11.3 Features

### Basic Concepts

#### ▾ ARP Guard

In local area networks (LANs), IP addresses are mapped to MAC addresses through ARP, which has a significant role in safeguarding network security. ARP-based DoS attacks mean that a large number of unauthorized ARP packets are sent to the gateway through the network, causing the failure of the gateway to provide services for normal hosts. To prevent such attacks, limit the rate of ARP packets and identify and isolate the attack source.

#### ▾ IP Guard

Many hacker attacks and network virus intrusions start from scanning active hosts in the network. Therefore, many scanning packets rapidly occupy the network bandwidth, causing network communication failure.

To solve this problem, FS Layer-3 switches provide IP guard function to prevent hacker scanning and Blaster Worm viruses and reduce the CPU load. Currently, there are mainly two types of IP attacks:

Scanning destination IP address changes: As the greatest threat to the network, this type of attacks not only consumes network bandwidth and increases device load but also is a prelude of most hacker attacks.

Sending IP packets to non-existing destination IP addresses at high rates: This type of attacks is mainly designed for consuming the CPU load. For a Layer-3 device, if the destination IP address exists, packets are directly forwarded by the switching chip without occupying CPU resources. If the destination IP address does not exist, IP packets are sent to the CPU, which then sends ARP requests to query the MAC address corresponding to the destination IP address. If too many packets are sent to the CPU, CPU resources will be consumed. This type of attack is less destructive than the former one.

To prevent the latter type of attack, limit the rate of IP packets and find and isolate the attack source.

#### ▾ ICMP Guard

ICMP is a common approach to diagnose network failures. After receiving an ICMP echo request from a host, the router or switch returns an ICMP echo reply. The preceding process requires the CPU to process the packets, thereby definitely consuming part of CPU resources. If an attacker sends a large number of ICMP echo requests to the destination device, massive CPU resources on the device will be consumed heavily, and the device may even fail to work properly. This type of attacks is called ICMP flood. To prevent this type of attacks, limit the rate of ICMP packets and find and isolate the attack source.

#### ▾ DHCP Guard

DHCP is widely used in LANs to dynamically assign IP addresses. It is significant to network security. Currently, the most common DHCP attack, also called DHCP exhaustion attack, uses faked MAC addresses to broadcast DHCP requests. Various attack tools on the Internet can easily complete this type of attack. A network attacker can send sufficient DHCP requests to use up the address space provided by the DHCP server within a period. In this case, authorized hosts will fail to request DHCP IP addresses and thereby fail to access the network. To prevent this type of attacks, limit the rate of DHCP packets and find and isolate the attack source.

#### ▾ DHCPv6 Guard

DHCP version 6 (DHCPv6) is widely used in LANs to dynamically assign IPv6 addresses. Both DHCP version 4 (DHCPv4) and DHCPv6 have security problems. Attacks to DHCPv4 apply also to DHCPv6. A network attacker can send a large number of DHCPv6 requests to use up the address space provided by the DHCPv6 server within a period. In this case, authorized hosts will fail to request IPv6

addresses and thereby fail to access the network. To prevent this type of attacks, limit the rate of DHCPv6 packets and find the attack source.

### ↘ ND Guard

Neighbor Discovery (ND) is mainly used in IPv6 networks to perform address resolution, router discovery, prefix discovery, and redirection. ND uses five types of packets: Neighbor Solicitation (NS), Neighbor Advertisement (NA), Router Solicitation (RS), Router Advertisement (RA), and Redirect. These packets are called ND packets.

### ↘ Self-Defined Guard

There are various types of network protocols, including routing protocols such as Open Shortest Path First (OSPF), Border Gateway Protocol (BGP), and Routing Information Protocol (RIP). Various devices need to exchange packets through different protocols. These packets must be sent to the CPU and processed by appropriate protocols. Once the network device runs a protocol, it is like opening a window for attackers. If an attacker sends a large number of protocol packets to a network device, massive CPU resources will be consumed on the device, and what's worse, the device may fail to work properly.

Since various protocols are being continuously developed, protocols in use vary with the user environments. FS devices hereby provide self-defined guard. Users can customize and flexibly configure guard types to meet guard requirements in different user environments.

### Overview

Feature	Description
Host-based Rate Limiting and Attack Identification	Limits the rate according to the host-based rate limit and identify host attacks in the network.
Port-based Rate Limiting and Attack Identification	Limits the rate according to the port-based rate limit and identify port attacks.
Monitoring Period	Monitors host attackers in a specified period.
Isolation Period	Uses hardware to isolate host attackers or port attackers in a specified period.
Trusted Hosts	Trusts a host by not monitoring it.
Centralized BandwidthAllocation	Classifies and prioritizes packets.

#### 11.3.1 Host-based Rate Limiting and Attack Identification

Limit the rate of attack packets of hosts and identify the attacks.

Identify ARP scanning.

Identify IP scanning.

#### Working Principle

Hosts can be identified in two ways: based on the source IP address, VLAN ID, and port and based on the link-layer source MAC address, VLAN ID, and port. Each host has a rate limit and an attack threshold (also called alarm threshold). The rate limit must be lower than the attack threshold. If the attack packet rate exceeds the rate limit of a host, the host discards the packets beyond the rate limit. If the attack packet rate exceeds the attack threshold of a host, the host identifies and logs the host attacks, and sends traps.

ARP scanning attack may have occurred if ARP packets beyond the scanning threshold received in the configured period meet either of the following conditions:

- The link-layer source MAC address is fixed but the source IP address changes.
- The link-layer source MAC address and source IP address are fixed but the destination IP address continuously changes.

Among IP packets beyond the scanning threshold received in the configured period, if the source IP address remains the same while the destination IP address continuously changes, IP scanning attack may have occurred.

- i** When NFPP detects a specific type of attack packets under a service, it sends a trap to the administrator. If the attack traffic persists, NFPP will not resend the alarm until 60 seconds later.
- i** To prevent CPU resource consumption caused by frequent log printing, NFPP writes attack detection logs to the buffer, obtains them from the buffer at a specified rate, and prints them. NFPP does not limit the rate of traps.

### Related Configuration

Use ARP guard as an example:

#### ▾ Configuring the Global Host-based Rate Limit, Attack Threshold, and Scanning Threshold

In NFPP configuration mode:

Run the **arp-guard rate-limit {per-src-ip | per-src-mac} pps** command to configure rate limits of hosts identified based on the source IP address, VLAN ID, and port and hosts identified based on the link-layer source MAC address, VLAN ID, and port.

Run the **arp-guard attack-threshold {per-src-ip | per-src-mac} pps** command to configure attack thresholds of hosts identified based on the source IP address, VLAN ID, and port and hosts identified based on the link-layer source MAC address, VLAN ID, and port.

Run the **arp-guard scan-threshold pkt-cnt** command to configure the ARP scanning threshold.

#### ▾ Configuring Host-based Rate Limit and Attack Threshold, and Scanning Threshold on an Interface

In interface configuration mode:

Run the **nfpp arp-guard policy {per-src-ip | per-src-mac} rate-limit-pps attack-threshold-pps** command to configure rate limits and attack thresholds of hosts identified based on the source IP address, VLAN ID, and port and hosts identified based on the link-layer source MAC address, VLAN ID, and port on an interface.

Run the **nfpp arp-guard scan-threshold pkt-cnt** command to configure the scanning threshold on an interface.

- i** Only ARP guard and IP guard support anti-scanning at present.

### 11.3.2 Port-based Rate Limiting and Attack Identification

#### Working Principle

Each port has a rate limit and an attack threshold. The rate limit must be lower than the attack threshold. If the packet rate exceeds the rate limit on a port, the port discards the packets. If the packet rate exceeds the attack threshold on a port, the port logs the attacks and sends traps.

### Related Configuration

Use ARP guard as an example:

#### ▾ Configuring the Global Port-based Rate Limit and Attack Threshold

In NFPP configuration mode:

Run the **arp-guard rate-limit per-port pps** command to configure the rate limit of a port.

Run the **arp-guard attack-threshold per-port pps** command to configure the attack threshold of a port.

### ↘ **Configuring Port-based Rate Limit and Attack Threshold on an Interface**

In interface configuration mode:

Run the **nfpp arp-guard policy per-port rate-limit-pps attack-threshold-pps** command to configure the rate limit and attack threshold of a port.

## 11.3.3 Monitoring Period

### **Working Principle**

The monitoring user provides information about attackers in the current system. If the isolation period is 0 (that is, not isolated), the guard module automatically performs software monitoring on attackers in the configured monitoring period. If the isolation period is set to a non-zero value, the guard module automatically isolates the hosts monitored by software and sets the timeout period as the isolation period. The monitoring period is valid only when the isolation period is 0.

### **Related Configuration**

Use ARP guard as an example:

### ↘ **Configuring the Global Monitoring Period**

In NFPP configuration mode:

Run the **arp-guard monitor-period seconds** command to configure the monitoring period.

## 11.3.4 Isolation Period

### **Working Principle**

Isolation is performed by the guard policies after attacks are detected. Isolation is implemented using the filter of the hardware to ensure that these attacks will not be sent to the CPU, thereby ensuring proper running of the device.

Hardware isolation supports two modes: host-based and port-based isolation. At present, only ARP or ND guard supports port-based hardware isolation.

A policy is configured in the hardware to isolate attackers. However, hardware resources are limited. When hardware resources are used up, the system prints logs to notify the administrator.

### **Related Configuration**

Use ARP guard as an example:

### ↘ **Configuring the Global Isolation Period**

In NFPP configuration mode:

Run the **arp-guard isolate-period [seconds | permanent]** command to configure the isolation period. If the isolation period is set to 0, isolation is disabled. If it is set to a non-zero value, the value indicates the isolation period. If it is set to **permanent**, ARP attacks are permanently isolated.

### ↘ **Configuring the Isolation Period on an Interface**

In interface configuration mode:

Run the **nfpp arp-guard isolate-period** [*seconds* | **permanent**] command to configure the isolation period. If the isolation period is set to 0, isolation is disabled. If it is set to a non-zero value, the value indicates the isolation period. If it is set to **permanent**, ARP attacks are permanently isolated.

#### ▾ Enabling Isolate Forwarding

In NFPP configuration mode:

Run the **arp-guard isolate-forwarding enable** command to enable isolate forwarding.

#### ▾ Enabling Port-based Ratelimit Forwarding

In NFPP configuration mode:

Run the **arp-guard ratelimit-forwarding enable** command to enable port-based ratelimit forwarding.

 At present, only ARP guard supports the configuration of isolate forwarding and ratelimit forwarding.

### 11.3.5 Trusted Hosts

#### Working Principle

If you do not want to monitor a host, you can run related commands to trust the host. This trusted host will be allowed to send packets to the CPU.

#### Related Configuration

Use IP anti-scanning as an example:

#### ▾ Configuring Trusted Hosts

In NFPP configuration mode:

Run the **ip-guard trusted-host** *ip mask* command to trust a host.

Run the **trusted-host** {*mac mac\_mask* | *ip mask* | *IPv6/prefixlen*} command to trust a host for a self-defined guard.

### 11.3.6 Centralized Bandwidth Allocation

#### Working Principle

Services defined in CPP are classified into three types: Manage, Route, and Protocol. (For details, see the following table.) Each type of service has an independent bandwidth. Different types of services cannot share their bandwidths. Traffics exceeding the bandwidth thresholds are discarded. By such service classification, service packets are processed by orders of precedence.

NFPP allows the administrator to flexibly assign bandwidth for three types of packets based on the actual network environment so that Protocol and Manage packets can be first processed. Prior processing of Protocol packets ensures proper running of protocols, and prior processing of Manage packets ensures proper management for the administrator, thereby ensuring proper running of important device functions and improving the guard capability of the device.

After classified rate limiting, all types of packets are centralized in a queue. When one type of service is processed inefficiently, packets of this service will be backlogged in the queue and may finally use up resources of the queue. NFPP allows the administrator to configure the percentages of these three types of packets in the queue. When the queue length occupied by one type of packets exceeds the value of the total queue length multiplied by the percentage of this packet type, the excessive packets will be discarded. This efficiently prevents one type of packets from exclusively occupying queue resources.

Packet Type	Service Type Defined in CPP
Protocol	tp-guard, dot1x, rldp, rerp, slow-packet, bpdu, isis dhcps, gvrp, ripng, dvmrp, igmp, mpls, ospf, pim, pimv6, rip, vrrp, ospf3, dhcp-relay-s, dhcp-relay-c, option82, tunnel-bpdu, tunnel-gvrp
Route	unknown-ipmc, unknown-ipmcv6, ttl1, ttl0, udp-helper, ip4-packet-other, ip6-packet-other, non-ip-packet-other, arp
Manage	ip4-packet-local, ip6-packet-local

 For the definitions of service types, see the Configuring CPU Protection.

## Related Configuration

### ▾ Configuring the Maximum Bandwidth of Specified Packets

In global configuration mode:

Run the **cpu-protect sub-interface { manage | protocol|route} pps pps\_value** command to configure the maximum bandwidth of specified packets.

### ▾ Configuring the Maximum Percentage of Specified Packets in the Queue

In global configuration mode:

Run the **cpu-protect sub-interface { manage | protocol | route} percent percent\_value** command to configure the maximum percentage of specified packets in the queue.

## 11.4 Configuration

Configuration	Description and Command	
Configuring ARP Guard	<b>arp-guard enable</b>	Enables ARP guard globally.
	<b>arp-guard isolate-period</b>	Configures the global ARP-guard isolation period.
	<b>arp-guard isolate-forwarding enable</b>	Enables ARP-guard isolate forwarding.
	<b>arp-guard ratelimit-forwarding enable</b>	Enables APR-guard ratelimit forwarding.
	<b>arp-guard monitor-period</b>	Configures the global ARP-guard monitoring period.
	<b>arp-guard monitored-host-limit</b>	Configures the maximum number of ARP-guard monitored hosts.
	<b>arp-guard rate-limit</b>	Configures the global ARP-guard rate limit.
	<b>arp-guard attack-threshold</b>	Configures the global ARP-guard attack threshold.
	<b>arp-guard scan-threshold</b>	Configures the global ARP-guard scanning threshold.
	<b>nfpp arp-guard enable</b>	Enables ARP guard on an interface.
	<b>nfpp arp-guard policy</b>	Configures the APR-guard rate limit and attack threshold on an interface.
Configuring IP Guard	<b>nfpp arp-guard scan-threshold</b>	Configures the APR-guard scanning threshold on an interface.
	<b>nfpp arp-guard isolate-period</b>	Configures the APR-guard isolation period on an interface.
	<b>ip-guard enable</b>	Enables IP guard globally.
	<b>ip-guard isolate-period</b>	Configures the global IP-guard isolation period.
	<b>ip-guard monitor-period</b>	Configures the global IP-guard monitoring period.
	<b>ip-guard monitored-host-limit</b>	Configures the maximum number of IP-guard

Configuration	Description and Command
	monitored hosts.
	<b>ip-guard rate-limit</b> Configures the global IP-guard rate limit.
	<b>ip-guard attack-threshold</b> Configures the global IP-guard attack threshold.
	<b>ip-guard scan-threshold</b> Configures the global IP-guard scanning threshold.
	<b>ip-guard trusted-host</b> Configures IP-guard trusted hosts.
	<b>nfpp ip-guard enable</b> Enables IP guard on an interface.
	<b>nfpp ip-guard policy</b> Configures the IP-guard rate limit and attack threshold on an interface.
	<b>nfpp ip-guard scan-threshold</b> Configures the IP-guard scanning threshold on an interface.
	<b>nfpp ip-guard isolate-period</b> Configures the IP-guard isolation period on an interface.
Configuring ICMP Guard	<b>icmp-guard enable</b> Enables ICMP guard globally.
	<b>icmp-guard isolate-period</b> Configures the global ICMP-guard isolation period.
	<b>icmp-guard monitor-period</b> Configures the global ICMP-guard monitoring period.
	<b>icmp-guard monitored-host-limit</b> Configures the maximum number of ICMP-guard monitored hosts.
	<b>icmp-guard rate-limit</b> Configures the global ICMP-guard rate limit.
	<b>icmp-guard attack-threshold</b> Configures the global ICMP-guard attack threshold.
	<b>icmp-guard trusted-host</b> Configures ICMP-guard trusted hosts.
	<b>nfpp icmp-guard enable</b> Enables ICMP guard on an interface.
	<b>nfpp icmp-guard policy</b> Configures the ICMP-guard rate limit and attack threshold on an interface.
<b>nfpp icmp-guard isolate-period</b> Configures the ICMP-guard isolation period on an interface.	
Configuring DHCP Guard	<b>dhcp-guard enable</b> Enables DHCP guard globally.
	<b>dhcp-guard isolate-period</b> Configures the global DHCP-guard isolation period.
	<b>dhcp-guard monitor-period</b> Configures the global DHCP-guard monitoring period.
	<b>dhcp-guard monitored-host-limit</b> Configures the maximum number of DHCP-guard monitored hosts.
	<b>dhcp-guard rate-limit</b> Configures the global DHCP-guard rate limit.
	<b>dhcp-guard attack-threshold</b> Configures the global DHCP-guard attack threshold.
	<b>nfpp dhcp-guard enable</b> Enables DHCP guard on an interface.
	<b>nfpp dhcp-guard policy</b> Configures the DHCP-guard rate limit and attack threshold on an interface.
	<b>nfpp dhcp-guard isolate-period</b> Configures the DHCP-guard isolation period on an interface.
Configuring DHCPv6 Guard	<b>dhcpv6-guard enable</b> Enables DHCPv6 guard globally.
	<b>dhcpv6-guard monitor-period</b> Configures the global DHCPv6-guard monitoring period.
	<b>dhcpv6-guard monitored-host-limit</b> Configures the maximum number of DHCPv6-guard

Configuration	Description and Command
	monitored hosts.
	<b>dhcpv6-guard rate-limit</b> Configures the global DHCPv6-guard rate limit.
	<b>dhcpv6-guard attack-threshold</b> { per-src-mac   per-port} pps Configures the global DHCPv6-guard attack threshold.
	<b>nfpp dhcpv6-guard enable</b> Enables DHCPv6 guard on an interface.
	<b>nfpp dhcpv6-guard policy</b> Configures the DHCPv6-guard rate limit and attack threshold on an interface.
Configuring ND Guard	<b>nd-guard enable</b> Enables ND guard globally.
	<b>nd-guard ratelimit-forwarding enable</b> Enables ND-guard ratelimit forwarding.
	<b>nd-guard rate-limit per-port</b> Configures the global ND-guard rate limit.
	<b>nd-guard attack-threshold per-port</b> Configures the global ND-guard attack threshold.
	<b>nfpp nd-guard enable</b> Enables ND guard on an interface.
	<b>nfpp nd-guard policy per-port</b> Configures the ND-guard rate limit and attack threshold on an interface.
Configuring a Self-Defined Guard	<b>define</b> Configures the name of a self-defined guard.
	<b>match</b> Configures <b>match</b> fields of a self-defined guard.
	<b>global-policy</b> Configures the global rate limit and attack threshold of a self-defined guard.
	<b>monitor-period</b> Configures the global monitoring period of a self-defined guard.
	<b>monitored-host-limit</b> Configures the maximum number of monitored hosts of a self-defined guard.
	<b>trusted-host</b> Configures trusted hosts of a self-defined guard.
	<b>define name enable</b> Enables a self-defined guard globally.
	<b>nfpp define name enable</b> Enables a self-defined guard on an interface.
	<b>nfpp define</b> Configures the rate limit and attack threshold of a self-defined guard on an interface.
Configuring NFPP Logging	<b>log-buffer entries</b> Configures the log buffer size.
	<b>log-buffer logs</b> Configures the log buffer rate.
	<b>logging vlan</b> Configures VLAN-based logging filtering.
	<b>logging interface</b> Configures interface-based logging filtering.
	<b>logging enable</b> Enables log printing.

### 11.4.1 Configuring ARP Guard

#### Configuration Effect

- ARP attacks are identified based on hosts or ports. Host-based ARP attack identification supports two modes: identification based on the source IP address, VLAN ID, and port and identification based on the link-layer source MAC address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the ARP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the ARP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- ARP guard can also detect ARP scanning attacks. ARP scanning attacks indicate that the link-layer source MAC address is fixed but the source IP address changes, or that the link-layer source MAC address and source IP address are fixed but the destination

IP address continuously changes. Due to the possibility of false positive, hosts possibly performing ARP scanning are not isolated and are provided for the administrator's reference only.

- Configure ARP-guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.

#### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.
- ARP guard prevents only ARP DoS attacks to the switch, but not ARP spoofing or ARP attacks in the network.
- For trusted ports configured for Dynamic ARP Inspection (DAI), ARP guard does not take effect, preventing false positive of ARP traffic over the trusted ports. For details about DAI trusted ports, see the Configuring Dynamic ARP Inspection.

#### Configuration Steps

##### ▾ Enabling ARP Guard

- (Mandatory) ARP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If ARP guard is disabled, the system automatically clears monitored hosts, scanned hosts, and isolated entries on ports.

##### ▾ Configuring the ARP-Guard Isolation Period

- (Optional) ARP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

##### ▾ Enabling ARP-Guard Isolate Forwarding

- (Optional) ARP-guard isolate forwarding is enabled by default.
- To make isolation valid only at the management plane instead of the forwarding plane, you can enable this function.
- This function can be enabled in NFPP configuration mode.

##### ▾ Enabling ARP-Guard Rate Limit Forwarding

- (Optional) This function is enabled by default.
- If the port-based isolation entry takes effect, you can enable this function to pass some of the packets while not discarding all of them.
- This function can be enabled in NFPP configuration mode.

##### ▾ Configuring the ARP-Guard Monitoring Period

- (Mandatory) The default ARP-guard monitoring period is 600 seconds.

- If the ARP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

#### ↘ **Configuring the Maximum Number of ARP-Guard Monitored Hosts**

- (Mandatory) The maximum number of ARP-guard monitored hosts is 20,000 by default.
- Set the maximum number of ARP-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of ARP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_ARP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ↘ **Configuring the ARP-Guard Attack Threshold**

- Mandatory.
- To achieve the best ARP-guard effect, you are advised to configure the host-based rate limit and attack threshold based on the following order: Source IP address-based rate limit < Source IP address-based attack threshold < Source MAC address-based rate limit < Source MAC address-based attack threshold.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_ARP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source MAC address-based rate limiting takes priority over source IP address-based rate limiting while the latter takes priority over port-based rate limiting.

#### ↘ **Configuring the ARP-Guard Scanning Threshold**

- Mandatory.
- The scanning threshold can be configured in NFPP configuration mode or interface configuration mode.
- The ARP scanning table stores only the latest 256 records. When the ARP scanning table is full, the latest record will overwrite the earliest record.
- ARP scanning attack may have occurred if ARP packets received within 10 seconds meet either of the following conditions:
  - The link-layer source MAC address is fixed but the source IP address changes.
  - The link-layer source MAC address and source IP address are fixed but the destination IP address continuously changes, and the change times exceed the scanning threshold.

## Verification

When a host in the network sends ARP attack packets to a switch configured with ARP guard, check whether these packets can be sent to the CPU.

- If the packets exceed the attack threshold or scanning threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

### ▾ Configuring the Global ARP-Guard Isolation Period

<b>Command</b>	<b>arp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling ARP-Guard Isolate Forwarding

<b>Command</b>	<b>arp-guard isolate-forwarding enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Enabling ARP-Guard Ratelimit Forwarding

<b>Command</b>	<b>arp-guard ratelimit-forwarding enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global ARP-Guard Monitoring Period

<b>Command</b>	<b>arp-guard monitor-period</b> <i>seconds</i>
<b>Parameter</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.

<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Maximum Number of ARP-Guard Monitored Hosts

<b>Command</b>	<b>arp-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Global ARP-Guard Rate Limit

<b>Command</b>	<b>arp-guard rate-limit</b> { <b>per-src-ip</b>   <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Limits the rate of each source IP address. <b>per-src-mac</b> : Limits the rate of each source MAC address. <b>per-port</b> : Limits the rate of each port. <i>pps</i> : Indicates the rate limit, ranging from 1 to 19,999.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Global ARP-Guard Attack Threshold

<b>Command</b>	<b>arp-guard attack-threshold</b> { <b>per-src-ip</b>   <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the attack threshold of each source IP address. <b>per-src-mac</b> : Configures the attack threshold of each source MAC address. <b>per-port</b> : Configures the attack threshold of each port. <i>pps</i> : Indicates the attack threshold, ranging from 1 to 19,999. The unit is packets per second (pps).
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

#### ↘ Configuring the Global ARP-Guard Scanning Threshold

<b>Command</b>	<b>arp-guard scan-threshold</b> <i>pkt-cnt</i>
<b>Parameter Description</b>	<i>pkt-cnt</i> : Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ↘ Enabling ARP Guard on an Interface

<b>Command</b>	<b>nfpp arp-guard enable</b>
<b>Parameter</b>	N/A

<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	ARP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

#### ↘ Configuring the ARP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp arp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the ARP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp arp-guard policy</b> { <b>per-src-ip</b>   <b>per-src-mac</b>   <b>per-port</b> } <i>rate-limit-pps attack-threshold-pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the rate limit and attack threshold of each source IP address. <b>per-src-mac</b> : Configures the rate limit and attack threshold of each source MAC address. <b>per-port</b> : Configures the rate limit and attack threshold of each port. <i>rate-limit-pps</i> : Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps</i> : Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

#### ↘ Configuring the ARP-Guard Scanning Threshold on an Interface

<b>Command</b>	<b>nfpp arp-guard scan-threshold</b> <i>pkt-cnt</i>
<b>Parameter Description</b>	<i>pkt-cnt</i> : Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

**Common Errors**

N/A

**11.4.2 Configuring IPGuard**

**Configuration Effect**

- IP attacks are identified based on hosts or physical interfaces. In host-based IP attack identification, IP attacks are identified based on the source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the IP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the IP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.

- IP guard can also detect IP scanning attacks. IP anti-scanning applies to IP packet attacks as follows: the destination IP address continuously changes but the source IP address remains the same, and the destination IP address is not the IP address of the local device.
- Configure IP guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.
- IP anti-scanning applies to IP packet attacks where the destination IP address is not the local IP address. The CPP limits the rate of IP packets where the destination IP address is the local IP address.

#### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.

#### Configuration Steps

##### ▾ Enabling IP Guard

- (Mandatory) IP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If IP guard is disabled, the system automatically clears monitored hosts.

##### ▾ Configuring the IP-Guard Isolation Period

- (Optional) IP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

##### ▾ Configuring the IP-Guard Monitoring Period

- (Mandatory) The default IP-guard monitoring period is 600 seconds.
- If the IP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

##### ▾ Configuring the Maximum Number of IP-Guard Monitored Hosts

- (Mandatory) The maximum number of IP-guard monitored hosts is 20,000 by default.
- Set the maximum number of IP-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of IP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than

current monitored hosts 20,000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.

- If the table of monitored hosts is full, the system prints the log "% NFPP\_IP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ▾ **Configuring the IP-Guard Attack Threshold**

- Mandatory.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_IP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source IP address-based rate limiting takes priority over port-based rate limiting.

#### ▾ **Configuring the IP-Guard Scanning Threshold**

- Mandatory.
- The scanning threshold can be configured in NFPP configuration mode or interface configuration mode.
- ARP scanning attack may have occurred if ARP packets received within 10 seconds meet the following conditions:
  - The source IP address remains the same.
  - The destination IP address continuously changes and is not the local IP address, and the change times exceed the scanning threshold.

#### ▾ **Configuring IP-Guard Trusted Hosts**

- (Optional) No IP-guard trusted host is configured by default.
- For IP guard, you can only configure a maximum of 500 IP addresses not to be monitored.
- Trusted hosts can be configured in NFPP configuration mode.
- If any entry matching a trusted host (IP addresses are the same) exists in the table of monitored hosts, the system automatically deletes this entry.
- If the table of trusted hosts is full, the system prints the log "%ERROR: Attempt to exceed limit of 500 trusted hosts." to notify the administrator.
- If a trusted host cannot be deleted, the system prints the log "%ERROR: Failed to delete trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If a host cannot be trusted, the system prints the log "%ERROR: Failed to add trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If the host to trust already exists, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 has already been configured." to notify the administrator.
- If the host to delete from the trusted table does not exist, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 is not found." to notify the administrator.

- If the memory cannot be allocated to a trusted host, the system prints the log "%ERROR: Failed to alloc memory." to notify the administrator.

### Verification

When a host in the network sends IP attack packets to a switch configured with IP guard, check whether these packets can be sent to the CPU.

- If the rate of packets from untrusted hosts exceeds the attack threshold or scanning threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

### Related Commands

#### ▾ Enabling IP Guard Globally

<b>Command</b>	<b>ip-guard enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Global IP-Guard Isolation Period

<b>Command</b>	<b>ip-guard isolate-period [seconds   permanent]</b>
<b>Parameter</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400.
<b>Description</b>	<b>permanent</b> : Indicates permanent isolation.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Global IP-Guard Monitoring Period

<b>Command</b>	<b>ip-guard monitor-period seconds</b>
<b>Parameter</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

#### ▾ Configuring the Maximum Number of IP-Guard Monitored Hosts

<b>Command</b>	<b>ip-guard monitored-host-limit number</b>
<b>Parameter</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Description</b>	
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Global IP-Guard Rate Limit

<b>Command</b>	<b>ip-guard rate-limit {per-src-ip   per-port} pps</b>
<b>Parameter Description</b>	<b>per-src-ip:</b> Limits the rate of each source IP address. <b>per-port:</b> Limits the rate of each port. <i>pps:</i> Indicates the rate limit, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Global IP-Guard Attack Threshold

<b>Command</b>	<b>ip-guard attack-threshold {per-src-ip   per-port} pps</b>
<b>Parameter Description</b>	<b>per-src-ip:</b> Configures the attack threshold of each source IP address. <b>per-port:</b> Configures the attack threshold of each port. <i>pps:</i> Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

#### ↘ Configuring the Global IP-Guard Scanning Threshold

<b>Command</b>	<b>ip-guard scan-threshold pkt-cnt</b>
<b>Parameter Description</b>	<i>pkt-cnt:</i> Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring IP-Guard Trusted Hosts

<b>Command</b>	<b>ip-guard trusted-host ip mask</b>
<b>Parameter Description</b>	<i>ip:</i> Indicates the IP address. <i>mask:</i> Indicates the mask of an IP address. <b>all:</b> Used with <b>no</b> to delete all trusted hosts.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If you do not want to monitor a host, you can run this command to trust the host. This trusted host can send IP packets to the CPU, without any rate limiting or alarm reporting.

#### ↘ Enabling IP Guard on an Interface

<b>Command</b>	<b>nfpp ip-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	IP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

#### ↘ Configuring the IP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp ip-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter Description</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent</b> : Indicates permanent isolation.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the IP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp ip-guard policy</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>rate-limit-pps</i> <i>attack-threshold-pps</i>
<b>Parameter Description</b>	<b>per-src-ip</b> : Configures the attack threshold of each source IP address. <b>per-port</b> : Configures the attack threshold of each port. <i>rate-limit-pps</i> : Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps</i> : Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

#### ▾ Configuring the IP-Guard Scanning Threshold on an Interface

<b>Command</b>	<b>nfpp ip-guard scan-threshold</b> <i>pkt-cnt</i>
<b>Parameter Description</b>	<i>pkt-cnt</i> : Indicates the scanning threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

### Configuration Example

#### ▾ CPU Protection Based on IP Guard

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● IP host attacks exist in the system, and packets of some hosts cannot be properly routed and forwarded.</li> <li>● IP scanning exists in the system, causing a very high CPU utilization rate.</li> <li>● Packet traffic of some hosts is very laFSe in the system, and these packets need to pass through.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the host-based attack threshold.</li> <li>● Configure the IP scanning threshold.</li> <li>● Set the isolation period to a non-zero value.</li> <li>● Configure trusted hosts.</li> </ul>
	<pre> FS# configure terminal FS(config)# nfpp FS (config-nfpp)#ip-guard rate-limit per-src-ip 20 FS (config-nfpp)#ip-guard attack-threshold per-src-ip 30 FS (config-nfpp)#ip-guard isolate-period 180 FS (config-nfpp)#ip-guard trusted-host 192.168.201.46 255.255.255.255 </pre>

<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show nfpp ip-guard summary</b> command to display the configuration.</li> </ul>
	<p>(Format of column Rate-limit and Attack-threshold is per-src-ip/per-src-mac/per-port.)</p> <pre>Interface Status Isolate-period Rate-limit      Attack-threshold Scan-threshold Global      Disable 180          20-/100        30-/200        100  Maximum count of monitored hosts: 1000 Monitor period: 600s</pre>
	<ul style="list-style-type: none"> <li>● Run the <b>show nfpp ip-guard hosts</b> command to display the monitored hosts.</li> </ul>
	<p>If col_filter 1 shows "**", it means "hardware do not isolate host".</p> <pre>VLAN   interface  IP address      Reason    remain-time(s) ----   - 1      Gi0/5      192.168.201.47  ATTACK    160  Total: 1 host</pre>
	<ul style="list-style-type: none"> <li>● Run the <b>show nfpp ip-guard trusted-host</b> command to display the trusted hosts.</li> </ul>
	<pre>IP address      mask ----- 192.168.201.46  255.255.255.255  Total: 1 record(s)</pre>

**Common Errors**

N/A

**11.4.3 Configuring ICMP Guard**

**Configuration Effect**

- ICMP attacks are identified based on hosts or ports. In host-based attack identification, ICMP attacks are identified based on the source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the ICMP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the ICMP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- Configure ICMP guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.

**Notes**

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.

**Configuration Steps**

### ▾ Enabling ICMP Guard

- (Mandatory) ICMP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If ICMP guard is disabled, the system automatically clears monitored hosts.

### ▾ Configuring the ICMP-Guard Isolation Period

- (Optional) ICMP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

### ▾ Configuring the ICMP-Guard Monitoring Period

- (Mandatory) The default ICMP-guard monitoring period is 600 seconds.
- If the ICMP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

### ▾ Configuring the Maximum Number of ICMP-Guard Monitored Hosts

- (Mandatory) The maximum number of ICMP-guard monitored hosts is 20,000 by default.
- Set the maximum number of ICMP-guard monitored hosts reasonably. As the number of actually monitored hosts increases, more CPU resources are used.
- The maximum number of ICMP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_ICMP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

### ▾ Configuring the ICMP-Guard Attack Threshold

- Mandatory.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_ICMP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.

- Source IP address-based rate limiting takes priority over port-based rate limiting.

### ✚ Configuring ICMP-Guard Trusted Hosts

- (Optional) No ICMP-guard trusted host is configured by default.
- For ICMP guard, you can only configure a maximum of 500 IP addresses not to be monitored.
- Trusted hosts can be configured in NFPP configuration mode.
- If any entry matching a trusted host (IP addresses are the same) exists in the table of monitored hosts, the system automatically deletes this entry.
- If the table of trusted hosts is full, the system prints the log "%ERROR: Attempt to exceed limit of 500 trusted hosts." to notify the administrator.
- If a trusted host cannot be deleted, the system prints the log "%ERROR: Failed to delete trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If a host cannot be trusted, the system prints the log "%ERROR: Failed to add trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If the host to trust already exists, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 has already been configured." to notify the administrator.
- If the host to delete from the trusted table does not exist, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 is not found." to notify the administrator.
- If the memory cannot be allocated to a trusted host, the system prints the log "%ERROR: Failed to alloc memory." to notify the administrator.

### Verification

When a host in the network sends ICMP attack packets to a switch configured with ICMP guard, check whether these packets can be sent to the CPU.

- If the rate of packets from an untrusted host exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

### Related Commands

#### ✚ Enabling ICMP Guard Globally

<b>Command</b>	<b>icmp-guard enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ✚ Configuring the Global ICMP-Guard Isolation Period

<b>Command</b>	<b>icmp-guard isolate-period [seconds   permanent]</b>
<b>Parameter</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation.
<b>Description</b>	

	<b>permanent:</b> Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attacker isolation period falls into two types: global isolation period and port-based isolation period (local isolation period). For a port, if the port-based isolation period is not configured, the global isolation period is used; otherwise, the port-based isolation period is used.

#### ▾ Configuring the Global ICMP-Guard Monitoring Period

<b>Command</b>	<b>icmp-guard monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds:</i> Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout period as the monitoring period. The monitoring period is valid only when the isolation period is 0.  If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

#### ▾ Configuring the Maximum Number of ICMP-Guard Monitored Hosts

<b>Command</b>	<b>icmp-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number:</i> Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.  If the table of monitored hosts is full, the system prints the log "% NFPP_ICMP_GUARD-4-SESSION_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ▾ Configuring the Global ICMP-Guard Rate Limit

<b>Command</b>	<b>icmp-guard rate-limit</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-ip:</b> Limits the rate of each source IP address. <b>per-port:</b> Limits the rate of each port. <i>pps:</i> Indicates the rate limit, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the Global ICMP-Guard Attack Threshold

<b>Command</b>	<b>icmp-guard attack-threshold</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>pps</i>
----------------	---

<b>Parameter</b>	<b>per-src-ip:</b> Configures the attack threshold of each source IP address.
<b>Description</b>	<b>per-port:</b> Configures the attack threshold of each port. <i>pps:</i> Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ▾ Configuring ICMP-Guard Trusted Hosts

<b>Command</b>	<b>icmp-guard trusted-host</b> <i>ip mask</i>
<b>Parameter</b>	<i>ip:</i> Indicates the IP address.
<b>Description</b>	<i>mask:</i> Indicates the mask of an IP address. <b>all:</b> Used with <b>no</b> to delete all trusted hosts.
<b>Command</b>	NFPP configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	If you do not want to monitor a host, you can run this command to trust the host. This trusted host can send ICMP packets to the CPU, without any rate limiting or alarm reporting. You can configure the mask so that no host in one network segment is monitored. You can configure a maximum of 500 trusted hosts.

### ▾ Enabling ICMP Guard on an Interface

<b>Command</b>	<b>nfpp icmp-guard enable</b>
<b>Parameter</b>	N/A
<b>Description</b>	
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	ICMP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

### ▾ Configuring the ICMP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp icmp-guard isolate-period</b> [ <i>seconds</i>   <b>permanent</b> ]
<b>Parameter</b>	<i>seconds:</i> Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation.
<b>Description</b>	<b>permanent:</b> Indicates permanent isolation.
<b>Command</b>	Interface configuration mode
<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ▾ Configuring the ICMP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp icmp-guard policy</b> { <b>per-src-ip</b>   <b>per-port</b> } <i>rate-limit-pps attack-threshold-pps</i>
<b>Parameter</b>	<b>per-src-ip:</b> Configures the rate limit and attack threshold of each source IP address.
<b>Description</b>	<b>per-port:</b> Configures the rate limit and attack threshold of each port. <i>rate-limit-pps:</i> Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps:</i> Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command</b>	Interface configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

**Configuration Example**

📄 **CPU Protection Based on ICMP Guard**

<b>Scenario</b>	<ul style="list-style-type: none"> <li>ICMP host attacks exist in the system, and some hosts cannot successfully ping devices.</li> <li>Packet traffic of some hosts is very large in the system, and these packets need to pass through.</li> </ul>

#### 11.4.4 Configuring DHCP Guard

##### Configuration Effect

- DHCP attacks are identified based on hosts or ports. In host-based attack identification, DHCP attacks are identified based on the link-layer source IP address, VLAN ID, and port. Each type of attack identification has a rate limit and an attack threshold. If the DHCP packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the DHCP packet rate exceeds the attack threshold, the system prints alarm information and sends traps. In host-based attack identification, the system also isolates the attack source.
- Configure DHCP guard isolation to assign hardware-isolated entries against host attacks so that attack packets are neither sent to the CPU nor forwarded.

##### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.
- Isolation is disabled by default. If isolation is enabled, attackers will occupy hardware entries of the security module.
- For trusted ports configured for DHCP snooping, DHCP guard does not take effect, preventing false positive of DHCP traffic on the trusted ports. For details about trusted ports of DHCP snooping, see "Configuring Basic Functions of DHCP Snooping" in the Configuring DHCP Snooping.

##### Configuration Steps

###### ▾ Enabling DHCP Guard

- (Mandatory) DHCP guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.
- If DHCP guard is disabled, the system automatically clears monitored hosts.

###### ▾ Configuring the DHCP-Guard Isolation Period

- (Optional) DHCP-guard isolation is disabled by default.
- If the packet traffic of attackers exceeds the rate limit defined in CPP, you can configure the isolation period to discard packets and therefore to save bandwidth resources.
- The isolation period can be configured in NFPP configuration mode or interface configuration mode.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

###### ▾ Configuring the DHCP-Guard Monitoring Period

- (Mandatory) DHCP-guard monitoring is enabled by default.
- If the DHCP-guard isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in NFPP configuration mode.

###### ▾ Configuring the Maximum Number of DHCP-Guard Monitored Hosts

- (Mandatory) The maximum number of DHCP-guard monitored hosts is 20,000 by default.
- Set the maximum number of DHCP-guard monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of DHCP-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_DHCP\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

### ✚ Configuring the DHCP-Guard Attack Threshold

- Mandatory.
- The attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_DHCP\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source MAC address-based rate limiting takes priority over port-based rate limiting.

### Verification

When a host in the network sends DHCP attack packets to a switch configured with DHCP guard, check whether these packets can be sent to the CPU.

- If the parameter of the packets exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

#### ✚ Configuring the Global DHCP-Guard Isolation Period

<b>Command</b>	<b>dhcp-guard isolate-period [seconds   permanent]</b>
<b>Parameter</b>	<i>seconds</i> : Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The

<b>Description</b>	value 0 indicates no isolation. <b>permanent:</b> Indicates permanent isolation.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The attacker isolation period falls into two types: global isolation period and port-based isolation period (local isolation period). For a port, if the port-based isolation period is not configured, the global isolation period is used; otherwise, the port-based isolation period is used.

#### ↘ Configuring the Global DHCP-Guard Monitoring Period

<b>Command</b>	<b>dhcp-guard monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds:</i> Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout period as the monitoring period. The monitoring period is valid only when the isolation period is 0.  If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

#### ↘ Configuring the Maximum Number of DHCP-Guard Monitored Hosts

<b>Command</b>	<b>dhcp-guard monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number:</i> Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.  If the table of monitored hosts is full, the system prints the log "% NFPP_DHCP_GUARD-4-SESSION_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ↘ Configuring the Global DHCP-Guard Rate Limit

<b>Command</b>	<b>dhcp-guard rate-limit</b> { <b>per-src-mac</b>   <b>per-port</b> } <i>pps</i>
<b>Parameter Description</b>	<b>per-src-mac:</b> Limits the rate of each source MAC address. <b>per-port:</b> Limits the rate of each port. <i>pps:</i> Indicates the rate limit, ranging from 1 to 19,999.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Global DHCP-Guard Attack Threshold

<b>Command</b>	<b>dhcp-guard attack-threshold {per-src-mac   per-port} pps</b>
<b>Parameter Description</b>	<b>per-src-mac:</b> Configures the attack threshold of each source MAC address. <b>per-port:</b> Configures the attack threshold of each port. <i>pps:</i> Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Enabling DHCP Guard on an Interface

<b>Command</b>	<b>nfpp dhcp-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	DHCP guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

#### ▾ Configuring the DHCP-Guard Isolation Period on an Interface

<b>Command</b>	<b>nfpp dhcp-guard isolate-period [seconds   permanent]</b>
<b>Parameter Description</b>	<i>seconds:</i> Indicates the isolation period in the unit of second. It can be set to 0 or any value from 30 to 86,400. The value 0 indicates no isolation. <b>permanent:</b> Indicates permanent isolation.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring the DHCP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp dhcp-guard policy {per-src-mac   per-port} rate-limit-pps attack-threshold-pps</b>
<b>Parameter Description</b>	<b>per-src-ip:</b> Configures the rate limit and attack threshold of each source IP address. <b>per-port:</b> Configures the rate limit and attack threshold of each port. <i>rate-limit-pps:</i> Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps:</i> Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

- The maximum number of DHCPv6-guard monitored hosts can be configured in NFPP configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.
- If the table of monitored hosts is full, the system prints the log "% NFPP\_DHCPV6\_GUARD-4-SESSION\_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.

#### ▾ **Configuring the DHCPv6-Guard Attack Threshold**

- Mandatory.
- The DHCPv6-guard attack threshold can be configured in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_DHCPV6\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.
- Source MAC address-based rate limiting takes priority over port-based rate limiting.

#### **Verification**

When a host in the network sends DHCPv6 attack packets to a switch configured with DHCPv6 guard, check whether these packets can be sent to the CPU.

- If the parameter of the packets exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

#### **Related Commands**

### ▾ Enabling DHCPv6 Guard Globally

<b>Command</b>	<b>dhcpv6-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global DHCPv6-Guard Monitoring Period

<b>Command</b>	<b>dhcpv6-guard monitor-period <i>seconds</i></b>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	<p>If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout period as the monitoring period. The monitoring period is valid only when the isolation period is 0.</p> <p>If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.</p>

### ▾ Configuring the Maximum Number of DHCPv6-Guard Monitored Hosts

<b>Command</b>	<b>dhcpv6-guard monitored-host-limit <i>number</i></b>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	<p>If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.</p> <p>If the table of monitored hosts is full, the system prints the log "% NFPP_DHCPV6_GUARD-4-SESSION_LIMIT: Attempt to exceed limit of 20000 monitored hosts." to notify the administrator.</p>

### ▾ Configuring the Global DHCPv6-Guard Rate Limit

<b>Command</b>	<b>dhcpv6-guardrate-limit { <i>per-src-mac</i>   <i>per-port</i> } <i>pps</i></b>
<b>Parameter Description</b>	<p><b>per-src-mac</b>: Limits the rate of each source MAC address.</p> <p><b>per-port</b>: Limits the rate of each port.</p> <p><i>pps</i>: Indicates the rate limit, ranging from 1 to 19,999.</p>
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Global DHCPv6-Guard Attack Threshold

<b>Command</b>	<b>dhcpv6-guard attack-threshold { per-src-mac   per-port} pps</b>
<b>Parameter Description</b>	<b>per-src-mac:</b> Configures the attack threshold of each source MAC address. <b>per-port:</b> Configures the attack threshold of each port. <i>pps:</i> Indicates the attack threshold, ranging from 1 to 19,999. The unit is pps.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Enabling DHCPv6 Guard on an Interface

<b>Command</b>	<b>nfpp dhcpv6-guard enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	DHCPv6 guard configured in interface configuration mode takes priority over that configured in NFPP configuration mode.

#### ▾ Configuring the DHCP-Guard Rate Limit and Attack Threshold on an Interface

<b>Command</b>	<b>nfpp dhcpv6-guard policy {per-src-mac   per-port} rate-limit-pps attack-threshold-pps</b>
<b>Parameter Description</b>	<b>per-src-ip:</b> Configures the rate limit and attack threshold of each source IP address. <b>per-port:</b> Configures the rate limit and attack threshold of each port. <i>rate-limit-pps:</i> Indicates the rate limit, ranging from 1 to 19,999. <i>attack-threshold-pps:</i> Indicates the attack threshold, ranging from 1 to 19,999.
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

#### Configuration Example

##### ▾ CPU Protection Based on DHCPv6 Guard

<b>Scenario</b>	<ul style="list-style-type: none"> <li>DHCPv6 host attacks exist in the system, and DHCPv6 neighbor discovery fails on some hosts.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>Configure the host-based attack threshold.</li> </ul> <pre> FS# configure terminal FS(config)# nfpp FS (config-nfpp)#dhcpv6-guard rate-limit per-src-mac 8 FS (config-nfpp)#dhcpv6-guard attack-threshold per-src-mac 16 </pre>

### Common Errors

N/A

### 11.4.6 Configuring NDGuard

#### Configuration Effect

- AR ND guard classifies ND packets into three types based on their purposes: 1. NS and NA; 2. RS; 3. RA and Redirect. Type 1 packets are used for address resolution. Type 2 packets are used by hosts to discover the gateway. Type 3 packets are related to routing: RAs are used to advertise the gateway and prefix while Redirect packets are used to advertise a better next hop.
- At present, only port-based ND packet attack identification is supported. You can configure the rate limits and attack thresholds for these three types of packets respectively. If the ND packet rate exceeds the rate limit, the packets beyond the rate limit are discarded. If the ND packet rate exceeds the attack threshold, the system prints logs and sends traps.

#### Notes

- For a command that is configured both in NFPP configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in NFPP configuration mode.

#### Configuration Steps

##### ▾ Enabling NDGuard

- (Mandatory) ND guard is enabled by default.
- This function can be enabled in NFPP configuration mode or interface configuration mode.

##### ▾ Enabling ND-Guard Rate Limit Forwarding

- (Optional) This function is enabled by default.
- If the port-based isolation entry takes effect, you can enable this function to pass some of the packets while not discarding all of them.
- This function can be enabled in NFPP configuration mode.

##### ▾ Configuring the ND-Guard Attack Threshold

- Mandatory.

- The ND-guard attack threshold can be enabled in NFPP configuration mode or interface configuration mode.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.
- If memories cannot assigned to detected attackers, the system prints the log "%NFPP\_ND\_GUARD-4-NO\_MEMORY: Failed to alloc memory." to notify the administrator.

### Verification

When a host in the network sends ND attack packets to a switch configured with ND guard, check whether these packets can be sent to the CPU.

- If the parameter of the packets exceeds the attack threshold, an attack log is displayed.

### 11.4.7 Configuring a Self-Defined Guard

#### Configuration Effect

- Configure a self-defined guard to resolve network attack problems in special scenarios.

#### Notes

- For a command that is configured both in self-defined guard configuration mode and interface configuration mode, the configuration in interface configuration mode takes priority over that configured in self-defined guard configuration mode.
- A self-defined guard takes priority over basic guards. When configuring the match fields of self-defined guards, see the Configuration Guide.

#### Configuration Steps

##### ▾ Configuring the Guard Name

- (Mandatory) Configure the name of a self-defined guard to create the self-defined guard.
- The guard name must be unique, and the match fields and values must be different from those of ARP, ICMP, DHCP, IP, and DHCPv6 guards. If the parameters you want to configure already exist, a message is displayed to indicate the configuration failure.

##### ▾ Configuring the Match Fields

- Mandatory.
- Self-defined packets are classified based on the following fields: **etype** (Ethernet link-layer type), **smac** (source MAC address), **dmac** (destination MAC address), **protocol** (IPv4/IPv6 protocol number), **src-ip** (source IPv4/IPv6 address), **dip** (destination IPv4/IPv6 address), **sport** (source transport-layer port), and **dport** (destination transport-layer port).
- **protocol** is valid only when the value of **etype** is **ipv4** or **ipv6**. **src-ip** and **dst-ip** are valid only when the value of **etype** is **ipv4**. **src-ipv6** and **dst-ipv6** are valid only when the value of **etype** is **ipv6**. **src-port** and **dst-port** are valid only when the value of **protocol** is **tcp** or **udp**.
- If the **match** fields and values of a self-defined guard are totally the same as those of an existing guard, the system prints the log "%ERROR: the match type and value are the same with define name (name of an existing guard)." to notify the administrator of the configuration failure.
- If **protocol** is configured but **etype** is IPv4 or IPv6 in the **match** policy, the system prints the log "%ERROR: protocol is valid only when etype is IPv4(0x0800) or IPv6(0x86dd)."
- If **src-ip** and **dst-ip** are configured but **etype** is not IPv4 in the **match** policy, the system prints the log "%ERROR: IP address is valid only when etype is IPv4(0x0800)."
- If **src-ipv6** and **dst-ipv6** are configured but **etype** is not IPv6 in the **match** policy, the system prints the log "%ERROR: IPv6 address is valid only when etype is IPv6(0x86dd)."
- If **src-port** and **dst-port** are configured but **protocol** is not TCP or UDP in the **match** policy, the system prints the log "%ERROR: Port is valid only when protocol is TCP(6) or UDP(17)."

- The following table lists guard policies corresponding to some common network protocols. The rate limits and attack thresholds listed below can meet the requirements in most network scenarios and are for reference only. You can configure valid rate limits and attack thresholds based on actual scenarios.

Protocol	match	policy per-src-ip	policy per-src-mac	policy per-port
RIP	etype 0x0800 protocol 17 dst-port 520	rate-limit 100 attatch-threshold 150	Not applicable to this policy	rate-limit 300 attatch-threshold 500
RIPng	etype 0x86dd protocol 17 dst-port 521	rate-limit 100 attatch-threshold 150	Not applicable to this policy	rate-limit 300 attatch-threshold 500
BGP	etype 0x0800 protocol 6 dst-port 179	rate-limit 1000 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
BPDU	dst-mac 0180.c200.0000	Not applicable to this policy	rate-limit 20 attatch-threshold 40	rate-limit 100 attatch-threshold 100
RERP	dst-mac 01d0.f800.0001	Not applicable to this policy	rate-limit 20 attatch-threshold 40	rate-limit 100 attatch-threshold 100
REUP	dst-mac 01d0.f800.0007	Not applicable to this policy	rate-limit 20 attatch-threshold 40	rate-limit 100 attatch-threshold 100
BGP	etype 0x0800 protocol 6 dst-port 179	Not applicable to this policy	Not applicable to this policy	Not applicable to this policy
OSPFv2	etype 0x0800 protocol 89	rate-limit 800 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
OSPFv3	etype 0x86dd protocol 89	rate-limit 800 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
VRRP	etype 0x0800 protocol 112	rate-limit 64 attatch-threshold 100	Not applicable to this policy	rate-limit 1024 attatch-threshold 1024
IPv6 VRRP	etype 0x86dd protocol 112	rate-limit 64 attatch-threshold 100	Not applicable to this policy	rate-limit 1024 attatch-threshold 1024
SNMP	etype 0x0800 protocol 17 dst-port 161	rate-limit 1000 attatch-threshold 1200	Not applicable to this policy	rate-limit 2000 attatch-threshold 3000
RSVP	etype 0x0800 protocol 46	rate-limit 800 attatch-threshold 1200	Not applicable to this policy	rate-limit 1200 attatch-threshold 1500
LDP (UDP hello)	etype 0x0800 protocol 17 dst-port 646	rate-limit 10 attatch-threshold 15	Not applicable to this policy	rate-limit 100 attatch-threshold 150

- To contain as many existing protocol types as possible and facilitate expansion of new protocol types, self-defined guards allow hosts to freely combine type fields of packets. If the configuration is inappropriate, the network may become abnormal. Therefore, the network administrator needs to have a good knowledge of network protocols. As a reference, the following table lists valid configurations of currently known protocols for common self-defined guard policies. For other protocols not listed in the table, configure them with caution.

### ↘ **Configuring the Global Rate Limit and Attack Threshold**

- (Mandatory) If these parameters are not configured, the self-defined guard cannot be enabled.
- You must configure one of the per-src-ip, per-src-mac, and per-port fields. Otherwise, the policy cannot take effect.
- per-src-ip is valid only when etype is IPv4 or IPv6.
- The rate limit configured based on the source MAC address, VLAN ID, and port takes priority over that configured based on the source IP address, VLAN ID, and port.
- The port-based host identification policy of a self-defined guard must be consistent with the global port-based host identification policy.
- If the **per-src-ip** policy is not configured globally but configured for a port, the system prints the log "%ERROR: name (name of a self-defined guard) has not per-src-ip policy." to notify the administrator of the configuration failure.
- If the **per-src-mac** policy is not configured globally but configured for a port, the system prints the log "%ERROR: name (name of a self-defined guard) has not per-src-mac policy." to notify the administrator of the configuration failure.
- If the memory cannot be allocated to detected attackers, the system prints the log "%NFPP\_DEFINE\_GUARD-4-NO\_MEMORY: Failed to allocate memory." to notify the administrator.
- If the configured rate limit is greater than the attack threshold, the system prints the log "%ERROR: rate limit is higher than attack threshold 500pps." to notify the administrator.
- If the configured attack threshold is less than the rate limit, the system prints the log "%ERROR: attack threshold is smaller than rate limit 300pps." to notify the administrator.

### ↘ **Configuring the Global Monitoring Period**

- (Mandatory) The default monitoring period is 600 seconds.
- If the isolation period is configured, it is directly used as the monitoring period, and the configured monitoring period will lose effect.
- The monitoring period can be configured in self-defined guard configuration mode.
- If the isolation period is 0, the system performs software monitoring on detected attackers. The timeout period is the monitoring period. During software monitoring, if the isolation period is set to a non-zero value, the system automatically performs hardware isolation against monitored attackers and sets the timeout period as the monitoring period. The monitoring period is valid only when the isolation period is 0.
- If the isolation period is changed to 0, attackers under the corresponding port is deleted, instead of being monitored.

### ↘ **Configuring the Maximum Number of Monitored Hosts**

- (Mandatory) The maximum number of monitored hosts is 20,000 by default.
- Set the maximum number of monitored hosts reasonably. As the number of monitored hosts increases, more CPU resources are used.
- The maximum number of monitored hosts can be configured in self-defined guard configuration mode.
- If the number of monitored hosts reaches 20,000 (default value) and the administrator sets the maximum number lower than 20,000, the system does not delete monitored hosts but prints the log "%ERROR: The value that you configured is smaller than current monitored hosts 20000, please clear a part of monitored hosts." This information notifies the administrator that the configuration does not take effect and that some monitored hosts need to be deleted.

- If the table of monitored hosts is full, the system prints the log "%NFPP\_DEFINE-4-SESSION\_LIMIT: Attempt to exceed limit of name's 20000 monitored hosts." to notify the administrator.

### ↘ **Configuring Trusted Hosts**

- (Optional) No trusted host is configured by default.
- You can configure a maximum of 500 trusted IP address or MAC address for a self-defined guard.
- Trusted hosts can be configured in self-defined guard configuration mode.
- If you do not want to monitor a host, you can run the following commands to trust the host. This trusted host can send ICMP packets to the CPU, without any rate limiting or alarm reporting. You can configure the mask so that no host in one network segment is monitored.
- You must configure the **match** type before configuring trusted hosts. If the packet type is IPv4 in the **match** policy, you are not allowed to configure trusted IPv6 addresses. If the packet type is IPv6 in the match policy, you are not allowed to configure trusted IPv4 addresses.
- If the **match** type is not configured, the system prints the log "%ERROR: Please configure match rule first."
- If a trusted IPv4 host is added but **etype** is not IPv4 in the **match** policy, the system prints the log "%ERROR: Match type can't support IPv4 trustedhost."
- If a trusted IPv6 host is added but **etype** is not IPv6 in the **match** policy, the system prints the log "%ERROR: Match type can't support IPv6 trustedhost."
- If the table of trusted hosts is full, the system prints the log "%ERROR: Attempt to exceed limit of 500 trusted hosts." to notify the administrator.
- If any entry matching a trusted host (IP addresses are the same) exists in the table of monitored hosts, the system automatically deletes this entry.
- If a trusted host cannot be deleted, the system prints the log "%ERROR: Failed to delete trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If a host cannot be trusted, the system prints the log "%ERROR: Failed to add trusted host 1.1.1.0 255.255.255.0." to notify the administrator.
- If the host to trust already exists, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 has already been configured." to notify the administrator.
- If the host to delete from the trusted table does not exist, the system prints the log "%ERROR: Trusted host 1.1.1.0 255.255.255.0 is not found." to notify the administrator.
- If the memory cannot be allocated to a trusted host, the system prints the log "%ERROR: Failed to allocate memory." to notify the administrator.

### ↘ **Enabling a Self-Defined Guard**

- Mandatory.
- You have to configure at least one policy between host-based self-defined guard policy and port-based self-defined guard policy. Otherwise, the self-defined guard cannot be enabled.
- If a self-defined guard is disabled, the system automatically clears monitored hosts.
- Self-defined guards can be configured in self-defined guard configuration mode or interface configuration mode.

- If a self-defined guard policy is not completely configured, the self-defined guard cannot be enabled and a prompt is displayed to notify hosts of the missing policy configurations.
- If the name of a self-defined guard does not exist, the system prints the log "%ERROR: The name is not exist."
- If the match type is not configured for a self-defined guard, the system prints the log "%ERROR: name (name of the self-defined guard) doesn't match any type."
- If no policy is configured for a self-defined guard, the system prints the log "%ERROR: name (name of the self-defined guard) doesn't specify any policy."

### Verification

When a host in the network sends packets to a switch configured with a self-defined NFPP guard, check whether these packets can be sent to the CPU.

- If the rate of packets from an untrusted host exceeds the attack threshold, an attack log is displayed.
- If an isolated entry is created for the attacker, an isolation log is displayed.

### Related Commands

#### ▾ Configuring the Name of a Self-defined Guard

<b>Command</b>	<code>define name</code>
<b>Parameter Description</b>	<b>name:</b> Indicates the name of a self-defined guard.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

#### ▾ Configuring Match Fields of a Self-defined Guard

<b>Command</b>	<code>match [etype] [ src-mac smac [src-mac-mask smac_mask] [dst-mac dmac [dst-mac-mask dst_mask]] [ protocol protocol ] [ src-ip sip [src-ip-mask sip-mask] [ src-ipv6 sipv6 [src-ipv6-mask len sipv6-mask len]] [dst-ip dip [dst-ip-mask dip-mask] [dst-ipv6 dipv6 [dst-ipv6-mask len dipv6-mask len]]] [src-ports sport] [dst-port dport]</code>
<b>Parameter Description</b>	<p><i>type</i>: Indicates the type of Ethernet link-layer packets.</p> <p><i>smac</i>: Indicates the source MAC address.</p> <p><i>smac_mask</i>: Indicates the mask of the source MAC address.</p> <p><i>dmac</i>: Indicates the destination MAC address.</p> <p><i>dst_mask</i>: Indicates the mask of the destination MAC address.</p> <p><i>protocol</i>: Indicates the protocol number of IPv4/IPv6 packets.</p> <p><i>sip</i>: Indicates the source IPv4 address.</p> <p><i>sip-mask</i>: Indicates the mask of the source IPv4 address.</p> <p><i>sipv6</i>: Indicates the source IPv6 address.</p> <p><i>sipv6-masklen</i>: Indicates the mask length of the source IPv6 address.</p> <p><i>dip</i>: Indicates the destination IPv4 address.</p> <p><i>dip-mask</i>: Indicates the mask of the destination IPv4 address.</p> <p><i>dipv6</i>: Indicates the destination IPv6 address.</p> <p><i>dipv6-masklen</i>: Indicates the mask length of the destination IPv6 address.</p> <p><i>sport</i>: Indicates the ID of the source transport-layer port.</p>

	<i>dsport</i> : Indicates the ID of the destination transport-layer port.
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	Create a new self-defined guard and specify the packet fields matched by this guard.

#### ↘ Configuring the Global Rate Limit and Attack Threshold of a Self-defined Guard

<b>Command</b>	<b>global-policy</b> { <i>per-src-ip</i>   <i>per-src-mac</i>   <i>per-port</i> } <i>rate-limit-pps</i> <i>attack-threshold-pps</i>
<b>Parameter Description</b>	<p><b>per-src-ip</b>: Collects rate statistics for host identification based on the source IP address, VLAN ID, and port.</p> <p><b>per-src-mac</b>: Collects rate statistics for host identification based on the source MAC address, VLAN ID, and port.</p> <p><b>per-port</b>: Collects rate statistics based on each packet receiving port.</p> <p><i>rate-limit-pps</i>: Indicates the rate limit.</p> <p><i>attack-threshold-pps</i>: Indicates the attack threshold.</p>
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	Before creating a self-defined guard type, you must specify rate statistic classification rules for this type, namely, source IP address-based host identification, source MAC address-based host identification, host-based self-defined packet rate statistics, or port-based rate statistics, and specify the rate limits and attack thresholds for the specified rules.

#### ↘ Configuring the Global Monitoring Period of a Self-defined Guard

<b>Command</b>	<b>monitor-period</b> <i>seconds</i>
<b>Parameter Description</b>	<i>seconds</i> : Indicates the monitoring period in the unit of second. The value ranges from 180 to 86,400.
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring the Maximum Number of Monitored Hosts of a Self-defined Guard

<b>Command</b>	<b>monitored-host-limit</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the maximum number of monitored hosts, ranging from 1 to 4,294,967,295.
<b>Command Mode</b>	Self-defined guard configuration mode
<b>Usage Guide</b>	N/A

#### ↘ Configuring Trusted Hosts of a Self-defined Guard

<b>Command</b>	<b>trusted-host</b> { <i>mac mac_mask</i>   <i>ip mask</i>   <i>IPv6/prefixlen</i> }
<b>Parameter Description</b>	<p><i>mac</i>: Indicates the MAC address.</p> <p><i>mac_mask</i>: Indicates the mask of an MAC address.</p> <p><i>ip</i>: Indicates the IP address.</p> <p><i>mask</i>: Indicates the mask of an IP address.</p> <p><i>IPv6/prefixlen</i>: Indicates the IPv6 address and its mask length.</p> <p><b>all</b>: Used with <b>no</b> to delete all trusted hosts.</p>
<b>Command</b>	Self-defined guard configuration mode

<b>Mode</b>	
<b>Usage Guide</b>	N/A

### ▾ Enabling a Self-Defined Guard Globally

<b>Command</b>	<b>define name enable</b>
<b>Parameter</b>	<i>name</i> : Indicates the name of a self-defined guard.
<b>Description</b>	
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	The configuration takes effect only after you have configured <b>match</b> , <b>rate-count</b> , <b>rate-limit</b> , and <b>attack-threshold</b> . Otherwise, the configuration fails.

### ▾ Enabling a Self-defined Guard on an Interface

<b>Command</b>	<b>nfpp define name enable</b>
<b>Parameter</b>	<i>name</i> : Indicates the name of a self-defined guard.
<b>Description</b>	
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The self-defined name must exist. The configuration takes effect only after you have configured <b>match</b> , <b>rate-count</b> , <b>rate-limit</b> , and <b>attack-threshold</b> . Otherwise, the configuration fails.

### ▾ Configuring the Rate Limit and Attack Threshold of a Self-defined Guard on an Interface

<b>Command</b>	<b>nfpp define name policy {per-src-ip   per-src-mac   per-port} rate-limit-pps attack-threshold-pps</b>
<b>Parameter</b>	<i>name</i> : Indicates the name of a self-defined guard.
<b>Description</b>	<p><b>per-src-ip</b>: Configures the rate limit and attack threshold of each source IP address.</p> <p><b>per-src-mac</b>: Configures the rate limit and attack threshold of each source MAC address.</p> <p><b>per-port</b>: Configures the rate limit and attack threshold of each port.</p> <p><i>rate-limit-pps</i>: Indicates the rate limit, ranging from 1 to 19,999.</p> <p><i>attack-threshold-pps</i>: Indicates the attack threshold, ranging from 1 to 19,999.</p>
<b>Command Mode</b>	Interface configuration mode
<b>Usage Guide</b>	The attack threshold must be equal to or greater than the rate limit.

### Configuration Example

#### ▾ CPU Protection Based on a Self-Defined Guard

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Basic guards cannot protect the system with RIP attacks.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure a self-defined guard, with the key fields matching RIP packets.</li> <li>● Configure the rate limit.</li> <li>● Configure trusted hosts.</li> </ul>
	<pre>FS# configure terminal FS(config)# nfpp FS (config-nfpp)#define rip</pre>

	<pre> FS (config-nfpp-define)#match etype 0x0800 protocol 17 dst-port 520 FS (config-nfpp-define)#global-policy per-src-ip 100 150 FS (config-nfpp-define)#trusted-host 192.168.201.46 255.255.255.255 FS (config-nfpp-define)#exit FS (config-nfpp)#define rip enable                     </pre>
<b>Verification</b>	<ul style="list-style-type: none"> <li>● Run the <b>show nfpp define summary rip</b> command to display the configuration.</li> </ul>
	<pre> Define rip summary: match etype 0x800 protocol 17 dst-port 520 Maximum count of monitored hosts: 1000 Monitor period: 600s (Format of column Rate-limit and Attack-threshold is per-src-ip/per-src-mac/per-port.) Interface Status Rate-limit Attack-threshold Global Enable 100/-/ 150/-/                     </pre>
	<ul style="list-style-type: none"> <li>● Run the <b>show nfpp define trusted-host rip</b> command to display the trusted hosts.</li> </ul>
	<pre> Define rip: IP trusted host number is 1: IP address IP mask ----- 192.168.201.46 255.255.255.255  Total: 1 record(s) Global Enable 180 100/-/ 150/-/                     </pre>
	<ul style="list-style-type: none"> <li>● Run the <b>show nfpp define hosts rip</b> command to display the monitored hosts.</li> </ul>
	<pre> If col_filter 1 shows "*", it means "hardware do not isolate host". VLAN interface IP address remain-time(s) --- 1 Gi0/5 192.168.201.47 160  Total: 1 host                     </pre>

**Common Errors**

N/A

**11.4.8 Configuring Centralized Bandwidth Allocation**

**Configuration Effect**

- Configure centralized bandwidth allocation so that Manage and Protocol packets are first processed when the network is busy.

**Notes**

- The following condition must be met: Valid percentage range of a type of packets  $\leq 100\%$  – Percentage of the sum of the other two types

### Configuration Steps

#### ✚ Configuring the Maximum Bandwidth of Specified Packets

- (Mandatory) Manage, Route, and Protocol packets share the same default bandwidth.

#### ✚ Configuring the Maximum Percentage of Specified Packets in the Queue

- (Mandatory) By default, Manage packets occupy 30% of the bandwidth, Route packets occupy 25%, and Protocol packets occupy 45%.

### Verification

Send a large number of protocol packets such as OSPF packets to a switch, causing high CPU utilization.

- When the host pings the switch, the pinging must be successful and no packet is lost.

### Related Commands

#### ✚ Configuring the Maximum Bandwidth of Specified Packets

<b>Command</b>	<code>cpu-protect sub-interface { manage   protocol route} pps <i>pps_value</i></code>
<b>Parameter Description</b>	<i>pps_value</i> : Indicates the rate limit, ranging from 1 to 100,000.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	N/A

#### ✚ Configuring the Maximum Percentage of Specified Packets in the Queue

<b>Command</b>	<code>cpu-protect sub-interface { manage   protocol   route} percent <i>percent_value</i></code>
<b>Parameter Description</b>	<i>percent_value</i> : Indicates the percentage of a type of packets in the queue, ranging from 1 to 100.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	The following condition must be met: Valid percentage range of a type of packets $\leq 100\%$ – Percentage of the sum of the other two types

### Configuration Example

#### ✚ Prioritizing Packets Sent to the CPU Through Centralized Bandwidth Allocation

<b>Scenario</b>	<ul style="list-style-type: none"> <li>● Various types of mass packets exist in the network and belong to different centralized types.</li> </ul>
<b>Configuration Steps</b>	<ul style="list-style-type: none"> <li>● Configure the maximum bandwidth of specified packets.</li> <li>● Configure the maximum percentage of specified packets in the queue.</li> </ul>
	<pre>FS# configure terminal FS(config)# cpu-protect sub-interface manage pps 5000 FS(config)# cpu-protect sub-interface manage percent 25</pre>

<b>Verification</b>	N/A
---------------------	-----

### Common Errors

N/A

### 11.4.9 Configuring NFPP Logging

#### Configuration Effect

- NFPP obtains a log from the dedicated log buffer at a certain rate, generates a system message, and clears this log from the dedicated log buffer.

#### Notes

- Logs are continuously printed in the log buffer, even if attacks have stopped.

#### Configuration Steps

##### ▾ Configuring the Log Buffer Size

- Mandatory.
- If the log buffer is full, new logs replace the old ones.
- If the log buffer overflows, subsequent logs replace previous logs, and an entry with all attributes marked with a hyphen (-) is displayed in the log buffer. The administrator needs to increase the log buffer size or the system message generation rate.

##### ▾ Configuring the Log Buffer Rate

- Mandatory.
- The log buffer rate depends on two parameters: the time period and the number of system messages generated in the time period.
- If both of the preceding two parameters are set to 0, system messages are immediately generated for logs but are not stored in the log buffer.

##### ▾ Enabling Log Filtering

- (Optional) Log filtering is disabled by default.
- Logs can be filtered based on an interface or VLAN.
- If log filtering is enabled, logs not meeting the filtering rule are discarded.

##### ▾ Enabling Log Printing

- (Mandatory) Logs are stored in the buffer by default.
- If you want to monitor attacks in real time, you can configure logs to be printed on the screen to export the log information in real time.

#### Verification

Check whether the configuration takes effect based on the log configuration and the number and interval of printed logs.

#### Related Commands

### ▾ Configuring the Log Buffer Size

<b>Command</b>	<b>log-buffer entries</b> <i>number</i>
<b>Parameter Description</b>	<i>number</i> : Indicates the buffer size in the unit of the number of logs, ranging from 0 to 1,024.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring the Log Buffer Rate

<b>Command</b>	<b>log-buffer logs</b> <i>number_of_message interval length_in_seconds</i>
<b>Parameter Description</b>	<i>number_of_message</i> : Ranges from 0 to 1,024. The value 0 indicates that all logs are recorded in the log buffer and no system message is generated. <i>length_in_seconds</i> : Ranges from 0 to 86,400 (1 day). The value 0 indicates that logs are not recorded in the log buffer but system messages are instantly generated. This also applies to <i>number_of_message</i> and <i>length_in_seconds</i> . <i>number_of_message/length_in_second</i> indicates the system message generation rate.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	N/A

### ▾ Configuring VLAN-based Log Filtering

<b>Command</b>	<b>logging vlan</b> <i>vlan-range</i>
<b>Parameter Description</b>	<i>vlan-range</i> : Records logs in a specified VLAN range. The value format is 1-3,5 for example.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	Run this command to filter logs so that only logs in the specified VLAN range are recorded. Between interface-based log filtering and VLAN-based log filtering, if either rule is met, logs are recorded in the log buffer.

### ▾ Configuring Interface-based Log Filtering

<b>Command</b>	<b>logging interface</b> <i>interface-id</i>
<b>Parameter Description</b>	<i>interface-id</i> : Records logs of a specified interface.
<b>Command Mode</b>	NFPP configuration mode
<b>Usage Guide</b>	Run this command to filter logs so that only logs of the specified interface are recorded. Between interface-based log filtering and VLAN-based log filtering, if either rule is met, logs are recorded in the log buffer.

### ▾ Enabling Log Printing

<b>Command</b>	<b>log-buffer enable</b>
<b>Parameter Description</b>	N/A
<b>Command Mode</b>	NFPP configuration mode

<b>Usage Guide</b>	N/A
--------------------	-----

## Configuration Example

### Configuring NFPP Logging

<b>Scenario</b>	<ul style="list-style-type: none"> <li>If attackers are too many, log printing will affect the usage of user interfaces, which requires restriction.</li> </ul>

Displays the NFPP log buffer.	<b>show nfpp log buffer [statistics]</b>

## 12 Configuring Security Log

### 12.1 Overview

Security log is used to record the key operations on device so that each operation can be audited and traced afterwards, and to meet the national security standards.

Key operations include:

- 1) Adding/deleting an account
- 2) Editing authentication information
- 3) Changing configuration (DNS, IP, etc.)
- 4) User login/logout
- 5) Restarting/turning off a device
- 6) Uploading/downloading a file (when supported)
- 7) Editing user permissions (when supported)
- 8) Enabling/disabling log auditing, deleting log (when supported)

### 12.2 Applications

Application	Description
<a href="#">Enabling Security Log Auditing</a>	Check recent key operations on devices; if any abnormal operation occurs, the admin can find out the operator, time and method.

#### 12.2.1 Enabling Security Log Auditing

##### Scenario

After enabling the security log auditing, the device will record key operations including account management, log event, system event, configuration change and security log event. After logging in to the device, the admin can check which users have visited the device and what operation they performed.

Remarks	Admin logs in to the device and check the log of key operations.
---------	--

##### Deployment

- Enable the function to use.

## 12.3 Features

### Basic Concepts

#### 📌 Key Operation

After enabling the security log auditing, the device will record key operations including account management, log event, system event, configuration change and security log event. The record is stored for 180 days by default (the time can be customized).

#### Overview

Feature	Description
<a href="#">Enabling Security Log Auditing</a>	Record the key operations on device.

### 12.3.1 Enabling Security Log Auditing

Enable to record key operation and store the log.

#### Working Principle

After enabling the security log auditing, related modules will record the time, username, IP, operation and results, etc. when the user performs key operations including account management, log event, restart, configuration change and security log event. The log will be stored in local database by log audit framework.

The log is stored for 180 days by default. At 3 am each day, the system will check and delete any log that expires.

At most 10,000 logs can be stored by default. After the log exceeds the storage limit, new logs will cover the old ones.

#### Related Configuration

#### 📌 Enabling Security Log Auditing

By default, the security log auditing is enabled.

## 12.4 Configuration

Configuration Item	Description and Command	
<a href="#">Configuring Security Log Auditing</a>	 Mandatory	
	<b>security-log audit-enable</b>	Enables log auditing.
<a href="#">Configuring Log Storage Time</a>	 Optional	
	<b>security-log data-store-days</b> <i>day</i>	Configures the local storage time of security log.
<a href="#">Configuring Aging Time of Security Log</a>	 Optional	
	<b>security-log auto-vacuum-time</b> <i>hh:mm:ss</i>	Configures the aging time of security log.
<a href="#">Configuring Local Storage Capacity of Security Log</a>	 Optional	
	<b>security-log data-store-items</b> <i>num</i>	Configures the local storage capacity of security log.

### 12.4.1 Configuring Security Log Auditing

#### Configuration Effect

After enabling the security log auditing, the device will record key operations including account management, log event, system event, configuration change and security log event.

#### Notes

N/A

#### Configuration Steps

##### ▾ Enabling Security Log Auditing

- Mandatory
- Enabled on the device.

#### Verification

- Log in to the device, perform key operations, and check the log record.

#### Related Commands

##### ▾ Enabling Security Log Auditing

<b>Command</b>	<b>security-log audit-enable</b>
<b>Parameter</b>	
<b>Description</b>	
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	

#### Configuration Example

##### ▾ Enabling Security Log Auditing

<b>Configuration Steps</b>	Enable security log auditing.  FS# configure terminal FS(config)# security-log audit-enable
<b>Verification</b>	Log in to the device, perform key operations, and check the log record after 30 seconds.
<b>SW1</b>	FS# show security-log detail all time, username, peerinfo, hostname, log-type: content 2019-10-22 10:00:02, admin, vty0(192.168.111.111), FS, SEC_LOG: SECURITY_LOG deleted all security log successfully 2019-10-22 10:00:02, admin, vty0(192.168.111.111), FS, SEC_LOG: SECURITY_LOG disabled security log audit configuration unsuccessfully 2019-10-22 10:00:03, ---, console, FS, SEC_LOG: SECURITY_LOG enabled security log audit configuration successfully .....

## 12.4.2 Configuring Log Storage Time

### Configuration Effect

Configure the log storage time. The log exceeds the time will be deleted.

### Notes

N/A

### Configuration Steps

#### ▾ Configuring Log Storage Time

- Optional
- 180 days by default, range: 1-65535.

### Verification

- Run the **show running-config** or **show security-log config** command to check configuration status.

### Related Commands

#### ▾ Configuring Log Storage Time

<b>Command</b>	<b>security-log data-store-days</b> <i>day</i>
<b>Parameter Description</b>	<i>day</i> : storage time, range: 1-65535. Default: 180 days.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure the log storage time. The log exceeds the time will be deleted.

### Configuration Example

#### ▾ Configuring Log Storage Time

<b>Configuration Steps</b>	Configure the storage time as 300 days.
<b>SW1</b>	<pre>FS# configure terminal FS(config)# security-log data-store-days 300</pre>
<b>Verification</b>	Run the <b>show running-config</b> or <b>show security-log config</b> command to check configuration status.
<b>SW1</b>	<pre>FS# show running   in security-log data-store-days security-log data-store-days 300  FS# show security-log config Security-log audit: enable Limit number: 10000 Store days: 300  Auto vacuum time: 03:00:00</pre>

### 12.4.3 Configuring Aging Time of Security Log

#### Configuration Effect

Configure the aging time of security log. The system will check and delete any log exceeding the storage time at the aging time (time error: 5 minutes).

#### Configuration Steps

##### ▾ Configuring Aging Time of Security Log

- Optional
- 3 am every day by default.

#### Verification

- Run the **show running-config** or **show security-log config** command to check configuration status.

#### Related Commands

##### ▾ Configuring Aging Time of Security Log

<b>Command</b>	<b>security-log auto-vacuum-time</b> <i>hh:mm:ss</i>
<b>Parameter Description</b>	<i>hh:mm:ss</i> : hour: minute: second. 03:00:00 by default.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	Run this command to configure the aging time of security log. The system will check and delete any log exceeding the storage time at the aging time (time error: 5 minutes).

#### Configuration Example

##### ▾ Configuring Aging Time of Security Log

<b>Configuration Steps</b>	Configure the aging time as 5:05 am.  FS# configure terminal FS(config)# security-log auto-vacuum-time 05:05:00
<b>Verification</b>	Run the <b>show running-config</b> or <b>show security-log config</b> command to check configuration status.  FS# show running   in security-log auto-vacuum-time security-log auto-vacuum-time 05:05:00  FS# show security-log config Security-log audit: enable Limit number: 10000 Store days: 300 Auto vacuum time: 05:05:00

## 12.4.4 Configuring Local Storage Capacity of Security Log

### Configuration Effect

Configures the storage capacity of log. After the log exceeds the storage limit, new logs will cover the old ones.

### Configuration Steps

#### ▾ Configuring Local Storage Capacity of Security Log

- Optional
- The default value and max value vary with product capability (range: 500-10,000, default value: 10,000). The min value is 500.

### Verification

- Run the **show running-config** or **show security-log config** command to check configuration status.

### Related Commands

#### ▾ Configuring Local Storage Capacity of Security Log

<b>Command</b>	<b>security-log data-store-items num</b>
<b>Parameter Description</b>	<i>Num</i> : local storage capacity. The default value and max value vary with product capability (range: 500-10,000, default value: 10,000). The min value is 500.
<b>Command Mode</b>	Global configuration mode
<b>Usage Guide</b>	If flash space is limited, run this command to decrease the storage capacity.

### Configuration Example

#### ▾ Configuring Local Storage Capacity of Security Log

<b>Configuration Steps</b>	Configure the local storage capacity of security log as 1000.
	<pre>FS# configure terminal FS(config)# security-log data-store-items 1000</pre>
<b>Verification</b>	Run the <b>show running-config</b> or <b>show security-log config</b> command to check configuration status.
	<pre>FS# show running   in security-log data-store-items security-log data-store-items 1000  FS# show security-log config Security-log audit: enable Limit number: 1000 Store days: 300 Auto vacuum time: 05:05:00</pre>

## 12.5 Monitoring

### Clearing

Description	Command
Deletes all logs	<b>security-log delete all</b>

### Displaying

Description	Command
Displays all logs	<b>show security-log</b>
Displays the detailed log information which can be filtered by time, type, username, host name, etc.	<b>show security-log detail</b> {all {from yyyy mm dd hh:mm:ss to yyyy mm dd hh:mm:ss}}[log-type{SEC_LOG ACC_MNT LOGIN SYS CONFIG OTHER}] [user username][hostname hostname] [peerinfo peerinfo] {[order-by [time   log-type] {asc   desc} [start-item integer1 end-item integer2] ] }
Exports the detailed log information which can be filtered by time, type, username, host name, etc.	<b>show security-log detail export</b> { from yyyy mm dd hh:mm:ss to yyyy mm dd hh:mm:ss } [log-type { SEC_LOG   ACC_MNT   LOGIN   SYS   CONFIG   OTHER } ] [ user username ] [ hostname hostname ] [ peername peername ] [ ip ip-address ]
Displays the log statistics which can be filtered by time, type, username, host name, etc.	<b>show security-log detail stat</b> { all   { from yyyy mm dd hh:mm:ss to yyyy mm dd hh:mm:ss } } [ log-type { SEC_LOG   ACC_MNT   LOGIN   SYS   CONFIG   OTHER } ] [ user username ] [ hostname hostname ] [ peerinfo peerinfo ]
Displays the configuration information.	<b>show security-log config</b>
Displays the statistics information.	<b>show security-log statistics</b>
Displays the statistics information during log processing.	<b>show security-log info</b>

### Debugging

System resources are occupied when debugging information is output. Therefore, disable debugging immediately after use.

Description	Command
Debugs the log auditing.	<b>debug security-log errors</b>
Debugs the received log.	<b>debug security-log rcv-info</b>
Debugs the log database.	<b>debug security-log sql-info</b>

## **ACL & QoS Configuration**

1. Configuring ACL
2. Configuring QoS
3. Configuring MMU

# 1 Configuring the ACL

## 1.1 Overview

Access control list (ACL) is also called access list or firewall. It is even called packet filtering in some documents. The ACL defines rules to determine whether to forward or drop data packets arriving at a network interface.

ACLs are classified by function into two types:

- Security ACLs: Used to control data flows that are allowed to pass through a network device.
